RECORD OF PROFESSIONAL REVISIONS
Table of Contents
Sealed Specification Records

END OF TABLE OF CONTENTS
PART 1 - GENERAL

1.1 GENERAL

A. The General Requirements (Division 1 sections) of these specifications expand on the General and Special Provisions and cover administrative and procedural matters relating to work specified in all the technical sections.

1.2 SPECIFICATIONS

A. Grammatical Mood: These Specifications are written in the imperative mood and abbreviated form. This imperative language of the technical sections is directed at the Contractor unless specifically noted otherwise. Complete incomplete sentences by inserting "shall", "the Contractor shall", and "shall be", and similar mandatory phrases by inference in the same manner as they are applied to notes on the Drawings. Supply the word "shall be" by inference where a colon (:) is used within sentences or phrases. Except as worded to the contrary, fulfill (perform) all indicated requirements whether stated imperatively or otherwise.

B. Brevity: In the interest of brevity these Specifications frequently omit modifying words such as "all" and "any" and articles such as "the" and "an," but the fact that a modifier or an article is absent from one statement and appears in another is not intended to affect the interpretation of either statement.

C. Definitions: For the purposes of this Contract, in addition to General Provisions Paragraphs "Definition" and "Specifications and Drawings", the following terms and their derivative forms shall be accorded the meanings assigned below:

1. Approved: Unless otherwise specified, as approved by the Contracting Officer.

2. Construction Site (Project Site, Worksite, plant, or Site): The area delineated on the Contract plans for the Project and all the areas utilized by the Contractor for the storage and/or processing of materials to be incorporated into the Work that has been approved by the Contracting Officer.

3. Contract Documents: Consist of the Invitation for Bid, the Bid Schedule, and all Exhibits identified on the Invitation for Bid.

4. Construction Staging Area: Property available for use by the Contractor during the construction period for the purpose of storing products and construction equipment and for the purpose of staging work.

5. Contractor: The individual, partnership, or corporation or a combination of any or all jointly undertaking the execution of the Work under terms of the Contract and acting directly or through agents or employees.

6. Defective: An adjective which when used to describe the contractual work effort that does not conform to the Contract Documents, or does not meet the requirements of any inspection, reference standard, test, or approval referred to in the Contract Documents.

7. Drawings: Graphic and pictorial portions of the Contract Documents, showing the design, locations, and dimensions of the Work. Generally including plans, elevations, sections, details, schedules, and diagrams.

a. Synonym: Plans

8. Experienced: The term “experienced” means having successfully completed a minimum of five previous projects similar in size and scope to the work within the Contract for which the experience is required.

9. Gauge: The term "gauge", when used in connection with the measurement of plates, will mean the U.S. Standard Gage; except that when reference is made to the measurement of galvanized or aluminum sheets used in the manufacture of corrugated metal pipe, metal plate culverts, arches, arched metal cribbing and corrugated aluminum pipe, then the term "gauge" will mean that specified in the applicable AASHTO or ASTM standard.

a. When the term "gauge" refers to the measurement of wire in regard to concrete reinforcement, it will mean the wire gauge specified in the applicable AASHTO or ASTM standard.
10. Including/Consisting of:
   a. Including: Introduces a partial, representative listing of things or actions.
   b. Consisting of: Introduces a complete listing of things or actions which constitute the whole.

11. Installer: An Installer is the Contractor or another entity engaged by the Contractor, either as an employee, subcontractor, or contractor of lower tier, to perform a particular construction operation, including installation, erection, application, and similar operations. Installers are required to be experienced in the operations they are engaged to perform.
   a. Trades: Using terms such as "carpentry" does not imply that certain construction activities must be performed by accredited or unionized individuals of a corresponding generic name, such as carpenter. It also does not imply that requirements specified apply exclusively to tradespersons of the corresponding generic name.

12. Jurisdictional Authorities: State, Federal, and local authorities or agency thereof having jurisdiction over work to which reference is made.

13. Milestone: A principal event specified in Contract Documents relating to an intermediate completion date, time period prior to completion of all work, or final completion of all work.

15. Paragraph: An element of the specification section bearing its own alphanumeric designation.

16. Permanent Drainage Easement: A right to construct and maintain permanent drainage facilities for retention, release, and passage of surface water in a particular area.

17. Permanent Subsurface Easement: A right to construct and maintain permanent subsurface facilities in an underground space.

18. Permanent Utility Easement: A right to construct and maintain utility facilities in a particular area.

19. Review: A general overview, not an approval.

20. Right-of-Way: A term denoting land and property, and interests therein, acquired by the Authority.

21. Similar: Generally the same but not necessarily identical; details shall be worked out in relation to location and relation to other parts of work.

22. Shall/Will/May:
   a. Shall: Indicates action which is mandatory on the part of the Contractor.
   b. Will: Indicates probable action.
   c. May: Indicates permissible action.

24. Specified: Unless otherwise stated, as required by the General Provisions, the drawings, the Specifications, and the Special Provisions for the Project.

25. Supplier: A manufacturer, fabricator, supplier, distributor, material manufacturer, or vendor who contracts with the Contractor or any Subcontractor to furnish materials or equipment to be incorporated in the Work by Contractor or any Subcontractor.

26. Subcontractor: A person, persons, or entity who contracts with the Contractor or any Subcontractor to perform work, provide labor, or to render service on or about the Work.

27. Submit: Unless otherwise specified, transmit to the Contracting Officer for approval, or review and record. Refer to Section 01330, "Submittals", for general requirements for submittals.

28. Temporary Construction Easement Line: Boundary which describes the area not
1.3 CONTRACTOR'S SUPERINTENDENT

A. In furtherance of General Provisions, Paragraph, "SUPERINTENDENCE BY THE CONTRACTOR", the Contractor shall appoint immediately upon award of the Contract, a superintendent who is satisfactory to the Contracting Officer and has the authority to act for the Contractor.

B. The appointment of the superintendent (by the Contractor) shall at all times be subject to the approval in writing of the Contracting Officer (which approval may at anytime be withdrawn). If the Contracting Officer withdraws such approval, the Contractor shall remove the superintendent from the Work and shall not employ him on the Work in any other capacity; and shall replace him by another superintendent as approved by the Contracting Officer.

4.1 MEASUREMENT

A. Unless specifically stated, no separate measurement will be made for the work specified in the various sections under Division 1, "General Requirements".

4.2 PAYMENT

A. No separate payment will be made for the work specified in various sections under Division 1, "General Requirements" except for items specifically designated as separate pay items, but shall be included in the Contract Bid Schedule at the lump sum for "General Requirements". This lump sum price will be full compensation for all materials, labor, tools, equipment, and incidentals necessary for the completion of the work; and for performance of all requirements as described in all sections under Division 1, "General Requirements" and relevant plans and Contract Documents. Payment will be made in the following manner:

1. Twenty-five percent of the lump sum price for General Requirements will be paid in three equal amounts, as part of each of the first three progress payments subject to timely and satisfactory compliance with the requirements of the General Requirements.

2. Seventy-five percent of the lump sum price for the General Requirements will be paid in equal amounts over the remaining duration of the Contract, beginning with the fourth progress payment, subject to compliance with the requirements of the General Requirements including Quality Control, Maintenance of As-Built Drawings, and Schedule Update.

3. The value allocated to General Requirements shall not exceed five percent of the total bid amount.

END OF SECTION 01001
PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

A. The Work under the Contract consists of construction as described in the Contract Documents. Extent and details of the construction site are shown on the Contract drawings. Unless otherwise provided, the Contractor shall furnish all materials, labor, tools, equipment, and incidentals necessary for the proper prosecution and completion of the Work.

B. The Work By Others: In accordance with and in addition to the General Provisions, Paragraph, "OTHER CONTRACTS":

1. The exercise of the right reserved by the Authority to permit other contractors and persons to do work in or about the Contract area during the performance period of this contract does not in any way or to any extent relieve the Contractor from liability for loss and damage to the Work due to or resulting from the Contractor’s operations.

2. These provisions apply to the relations between the Contractor and utility companies performing work in connection with Authority construction. Permit free and clear access to utility companies for their construction.

3. Coordinate interface requirements with other Contractors; schedule and sequence the activities to meet the project schedule and milestones.

1.2 CONTRACT MILESTONE AND PHASED CONSTRUCTION

A. Contract milestones and construction planning requirements, when applicable, are described in the Contract Documents. Schedules prepared under Section 01320 “Construction Schedules and Progress Reports” or Section 01321 “Construction Schedules and Progress Reports for Small Projects”, shall be consistent with contract milestones and construction planning requirements. The work sequence shall be in accordance with the approved Construction Schedule.

B. Suggested construction phasing, when applicable, is described in the Contract Documents.

C. The Contractor shall develop for Authority review and approval a detailed and comprehensive cut-over work plan for the cutover, or connection of the new line section to the existing alignment and systems. The Contractor shall coordinate with the Authority and other contractors or consultants during the development and execution of the cut-over work plan. The cutover work plan shall be submitted to the Authority a minimum of 90 days prior to the requested cutover date. The cutover work plan shall include:

1. Physical work to be implemented.
2. Impacts to rail facilities, systems and operations.
3. Integrated testing plans.
4. Operations and maintenance requirements.
5. Narrative and schedule information identifying work crew members and work shifts.
6. Hourly schedule detailing all work elements and identification of key hold points to be adhered to during the cutover process.
7. Identify contingency resources and the criteria for implementing the contingencies.
8. Identify required outages and measures for the cutover.

D. Perform work to accommodate vehicular and pedestrian traffic during construction as specified in Section 01570 “Maintenance and Control Of Traffic”.

E. Contractor shall notify the Contracting Officer immediately of the Contractor’s inability to meet any of the constraints or milestones described in the Contract.

1.3 GEOTECHNICAL REPORT

A. The Contractor shall use the Geotechnical Report, Exhibit K, in the performance of the Work.

1.4 WORKSITE

A. Location of the Worksite: The Work is located in the DART service area. Exact location of the Worksite, including the area available for Contractor’s operations, access routes, and the right-of-way are shown in the Contract Drawings.

B. Access to the Worksite

1. Plan and execute safe access to the Worksite by construction equipment, vehicles, and personnel in accordance with the Contract.

2. A plan for haul and delivery roads shall be developed by the Contractor and submitted in accordance with Section 01570 "Maintenance and Control of Traffic".
3. The Contractor shall take into consideration the following guidelines for haul and delivery roads plan development:

a. Coordinate access and delivery roads with other contractors active in the area.

b. Minimize nighttime disturbance of hotel, apartment, single family and condominium residents in the area as required in accordance with the specifications for Section 01560 “Environmental Protection” and by the local rules and regulations of the jurisdictional agencies.

c. Minimize daytime disruption to retail and office operations.

d. Refer to Sections 01500 “Temporary Facilities and Services”, 01560 “Environmental Protection”, 01570 “Maintenance and Control of Traffic”, and other applicable provisions of Contract Documents for related requirements.

e. Provide for access by utility companies and their vehicles to and on the Worksit.

f. Provide for access by DART maintenance Personnel and their vehicles to and on the Worksit.

4. The Contractor shall not restrict the portion of the public right-of-way except as noted in these Specifications.

5. The Contractor shall provide access for other contractors during construction.

1.5 CONTRACTOR’S STAGING AREA

A. Refer to the Contract Drawings for specific areas available for Contractor staging areas. Access and egress from the staging area is subject to the approval of the Contracting Officer.

B. Areas Provided by Contractor: Subject to the approval of the Contracting Officer, the Contractor shall provide, with no liability to the Authority, any additional areas and access thereto not shown or described that may be required for temporary construction facilities or storage of materials. Contractor shall construct and maintain all access roads, detour roads, or other temporary work as required by the Contractor’s operation. Refer to Article entitled “Contractor’s Use of Private Property” herein for additional requirements.

C. The boundary of all staging areas shall be located 30 feet or more from the edge of lanes open to the public.

D. The Contractor’s material and equipment shall be stored at the approved Contractor’s staging area or at locations approved by the Contracting Officer. The Contractor shall confine equipment, storage of materials, and operation of workers to those areas approved with no liability to the Authority.

E. When required in the interest of the Work, the Contractor shall arrange offsite parking with a third party at the Contractor’s sole responsibility and risk.

F. Contractor shall provide a security fence for all staging areas used by the Contractor to prevent intrusion into the areas by unauthorized personnel.

G. The Contractor shall be responsible for the staging areas and offsite parking including the security, maintenance, compliance with the applicable Contract provisions, cleaning, and restoration to their original condition.

H. The Contractor’s facility and the Contracting Officer’s facility may be located in one of the staging areas subject to the approval of the Contracting Officer and in accordance with Section 01500, “Temporary Facilities and Services”, of the Specifications.

1.6 WORKSITE AND STAGING AREA

A. The Contractor’s work activities shall be confined within the Right-of-Way, Easements, and Staging areas as depicted on the drawings, unless approved otherwise.

1.7 CONTRACTOR’S USE OF PRIVATE PROPERTY

A. Use by the Contractor of private property including use for storage, staging, parking, or travel across property shall be with no liability to the Authority and shall be subject to the following provisions.

B. The Contractor shall identify its need (including the need of its subcontractors of all tiers) for use of private property and obtain written authorization from property owners. Contractor shall also obtain written authorization from occupants, if appropriate.

C. Contractor shall submit such written authorization for approval by the Contracting Officer. Written authorization shall be in a form acceptable to the Contracting Officer. Refer to Form 01010-A “Temporary Use Agreement”, at the end of this Section as an example of an acceptable form.

D. Such authorization shall typically be submitted a minimum of 21 days prior to Contractor’s use of the property. In all cases, such authorization shall be submitted prior to Contractor’s use of the property.
1.8 WORK HOURS

A. Construction will be limited to the daylight hours of 7:00 a.m. to 9:00 p.m., Monday through Friday, or as approved by the jurisdictional authority.

1.9 PERMITS AND LICENSES

A. Refer to General Provisions, Paragraph “PERMITS AND RESPONSIBILITIES”.

B. Submit copies of permits and licenses prior to proceeding with work.

1.10 NOTIFICATIONS AND COMMUNITY RELATIONS

A. Contractor shall be responsible for coordination with and notifications to adjacent property owners and businesses regarding disruptions due to the Work scheduled in those areas.

B. The Contractor shall designate a contact person to be responsible for coordination and notifications. This contact person shall coordinate with the Authority’s Community Relations Department prior to contact with property owners and businesses.

C. Refer to Section 01570 “Maintenance and Control of Traffic”, for community notification requirements in regard to disruption of normal vehicular and pedestrian traffic flow patterns.

D. Prior to commencement of any part of the Work, give any notices required to be given to adjoining landowners or other parties.

ATTACHMENT 01010 - A

STATE OF TEXAS
COUNTY OF ________________________________

TEMPORARY USE AGREEMENT

As property owner of the property located at ____________________________________________________________ Address

I do hereby grant ___________________________________________________________ Contractor’s Name and Address

(Contractor) the right to use my property for the purpose of ____________________________________________ Specific Use

In connection with the construction of the Dallas Area Rapid Transit’s project: _______________________________ Specific Name of DART Project

The temporary use of my property shall be for a term of ____ months beginning _________ and ending ______________. Start Date End Date

Contractor agrees that at the end of the term as specified above, all surplus excavation, debris, trash, and litter resulting from said use of my property shall be cleaned up and hauled off the premises and my property shall be restored as nearly as reasonable to its original condition. This agreement does not waive any damages to my remaining property, which were the result of the Contractor’s activities upon this specified property.

Executed this __________ day of __________, 20 ________.

_________________________________________________
Property Owner’s Signature

THE STATE OF TEXAS
COUNTY OF ________________________________

The foregoing instrument was acknowledged before me on the ________________ day of __________________, 20 __________ by _____________________ and acknowledge to me that he-she executed this agreement for the purposes and consideration Name

herein expressed.

Given under my hand and seal of office on this the ________________ day of ______________________, 20 ______________.

_________________________________________________
Notary Public, State of Texas

END OF ATTACHMENT
PART 1 - GENERAL

1.1 DESCRIPTION

A. The Work to be done under this Section consists of establishing and maintaining a Contractor System Safety Program (CSSP). This safety program shall be developed by the designer and integrated into all Work phases relating to Communications, Traction Electrification, i.e., Overhead Contact System and Traction Power Substations, Signals, and Fare Collection, and these Contract Work elements shall be known collectively as “Systems.” The CSSP requirements shall be applied to subcontractors, suppliers, and vendors.

B. The CSSP shall prescribe a formal approach to hazard control through engineering, design, education, management policy, and supervisory control of conditions and practices. The procurements and guidelines established in MIL-STD-882D, Standard Practice For System Safety, shall be applied to the CSSP.

C. The CSSP shall supplement the fail-safe and fault tolerant design requirements of these Specifications, but shall not, in any way, relieve the Contractor of design responsibility.

1.2 REFERENCED STANDARDS

A. Military Standards

1. MIL-STD-882D – Standard Practice For System Safety

B. Dallas Area Rapid Transit (DART/Authority)

1. DART Light Rail Transit, Systems Safety and Security Program Plan, January 2006, Revision 8 (SSPP)

1.3 OBJECTIVES

A. The primary objective of the CSSP shall be to eliminate hazards from the “Systems” equipment and facilities provided under this Contract. These are hazards which could result in personal injury, damage, or loss of a portion of the subject facilities, see Article 1.6, “Hazard Risk Assessment and Resolution” of this Section. Hazard risk assessment applies both directly and indirectly, (i.e., whether the injury, damage, or loss, were to be caused directly by a subject facility malfunction or indirectly by the resultant unsafe operation of one or more trains.)
c. Approach for evaluating the system safety impacts of these new and different elements.

3. The Authority approved CSSP shall be maintained throughout the life of the Contract.

B. Monthly Progress Reports: Contractor shall submit to the Authority a Monthly System Safety Reports, commencing no later than 60 days after Contract NTP, as a part of the Monthly Progress Report. The Monthly System Safety Reports shall include the following:

1. A list of in-progress System safety tasks and the status of each.
2. Evaluation of design changes on the System safety.
3. A list of open items relevant to System safety.
4. A list of System safety tasks to be accomplished in the next reporting period.
5. An updated schedule showing the significant milestones of the CSSP, with expected dates of completion.

C. Preliminary Hazard Analysis (PHA): Contractor shall submit the PHA in quarterly increments beginning no later than 6 months after Contract NTP. Each submittal shall include the following information:

1. The PHA, in the current state of completion.
2. Perform the PHA and ensure compliance with the relevant portions of the Authority’s SSPP Chapter 5, the CSSP and these Specifications.
3. Identification of changes, additions, or deletions since the previous submittal.
4. Status of all known operating hazards.

D. Operating Hazard Analysis (OHA): Contractor shall submit the OHA in quarterly increments, beginning no later than 6 months after Contract NTP. Each submittal shall include the following information:

1. The OHA, in the current state of completion.
2. Perform the OHA and ensure compliance with the relevant portions of the Authority’s SSPP Chapter 5, the CSSP and these Specifications.
3. Identification of changes, additions, or deletions since the previous submittal.
4. Status of all known operating hazards.

E. Failure Mode Effects Analysis (FMEA): Contractor shall submit the FMEA in quarterly increments, beginning no later than 6 months after Contract NTP. Each submittal shall include the following information:

1. The FMEA, in the current state of completion.
2. Perform the FMEA and ensure compliance with the relevant portions of the Authority’s SSPP Chapter 5, the CSSP and these Specifications.
3. Identification of changes, additions, or deletions since the previous submittal.
4. Status of all known operating hazards.

F. Fault Tree Analysis (FTA): Contractor shall submit the FTA in quarterly increments, beginning no later than 6 months after Contract NTP. Each submittal shall include the following information:

1. The FTA, in the current state of completion.
2. Perform the FTA and ensure compliance with the relevant portions of the Authority’s SSPP Chapter 5, the CSSP and these Specifications.
3. Identification of changes, additions, or deletions since the previous submittal.
4. Status of all known operating hazards.

1.5 REQUIREMENTS

A. Management: Contractor shall be responsible for the CSSP management and operation. The responsibilities and functions of those directly associated with System Safety policies and implementation of the program shall be clearly defined. The authority delegated to this organization and the relationship between line, staff, interdepartmental, project, functional and general management organizations shall be identified. It is not the intent of this Section to prescribe or imply organizational structure, management methodology, implementation procedures, or internal documentation. Pertinent aspects of the CSSP Management shall be reported in the monthly reports.
B. Contractor shall designate an employee as “System Safety Supervisor or Manager” to manage all aspects of the Contractor’s and subcontractors’ CSSP. The requirements for the System Safety Supervisor or Manager shall be:

1. Minimum of three years experience in performing operating hazard analyses and preliminary hazard analyses.
2. Knowledge in “Systems” technology.
3. Knowledge of Light Rail or Transit control system software safety characteristics.
4. Contractor shall submit the designated Safety Manager/Supervisor employee and resume and credentials for Authority approval.

C. Preliminary Hazard Analysis: Contractor shall conduct a complete and comprehensive PHA to identify, classify, evaluate and resolve hazards in the System. The PHA shall include consideration of all “Systems” subsystems, assemblies and components. The PHA shall include the following information:

1. Hazard Index Number
2. Description of the hazard.
3. Effects of the hazard.
4. Initial hazard risk.
5. Controls for the hazard.
6. Final hazard risk.
7. Status of the hazard.

D. Operating Hazard Analysis: Contractor shall conduct a complete and comprehensive OHA.

E. Interface With the Authority System Safety Activities.

1. The Authority will perform System Safety Activities as defined in Authority's SSPP. Included in these activities are PHA and OHA. Contractor shall support these activities by providing:
   a. Technical data related to the Contract requested by the Authority.
   b. Response to System Safety questions for equipment, procedures or other material related to the Contract.
   c. Contractor shall disclose, analyze, explain, and discuss designs with the Authority that impact or potentially impact the safety, operation, or reliability where the Contractor’s designs deviate from the Authority’s current configuration and equipment complement and potentially compel the Authority to review the system safety impact.

F. Interface With the Authority Operations: Contractor employees that are required to work in and around the Authority revenue operations shall attend an Authority sponsored safety class prior to commencing any Work.

1.6 HAZARD RISK ASSESSMENT AND RESOLUTION

A. Hazard Risk is comprised of two elements: severity and frequency. Severity is a qualitative measure of the injury and damage resulting from a mishap. Frequency is a qualitative measure of how often a mishap occurs.

B. Hazard severity shall be classified and assigned a relative quantitative severity in accordance with the Authority’s SSPP Paragraph 5.2.1.

C. Hazard frequency shall be assigned a relative frequency of occurrence in accordance with the Authority’s SSPP Paragraph 5.2.2.

D. Contractor shall take immediate action to control hazards in accordance with the requirements of Authority’s SSPP Paragraph 5.4.

1.7 TASKS AND PROCEDURES

A. The CSSP shall specifically describe the procedures that the Contractor shall follow in order to accomplish CSSP tasks. These tasks shall include the following:

1. Adequately control entire system hazards in the design phase as early as possible.
2. Eliminate from the System any identified false Signal proceed aspects or the evoking of any false proceed aspects.
3. Identify any single failure in the Communication and Control System, Signal System, and Overhead Contact System, Traction Power Substation, Fare Collection or their interfaces that may cause an unsafe condition.
4. Minimize the number of false signal stop aspects and other false communications control indications due to equipment design, installation, or operating procedure.
5. Evaluate design changes and the impact these changes will have on the safety of the complete System.

6. Establish and maintain the required backup data, information and material to assure and support System Safety Certification of the Communications and Control, OCS, and Signals Systems.

PART 2 - PRODUCTS

2.1 CONTRACTOR FURNISHED MATERIALS

A. Contractor shall provide all the materials, tools, equipment, computer time, reference literature and any such required items that are essential to meet the CSSP requirements.

PART 3 - EXECUTION

3.1 PERFORMANCE

A. The System Safety Supervisor / Manager, identified in this Section shall have the following responsibilities:

1. Direct the activities of the CSSP and assigned personnel to complete all required CSSP tasks in accordance with the Contract Documents, while maintaining and staying within schedule and budget.

2. Supervise the Contractor's "PHA" of the Communications, OCS, Traction Power Substation, Fare Collection, and Signal Systems and its individual subsystems and interface areas.

3. Maintain records of all changes to the CSSP. These records shall be available to the Authority upon 48 hours notice.

4. Determine potential changes that could be made in the systems, operating rules, training procedures, equipment, maintenance procedures, physical structure, or other systems outside this Contract to eliminate critical and marginal hazard conditions or to reduce their effect to a negligible status and recommend these changes to the Authority.

5. Implement those safety changes approved or required by the Authority, which fall within these Specifications.

6. Prepare and submit the Monthly System Safety Reports to the Authority as required in Paragraph 1.4.B of this Section.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Work specified in this Section will not be measured separately for payment.

4.2 PAYMENT

A. In accordance with Section 01001, "General Requirements."

END OF SECTION 01047
PART 1 - GENERAL

1.1 PURPOSE

A. The purpose of this standard is to establish, by means of color-coding, a method for identification of the contents of pipelines; in addition, a uniform color system is given for the painting of safe and hazardous areas of equipment and in buildings.

B. In all cases where identification is essential to safe operation, use English legend and provide framed/mounted color code guides.

1.2 REFERENCE STANDARDS

A. National Electrical Manufacturers Association (NEMA):

   1. NEMA Z535.1 - Safety Color Code

1.3 CONTENTS

A. This standard covers the following color codes, standards, and systems:

   2. Pipeline Identification Color Code.

1.4 CODE SYSTEMS USED

A. The color codes and standards presented herein are based on historical practice and accepted codes of the American National Standards Institute (ANSI), the National Safety Council and the Occupational Safety and Health Administration (OSHA).

1.5 GROUP IDENTIFICATION

A. Because there is a limited number of colors which are readily distinguishable under all conditions of lighting and aging, materials having some property in common are grouped together under one base or ground color. Within each color group, individual designations are indicated by a secondary color applied as a stripe, or used for the color of letters in stencil.

1.6 BASE COLORS

A. The base or ground colors and the groups of materials they represent are presented in Table 01086 - 1.

PART 2 - PRODUCTS

2.1 SAFETY COLOR CODE

A. General Hazard Indication: This Safety Color Code for the use of colors to call attention to physical hazards, the location of safety equipment, and the identification of fire and other protective equipment, is based on NEMA Z535.1.

B. Code Colors:

   1. Red - Fire Protection and Emergency: Use for hydrants and associated piping, firefighting equipment and facilities, also for emergency shut-down controls.
   2. Green - Safety: Use for first aid and personal protective equipment and facilities and for sealing devices on valves.
   3. Yellow - Caution: Use to designate locations of physical hazards which might cause striking against, stumbling, falling, tripping, "caught in between", as well as for traffic marks.
   4. Yellow & Black Stripes - Danger: Use to attract special attention to locations of the physical hazards discussed above.
   5. Orange - Alert: Use to designate dangerous parts of machines or energized equipment which may cut, crush, shock, or otherwise injure, and to emphasize such hazards when enclosure doors or other guards around moving equipment are opened or removed.

C. Examples of some applications of the Safety Color Code:

   1. Red - Fire Protection and Emergency:
      a. Fire alarm boxes.
      b. Fire hydrants.
      c. Fire buckets or pails.
      d. Fire extinguishers and areas on walls or supports on which they are mounted.
      e. Fire exit signs.
f. Fire hose drum shelters.
g. Fire hose cabinets.
h. Fire Doors.
i. Water lines used primarily for fire fighting purposes.

2. Green - Safety:
   a. Gas mask boxes.
   b. First aid kits.
   c. Stretcher.
   d. Safety deluge showers (white and green stripes).

3. Yellow - Caution:
   a. Corner markers for piles of stored materials.
   b. Traffic aisles in shops.
   c. Caution traffic signs in shop and warehouse aisles.
   d. Coverings or guards for guy wires.
   e. Crane hooks.
   f. Suspended fixtures which extend into normal operating areas.
   g. Projecting fixtures such as doorways, traveling conveyer, low beams, and pipes.

4. Black & Yellow Stripes - Danger:
   a. Dangerous curbs.
   b. Bottom risers and top landings of industrial and public stairways.
   c. Exposed and unguarded edges of platforms, pits, and walls.
   d. Lower pulley blocks of cranes.
   e. Car bumpers of fork-lift trucks and cranes.
   f. Pillars, posts, and columns in areas hazardous to personnel (paint to 5 feet above floor).

5. Orange - Alert:
   a. Inside of removable guards for pulleys, shafts, chains.
   b. Inside of enclosed doors for electrical equipment.
   c. Any valves which for safety reasons are required to be locked open.

6. Blue - Precaution: Electrical control units.

PART 3 - EXECUTION

3.1 PIPELINE IDENTIFICATION COLOR CODE

A. Usage:
   1. This Pipeline Identification Color Code is for use on all piping systems.
   2. Label identifications and the use of English legend are mandatory for the content.

B. Non-Descriptive Color:
   1. Aluminum: The only non-descriptive color used or permitted throughout the Contract.
   2. When shown on the Drawings, or when approved by the Contracting Officer, paint the entire length of pipe with aluminum color.
   3. When aluminum color is used as a non-descriptive color, indicate the base color or band color as specified herein.

C. Base or Ground Colors Only: When it is necessary to indicate only the broad group of materials handled, without designating the specific material by a stripe, apply only the base or ground color.

D. Secondary Colors:
   1. Apply the narrow stripe presenting the secondary color which identifies the specific material by painting, or preferably by use of adhesive plastic tapes or snap-on plastic sleeves of the correct color. Tapes or snap-on plastic sleeves manufactured for this purpose are available from many vendors, with colors matching ANSI colors.
   2. In addition, further identify by arrows and legend in English the direction of flow and contents of the pipeline.
E. Color Bands: The location and size of stripes and bands applied to the pipes are recommended as follows:

1. One each side of and adjacent to valves and tees, and other major fittings.

2. Where the pipe enters and emerges from walls, and road and walkway overpasses; on 20 foot centers in equipment rooms.

3. At uniform intervals (20 foot centers) along long sections of the pipe.

4. Adjacent to tanks, vessels, and pumps. When bands are employed in place of painting the entire line, provide these bands 1 foot long. Paint stripes 2 inches wide centered on the band, and space 1 inch apart when two stripes are applied.

F. Examples of Application of the Pipeline Identification:

1. Color Code: Table 01086-2 presents the comprehensive Identification Color Code, listing both band and stripe colors:

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

END OF SECTION 01086
PART 1 - GENERAL

1.1 DESCRIPTION

A. In addition to the General Provisions Paragraphs, "MEASUREMENT AND PAYMENT OF SCHEDULED ITEMS" and "PAYMENTS", this Section includes specifications for measurement and payment as they apply to the Work, and includes provisions applicable to lump sum prices, unit prices, and allowances, as indicated.

B. Measurement methods specified in the individual Sections of these Specifications shall govern if they differ from methods specified in this Section.

1.2 LUMP-SUM MEASUREMENT

A. The term "lump sum" when used as an item of payment, will mean complete and fixed price for the work prescribed for that portion of the contract work under the item described in the contract.

B. The quantities may be shown on the Contract Drawings for items for which lump sum is the method of measurement. If shown, the quantities are shown for the convenience of the Contractor. Contractor shall verify quantities for purposes of bidding and construction. The Contractor will not be entitled to additional compensation if the quantities shown vary from those actually required.

C. Breakdown of costs of lump sum items:

1. If the Contractor requests progress payments for lump-sum items or amounts in the Bid Schedule, such progress payments will be made in accordance with a well-balanced, detailed breakdown of costs of lump sum items for payment purposes, prepared by the Contractor and submitted to the Contracting Officer for approval.

2. Such breakdown for each applicable lump-sum item shall show fixed definable and measurable quantities where possible and unit prices therefor as developed and assigned by the Contractor to the different features of the work and major subdivisions thereof. The summation of extensions of quantities and unit prices and related costs shall equal the amount of the lump-sum Contract Price or lump sum bid item indicated in the Bid Schedule.

3. Following the Contracting Officer’s approval, progress payments will be made in accordance with the Contractor’s breakdown and from the approved progress schedule, reflecting the progress which occurred during the payment period as approved by the Contracting Officer.

1.3 MEASUREMENT OF QUANTITIES FOR UNIT PRICES

A. Measurement will be in accordance with the General Provisions Paragraph, "MEASUREMENT AND PAYMENT OF SCHEDULED ITEMS".

B. Measurement Standards: Work paid for at a unit price per unit measurement will be measured in accordance with United States Standard Measures except as otherwise specified.

1. The term "pound" when used in the measurement or payment of any material or work, will mean 16 ounces avoirdupois, based on computed or scale weight.

2. The term "ton" when used in the measurement or payment of any material or work, will mean the short ton consisting of 2000 pounds avoirdupois. When applicable, materials measured in pounds will be converted to tons.

C. Measurement, General: Unless otherwise specified, the following shall apply:

1. Structures will be measured according to neat lines shown on the Contract Drawings or as ordered in writing, unless otherwise specified. Concrete and masonry will be measured and accurately computed by dividing the work into simple geometrical figures and adding their volumes or areas.

2. Allowance will not be made for surface laid over a greater area than shown on the Contract Drawings, or for any material moved from outside the area of the cross section and lines shown on the Contract Drawings except when specifically authorized by the Contracting Officer.

D. Measurement by Area: Unless otherwise specified, the following shall apply: Longitudinal measurements for area computations will be made horizontally. Transverse measurements will be the neat dimensions shown on the Contract Drawings or ordered in writing by the Contracting Officer.

E. Measurement by Volume: Unless otherwise specified, the following shall apply: In computing volumes of excavation, embankment or borrow, methods utilizing electronic computation, planimeters, or other accepted engineering procedure having general acceptance in the engineering profession will be used. When the measurement is based on the cross sectional area, the average end area method will be used.

F. Linear Measurement: Unless otherwise specified, the following shall apply: Items which are measured by the linear foot, such as guardrail, underdrains, etc., will be measured parallel to the base or foundation upon which such structures are placed, unless
Measurement per Each: The term "each" when used as an item of payment such as project markers and Right-of-Way monuments will mean complete payment for the work prescribed for that item.

Measurement by Weight: Unless otherwise specified, items measured on a linear basis will be measured at the centerline of item in place.

Bituminous Materials: Bituminous materials, where specified to be paid for separately, will be measured by the ton, unless specified or directed otherwise. Bituminous materials delivered in tank trucks or tank feeders shall be weighed on scales, as approved by the Authority.

Timber: Where specified to be paid for separately by the board foot, timber will be measured by the board foot actually incorporated in the structure. Measurement will be based on nominal widths, and the thickness and the extreme length of each piece.

Measurement will be based on nominal widths, and the thickness and the extreme length of each piece.

1.4 VALUES OF UNIT PRICES

A. The number of units and quantities contained in the Bid Schedule as estimated quantities are approximate only, and final payment will be made for the actual number of units and quantities, which are incorporated in the Work and required by the Contract, as, measured by the Contracting Officer.

B. In the event that work or materials or equipment are required to be furnished to a greater or lesser extent than is indicated in the Contract Documents, such work or materials or equipment shall be furnished in greater or lesser quantities in accordance with General Provisions Paragraph, "VARIATION IN ESTIMATED QUANTITY".

1.5 ALLOWANCES

A. Description: Allowances specified in the Contract Documents and indicated in the Bid Schedule shall cause the work so covered to be furnished, performed, and completed for such sums as are acceptable to the Contracting Officer and shall include the cost to the Contractor of all materials and equipment to be delivered and installed under the specified allowances.

B. Specific Allowances: Specific allowances, if any, included in the Contract are indicated in the Bid Schedule.

C. Administration:

1. The allowances specified in the Contract Specifications and indicated in the Bid Schedule are exclusive of any work indicated in the Contract Documents for which payment is included under other specifically designated items in the Bid Schedule.

2. Contractor Accountability of Allowance Work Performed: Contractor shall maintain a separate account of all incurred, segregable, direct costs for the work allocable to the item requirements. Only allowable and allocable direct costs will be reimbursed; there shall be no compensation for any other related costs including but not limited to overhead indirect costs, commission or profit. These amounts shall not subject to retainage.

1.6 CONTRACT PAYMENTS

A. Payments will be in accordance with the General Provisions Paragraph, "PAYMENTS".

B. Full Compensation:
1. The Contract lump sum and unit prices paid for the various items and classifications of work shall include full compensation for furnishing labor, supervision, materials, tools, equipment, transportation, services, and incidentals, and for performing work necessary for completing the construction or installation of the item or work classification, complete in place, unless stated otherwise. Prices paid shall include all miscellaneous components, accessories, and appurtenances; shop drawings, working drawings, and other submittals; and testing and inspection, unless stated otherwise.

   a. The term "complete in place", when used in regard to measurement and payment, means the completion of the contract item, including the furnishing of materials, equipment, tools, labor, supervision and work incidental thereto, unless otherwise specified.

2. Refer to with the General Provisions Paragraph, "MEASUREMENT AND PAYMENT OF SCHEDULED ITEMS" for payment for cost of work not specifically provided for by a pay item in the Bid Schedule.

C. Refer to the breakdown of costs of the lump sum price for General Requirements required under this Section: If in any month, the Contractor fails to comply with any portion of the General Requirements that has value to the Authority which will not be fulfilled by the untimely performance of that aspect of the work, the entire monthly payment for General Requirements will be deducted from the Contract Amount. If such work is completed or submitted late within a particular month, the payment will be prorated at the option of the Contracting Officer and a percent of the payment (in accordance with the proration) will be deducted from the Contract Amount. Examples of aspects of the work which have value to the Authority only or primarily in their timely execution for each month are submittal of properly prepared Schedule Update, proper execution of Contractor's Quality Control Plan, and maintenance of complete and correct Working (As-Built) Drawings and Specifications.

1.7 REJECTED, EXCESS, OR WASTED MATERIALS

A. Quantities of material wasted or disposed of in a manner not called for under the Contract; rejected loads of material, including material rejected after it has been placed by reasons of the failure of the Contractor to conform to the provisions of the Contract; material not unloaded from the transporting vehicle; material placed outside the lines indicated on the Contract Drawings or established by the Contracting Officer; or material remaining on hand after completion of the Work, will not be paid for, and such quantities shall not be included in the final total quantities. No additional compensation will be permitted for loading, hauling, and disposing of rejected material.

1.8 CERTIFICATION OF AS-BUILTS

A. The Contractor shall submit with each pay request, a certification that all Request for Information (RFI’s), Change Orders or Supplemental Agreements, clarifications, revisions and field surveyed data have been documented on the Working (As-Built) Drawings and Specifications sets in accordance with the contract requirements. Working (As-Built) Drawings and Specifications shall be certified correct and complete by the Contractor’s Quality Control Representative at the time invoices are submitted for progress payments.

PART 2 - PRODUCTS

Not Used.

PART 3 - EXECUTION

Not Used.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 01001, “General Requirements”

END OF SECTION 01220
PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies the general requirements and procedures regarding the project meetings.

1.2 TYPES OF MEETINGS
A. Pre-Construction Conference: Prior to the start of construction.
B. Initial Coordination Meeting: Prior to the start of construction
C. Initial Coordination Utility and Jurisdictional Agency Meetings: As needed.
D. Contractor Coordination Meeting (Weekly Progress Meeting): Held weekly.
E. Mutual Understanding Meeting: Held after the Contractor’s Quality Control Plan is approved, refer to Section 01450, Quality Control.
F. Contractor’s Quality Control (CQC) Meetings: Held weekly.
G. Ad-Hoc Meetings: As required throughout prosecution of the Work. To address immediately any matter or situation that has a bearing on the quality or completion of the Contract Work.

1.3 PRE-CONSTRUCTION CONFERENCE
A. The Contracting Officer will arrange a Pre-Construction Conference to orient the Contractor. The date of the conference will be as soon as practical after Notice of Award.
B. Attendees: Contracting Officer, other Authority representatives, and representatives of the Authority’s designers, utilities, and other jurisdictional authorities. Contractor’s Attendees: A responsible officer of the Contractor, the Project Manager, proposed Contractor’s Quality Control Representative (CQCR), Superintendent, Safety Supervisor, and other personnel as necessary.
C. Agenda:
   1. Project Organization and Discussion of Responsibilities.
   2. Design Overview
   3. Contract Documents
   4. Insurance and Bonds
   5. Quality Control
   6. Safety
   7. Environmental Protection
   8. DBE/MDE/WBE Requirements
   9. Operations Coordination
   10. Maintenance Coordination
   11. Utility Coordination
   12. Community Relations
   13. Neighborhood Job Opportunity Program

1.4 INITIAL COORDINATION MEETING
A. The Contracting Officer will arrange and conduct the Initial Coordination Meeting with the Contractor. The agenda will be forwarded to the Contractor soon after Notice to Proceed.
B. Contractor’s attendees shall include the Project Manager, CQCR, Superintendent, Safety Supervisor, and other personnel as necessary.
C. Agenda:
   1. Authority’s Project Organization
   2. Contractor’s Project Organization
   3. Partnering
   4. Quality Control
   5. Proposed Construction Methods
   6. Scheduling
   7. Communications Procedures
   8. Meetings
   9. Submittals
   10. Project Cost Control
   11. Differing Site Conditions
   12. Design Site Conditions
   13. Claims
   14. Project Completion
16. Payment Procedures

1.5 INITIAL COORDINATION UTILITY AND JURISDICTIONAL AGENCY MEETINGS

A. The Contracting Officer will arrange and conduct meetings with the Contractor and affected entities. The purpose of these meetings will be to establish an early working relationship between the Contractor and affected utilities and jurisdictional agencies and establish coordinated activities during the construction phase.

B. Agenda:

1. Review the Agreements with each party.
2. Representative contact and their authority for each party present.
3. Permit, insurance, safety requirements.
4. Scheduling of work.
5. Inspection and acceptance of work.

1.6 MONTHLY PROGRESS STATUS UPDATE MEETING

A. This meeting shall be held prior to the formal submittal to verify progress and review the approved schedule against actual progress and to establish a basis for the monthly payment estimate.

B. Agenda Topics

1. Agreement on Update Information: The Contracting Officer will review the Contractor submitted logic sort of last month’s printout as a draft. Either prior to or during the meeting, the update information listed below shall be agreed upon. This agreed-upon update information shall then be entered into the CPM Schedule.
   a. Actual start dates on activities started this period.
   b. Actual completion dates on activities finished this period.
   c. Remaining duration’s for activities which have started but are not completed.
2. Status of Project Milestones: Review project milestones with gains or slippages noted.
3. Schedule Slippages: Review any slippages in critical activities or on project milestones.

4. CPM Changes for Next Update: List and categorize any agreed changes to the schedule as shown below:
   a. Minor logic changes.
   b. Changes in the duration of any activity.
   c. Incorporation of any Change Orders and/or Contract Modifications into the schedule and their impact upon project milestones.
   d. Personnel loading changes.

5. Potential Delays: Review the planned activities (starting, in-progress, and completing) for the next period, highlighting any foreseeable delaying factors. Resolve problems that may have already affected the schedule, with the specific action to be taken by each party.

1.7 CONTRACTOR COORDINATION MEETING

A. This meeting shall serve as a forum to establish and maintain close coordination of work activities through an overview of the next month’s activities, provide details regarding the upcoming work week; and discussing the activities of the following work weeks in more general terms. The agenda shall include the following, as appropriate:

1. Review and approval of minutes of previous meeting.
2. Project safety issues.
3. Environmental protection and hazard related issues.
5. Community relations.
6. Review of work progress since previous meeting.
7. Activities in progress or scheduled for upcoming week including subcontracted work.
8. Manpower, material, and equipment restrictions.
9. Access and availability of work sites.
11. Corrective measures to regain project schedule.
12. Status of shop drawings, working drawings, and other submittals.

13. Review of offsite fabrication, inspection, and delivery schedules.

15. Interfaces and dependencies with preceding, concurrent, and follow-on contractors.

16. Quality assurance and quality control issues.

1.8 CONTRACTOR’S QUALITY CONTROL MEETING

A. This meeting shall be held to review Contractor’s and Authority’s quality control and quality assurance activities and results, review discrepant items, review deficiencies and non-conformances, discuss prevention and correction, identify work which requires as-built drawings, to agree on weather days, and discuss any other concerns which may be related to quality control. DART Quality has the option to attend these meetings.

1.9 MEETING ADMINISTRATION PROCEDURES

A. Unless advised otherwise, meetings will be held in the office of the Contracting Officer.

B. Except for ad-hoc meetings, the day and time for regularly scheduled meetings will be established at the Pre-construction Conference. Requests for changes in date and time of meeting by either party will require a minimum of 24 hours advance notice.

C. Except as otherwise specified, the Contracting Officer will prepare the meeting minutes and distribute them to attendees within five working days following the date of the meeting and within three working days following the date of the Monthly Progress Status Update Meeting.

D. Contractor shall submit any exceptions to the meeting minutes within 48 hours of receipt.

E. Contractor’s Quality Control Representative (CQCR) shall document CQC meetings and provide copies of the minutes to the Contracting Officer within two days after the meeting.

PART 2 - PRODUCTS

Not Used.

PART 3 - EXECUTION

Not Used.

PART 4 - METHOD OF MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 01001, “General Requirements”.

END OF SECTION 01312
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section together with Appendices A, B, and C specifies requirements and procedures for the Contractor to prepare Construction Schedule, Schedules of Values, Schedule Reports, Schedule Data Files, and related reports. The purpose of the schedules and reports shall be to:

1. Ensure adequate planning and timely execution of the work by the Contractor.
2. Establish a model to be used as a basis for determining satisfactory progress and completion of the Project.
3. Facilitate coordination and interfacing of the Contractor's work with others as needed.
4. Assist the Contracting Officer in monitoring progress.
5. Verify the approximate amount of the monthly progress payment to be made to the Contractor.
6. Evaluate proposed changes to the Contract and subsequent impacts to the schedule.

B. Contractor shall be required to provide and maintain at a minimum the following:

1. Monthly Requirements:
   a. Construction Schedule.
   b. Schedule of Values.
2. Weekly Requirements: Provide for Contractor Coordination (Weekly Progress) Meetings:
   a. Narrative Summary.
   b. Three Week Look Ahead (using the P6 Baseline Schedule) with updated data disk.

1.2 REFERENCED STANDARDS

A. The following publications are cited as references for the CPM scheduling technique described in this Contract:

1.3 CONSTRUCTION SCHEDULING PROCEDURE

A. Scheduling technique known as the Critical Path Method (CPM) will be used by the Contractor in complying with these Specifications. The Precedence Diagramming Method (PDM) shall be used in preparing the CPM diagrams and calculations.

B. Contractor shall prepare the Construction Schedule, Schedule Reports, and Schedule Data Files using products of Primavera Systems, Inc., specifically: Primavera Project Planner for Windows (latest version). Any versions of the specified scheduling software used by the Contractor shall be compatible with the versions employed by the Contracting Officer.

C. Construction Schedule, Schedule of Values, Review Bar Chart, and Schedule Data Files shall be produced in the formats described in Part 2 "PRODUCTS".

1.4 IN-HOUSE CAPABILITY

A. Within 14 calendar days after Notice of Award, submit a statement of network analysis capability to the Contracting Officer verifying that either the Contractor's organization has "in-house" capability qualified to satisfy the requirements of this specification or that the Contractor employs a consultant or firm which is so qualified. Contractor shall verify capability by providing a description of construction projects to which the Contractor or his consultant has successfully applied CPM network analysis. Include a minimum of two projects, with references, valued at least half of the value of this contract and which were controlled throughout the duration of the project by means of periodic systematic review, update and revision of a CPM network schedule.

B. The use of an outside consultant is at the Contractor's expense and does not relieve the Contractor of responsibility for complying with this section.

C. Contractor shall maintain on the project site, a full time dedicated scheduler whose sole responsibility is scheduling and who is qualified in CPM scheduling techniques and familiar with the Authority's CPM scheduling software. The dedicated scheduler shall have the primary responsibility for monitoring status, updating progress and revising the Contract Schedule to reflect current contract status.

1.5 SUBMITTALS

A. Construction Schedule:

1. Preliminary Construction Schedule:
   a. Contractor shall prepare a Preliminary Construction Schedule, which shall show in detail the Work activities for the first 3 months of the Work and a summary by
area/subarea of all remaining activities for the entire Contract.

b. Preliminary Construction Schedule shall consist of no less than 200 activities (refer to Appendix A) and shall be presented in the form of a Bar Chart.

c. Each activity, which is not a milestone, submittal, or information, on the Preliminary Construction Schedule shall be allocated a dollar value that coincides with the Schedule of Pay Items, the summation of which shall equal the Grand Total shown on the Schedule of Pay Items.

d. Preliminary Construction Schedule shall be submitted within 14 calendar days after the effective Notice to Proceed.

2. Secondary Construction Schedule:

a. Contractor shall expand the Preliminary Construction Schedule to create a Secondary Construction Schedule that will show in detail all work activities and corresponding costs and resource requirements including labor by type, major equipment, as required per activity for the entirety of the Contract.

b. Secondary Construction Schedule shall be divided into activities which are reasonable, realistic and feasible; and shall be representative of the separable portions of the work and shall comply with the policies of Activity Definition and Duration as outlined in Appendix A to this section.

c. Graphic representations and tabular reports shall be generated using the formats and quantities stipulated in PART 2 “PRODUCTS” using the software specified in Paragraph 1.3.B.

d. Secondary Construction Schedule is to be submitted within 25 calendar days after the effective Notice to Proceed.

3. Review Conference

a. In preparation for a Baseline Construction Schedule, and as part of the submittal process, the Contractor and Contracting Officer shall jointly review the Secondary Construction Schedule within 7 days after submittal to insure Contract compliance.

b. Revisions requested by the Contracting Officer with respect to schedule presentation shall be implemented and resubmitted for approval within 7 days after the Review Conference.

c. Contractor shall furnish within 7 days after the Review Conference a written narrative defining the Contractor’s determination of durations. The narrative shall describe the number of laborers, weather incorporation, the number of work days per week, and major construction equipment.

4. Baseline Construction Schedule:

a. A Secondary Construction Schedule incorporating any revisions as requested by the Contracting Officer as a result of the Review Conference shall be submitted 45 calendar days after Notice to Proceed for approval by the Contracting Officer.

b. Upon approval by the Contracting Officer, the Secondary Construction Schedule, as defined in Paragraph 1.5.A.2.a, shall constitute the Baseline Construction Schedule. Approval by the Contracting Officer is for conformance to the requirements of the contract documents only. Approval does not relieve the Contractor of any of its responsibility for the accuracy or feasibility of the Baseline Construction Schedule, or the Contractor’s ability to meet milestone dates and the contract completion date.

c. Baseline Construction Schedule and subsequent updates shall be generated using the formats and quantities stipulated in PART 2 “PRODUCTS” using the software specified in Paragraph 1.3.B.

d. Contractor shall discuss in detail the Baseline Construction Schedule with all subcontractors and major suppliers as it relates to their respective work.

e. Baseline Construction Schedule will be used as a basis for verifying future progress payments and to measure the Contractor’s overall performance on a monthly basis.

5. Update of Baseline Construction Schedule:

a. Baseline Construction Schedule, hereinafter referred to as the "Construction Schedule," shall be updated on a monthly basis until Contract completion except with respect to contract modifications or approved revisions to the Construction Schedule which will require interim submittals of the Construction Schedule as deemed necessary by the Contracting Officer.
b. Updated Construction Schedule shall be calculated using "retained logic" and shall depict progress of work and payments corresponding to the established "status" date as mutually agreed upon by the Contractor and Contracting Officer.

c. Actual progress shall be reflected in the following terms and subject to approval by the Contracting Officer:

1) Activities started and/or completed.

2) Percentage of resources expanded.

3) Estimated remaining duration for each activity in progress.

4) Budgeted dollar amount and actual dollar amount per activity based on percent complete per resource.

d. Contractor shall certify in writing that the updated Construction Schedule has been discussed in detail with all subcontractors and major suppliers as it relates to their respective work and a copy submitted to the Contracting Officer.

e. Updates to the Construction Schedule, as agreed upon by the Contracting Officer shall be submitted with requests for progress payment, commencing with the third payment request. Failure to meet the requirements of this paragraph shall result in the withholding of payments for the General Requirements.

f. Monthly reports shall be provided to the Contracting Officer with the request for progress payment by the 15th day of each month or by a date mutually agreed to by the Contractor and the Contracting Officer (See b above) and shall contain the latest updated progress information from the previous update.

g. Request for progress payment, narrative report, and the construction schedule shall cover a 1-month period from the end of the last period day 25 of the current month or as mutually agreed.

B. Schedule of Values:

1. Preliminary Schedule of Values:

a. Contractor shall prepare a Preliminary Schedule of Values to show the allocation of Pay Items to individual activities defined in the Preliminary Construction Schedule. 12 digit cost accounts by pay item number with Categories shall be assigned as indicated in Appendix B. The sum of the dollar amounts assigned to each activity shall equal the Grand Total shown on the Schedule of Pay Items.

b. Preliminary Schedule of Values shall outline at a minimum:

1) The "Title" of each activity as defined in the Construction Schedule.

2) The Pay Items used to determine the total dollar amount of each activity.

3) The total dollar value of each activity.

c. Preliminary Schedule of Values is to be submitted with the Preliminary Construction Schedule ten days after Notice to Proceed.

2. Secondary Schedule of Values:

a. Contractor shall update the Preliminary Schedule of Values to create a Secondary Schedule of Values that will allocate a dollar value (cost) for each activity of the CPM Schedule. Each activity cost allocation shall include a labor, equipment, and material cost and a prorata contribution to overhead and profit. The sum of activity costs shall be equal to the total Contract Sum.

b. Secondary Schedule of Values is to be submitted in the format and quantities stipulated in PART 2, "PRODUCTS".

c. Secondary Schedule of Values is to be submitted with the Secondary Construction Schedule, 25 days after Notice to Proceed.

3. Review Conference:

a. In conjunction with the Review Conference for the Secondary Construction Schedule, the Contracting Officer shall also review for approval the items delineated on the Secondary Schedule of Values.

b. If, in the opinion of the Contracting Officer, the Secondary Schedule of Values lacks sufficient detail to support an activity's value, the Contractor will be required to submit documentation substantiating the value of those activities in question.
1) Documentation shall be in the format defined in Appendix B to this section. This documentation shall be submitted within 3 working days after the Review Conference.

2) Based on the documentation provided for in the preceding paragraph, dollar amount allocations will be considered unbalanced if an activity on the Construction Schedule has been assigned a disproportionate share of the dollar amounts.

c. Any adjustment to the dollar amounts of activities as deemed necessary by the Contracting Officer shall be implemented and resubmitted for approval within 7 days after the Review Conference.

4. Baseline Schedule of Values:

a. Secondary Schedule of Values incorporating any dollar amount adjustments as requested by the Contracting Officer as a result of the Review Conference, and subsequent review of any additional dollar amount documentation as described under Sub-section 1.5.B.3 shall be submitted with the Secondary Construction Schedule, 45 days after the effective Notice to Proceed for approval by the Contracting Officer.

b. Upon approval, the Secondary Schedule of Values as defined in Paragraph 1.5B.4.a. shall constitute the Baseline Schedule of Values.

5. Update of the Baseline Schedule of Values:

a. Contractor shall update the Baseline Schedule of Values to reflect approved contract modifications and/or revisions affecting activity dollar amounts.

b. Submit Updates to the Baseline Schedule of Values to the Contracting Officer for approval.

c. Updates to the Baseline Schedule of Values, as approved by the Contracting Officer, shall be submitted with the corresponding updates to the Construction Schedule.

D. Three-Week Look Ahead:

1. Contractor shall prepare a Three-Week Look Ahead on a weekly basis.

2. Three-Week Look Ahead shall be submitted to the Contracting Officer for review no later than 24 hours prior to the Contractor Coordination Meeting.

3. Three-Week Look Ahead shall be created in P6 format or other acceptable formats approved by DART from the latest accepted Construction Schedule.

a. Additional detail shall be added to the Construction schedule if the Three-Week Look Ahead requires additional detail.

b. No activity ID number or Description shall be changed.

c. Additional detail shall be added by changing the activity type to hammock and creating the detail within the hammock.
E. Qualifications of Scheduler: Refer to Article entitled “In-House Capabilities” herein for submittal requirements.

PART 2 - PRODUCTS

2.1 FORMATS

A. This section defines the acceptable formats for which the Construction Schedule, Schedule Data Files, Schedule of Values, Weekly Narrative Summary, and Review Bar Chart shall be submitted:

2.2 CONSTRUCTION SCHEDULE

A. Bar-Chart:

1. Bar-Charts shall be produced in 8-1/2 inch by 11 inch format with sufficient clarity and readability so the Contracting Officer can readily monitor and follow progress for all portions of the Contract.

2. Bar-Charts shall contain the following information for each activity in the activity column:
   a. Identification Number.
   b. Activity Description (“Title”).
   c. Original Duration.
   d. Remaining Duration.
   e. Percent Complete.
   f. Total Float.
   g. Calendar.
   h. Early Start and Early Finish Date (“Bars”).
   i. Free Float.

3. Bar-Charts are to be sorted according to the area/sub-area and Early Start/Early Finish.

4. Critical path shall be clearly shown on the Bar-charts. Critical activities shall be defined as activities with "total float" of less than one day and being the longest path associated to physical work.

5. One Bar-Chart shall be submitted in accordance with Paragraph 1.5.A, “Construction Schedule”

B. Schedule Narrative Reports:

1. Schedule Narrative Reports shall comment on the following updated information for each changed activity:
   a. Logic.
   b. Codes.
   c. Early Dates.
   d. Actual Dates.
   e. Calendar.
   f. Original Duration.
   g. Resources.

1) Labor Resources.
2) Equipment Resources.
3) Whether work will be performed on a single, double or triple shift, and whether it is to be done on a 5, 6 or 7 day work week basis.

h. Budgeted Dollar amount per activity.

2. Narrative Report shall be sorted Area/Sub-Area activity ID.

3. One copy of the Schedule Narrative Report shall be submitted in accordance with Paragraph 1.5.A

2.3 SCHEDULE DATA FILES

A. A copy of data files in PRX back-up format for the Construction Schedule and subsequent approved updates of the Construction Schedule shall be submitted on a CD-ROM or DVD. Each submitted schedule shall have a unique P6 “project name”. These data files are hereinafter referred to as the Schedule Data Files.

B. Schedule Data Files shall be submitted with the corresponding hard copy of the Construction Schedule and subsequent approved updates to the Construction Schedule.

C. Schedule Data Files shall be considered the property of the Authority upon receipt.

2.4 SCHEDULE OF VALUES

A. Schedule of Values shall be presented using the outline in Table 01320 – 1

B. Schedule of Values shall be arranged and subtotaled to match the format followed by the bid “Schedule”.

C. Include manload for Baseline and Update Baseline Construction Schedules.

D. One copy of the Schedule of Values shall be submitted in accordance with Paragraph 1.5.B
2.5 WEEKLY NARRATIVE SUMMARY

A. Weekly Narrative Summary shall be generated and one copy provided to the Contracting Officer in accordance to Paragraph 1.5.B in this section.

B. Weekly Narrative Summary shall be typed and on 8-1/2 inch by 11 inch paper.

2.6 THREE-WEEK LOOK AHEAD

A. Information on the Three-Week Look Ahead shall relate to physical progress during the preceding week, plans for the current week and for succeeding 2 weeks. The Three-Week Look Ahead shall depict the time frame corresponding to the weekly progress meetings and shall be accompanied by a data disk with the updated monthly Construction Schedule. The most updated construction schedule can be provided, even if same as before.

B. Three-Week Look Ahead shall depict the following information in the column field

1. Identification Number.
2. Activity Description.
3. Original Duration,
4. Remaining Duration.
5. Percent Complete.
6. Total Float.
7. Calendar.
8. Early Start and Early Finish Date. (bars).

C. Area, Sub-Area and Early Start Dates shall sort the activities.

D. One copy of the Three-Week Look Ahead shall be generated in accordance with Paragraph 1.5.D.

PART 3 - EXECUTION

3.1 PERFORMANCE CONDITIONS

A. Baseline Construction Schedule does not relieve the Contractor of responsibility for the accuracy and feasibility of the Construction Schedule. However, to the extent the Baseline Construction Schedule is reasonable, it shall become a part of the Contract and defines the obligations of the Contractor to achieve a timely Contract completion.

B. Failure by either the Contractor or Contracting Officer to include any element of work required for performance of the Contract in the Construction Schedule shall not excuse the Contractor from its obligation under the Contract to complete all work with the Contract completion time.

C. Contractor shall be responsible in accordance with the General Provisions Paragraph, “PERMITS AND RESPONSIBILITIES” for obtaining all necessary permits and licenses unless otherwise indicated. Should the Contractor’s work be delayed because a necessary permit was not obtained, the Contractor shall reschedule work and/or employ additional labor and equipment as is necessary to complete the work by the date required at no additional cost to the Authority.

D. Contractor shall furnish sufficient forces, plant and equipment, and shall work such hours, including overtime operations, as necessary and approved by the Contracting Officer, to ensure the execution of work in accordance with the current monthly update of the Construction Schedule.

1. If, in the opinion of the Contracting Officer, the Contractor is failing to achieve the Contractual Milestone Dates, as required in the current monthly update, the Contractor shall submit a recovery plan, in the form of a Three Week Look Ahead, PRX back-up file and narrative, for the Contracting Officer’s approval within 3 days of notification.

2. The recovery plan is dependent on the cause for loss of time and may require the Contractor to increase the number of shifts; days of work; institute or increase overtime operations; and/or increase the amount of construction plant and equipment without additional cost to the Authority.

E. It shall be the responsibility of the Contractor to maintain progress so as not to delay the work of other Authority Contractors participating in the Project.

F. If the Contractor delays the work of other Authority Contractors, the Contractor shall, with the approval of the Contracting Officer, increase the number of shifts; days of work; institute or increase overtime operations; and/or increase the amount of construction plant and equipment without additional cost to the Contract so as not to impede the work of others.

G. Float time is not for the exclusive use of, or benefit of, either the Authority or the Contractor.

3.2 UPDATES, REVISIONS, AND CHANGES

A. In the event actual progress on critical activities (activities with total float less than one day and on the longest path); or on activities with less than 15 percent total float (refer to Appendix D for mathematical computation) is observed to deviate from the Baseline Construction Schedule by 1 week behind (5 working days), the Contractor shall provide, within 3 working days after notification by the Contracting Officer, a recovery plan for completing the work in accordance with Paragraph 3.1.D.

B. Updates to the Construction Schedule to reflect progress to date shall not be considered a revision to the Baseline Construction Schedule. However, the Contractor shall submit to the Contracting Officer for
approval a revised Construction Schedule in the formats and quantities stipulated in PART 2, “PRODUCTS”, if one or more of the following conditions occur:

1. Changes which reflect adjustments to activities and related dollar amounts.

2. Contractor elects to change any sequence of activities from the previously approved update to the Construction Schedule. Contractor shall notify the Contracting Officer in writing, stating the necessity for proposed revisions and receive the Contracting Officer’s approval prior to making any such revisions.

3. When, in the opinion of the Contracting Officer, the status of work is such the Baseline Construction Schedule is no longer representative for planning and evaluation of the Contractor’s work.

3.3 TIME EXTENSIONS

A. Requests, if any, for extensions of time resulting from Excusable or Compensable changes issued by the Contracting Officer shall be accompanied by a full schedule analysis. The analysis shall include an updated Baseline Construction Schedule reflecting proposed changes; a narrative explaining the impacts and any dollar amounts associated with the extension. The requests shall be submitted in accordance with the General Provisions, Paragraph, “CHANGES”.

B. Construction Schedules revised as a result of the foregoing conditions are to be submitted in the formats and quantities stipulated in PART 2, “PRODUCTS”.

3.4 EARLY COMPLETION

A. An early completion schedule is one which anticipates completion of all or specified parts of the work ahead of the corresponding Contract Time. Since Contract float belongs to the project, the Contractor shall not be entitled to any extension in Contract Time, or recovery for any delay incurred because of extensions in an early completion date, until all contract float is used or consumed and performance or completion of the work extends beyond the corresponding Contract Time. Contractor shall adjust or remove any float suppression techniques, e.g. preferential sequencing (crew movements, equipment use, form reuse, etc.), extended durations, imposed dates, scheduling of Work not required for a Contract Time as required Work, and others, as a prerequisite to a request for an increase in Contract Price or Contract Time. Use of restraint dates should be minimized and require approval by the Contracting Officer.

3.5 NON-COMPLIANCE

A. Failure of the Contractor to comply with the requirements of this section may result in withholding of progress payments or in termination of the Contractor’s right to proceed with the Work, or any separate part thereof, in accordance with the Contract.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 01001, “General Requirements”.

<table>

</table>

TABLE 01320 – 1
ACTIVITY DEFINITION AND DURATION POLICY

I. ACTIVITY DEFINITIONS

A. Construction activities shall be defined as work activities that require time and resources (manpower, equipment, and/or material) to complete. The description shall be a concise representation in sufficient detail to identify the work to be performed. The use of “start,” “continue,” “complete,” or similar words is not acceptable.

B. The Construction Schedule shall contain sufficient detail of activities to include the following:
   1. Procurement, fabrication, delivery, installation, and test activities for major materials and equipment.
   2. Submittal and approval of shop and working drawings and material samples.
   3. Commissioning, training, and Operations & Maintenance (O & M) manuals.
   4. Access and availability to work areas.
   5. Delivery of any Authority-furnished equipment.
   6. Interfaces and dependencies with preceding, concurrent and follow-on contractors.
   7. Work to be performed by subcontractors.

C. As part of the process of defining activities, the activities shall be coded in such a manner as to reflect the Work Breakdown Structure defined in Appendix C of this section.

D. Each construction activity shall have only one responsible party performing the work.

II. MILESTONES (EVENTS)

A. Milestones in the Contract Documents spell out conditions regarding necessary progress of work, construction planning milestones, and completion time which shall be incorporated into the Construction Schedule.

B. Section 01010, "Summary of the Work", contain prerequisites for interfacing with other Authority contractors which shall be incorporated into the Construction Schedule.

III. ACTIVITY DURATIONS

A. The construction process shall be divided into activities and durations which are reasonable, realistic, and feasible; and shall be representative of the separable portions of the Work.

B. In the event there is other concurrent non-Authority construction occurring within the defined regional parameters of this Contract which may impact the efficiency with which the requirements of this Contract are met, the Contractor is to take this into consideration when determining the duration of activities defining the Construction Schedule.
The following outline is to be used for further delineation of those items listed on the Schedule of Values for which the Contracting Officer requests more detailed information for the determination and substantiation of fair allocations of costs per activity.

SECTION 01320

WORK STRUCTURES

I. WORK STRUCTURE
   A. In order to achieve a standardized coding structure, the following activity code definitions are required as a minimum:
      1. DART Project Code.
      2. DART Function Code.
      3. DART Contract Number.
      4. Pay Item Number.
      5. Area of Work.

II. ACTIVITY CODES DICTIONARY

<tr>
<td>AREA</td>
<td>6</td>
<td>Area of Work</td>
</tr>
<tr>
<td>SUBA</td>
<td>4</td>
<td>Sub-Area of Work</td>
</tr>
</tbody>
</table>

Note: Procurement should be an “AREA” and Submittal, Submittal Review by Contractor, DART Approval and Delivery should all be “SUB AREAS” of work.

III. ACTIVITY CODE DEFINITIONS
   A. DART Project Codes (PROJ): As Assigned by the Authority.
   B. DART Function Codes (FUNC): As Assigned by the Authority.
   C. DART Contract Number (CONT): As Assigned by DART Contracts Department.
   D. Pay Item Number (PAY): As per the associated item number in the Bid Schedule.
   E. Area of Work (AREA): As assigned by Contractor.
   F. Sub-Area of Work (SUBA): As assigned by Contractor.

END OF SECTION 01320
PART 1 - GENERAL

1.1 DESCRIPTION
A. This Section includes specifications for the preparation, updating, revision, and submittal of the Construction Schedule, Three Week Look Ahead, Schedule of Values, and Progress Reports.

1.2 CONSTRUCTION SCHEDULING SOFTWARE
A. Contractor shall use products of Primavera Systems, Inc., specially: Primavera Project Planner for Windows (latest version). Any versions of the specified scheduling software used by the Contractor shall be compatible with the version employed by the Authority.

1.3 SUBMITTALS
A. Submit three copies of items required under this Section, with the exception of schedules.

B. Schedules, including Preliminary Baseline Construction Schedule and Three Week Look Ahead, shall be submitted as one hard copy and one electronic copy as specified herein. The electronic copy shall be a full schedule "backup" in P6. Only a PRX file will be accepted.

C. Submit preliminary Construction Schedule as specified under “Submittal of Preliminary Baseline Construction Schedule” herein.

D. Submit Monthly Summary Report and updated Construction Schedule and Schedule of Values with each monthly progress payment application.

E. Submit Three Week Look Ahead at Contractor’s Coordination (Weekly Progress) Meetings. Submit revised Construction Schedule and analyses as required.

F. Submit revised Construction Schedule and analyses as required.

PART 2 - PRODUCTS

2.1 SCHEDULE FORMS
A. The Authority will provide criteria on schedule code definitions at a meeting between the Contractor’s scheduler and the Authority. This meeting will be initiated by the Contractor and take place no later than 5 days after Notice to Proceed (NTP). The schedule format and structure will be presented and explained at this meeting.

B. Updated schedules shall be submitted as a back-up (PRX) copy in “P6 Concentric” format on a CD with an attached hard copy as explained below.

C. Prepare the Construction Schedule and Three Week Look Ahead in the form of a Gantt (Bar) chart.

2.2 CONTENT OF SCHEDULES
A. Submittal of Preliminary Baseline Construction Schedule:

1. Contractor shall prepare a Preliminary Baseline Construction Schedule for all work and submit it within 10 days after NTP. The schedule shall be coded as defined in the activity codes provided. The schedule shall cover the entire contractual duration and contain sufficient numbers of activities to cover all work in detail.

2. The Construction Schedule shall consist of activities having durations no greater than 14 days and costs no greater than $50,000.

3. Refer to Paragraph entitled “Construction Progress (hard copy)” herein for detailed requirements.

4. The Contracting Officer will review the preliminary schedule and return with comments within 10 days after receipt. Contractor shall incorporate comments and return within one week. When the Contracting Officer has accepted the schedule as fulfilling all of the contractual requirements, it will then be accepted as the Baseline Construction Schedule.

B. Construction Progress (hard copy):

1. Show activities required for construction in the bar-chart area, organized by Area, Early Start, and Early Finish.

2. Show the following data in the activities column: Activity I.D., “Early Start” and “Early Finish” dates, original duration, remaining duration, calendar and total float.

C. Schedule for Submittals of Shop Drawings, Product Data and Samples. Show:

1. Activities for Contractor’s submittals.

2. Activities for DART approved submittals.

D. The Three Week Look Ahead shall relate to the physical progress during the preceding week and plans for the succeeding three weeks (three week look-ahead) in detail. The Data Date for the Weekly Update shall be on Sunday. If the monthly update coincides with the weekly, then only submit the monthly for that week.

1. If the Three Week Look Ahead does not contain sufficient detail to schedule work, then change the activity in question to a hammock activity and create detail activities in support of the hammock.

E. Develop the Schedule of Values using the Bid Schedule. Each pay item in the Schedule of Values shall be represented within an activity or activities in the baseline schedule by a corresponding cost as a resource. This shall be defined in “Define Resource”, represented by the appropriate pay item number.

2.3 PROGRESS REVISIONS

A. The data date for the monthly updated Construction Schedule and the date of the submittal of the request for payment application shall be the 25th of the month or a mutually agreed date.

B. Indicate progress of each activity to the data date.

C. Show changes occurring since previous submission of schedule.

1. Major changes in scope (requires changes to baseline schedule).

2. Activities modified since previous submission.

3. Revised projections of completion.

4. Other identifiable changes.

D. The Monthly Progress Report shall contain activities sorted by area. Provide a narrative report by area, as needed to define:

1. Problem areas, anticipated delays and the impact on schedule.

2. Corrective action that will be taken by the Contractor to get the project back on schedule. This item is required whenever the progress of the job is impacting the contractual milestone dates.

3. The effect of changes on schedule or on sub-contractors.

PART 3 - EXECUTION

3.1 PERFORMANCE CONDITIONS

A. The Approved Construction Schedule does not relieve the Contractor of responsibility for the accuracy and feasibility of the Construction Schedule. However, to the extent the Approved Construction Schedule is reasonable, it shall become a part of this Contract and defines the obligations of both the Contractor and the Authority to achieve a timely Contract completion.

B. Failure by either the Contractor or Contracting Officer to include any element of work required for performance of the Contract in the Construction Schedule shall not excuse the Contractor from its obligation under the Contract to complete all work within the Contract completion time.

C. Contractor shall furnish sufficient forces, plant and equipment, and shall work such hours, including overtime operations, as necessary and approved by the Contracting Officer, to ensure the execution of work in accordance with the current monthly update of the Construction Schedule.

1. If, in the opinion of the Contracting Officer, the Contractor is failing to achieve the start and/or finish dates of the Approved Construction Schedule as presented in the current monthly updates, the Contractor shall submit a recovery plan for the Contracting Officer’s approval within five working days of notification.

2. The recovery plan may require the Contractor to increase the number of shifts; days of work; institute or increase overtime operations; and/or the amount of construction plant and equipment without additional cost to the Authority.

D. It shall be the responsibility of the Contractor to maintain progress so as not to delay the work of other Authority Contractors participating in the Project.

E. If the Contractor delays the work of other Authority Contractors, the Contractor shall, with the approval of the Contracting Officer, increase the number of shifts; days of work; institute or increase overtime operations; and/or the amount of construction plant and equipment without additional cost to the Contract so as not to impede the work of others.

F. Float time is not for the exclusive use of, or benefit of, either the Authority or the Contractor.
3.2 UPDATES, REVISIONS, AND CHANGE ORDERS

A. Updates to the Construction Schedule to reflect progress to date shall not be considered a revision to the Approved Construction Schedule. However, the Contractor shall submit to the Contracting Officer for review a revised Construction Schedule in the formats and quantities stipulated in PART 1, if one or more of the following conditions occur:

1. Approved change orders which reflect adjustments to activities.

2. Contractor elects to change any major sequence of activities affecting the critical path or significantly change the previously approved update to the Construction Schedule. Contractor shall notify the Contracting Officer in writing, stating the necessity for proposed revisions and receive the Contracting Officer’s approval prior to making any such revisions.

3. When, in the opinion of the Contracting Officer, the status of work is such the Approved Construction Schedule is no longer representative for planning and evaluation of the Contractor’s work.

B. Acceptance of the revised Approved Construction Schedule by the Contracting Officer is a condition precedent to approval of progress payments.

3.3 TIME EXTENSIONS

A. Requests, if any, for extensions of time resulting from changes issued by the Contracting Officer shall be accompanied by a full schedule analysis. The analysis shall include an updated Approved Construction Schedule reflecting proposed changes; a narrative explaining the impacts and any dollar amounts associated with the extension; and, if applicable, an updated Scheduled Earnings Curve. The requests shall be submitted in accordance with the General Provisions, Paragraph, “CHANGES”.

B. Construction Schedules revised as a result of the foregoing condition, shall be submitted in the formats and quantities stipulated in PART 1.

C. Since Contract float belongs to the project, the Contractor shall not be entitled to any extension in Contract Time, or recovery for any delay incurred because of extensions in an early completion date, until all contract float is used or consumed and performance or completion of the work extends beyond the corresponding Contract Time. Contractor shall adjust or remove any float suppression techniques, e.g. preferential sequencing through imposed logic (crew movements, equipment use, form reuse, etc.), extended durations, imposed dates, scheduling of Work not required, and others, as a prerequisite to a request for an increase in Contract Price or Contract Time. Use of restraint dates should be minimized and require approval by the Contracting Officer.

3.4 EARLY COMPLETION

A. An early completion schedule is one which anticipates completion of all or specified parts of the work ahead of the corresponding Contract Time.

3.5 NON-COMPLIANCE

A. Failure of the Contractor to comply with the requirements of this section may result in withholding of progress payments or in termination of the Contractor’s right to proceed with the Work, or any separate part thereof, in accordance with the Contract.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 01001, “General Requirements”.
APPENDIX A TO SECTION 01321

WORK STRUCTURES

I. WORK STRUCTURE

In order to achieve a standardized coding structure, the following activity code definitions are required as a minimum:

1) DART Project Code
2) DART Function Code
3) DART Contract Number
4) Pay Item Number

II. ACTIVITY CODES DICTIONARY

<table>

III. ACTIVITY CODE DEFINITIONS

1) DART Project Codes (PROJ): As Assigned by the Authority.
2) DART Function Codes (FUNC): As Assigned by the Authority.
3) DART Contract Number (CONT): As Assigned by DART Contracts Department.
4) Pay Item Number (PAY): As per the associated Item number in the Bid schedule.

END OF SECTION 01321
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes specifications for the general requirements and procedures for preparing and submitting construction information and data for approval or information. Other requirements for submittals are specified under applicable Sections of the Standard Specifications and Contract Specifications. Requirements herein concern submittals directly related to the Work (non-administrative). Refer to General Provisions Paragraph, "SPECIFICATIONS AND DRAWINGS", for related requirements.

B. Project progress schedules and status reports are specified in Section 01320, “Construction Schedule and Progress Reports” or Section 01321, “Construction Schedule and Progress Reports for Small Projects”.

C. General requirements and procedures for preparing and submitting Shop Drawings, product data, and samples are specified in Section 01340, “Shop Drawings, Product Data, and Samples”. Field samples and mock-ups are a special form of sample too large to be transmitted in the specified manner for transmittal of sample submittals. Refer to Section 01454, “Field Samples and Mock-Ups”.

D. Submittals related to the Contractor’s quality program are specified in Section 01450, “Quality Control”.

E. Submittals required to complete the Contract closeout are specified in Section 01770, “Contract Closeout”.

F. Preparation and submission of project record documents are specified in Section 01785, “Project Record Documents”.

G. Preparation and submission of equipment and systems operation and maintenance manuals are specified in Section 01786, “Operation and Maintenance Instructions”.

1.2 SUBMITTAL CONTROL DOCUMENT

A. Submit a Submittal Control Document within 30 days after Notice to Proceed (NTP). Submittal Control Document shall be presented in a form acceptable to the Contracting Officer in both electronic and hard copy versions and shall be updated and sent to the Contracting Officer on a monthly basis noting deviations, if any. The completed Submittal Control Document shall be subject to final review and approval by the Contracting Officer. Once the Submittal Contract Document is finalized, the Contractor shall adhere to the outlined schedule.

B. Identify all submittals which are required by the Contract Documents and determine the date on which each submittal will be submitted in conformance with the schedules specified in Section 01320, “Construction Schedule and Progress Report” or Section 01321, “Construction Schedule and Progress Reports for Small Projects”.

C. Submittal Control Document shall consist of a completed submittal schedule and list of products for all items requiring the Contracting Officer’s review and approval, as follows:

1. Description of submittal (i.e. shop drawing) and of the item including name of manufacturer, trade name and model number.

3. Intended submission/resubmission date(s).

4. Order release date.

5. Lead-time to delivery/anticipated delivery date(s).

6. Highlight any items for which expedited review is requested to meet the project schedule.

D. Refer to Section 01450, “Quality Control”, for Submittal Status Log requirements.

1.3 GENERAL SUBMITTAL PROCEDURES

A. Obtain the Contracting Officer’s approval of shop drawings, product data, and other submittals before any work involving such submittal is performed. Initiate actions for procurement, fabrication, or construction only after obtaining the Contracting Officer’s approval of the relevant submittals. Materials for which samples are required shall not be used in the Work until approved in writing by the Contracting Officer. Changes in products for which drawings, product data, or samples have been submitted will not be permitted unless those changes have been accepted and approved in writing by the Contracting Officer.

B. Contractor shall be responsible for accuracy, completeness, and scheduling of submittals so as to facilitate the review and approval by the Contracting Officer.

C. Printed quantities: Submit the following minimum quantities, unless specified under applicable Sections of the Standard and Contract Specifications:
1. Drawings: One reproducible and 3 copies of each drawing.

2. Calculations: 4 copies of Contractor’s or manufacturers’ calculations, including design calculations for bridge structures.

3. Catalog Cuts: 4 originals, minimum, of manufacturers’ catalog cuts or entire catalogs.

4. Instructions: 4 copies of manufacturers’ printed installation, erection, application, and placing instructions.

5. Samples: 4 of each sample item specified in the various Specification Sections, except for color range samples and unless otherwise specified or requested.

6. One original and 3 copies of inspection reports, test reports, certificates of compliance, delivery tickets, batch tickets and bills of materials.

7. Survey Data: As specified in Section 01722, “Field Engineering - Surveying”.

8. Guarantees, Warranties, and Bonds: 1 executed original, if specified.

9. Where submittals are submitted to the Contracting Officer for information or record purposes, submit 2 copies.

10. Where permits and licenses and other such documents are obtained in the Authority's name, submit the original and 1 copy.

D. Electronic quantities (applies to all submittals): Submit the following minimum quantities. Submit greater quantities when specified.

1. All submittals shall be delivered to the Authority in an electronic format in both their native software format and in PDF format. Digital electronic files shall be provided to the Authority on CD ROM disk or DVD and each CD ROM or DVD shall:
   a. Provided in a protective cover with an exterior label.
   b. Contain an index of the CD ROM or DVD’s contents that lists each file name along with a file description.
   c. Include PDF’s of the submittal reports, files or drawings.

E. Contracting Officer will return 2 sets of submitted items including the reproducible for shop drawings to the Contractor with the following exceptions:

1. Submittals for record of the Authority will not be returned.

2. One of the 6 catalog cuts or catalogs will be returned to the Contractor after review. Submit additional copies if more than one are desired.

F. Review Period: Transmit submittals sufficiently in advance of construction requirements to permit no less than 21 days for review and appropriate response by the Contracting Officer.

1. Contractor shall be responsible for determining whether or not certain governmental entities and utilities require longer review periods. Where longer review periods are required, the Contractor shall schedule the Work accordingly, so that the progress of the Work is not adversely impacted.

G. Submittal Form: Include only 1 item per submittal, with form attached to each copy of the submittal, do not group different submittal items under one submittal form and number. Accompany submittals with a Contracting Officer approved submittal form containing the following information attached to each copy of submittal:

1. Sequential submittal number and date.

2. Contract title and number.

3. “To:” and “From”: Including the Contractor’s name, address, and telephone number.

4. Supplier’s, manufacturer's, or Subcontractor’s name, address, and telephone number.

6. Category and Type of Submittal.

7. Purpose.

8. Description.

9. Signature of Submitter.

H. Submittal Numbering:

1. Assign sequential numbers to each submittal using the related Specification Section number for the first 5 digits and a 3-digit number for each submittal, all initial
SUBMITTALS

1. Submittals will be issued as Rev. 0 (i.e. 03300-001-Rev.0, 16001-030-Rev. 0).

2. Assign revision numbers (i.e. 03300-001-Rev. 1, 03200-030-Rev. 3) to all re-submittals and cross-reference to previous submittals.

I. Provide Contractor's Certification Stamp worded exactly as shown on Figure 01330-2 herein, and stamp and sign each submittal.

J. Professional Seal Required: Submittals involving engineering expertise, such as excavation support structures, falsework for concrete, Systems design progression, load calculations and when required by the individual Specification Sections shall be sealed and signed by a professional engineer, currently registered in the State of Texas, for the discipline involved. Furnish information sufficient to completely explain the facility, product, machine, or system described and its intended manner of use. When professional certification is required by the Contract requirements, the Authority is entitled to rely upon the accuracy and completeness of such calculations and certifications.

K. Space for Contracting Officer's Disposition Stamp: Include a 4 inch square blank space, on each submittal for the Contracting Officer's disposition stamp. On drawings, provide this space in the lower right corner, just above the title block.

L. Maintain at the Worksite a complete up-to-date, organized file of all past and current submittals including an index and locating system that identifies the status of each submission. Refer to Section 01450, “Quality Control”, for Submittal Status Log requirements.

1. Quality Control Set: Maintain the returned final set of samples at the construction site in suitable condition and available for quality control comparisons by the Contracting Officer.

2. Refer to Section 01785, “Project Record Documents”, for maintenance of record and as-built documents.

M. Submittal Delivery: Ship submittals prepaid or deliver by hand directly to the Contracting Officer or elsewhere as required by the Contracting Officer.

N. Changes in Approved Submittals: Changes in approved submittals will not be permitted unless those approved submittals with changes have been resubmitted and approved, in the same manner as the original submittal.

O. Supplemental Submittals: Supplemental submittals initiated by the Contractor for consideration of corrective procedures shall contain sufficient data for review. Make supplemental submittals in the same manner as initial submittals.

1.4 CONTRACTOR'S RESPONSIBILITIES

A. Contractor's Review:

1. Examine and check the submittal for accuracy, completeness, and compliance with the Contract before delivery to the Contracting Officer. Each submittal shall be reviewed, stamped (refer to Figure 01330-2), and signed as reviewed and approved by the Contracting Officer prior to submission. Approval represents that the Contractor has determined and verified materials, field measurements (as verified by surveying) and field construction criteria related thereto, and has checked and coordinated the information contained within such submittals with the requirements of the Work and the Contract.

a. Submittals without this stamp may be returned to the Contractor for re-submittal.

2. If the submittal is designated to be approved by another governmental agency or utility and to be sent to the Contracting Officer for information, approval by the governmental agency or utility shall take place before submission to the Contracting Officer.

3. Contractor shall coordinate each submittal with the requirements of the Work, ensuring that each submittal of one trade is compatible with other submittals of that trade and with the submittals of other trades. Ensure submittal is complete with all relevant data required for review.

4. Approval does not relieve the Contractor from responsibility for furnishing materials of proper dimensions, quantity and quality; from responsibility for errors and omissions in the samples, mock-ups, sample panels, product data and shop drawings, calculations, etc.; from responsibility for deviations from the Contract Documents, nor from responsibility for complying with the requirements of this Contract.

5. Contractor's liability to the Authority, in case of deviations in the submittals from the requirements of the Contract Documents, is not relieved by the Contracting Officer's review and approval of submittals containing deviations, unless the Contracting Officer expressly approves the deviations by issuing a Change. If the Contractor fails to describe such variations, the Contractor is not relieved of the
6. If submittals show variations from the Contract requirements due to standard shop practice or for other reasons, describe such variations on the first page of submittal. If acceptable, the Contracting Officer may approve such variations, subject to the proper adjustment in the Contract under General Provisions, paragraph entitled “CHANGES”.

7. Contractor shall be responsible for the correctness of the submittals, for shop fits and field connections, and for the results obtained by the use of such submittals.

B. Distribution of Submittals after Review: Distribute prints or copies of approved submittals, bearing the Contracting Officer's or designated approval authority's stamp and signature, to the Contractor's field office and the Contracting Officer's field office; to affected and concerned Subcontractors, Suppliers, and fabricators; and to affected and concerned members of the Contractor's workforce.

1.5 CONTRACTING OFFICER'S REVIEW

A. In addition to the requirements of General Provisions Paragraph, "SPECIFICATIONS AND DRAWINGS", the Contracting Officer's actions with regard to shop drawings, working drawings, samples, mock-ups, sample panels, miscellaneous and other submittals are as hereinafter specified.

B. Contracting Officer will review and approve or take other appropriate action upon the Contractor's submittals only for the limited purpose of avoiding impacts on any other work and properties and of checking for conformance with information given and the design concept expressed in the Contract requirements. The Contracting Officer's action will be taken as to cause no delay in the Work or in the activities of the Contractor. Review of such submittals is not conducted for the purpose of determining the accuracy and completeness of other details such as dimensions and quantities, or for substantiating instructions for installation or performance of equipment or systems, all of which remain the responsibility of the Contractor as required by the Contract. The Contracting Officer's review will not constitute approval of safety precautions or, unless specifically stated by the Contracting Officer of any construction means, methods, techniques, sequences, or procedures. The Contracting Officer's approval of a specific item does not indicate approval of an entire assembly of which the item is a component.

C. Failure of any material to pass the specified tests is sufficient cause for refusal to consider, under this Contract, further samples of the same brand, make, or source of that material. The Contracting Officer reserves the right to disapprove any material or equipment that previously has proved unsatisfactory in service.

D. Contractor's submittals will be stamped with the date of receipt and with the Contracting Officer's Review/Disposition Stamp, see Figure 01330-1. The stamp will be marked, and the stamp will be signed and dated. Contracting Officer will indicate its reviews of submittals and the action taken (approvals and non-approvals) by means of its Review/Disposition Stamp. The stamp marks will have the following meanings:

1. APPROVED: Work may proceed, provided it complies with the Contract.

2. APPROVED AS NOTED (CORRECT AND RESUBMIT): Work may proceed, provided:
   a. It complies with the Contract as well as the corrections on the submittal; and the Contractor resubmits within 15 days corrected copies of the shop drawing, working drawing, or miscellaneous submittal for final approval; and
   b. Work performed by the Contractor prior to receiving final approval will be at the Contractor's risk.

3. APPROVED AS NOTED (CONFIRM): Work may proceed provided it complies with the Contract as well as the corrections on the submittal; and the Contractor confirms in writing within 15 days to the Contracting Officer prior to the commencement of work that the submittal have been duly noted and corrected as required.

4. DISAPPROVED: Work not recognized as being able to proceed.
   a. Make corrections required by the Contracting Officer. Resubmit without delay.
   b. Handle re-submittals in the same manner as first submittals. Refer to Paragraph entitled “Submittal Numbering” under Article “General Submittal Procedures” for revision numbering.
   c. On re-submittals, direct specific attention in writing on re-submitted shop drawings, working drawings, samples, mock-ups, sample panels, or miscellaneous submittals to revisions other than the corrections of previous submissions.
5. APPROVED and APPROVED AS NOTED (CONFIRM) shall not be construed:

a. As permitting any departure from the Contract requirements;

b. As relieving the Contractor of responsibility for errors and omissions, including details, dimensions, and quantity of materials; or

c. As approving departures from details furnished by the Contracting Officer.

E. Review stamps or other approval methods of the various designated approval authorities may not be the same as those of the Authority. Contractor shall work with the various designated approval authorities and shall obtain approvals in the clearest and most straightforward manner possible.

1.6 MISCELLANEOUS DOCUMENTATION

A. Certificates of Conformance or Compliance for Materials or Products: Refer to Section 01450, “Quality Control”, for detailed requirements.

B. Certificates: When specified, submit certificates to demonstrate proof of compliance regarding qualifications of personnel, manufacturers, fabricators, and installers specified in the individual specification section. Certificates shall be signed by an official authorized to certify on behalf of the issuing organization with the name and address of the Contractor, the project name, and location.

C. Certified Test Reports: Refer to Section 01450, “Quality Control”, for detailed requirements.

D. Certified Test Reports of Previous Testing: Where specified, submit certified test reports of previous testing of like items, if approved under similar Authority contracts. Include the following:

1. Certification that materials meet or exceed specified test requirements.

2. Name and address of testing laboratory.

3. Dates of tests to which reports apply.

4. Certification that materials provided are the same as those tested.

E. Calculations: When certified calculations are specified, they shall be certified by a Professional Engineer registered in the State of Texas.

F. Survey Data: Refer to Section 01722, “Field Engineering – Surveying”.

G. Plans such as Traffic Control Plans and Demolition Plans, submit as specified in individual specifications sections.

H. Progress Photographs: Furnish progress photographs as specified in Section 01345, “Construction Photographs”.

I. Record (As-Built) Drawings and Specifications: Refer to Section 01785, “Project Record Documents”.

PART 2 - PRODUCTS

Not Used.

PART 3 - EXECUTION

Not Used.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

SECTION 01340
SHOP DRAWINGS, PRODUCT DATA AND SAMPLES

PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes specifications for the general requirements and procedures for preparing and submitting Shop Drawings, Product Data, and Samples required by individual Specification Sections. Additional requirements are specified in the individual Specification Sections.

B. Refer to Section 01330, “Submittals”, for general requirements for submittals.

C. Refer to Section 01785, “Project Record Documents”, for requirements for submittal of final approved drawings and catalog cuts upon completion of the Work.

D. Certificates of Compliance: Refer to Section 01450, “Quality Control”.

1.2 DEFINITIONS

A. Shop Drawings: As defined in the General Provisions Paragraph, “SPECIFICATIONS AND DRAWINGS”, is an inclusive term and may include descriptive literature and test data. The term “Shop Drawings,” as used herein, includes fabrication, erection and installation, application, layout, and setting drawings, lists or schedules of materials and equipment, manufacturer’s standard drawings, wiring and control diagrams, all other drawings as may be required to show that the materials, equipment, and systems, and the positions thereof, comply with Contract requirements.

B. Product Data: The term “product data,” as used herein, includes manufacturer-prepared descriptive literature, catalog sheets, brochures, performance data, test data, printed diagrams, schedules, illustrations, and other information furnished by the Contractor or the various product and materials suppliers to illustrate and describe a product, material, system, or assembly for some portion of the Work.

C. Samples: The term “samples,” as used herein, are physical examples which illustrate materials, fixtures, appliances, equipment, colors, textures, finishes, and work quality, and establish the standards of quality and utility by which the Work will be judged for acceptance.

D. Working Drawings: Working drawings are Contractor prepared plans for temporary structures and facilities such as decking, temporary bulkheads, support of excavation, support of utilities, groundwater control systems, underpinning and for such other items of work as may be required for construction but which do not become an integral part of the completed Project.

1. Working drawings shall comply with the requirements for shop drawings.

2. Submit appropriate design calculations to support working drawings.

3. Working drawings and calculations shall be signed and sealed by the Contractor’s engineer who shall be a Professional Engineer licensed in the State of Texas.

E. Certificate of Compliance: Refer to Section 01450, “Quality Control”, for definition.

1.3 SUBMITTALS

A. Refer to Section 01330, “Submittals”, for submittal procedures.

1.4 SHOP DRAWINGS

A. General: Provide shop drawings complete, detailed, and dimensioned and including the following:

1. Fabrication, erection, layout, and setting drawings.

2. Complete list of materials.

4. Manufacturer's drawings.

5. Wiring and control diagrams, as applicable.

6. Drawings prepared by the Contractor for permanent structures, equipment, and systems designed by Contractor in accordance with Contract requirements.

7. Additional requirements specified in the individual Specification Sections.

B. Size of sheet: 22 inches by 34 inches or 11 inches by 17 inches as approved. Refer to Section 01330, “Submittals” for the space requirement for Contracting Officer’s Review/Disposition Stamp. The title block in the lower right hand corner shall display the following:

1. Contract number, name of project, and title of the drawing.

2. Date of drawing or revision.

3. Name of Contractor and subcontractor submitting the drawing.
4. Clear identification of contents and location of the work.
5. Title and number of Specification section.
6. Drawing Number.
7. Names of individuals who designed and checked drawings (Completed “Designed By” and “Checked By” boxes).

C. Each drawing shall include details necessary for the procurement, installation, maintenance, and repair of all components or facilities equipment provided. Change notices that are attached to drawings shall not constitute revised drawings. Each drawing shall include all changes and be upgraded to reflect the latest configuration.

1.5 LIST OF MATERIALS SOURCES

A. Refer to Section 01450, “Quality Control”, for requirement for submittal of a list of Contractor's sources of materials and equipment requiring approval, certification, or testing.

1.6 PRODUCT DATA

A. Contractor shall modify manufacturers' standard diagrams, charts, illustrations, brochures, calculations, schematics, catalog cuts, and other descriptive data to delete information which is not applicable to the Contract. Contractor shall supplement standard information with additional information applicable to this Contract, and indicate dimensions, clearances, performance characteristics, capacities, wiring and piping diagrams, and controls. Wherever applicable, clearly indicate field-measured dimensions.

B. Contractor shall modify the manufacturer’s printed installation, erection, application, and placing instructions to delete information which is not applicable to the Contract.

C. Submittals shall include the following:

1. Contract number and project name.
3. Title and number of applicable Specification Section.
4. Applicable standards, such as ASTM or Federal specification numbers.

1.7 SAMPLES

A. Contractor shall furnish to the Contracting Officer samples required by the Contract Documents.

B. Mark samples, tag, or otherwise properly identify as specified in these Specifications. Provide each tag or sticker with a clear space for the stamps of the Contractor and the Contracting Officer. Label each sample as follows:

1. Contract number and name of project.
2. Name of Contractor and subcontractor.
3. Material or equipment represented.
4. Place of origin.
5. Name of producer and brand, if any.
6. Location in project. Furnish samples of finish materials with additional markings identifying them under the schedules.

7. Sequentially number using related section numbers as described in Section 01330, “Submittals” under “Submittal Numbers”.

C. Quantities: The following specifies exceptions to the quantity of samples specified in Section 01330, “Submittals”, under the Article entitled “General Submittal Procedures”.

1. Where requested, or in case a range of color, gaining, texture, and other characteristics may be anticipated in finished products, furnish a number of samples of the specified materials to indicate the full range of such characteristics which will be present in the finished products and which will be considered one sample set. Such products delivered or erected without prior acceptance by the Contracting Officer are subject to rejection and removal or replacement.

2. Provide full sets of optional samples where the Contracting Officer's selection is required.

D. Prepare samples to match the Contracting Officer's sample where so indicated.

E. Provide samples of materials that are generally furnished in containers bearing the manufacturers' descriptive labels and printed application instructions. If these are not submitted in standard containers, supply such labels and application instructions.

F. Approval of a sample shall be only for the characteristics and use named in the submittal and approval, and shall not be construed to change or modify any Contract requirement.

G. Before submitting samples, the Contractor shall assure itself that the materials or equipment will be available in the quantities required in the Contract, as neither change nor substitution will be permitted after a sample has been approved.
unless the Contracting Officer in writing approves such change or substitution.

H. Samples of material from local sources taken for testing shall be taken by or in the presence of the Contracting Officer or approved designee. Samples taken otherwise shall not be considered for testing.

I. Approved samples not damaged in testing may be incorporated in the finished work if marked for identification and approved by the Contracting Officer. Materials incorporated in the Work shall match the approved samples.

J. Send approved samples, mock-ups, and sample panels not destroyed in testing, nor accepted as a part of the built-in work, to the Contracting Officer. Samples, mock-ups, and sample panels which fail testing or are not approved by the Contracting Officer will be disposed of, unless the Contractor requests, at the time of submittal, that they be returned to the Contractor at Contractor's expense.

K. The Contracting Officer may take for testing samples of material delivered to the site or installed in place. Failure of samples to meet Contract requirements shall annul previous approvals of the item tested.

PART 2 - PRODUCTS

Not Used.

PART 3 - EXECUTION

Not Used.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

END OF SECTION 01340
SECTION 01345
CONSTRUCTION PHOTOGRAPHS

PART 1 - GENERAL

1.1 DESCRIPTION
A. Work specified in this section includes employing a qualified photographer to take construction record photographs periodically during the course of the Work.

1.2 PHOTOGRAPHY
A. The quality of the work must meet the following intended uses:
   1. Visual survey of pre-construction conditions including historic properties.
   2. Construction progress record.
B. Views required:
   1. Vantage points will be determined by Contracting Officer who shall be notified at least 72 hours in advance of Photographer’s scheduled visit to the construction site.
   2. At successive periods of photography, take at least one photograph from the same overall view as previously.
C. Pre-construction photographs will include photographic recording of specific details on historic and other properties as directed by the Contracting Officer. Include minimum of 40 color photographs. Comply with requirements of Section 01715, “Pre-Construction Inspection”.
D. Construction progress: Each month during the Contract, take an average of 40 color photographs within the construction area as directed by the Contracting Officer.

1.3 NEGATIVES AND PRINTS
A. All negatives shall become the property of the Authority. If a digital camera is used, resolution shall be at least 1080 X 1080 dpi and, in addition to prints, the images shall be provided on a format acceptable to the Authority.
B. Type: color prints:
   1. Minimum film size: 35 millimeter or a digital camera of suitable resolution.
   2. Provide minimum of 4.1 mega pixels for digital cameras.

1.4 IDENTIFICATION
A. Include the following information on the face of each print:
   1. Orientation of view, station.
   2. Date and time of exposure.

1.5 DELIVERY AND COORDINATION:
A. Deliver two sets of 3 inch x 5 inch processed prints, filed in three ring notebooks or bound books as suitable, to the Contracting Officer within 7 days of the date of photography. If a digital camera is used, also include electronic files of photographs on CD-ROM. In addition, deliver one set of twenty 8 inch x 10 inch prints as selected by the Contracting Officer from the 3 inch x 5 inch submitted.
B. Photographer shall furnish additional prints, if required, to Contracting Officer at commercial rates applicable at the time of purchase. The Contracting Officer reserves the right to take possession of the negatives at any point during the Contract duration.
C. The Authority obtains all rights for publication.

PART 2 - PRODUCTS
Not Used.

PART 3 - EXECUTION
Not Used.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL
A. In accordance with Section 01001, “General Requirements”.

END OF SECTION 01345
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes specifications for construction industry standards of industry associations, trade associations, societies, organizations, and regulatory agencies as they are invoked and used in these Standard Specifications.

1.2 REFERENCE STANDARDS

A. The Contract Documents contain references to various standard specifications, codes, practices, and requirements for materials, equipment, work quality, installation, inspections, and tests, which references are published and issued by the organizations, societies, and associations listed herein by abbreviation and name. Such references are hereby made a part of the Contract Documents to the extent specified in General Provisions Paragraph, “MATERIALS AND WORKMANSHIP”.

B. Whenever a referenced standard contains administrative requirements, including measurement and payment provisions, such as the standard specifications of various government entities, utility districts, and other agencies, such administrative requirements shall not apply to the Work of this Contract. References to such standards shall be applicable to the pertinent technical provisions only.

1.3 REFERENCED STANDARDS FILE

A. The Contractor shall have access to the reference standards. Referenced standards shall be made readily available, when requested, for use by the Contracting Officer and the Contractor's staff in carrying out the quality assurance and quality control programs specified in the Contract Documents, and to assure compliance with the requirements of the codes, specifications, test methods, practices, and other standards referenced in the Contract Documents.

1.4 ABBREVIATIONS

A. Wherever in the Contract Documents an organization's abbreviation or acronym is used, it shall be understood to mean the full name of the respective organization as specified in the various Specification Sections, and as follows:

1.5 REFERENCES TO STANDARDS

A. In conjunction with the requirements of General Provisions Paragraph, "MATERIALS AND WORKMANSHIP", the listings below are acceptable standards to be used by the Authority, unless specified otherwise.

B. Technical References - Interpretation of Documents:

1. With reference to codes, regulations, reference standards, and specifications, perform work conforming to the edition current as of the date of Notice to Proceed (NTP), unless otherwise specified.

2. Where reference standards and specifications conflict with local jurisdictional requirements, the more stringent standard shall govern, unless otherwise approved.

C. In this Contract, if the Contractor wishes to use standards other than those referenced, submit a comparison of the proposed standard and the referenced standards. Demonstrate in the comparison that the Authority is being given material equal to or better than that specified, at no extra cost, and certify the comparison as being accurate by an engineer licensed in Texas.

D. Reference to manufacturer's printed specifications for specified products shall mean most current edition of the Specifications as of the date of the Notice to Proceed, unless otherwise noted.

E. References are made to recognized standards by use of the acronyms listed below.

PART 2 - PRODUCTS

Not Used.

PART 3 - EXECUTION

Not Used.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Separate measurement or payment will not be made for work required under this Section. Costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

END OF SECTION 01423
**PART 1 - GENERAL**

**1.1 DESCRIPTION**

A. This Section includes specifications for the Contractor's quality assurance of erection and installation of materials, equipment, systems, and assemblies, and construction of the Work, as indicated. The requirements specified herein are in addition to quality assurance requirements specified in other Sections of these Specifications.

B. Contractor's Quality Control Plan, quality control requirements, and Authority's Testing and Inspection are specified in Section 01450, "Quality Control".

C. Field samples and site mockups are specified in Section 01454, “Field Samples and Mockups”.

**1.2 WORK QUALITY**

A. Shop and field work shall be performed by mechanics, craft-persons, artisans, and workers skilled and experienced in the fabrication and installation of the work involved. The Work shall be performed in accordance with the Contract Documents and the reviewed and accepted submittals including Shop Drawings.

B. Work shall be erected and installed plumb, level, square, and true, or true to indicated angle, and in proper alignment and relationship to the work of other trades. Finished Work shall be free from defects and damage.

**1.3 MANUFACTURERS' SPECIFICATIONS AND INSTRUCTIONS**

A. Unless otherwise indicated or specified, manufactured materials, products, processes, equipment, systems, assemblies, and the like shall be erected, installed, or applied in accordance with the manufacturers' instructions, directions, or specifications. Said erection, installation, or application shall be in accordance with printed instructions furnished by the manufacturer of the material or equipment concerned for use under conditions similar to those at the jobsite.

B. Any deviation from the manufacturers' printed installation instructions and recommendations shall be explained and acknowledged as correct and appropriate for the circumstances, in writing, by the particular manufacturer and will require the Contracting Officer's approval prior to implementation. The Contractor will be held responsible for installations contrary to the respective manufacturers' instructions and recommendations.

**1.4 SPECIALIST APPLICATOR/INSTALLER**

A. Materials, equipment, systems, and assemblies requiring special knowledge and skill for the application or installation of such materials, equipment, systems, or assemblies shall be applied or installed by the specified product manufacturer or its authorized representative or by a skilled and experienced Subcontractor qualified and specializing in the application or installation of the specified product.

B. When required in the applicable specifications section, utilize an installation Subcontractor approved by the product manufacturer, as applicable.

**1.5 MANUFACTURERS' FIELD SERVICES**

A. When required in the applicable specifications section, the Contractor shall have the manufacturer of a product, system, or assembly provide appropriate field or job service at no additional cost to the Authority. The Contractor shall have the manufacturer inspect and approve in writing the application or installation work. If required under the applicable specifications section, the manufacturer's representative shall also provide test reports attesting that completed work is in compliance with specified requirements.

B. The Contractor shall make all necessary arrangements with the manufacturer of the products to be installed to provide onsite consultation and inspection services to assure the correct application or installation of the product, system, or assembly.

C. The manufacturer's authorized representative shall be present at the time any phase of this work is started.

D. The Contractor shall have the manufacturer's authorized representative inspect and approve all surfaces over which, or upon which, the manufacturer's product will be applied or installed.

E. The Contractor shall have the manufacturer's representative make periodic visits to the site as the work progresses as necessary for consultation and for expediting the work in the most practical manner.
1.6 FINISHED TOLERANCES

A. Except as specified otherwise in the individual Specifications Sections, finished tolerances shall conform with the following requirements:

1. Walls: Finished wall surfaces shall be plumb and shall have a maximum variation of 1/8 inch in 8 feet when a straightedge is laid on the surface in any direction, and no measurable variation in any 2-foot direction.

2. Ceilings: Finished ceiling surfaces shall present true, level, and plane surfaces, with a maximum variation of 1/8 inch in 8 feet when a straightedge and water level are laid on the surface in any direction, and no measurable variation in any 2-foot direction.

3. Concrete Floors: Tolerances for concrete floors and pavement are specified in Section 03350, “Concrete Finishing”.

4. Finished Floors: Where floor drains occur, slope finished floor to the drain at the rate of 1/8 inch per foot or as otherwise indicated on the Contract Drawings.

PART 2 - PRODUCTS

Not Used.

PART 3 - EXECUTION

Not Used.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Separate measurement or payment will not be made for work required under this Section. Costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

END OF SECTION 01430
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes specifications which describe the responsibilities for quality control of the Work including inspections and control testing by the Contractor. This Section describes the use of certificates of compliance. This Section also includes the Authority’s inspections and quality assurance testing.

B. Requirements specified herein are in accordance with and augment General Provisions Paragraph, “INSPECTION OF CONSTRUCTION”. The Contracting Officer and other Authority personnel will identify discrepancies and nonconformances through daily oversight and the Authority’s quality audits subject to the limitations stated in General Provisions Paragraph, ”INSPECTION OF CONSTRUCTION”.

C. Wherever it is required to obtain the approval of the Authority’s Quality Manager, it shall be understood that this approval shall be obtained through the Contracting Officer.

1.2 REFERENCED STANDARDS

A. ASTM International (Formerly American Society for Testing and Materials) (ASTM)

1. ASTM E329 Standard Specifications for Agencies Engaged in the Testing and/or Inspection of Materials Used in Construction

B. DART Quality Program Plan (QPP)

1. ISO/IEC 17025 General Requirements for the Competence of Testing and Calibration Laboratories

E. American National Standard Institute (ANSI):

F. Institute of Electrical and Electronic Engineers (IEEE):

3. IEEE Standard 1012 – Software Verification and Validation

1.3 DEFINITIONS

A. Acceptance Tests: Test conducted for the purpose of accepting or approving products and performance of the Contractor.

B. Certificate of Compliance: Written statement, signed by a qualified party, attesting that the items or services are in accordance with specified requirements and accompanied by additional information to substantiate the statement.

C. Certificate of Conformance: Written statement, signed by a qualified party, certifying that the items or services are in accordance with specified requirements.

D. Certified Test Reports: Reports of tests signed by a qualified professional attesting that tests were performed in accordance with the test method specified, that the test results reported are accurate, and that items tested meet or fail to meet the stated minimum requirements. Include calibration certificates, if required.

E. Certified Inspection Reports: Reports signed by Contractor’s Quality Control Representative (CQCR) attesting that the items inspected meet the specification requirements other than any exceptions included in the report.

F. Contractor Quality Control (CQC) Plan (System): Written description of proposed actions to control and assure quality. CQC Plan defines applicable quality policy for the project and applicable quality procedures. CQC Plan shall be established and maintained by the Contractor to ensure compliance with the Contract requirements. No portion of the Plan may be delegated to subcontractors or suppliers without the prior approval of the Contracting Officer.

G. Corrective Action: Corrective action identifies action to be taken to correct immediate defects and correct the root cause to prevent recurring defects. Corrective action addresses systemic or chronic problems. Corrective action includes procedures for investigating the cause of nonconforming work.
QUALITY CONTROL

and procedures for analysis to detect and eliminate potential causes of nonconforming work.

H. Factory Tests: Tests made on various products and component parts prior to shipment to the job site.

I. Procedure: Procedures as used in regard to Contractor’s quality control shall be understood to mean written instructions for implementing various components of quality control and its management. Procedures shall identify what is to be done, who will do it, and how, where, and when it will be done.

J. Quality Control Inspection: Examining, testing, analysis, or sampling products or workmanship, including when appropriate, raw materials, components, and intermediate assemblies, to determine conformance to stated requirements.

K. Manufacturer’s Certificate of Conformance or Compliance: Certificate signed by an authorized manufacturer’s official attesting that the material or equipment delivered meets the Specification requirements.

L. Nonconformance: A discrepancy in characteristic, documentation, or procedure which affects form, fit, or function and renders the quality of an item unacceptable or indeterminate in regard to meeting relevant project requirements. Examples of nonconformance include physical defects, test failures, incorrect or inadequate documentation, or deviation from prescribed processing, inspection, or test procedures.

M. Person: Associations, companies, corporations, educational institutions, firms, government agencies at the federal, state, and local level, partnerships, and societies, as well as divisions thereof, and individuals.

N. Product: A type or a category of manufactured goods, constructions, installations, and natural and processed materials or those associated services whose characterization, classification, or functional performance determination is specified by standards.

O. Quality Control Tests: Tests conducted and performed by the Contractor for the purpose of monitoring the quality of products and performance of the Contractor.

P. Testing Laboratory: Any person, as defined above, whose functions include testing, analyzing, or inspecting “products”, as defined above, or evaluating the designs or specifications of such “products” according to the requirements of applicable standards. Refer to Article 1.8 entitled “Qualifications of Contractor’s Testing Facility” herein for additional information.

Q. Consensus Standard: An artifact or process that is a de-facto standard by written agreement between the Contractor and the Authority where the de-facto standard’s content and applicability are established prior to application and is applied in place of a recognized U.S. national standard.

R. Measurement Standard: A metrology reference standard device used to calibrate measuring and test equipment (M&TE) or other measurement standards where a measurement standard has a National Institute of Standards and Technology (NIST) traceability property such that comparative measurement or value of a measurement standard is related to stated references through an unbroken chain of comparisons all having stated uncertainties.

S. Quality Assurance Audit: An examination of the Authority approved Contractor CQC Plan implementation to determine its compliance with and conformance to the CQC Plan and related documents.

T. Software Quality: A software product’s totality of features and characteristics that determine its ability to satisfy stated needs and conformity to these Specifications. The degree to which a software system meets these Specifications.

U. Software Quality Assurance (SQA): SQA is the planned and systematic set of activities that ensure that software process including all activities involved in design, coding, testing, and maintaining products including software, associated data, documentation and all supporting and reporting paperwork conform to requirements, standards, and procedures.

V. Software System Test: The activity of testing integrated hardware and software systems to verify whether the system meets the customer requirements and these technical Specifications.

W. Software Validation: Formal process to confirm that software components are consistent with customer requirements, functional requirements, and these Specifications.

1.4 CONTRACTOR’S QUALITY CONTROL (CQC) PLAN (SYSTEM) - OVERVIEW

A. Contractor shall develop; establish; implement; maintain; and evaluate an organization and system herein called the Contractor’s CQC Plan to perform inspections and tests to ensure compliance with the contract.

B. CQC Plan shall include inspections and tests for items of work of subcontractors and/or suppliers. CQC Plan shall also include retesting in the event of failure. CQC Plan shall include activities associated with quality required in the technical provisions of the Specifications for design and construction operations, including onsite and offsite fabrication and materials.

C. CQC Plan shall include procedures to verify that the quality related activities are performed. Procedures shall include assignment of CQC responsibilities to qualified, Authority-approved individuals and
organizations and documentation of the quality related activities to provide evidence and accountability of quality in the finished project.

D. Obtain DART Quality approval of the CQC Plan prior to its implementation. No revisions to the Plan will be allowed without prior approval of DART Quality. Unless specifically authorized by the Authority, in writing, construction shall not be started until the CQC Plan (including all personnel associated with implementation of the plan) is approved.

1. Contractor may identify quality control measures for early activities in its CQC Plan. With the Contracting Officer’s written approval, Contractor may proceed with early activities prior to approval of overall CQC Plan.

E. DART Quality will monitor the implementation of the CQC Plan.

F. CQC Plan shall address the ANSI/ISO/ASQ Q9001, Section 4.0, and “Quality Management System – Requirements” and shall be implemented to satisfy the needs of the Contractor and the Authority. It shall address: the objectives for service quality; the approach to be adopted in pursuit of quality objectives; and define the role of the quality personnel responsible for implementing the quality policy. CQC plan shall be based on the technical and manufacturing aspects of the engineering design and materials supplied on this job and the inspection and quality procedures for the design, construction, and installation of materials for this project.

1.5 CQC PLAN ELEMENTS

A. The CQC Plan shall address the requirements listed herein.

B. Management Responsibilities:

1. Quality Policy: Contractor shall define and document, in writing, a quality policy that will communicate, implement, and maintain that policy at all levels of its organization as well as to subcontractors and/or suppliers. This commitment to quality shall belong to the highest level of the Contractor’s management. The CQC Plan shall define quality goals and objectives.

2. Contractor’s Quality Control Representative (CQCR): Contractor’s management shall designate a full-time Contractor’s Quality Control Representative who shall have defined authority and responsibilities for ensuring that the quality policy is implemented and maintained. A letter appointing the CQCR, signed by an officer of the firm, shall outline the CQCR’s duties, responsibilities and authority, to include the authority to direct removal and replacement of any nonconforming work. CQCR shall report to that officer of the firm who signed the letter appointing the CQCR. Refer to the Article 1.7 entitled “Qualifications of Contractor’s Quality Control Staff” for CQCR qualifications.

a. Contractor’s Alternate – Quality Control Representative (ACQCR): A letter appointing the ACQCR, signed by an officer of the firm, delegating the CQCR’s responsibilities including the authority to direct removal and replacement of nonconforming work. ACQCR will report to the officer of the firm who signed the letter. Refer to the Article 1.7 entitled “Qualifications of Contractor’s Quality Control Staff” for Alternate CQCR qualifications.

3. Obtain DART Quality approval of the CQC Plan prior to beginning construction activities. The Contract time will not be extended for failure to propose an acceptable CQCR.

4. Upon receipt of a written notification that any Contractor’s Quality Control Personnel (CQCP) failed to perform that individual’s duties, a replacement shall be provided immediately. Contractor will not be entitled to any additional time or compensation if replacement of personnel is required.

5. Personnel List and Organization Chart: The Plan shall further identify all persons responsible for CQC functions and shall define in writing their responsibilities, authority, and interrelationship of these people. Personnel involved with quality related activities shall be identified and their interrelationship with management defined. This relationship shall be shown on an organization chart. Personnel responsible for ensuring quality shall be independent of those directly related for the work being performed and shall have no other work activities assigned except for ensuring quality. Personnel shall be free from the pressure of costs, construction scheduling, and production, and shall have the necessary independent authority to perform their roles effectively.

C. Documented Quality Plan (System): CQC Plan shall establish and maintain a documented quality plan to ensure that project quality objectives are met. No part of the Contractor’s quality control responsibilities may be delegated to subcontractors or suppliers without prior approval of the Contracting Officer. Quality requirements shall be extended to both the subcontractors and suppliers. This shall be done by written procedures and instructions for activities affecting quality in any required design, procurement, manufacturing, and construction as applicable for the work being
performed. Procedures and instructions shall be developed for control of process including inspection; testing; nondestructive examination; maintenance of calibration equipment; disposition of nonconforming work (processes and/or products); corrective action; maintenance of quality records; reviewing shop drawings, samples, certificates, or other submittals; quality audits; and training.

D. Design Control: Contractor shall, when required by the Contract, establish and maintain procedures to control and verify design efforts required for the Project to ensure that design criteria and regulations are satisfied (e.g. MSE Walls). The design control shall ensure that the design requirements are understood; plan the design interfaces and design verification activities; execute the design verification activities; and control any design changes through the project completion.

E. Document Control: Contractor shall establish and maintain procedures for control of project documents and data. The document control process shall ensure that relevant documents are current and available to users who require them.

1. Contractor shall establish and maintain procedures for quality records. These procedures shall identify which records will be kept, responsibility for production and collection, and responsibility for indexing, filing, storage, protection, maintenance, and disposition of quality records. Contractor shall certify that these records are current and accurate within each payment application. Failure to maintain these records shall be grounds for the Contracting Officer to withhold progress payments for the General Requirements.

2. CQC records shall be prepared, maintained, and filed in accordance with approved procedures. These records shall be kept in approved fire-safe storage cabinets that preclude damage, loss, or deterioration.

F. Purchasing: Contractor shall establish and maintain procedures for ensuring that services (subcontractors and/or manufacturers) or products comply with the Contract requirements. Contractor shall ensure that suppliers have a quality program appropriate to the work being performed and in accordance to the Contract requirements. The procedure shall ensure that purchasing documents are reviewed and approved by a designated authority prior to release.

G. Product Identification and Traceability: Contractor shall establish and maintain procedures for identifying and controlling items of production (batch, materials, parts, and components) to prevent the use of incorrect or defective items and to ensure that only correct and acceptable items are used or installed in accordance with the Contract requirements.

H. Process Control: Contractor shall establish and maintain procedures for identifying and planning the production and installation processes that shall be performed under controlled conditions as identified by the Contract requirements. Special processes, the result of which cannot be verified by subsequent inspection and testing of the product, shall be specifically identified and be continuously monitored. This shall also apply to both subcontractors and suppliers.

I. Inspection and Testing: Contractor shall establish and maintain procedures for inspection and testing. Inspection and testing shall be planned and executed as necessary to verify quality. Procedures shall be specified, referenced to Contractor’s schedule activity code numbers, implemented, and the results documented for receiving incoming products, for work in progress, and for final inspection and testing. For schedule activity code provisions, refer to Section 01320, “Construction Schedule and Progress Reports”, or Section 01321, “Construction Schedule and Progress Reports for Small Projects”, as applicable.

1. List of Tests: Contractor shall prepare a list of all tests the Contractor is to perform to meet the requirements of the Contract. The list shall give the test name, specification paragraph, if applicable, containing the test requirements, and the personnel and laboratory responsible for each type of test. The tests listed shall include, in addition to those specified, those required by manufacturers and those required at successive stages of the performance of the Work occurring in the field to document progressive quality of the Work such as compaction tests in various lifts in backfilling of a trench or the subgrade prior to construction of a facility.

   a. Identify those tests that require the presence of the CQC Officer during testing and the CQC Officer’s signed approval.

   b. Preliminary Schedule: Include a preliminary schedule for coordination with the Authority’s testing laboratory. Indicate tests to be performed by Contractor testing laboratory. Include at least 24 hours for on-site work and 48 hours for off-site work advance written notice to the Contracting Officer for collection of test samples, conducting field tests, and similar work by the Authority’s testing laboratory. Include at least 30 days advance written notice to the Contracting Officer for off-site inspections.

2. Establish procedures for inspection of incoming materials. Notify Contracting Officer of delivery and location of incoming material to facilitate Contracting Officer’s
3. Utilize 3-phase inspection process including preparatory, initial, and follow-up inspections.

   a. Preparatory Inspection and Meeting: Perform preparatory inspection before beginning any work on any definable segment of work. Participants will include a representative of the Contracting Officer and shall also include a member of the Contractor’s quality control staff assigned to inspect the work, the supervisor in charge of the work, and individuals responsible for accomplishing the work. Included in a preparatory meeting shall be a review of the Contract requirements, the review of approved shop drawings and other submittal data, the review of safety requirements, assurance that required control testing is to be provided, a physical examination to ensure that materials and equipment conform to approved shop drawings and submittal data, and assurance that required preliminary work has been completed. Participants shall discuss what will constitute a representative segment for purposes of the initial inspection of the particular item of work and shall come to a mutual agreement. If no mutual agreement is be made, the Contracting Officer will define the representative segment. This inspection and meeting shall be conducted and documented by the CQCR.

   b. Perform an initial inspection as soon as a representative segment of the particular item of work is accomplished. Include in the initial inspection the following: performance of scheduled tests, examination of the quality of workmanship, a review for omissions or dimensional errors, and approval or rejection of the initial segment of the Work.

   c. Perform follow-up inspections daily and include continued testing and examinations to ensure continued compliance with the Contract requirements. Follow-up inspections shall be identified with schedule activity code numbers in accordance with Section 01320, “Construction Schedule and Progress Reports”, or Section 01321, “Construction Schedule and Progress Reports for Small Projects”, as applicable.

4. Contractor shall provide Quality Control and Acceptance tests as necessary to ensure compliance with the contract. Where testing laboratory services are supplemented by the Authority, as described in the Article 1.11 entitled “Authority’s Testing and Inspection” herein, the Contractor shall coordinate and cooperate with the testing laboratory and furnish samples of materials, design mix, equipment, tools, storage, and assistance as requested.

5. Laboratory Reports: Notwithstanding that the testing laboratory provided by the Authority may be used, the Contractor shall provide reports which cite the Contract requirements, the test or analysis procedures used, the actual test results, and include a statement that the item tested or analyzed conforms or fails to conform to the Specification requirements. Stamp each report conspicuously on the cover sheet in large red letters a minimum of 1/2-inch high “CONFORMS” or “DOES NOT CONFORM” to the Specification requirements as the case may be. Submit test reports signed by a representative of the testing laboratory authorized to sign certified test reports.

   a. Reports in Regard to Nonconformance: Include with submittal of the signed original, an additional copy of tests which indicated nonconformance to the Contract requirements and the CQCR’s written explanation of proposed or actual corrective measures taken. When corrective measures are taken, submit a copy of the laboratory report indicating conformance, along with a copy of the nonconforming report and a description of the corrective action taken.

6. Tabulation of Tests: Maintain an up-to-date tabulation of all tests performed in connection with the Contract, including conforming, nonconforming and repeated test results. Tabulation of tests shall include logs of each test performed, such as mandreling of conduits and ground resistance tests. Each nonconforming test listed shall indicate the status of the nonconforming test result, either by indicating the resolving test laboratory report number, or by indicating that it still remains nonconforming or open. Certify the current tabulation(s) as complete, and deliver directly to the Contracting Officer with each payment application. Failure to maintain and provide these records shall be grounds for the Contracting Officer to withhold progress payments for General Requirements and to require the replacement of the CQCR responsible for these records. Prior to final closeout,
provide a tabulation of tests performed in connection with the Contract, including conforming, nonconforming, and repeated test results. Certify the tabulation(s) as complete, and deliver directly to the Contracting Officer.

7. Inspection and Test Record Numbering: Reports shall be numbered sequentially and traceable to Contract number, location, lot, part, and retest number, as applicable. Coordinate with the requirements specified under “List of Tests” and “Tabulation of Tests” herein.

8. Ensure inspections, measurements, and tests are performed under appropriate environmental conditions.

J. Inspection, Measuring, and Testing Equipment: Contractor shall establish and maintain procedures for identifying, controlling, calibrating, and maintaining inspection, measuring, and test equipment required to carry out inspection and testing. Procedures shall include maintenance of calibration records. Such equipment shall be identified, controlled, calibrated, and maintained in conformance to requirements established by ISO/IEC 17025. Such equipment shall be recalibrated in a timely manner. This shall apply to the Contractor and Contractor’s subcontractors and suppliers.

1. In maintaining calibration, use reference standards traceable to the U. S. National Institute of Standards and Technology, if no documented standard exists in ISO/IEC 17025.

2. Establish calibration intervals based on equipment manufacturer’s recommendations, usage, accuracy, and maintenance history. In every case, calibration shall be performed at intervals not to exceed 1 year.

3. Mark equipment indicating calibration status of the piece of equipment. Mark in a manner readily visible to operator but will not hamper operation of equipment.

4. Perform calibrations under appropriate environmental conditions.

5. Re-inspect and re-test equipment proven to be out of calibration.

6. Establish handling procedures for equipment to prevent damage that may cause inaccurate readings. Safe guard equipment to prevent adjustments that would invalidate calibration settings.

K. Nonconformances and Deficiencies: Contractor shall establish and maintain procedures for correcting and controlling nonconforming work and for the investigation of the cause of nonconforming work and the corrective action needed to prevent a recurrence. Such procedures shall ensure that work is not inadvertently used or installed. Such procedures shall include analysis to detect and eliminate potential causes of nonconforming work.

1. Nonconforming materials, equipment, components, parts, and work shall be identified, documented, and (when possible) segregated.

2. Procedures shall also include disposition of items noted as Deficiency during inspections. Procedures shall take into account the following requirements in regard to Deficiencies.

a. Deficiencies shall be transferred to a Nonconformance Report when the deficiency is not corrected and is sufficiently severe to cause the product or service or associated product or service not to satisfy its intended usage requirements.

b. Deficiencies shall be transferred to a Nonconformance Report when the deficiency will affect follow-on work.

c. Deficiencies shall be transferred to a Nonconformance Report when required by the Contracting Officer.

3. Nonconforming items will be classified as follows by the Contracting Officer:

a. Reject: The item is unsuitable for its intended use and economically or physically incapable of being repaired/rewilded.

b. Rework: The item can be brought into conformance with original requirements.

c. Repair: The item can be made acceptable for its intended purpose; however, it may not meet all requirements.

d. Use-As-Is: The item will be used without modifications; and will meet engineering functional requirements for performance and fit.

4. Upon rework or repair of those items classified as “Rework” and “Repair”, obtain the Contracting Officer’s inspection and approval prior to Nonconformance Report closure.

5. When and as determined by the Contracting Officer, a credit will be made to the Authority from those funds due to the Contractor for those for items dispositioned as “Repair” or
1.6 SUBMITTALS

A. Submit 3 copies of the following through the Contracting Officer to DART Quality for review and approval:

1. CQC Plan as defined herein within 14 days after the Notice to Proceed. Include samples of Contractor’s proposed Quality Control forms.

2. Qualifications of proposed Contractor’s Quality Control Personnel.

3. Matrix correlating the CQC Plan with the list at the end of the Section, Attachment 01450-1, showing the CQC Plan’s compliance with the requirements of this Section.

4. Qualifications of proposed Contractor’s testing laboratory including the name, address, and certification of compliance with ASTM E329, together with the scope of proposed services. Should the Contractor desire to use more than 1 firm for quality control testing, the required information shall be submitted for each such proposed firm.

B. Refer to Article 1.10 entitled “Specific Duties of the Contractor’s Quality Control Representative” for CQCR’s submittals.

1.7 QUALIFICATIONS OF CONTRACTOR’S QUALITY CONTROL STAFF

A. Contractor shall provide a full time CQCR supplemented by sufficient CQCP necessary to be physically at the job site at all times during work progress to provide continuous inspection of the work. For example, if the Contractor is performing work at separate locations or during more than 1 shift, an inspector shall be present at each location and during each shift to ensure that the work being performed meets the requirements specified by the Contract. The initial listing of staff in no way relieves the Contractor of meeting quality control requirements of the contract.

B. Qualification requirements for CQCP listed herein are minimum qualifications. Only individuals with qualifications, which meet the referenced standards, as applicable, shall be proposed. Each individual’s qualifications shall be detailed to show actual related experience in performing similar duties and responsibilities. If any proposed individual fails to meet the standard qualifications, that individual shall be withdrawn from consideration immediately.

C. CQCR shall have a minimum of 8 years verifiable construction experience in the type of construction prevalent for the contract being bid and who has developed the specialized knowledge, skills, and abilities to effectively perform the duties and responsibilities specified herein. Experience shall include 4 years managing a quality assurance/quality control program similar to the program specified herein. CQCR shall be a part of the Contractor’s staff, or an approved consultant working for the Contractor (not part of the staff of a subcontractor performing the work).

M. Training: Contractor shall establish and maintain procedures for training and documenting of personnel to perform any activity or job they are not qualified to perform. Only personnel qualified through experience and/or training shall perform activities that will affect quality for this Contract.

N. Include as part of the CQC Plan, a listing of outside organizations such as testing laboratories, architects, and consulting engineers to be employed by the Contractor. The listing shall include a description of the services these firms will provide, and list the authorized representatives for each organization that can sign reports. The services of such outside organizations may include the documentation of inspection activities of materials received; reports verifying the quantities of materials received; reports verifying factory tests completed on the materials received, as applicable; any physical damage of materials received; and other documentation of materials as required.

1. Include documentation of the accreditation of Contractor’s Testing Facilities. Refer to Article 1.8 entitled “Qualifications of Contractor’s Testing Facilities” herein.

O. Sources of Material: Include as part of the CQC Plan, a list of Contractor’s sources of materials to be incorporated in the work, which require approval, certification, or testing. This list shall make clear for which materials the Contractor proposes to use manufacturer’s certificates of conformance of compliance. Refer to Submittal Status Log specified herein for related requirements.

P. Sample forms are available for the Contractor’s use in the DART Quality Program Plan (QPP).

1.6 SUBMITTALS

A. Submit 3 copies of the following through the Contracting Officer to DART Quality for review and approval:

1. CQC Plan as defined herein within 14 days after the Notice to Proceed. Include samples of Contractor’s proposed Quality Control forms.

a. Sources of Materials: Submit list within 30 days of Notice to Proceed.
D. ACQCR shall have a minimum of 5 years of verifiable construction experience of a similar type of construction. Designate the ACQCR to act for the CQC (and notify the Contracting Officer) only when the CQC is officially absent from the job site. ACQCR cannot act for the CQC for a period longer than 10 consecutive calendar days in a 6-month period, without prior written approval from the Contracting Officer and DART Quality.

E. Inspectors shall have 4 years of verifiable experience on construction projects fulfilling similar type of positions.

1.8 QUALIFICATIONS OF CONTRACTOR’S TESTING FACILITIES

A. Contractor shall provide its own testing facilities or engage the services of an independent testing laboratory to perform tests and inspections at the Contractor’s cost.

B. Contractor-provided testing laboratory, whether such laboratory is part of the Contractor’s organization or an independent testing laboratory, shall hold and maintain an active accreditation in accordance with ASTM E329 throughout the course of the Contract.

C. Contractor shall notify the Contracting Officer if the accreditation status of its testing laboratory changes during the course of the Contract.

1.9 QUALITY CONTROL REQUIREMENTS

A. In accordance with the General Provisions Paragraph, "INSPECTION OF CONSTRUCTION", inspect and test the Work and maintain records of the inspections and tests. Obtain approvals, except those required for field installations, field applications, and field tests, before delivery of materials and equipment to the Project Site.

1. Factory Tests: Arrange for factory tests when required under the Contract and as required by the Contracting Officer.

2. Factory Inspection: Arrange for factory inspection when required under the Contract or as required by the Contracting Officer.

3. Field Inspections and Tests by the Contractor: Furnish equipment, instruments, qualified personnel, and facilities necessary to inspect the Work and perform all tests required to be conducted by the Contractor.

4. Field Inspections and Tests by the Authority: Provide assistance, equipment, instruments, qualified personnel, and facilities as required by the Contracting Officer for field inspections and tests conducted by the Authority in accordance with the following Article, “Authority’s Testing and Inspection” and the General Provisions Paragraph, “INSPECTION OF CONSTRUCTION”.

5. Samples: Prepare samples and submit in accordance with Section 01330, "Submittals".

B. Mutual Understanding Meeting: Within 5 calendar days after the CQC Plan is approved, but before construction operations are started, meet with the Contracting Officer and discuss the quality control requirements. The purpose of the meeting is to develop a mutual understanding relative to details of the system, including forms to be used for recording the quality control operations, inspections, tests, approvals, certifications, administration of the system, coordination with jurisdictional authorities, and Authority surveillance. As a minimum attendees shall include DART Quality, CQC, and representatives of affected entities. Refer to Section 01312, “Project Meetings”, for related requirements.

C. Contracting Officer shall have access to all work areas during the Contractor’s working time and shall have the right to monitor the methods and procedures used for construction related activities and/or CQC testing.

D. Certified Test Reports: Before delivery of materials and equipment, submit for approval certified copies of the test reports required in the technical sections. Accompany test reports with certificates from the manufacturer certifying that the material and equipment proposed to be supplied is of the same type, quality, manufacturer, and make as that tested.

E. Manufacturer’s Certificates of Conformance or Compliance: Contractor may use certificates of compliance for certain materials and products in lieu of the specified sampling and testing procedures. However, the Authority reserves the right to refuse to permit the use of certain materials on the basis of a certificate of compliance. The Authority will accept manufacturer’s certification furnished by the Contractor on items of materials and equipment incorporated into the Work only when this method will assure full compliance with the provisions of the Contract.

1. Certificates shall be originals; preprinted certifications will not be acceptable unless approved by the Contracting Officer. Certificates shall be signed by an authorized representative of the producer or manufacturer and shall state that the material complies with Contract requirements and the name and address of the Contractor, project name, and location.

2. Submit certificates with each lot of material delivered on the day the materials are delivered to the site. The lot certified shall be clearly identified by the certificate.
3. The certificate shall identify the materials or equipment being certified and give the information specified for submittals in Section 01330, “Submittals”. The certificate shall also identify the referenced standard as applicable, the name and address of the organization performing the tests, the date of the tests, and the quantity of material shipped. Certificates for a material shall state the date(s) of shipment or delivery to which the certificates apply.

4. Certificate of compliance shall be accompanied by a certified copy of test results or shall state that such test results are on file with the producer or manufacturer and shall be furnished to the Authority on request.

5. Materials used on the basis of a certificate of compliance may be sampled and tested by the Contracting Officer at any time. The fact that material is used on the basis of a certificate of compliance shall not relieve the Contractor of its responsibility for incorporating material in the Work which conforms to the requirements of the Contract, and any such material not conforming to such requirements will be subject to rejection, whether in place or not.

F. If Contractor fails to take Corrective Action in response to Corrective Action Reports, the Authority may terminate the right to proceed with the work or the separate part of the work in accordance with the General Provisions Article entitled “Default” or may remove the CQCR.

G. Refer to Section 01722, “Field Engineering - Surveying”, for requirements to provide surveying for both layout and for the subsequent verification that the work constructed complies with the dimensions and locations as shown.

1.10 SPECIFIC DUTIES OF THE CONTRACTOR’S QUALITY CONTROL REPRESENTATIVE

A. CQCR shall perform duties listed herein.

B. Meetings: Refer to Section 01312, “Project Meetings,” for the CQCR responsibilities in regard to Contractor’s Quality Control (CQC) meetings.

D. Prepare daily CQC reports identifying prime and subcontractor personnel and equipment on the site, idle equipment and personnel, material deliveries, weather conditions, work accomplished, inspections and tests conducted, results of inspection and tests, nature of defects found, causes for rejection, and corrective actions taken. Work shall be identified with schedule activity code numbers in accordance with Section 01320, “Construction Schedule and Progress Reports”, or Section 01321, “Construction Schedule and Progress Reports for Small Projects”, as applicable. Nonconforming tests and other nonconformances shall be noted on the daily CQC report. Daily CQC report shall note any questionable work identified by the Contracting Officer or other Authority representatives (called a Deficiency Notice). Daily CQC reports shall include the following certification: “On behalf of the Contractor, I certify that this report is complete and correct, and materials and equipment used and work performed during this reporting period are in compliance with the Contract Documents, to the best of my knowledge, except as noted above”. This certification shall be signed on behalf of the Contractor by the authorized CQCR.

E. CQCR shall submit the following for Contracting Officer’s review and use:

1. Test reports, certifications and other testing and inspection documentation. Deliver signed original to the Contracting Officer within 7 days. Refer to specific requirements in Article 1.5 entitled “CQC Plan Elements”, under Paragraph “Laboratory Reports”.

a. Deliver a copy of preliminary field inspection and testing reports to the Contracting Officer on the day of inspection and testing. Copy shall be either a photocopy of the handwritten report or a printout if report is prepared electronically in the field.

b. Reports, including preliminary reports, shall identify inspections as preparatory, initial, or follow-up.

2. Daily CQC reports. Submit by 9 am the following working day.

3. Updated copy of Tabulation of Tests performed with each payment application. Also submit as part of closeout submittals; refer to Section 01770, “Contract Closeout”.

4. Daily “next day activity list.” Submit at the end of normal work hours for the work to be performed the next day.

5. Written responses to Nonconformance Reports, Corrective Action Reports, and Audit Finding Reports. Submit within the time frame designated in the applicable report.
6. Original copies of reports dealing with nonconforming work.

F. Responsibilities in Regard to Submittals:

1. Verify that submittals required by the various sections of the Specifications have been certified by the Contractor as specified in Section 01330, “Submittals”, and that submittal quality control procedures have been followed in accordance with the CQC Plan.

2. Maintain at the Worksite an up-to-date Submittal Status Log showing the status of submittals required by the Contract. A sample format of an acceptable log is available on request. While the use of this sample format is not required, any other format shall contain the same information as shown on the sample. Submittal Status Log shall be based upon and be consistent with the Submittal Control Document specified in Section 01330, “Submittals”. Failure to update and maintain this log accurately shall be grounds for the Contracting Officer to withhold progress payments from the lump sum for “General Requirements”.

G. Next Day Activity List: Provide a daily “next day activity list” identifying work to be performed for the next day. This shall include a list of tests and inspections that will be required to ensure that the work complies with the requirements of the inspections. List shall identify inspections as preparatory, initial, or follow-up. List shall identify tests and corrective work to be performed in regard to Deficiencies and Nonconformance Reports.

H. Prepare a written response to any Nonconformance Reports (NCR), Corrective Action Reports (CAR), and Audit Finding Reports (AFR) that the Contracting Officer identifies to the Contractor.

I. Refer to Section 01220, “Measurement and Payment”, for CQC responsibilities in regard to certifications of as-buils.

1.11 AUTHORITY’S TESTING AND INSPECTION

A. The Authority will employ and pay for services of a certified testing laboratory that complies with ASTM E329 for the purpose of periodically performing quality assurance (QA) tests (solely for the Authority’s purposes) of the worksite, plant, or laboratory to verify performance of the Contractor. Performance of quality assurance tests by the Authority does not relieve the Contractor of the responsibility of performing quality control inspection and testing to verify that work meets Contract requirements.

1. Copies of non-conforming tests will be furnished to the Contractor to ensure that nonconforming work is corrected.

2. Contractor shall bring nonconforming work into conformance and perform retest of failed test. When the nonconforming work has been successfully tested by the Contractor’s testing laboratory, the Contractor shall then notify the Authority regarding when the Authority’s testing laboratory can perform retest. The testing laboratory that performed the failed test will perform the retests.

B. Repeat Quality Assurance Tests and Inspection by the Authority: In the event of a quality assurance test or inspection performed by the Authority fails, the Contractor shall be responsible for payment of cost for repeat quality assurance tests and inspections after each correction made to non-conforming materials and workmanship until tests and inspections by the QA testing laboratory or inspections of the Authority have certified that the materials, equipment, and workmanship conform to the contract requirements.

C. Coordination:

1. Under the general direction of the Contracting Officer, the Contractor shall cooperate and coordinate with the Authority’s testing laboratory to perform the tests specified by the Contract or required by the Contracting Officer to verify that the Contractor quality control measures and/or performance are adequate to provide a product which conforms to the contract requirements.

2. Refer to coordination and preliminary scheduling requirements specified in Article 1.5 entitled “CQC Plan Elements” under Paragraph “Preliminary Schedule” herein. To avoid delays to the progress of the Work, the Contractor shall submit written notice to the Contracting Officer at least 24 hours in advance for on-site work and 30 days in advance for off-site work of the time Authority-furnished testing laboratory field services are required. Contractor shall coordinate with the Contracting Officer in obtaining the required field services. Contractor shall provide assistance as necessary and as directed by the Contracting Officer to enable the Authority-furnished testing laboratory to perform the tests as specified.

1.12 AUTHORITY’S QUALITY AUDITS

A. The Authority may perform quality audits of the Contractor’s, subcontractor’s, and supplier’s quality records and performance. Contractor shall ensure that quality control records and places of work are open and available to the Authority for inspection during normal working hours.

1. Contractor shall reply to any findings resulting from such audit within 10 working days. Reply shall describe what caused any
deficiencies, what corrective actions are being taken, who is responsible for corrective actions, and when corrective actions will be complete.

B. Contractor, subcontractor, or supplier being audited shall be available during the audit as required by the audit team.

END OF ATTACHMENT
PART 1 - GENERAL

1.1 DESCRIPTION
A. This Section includes specifications for providing the field samples and site mock-ups required by the individual Specifications Sections.

1.2 FIELD SAMPLES AND MOCK-UPS
A. Field samples and mock-ups shall be prepared at the jobsite by the Contractor as specified in the various Sections of these Specifications. Affected finish work shall not be started until the Contracting Officer has approved the field samples and jobsite mock-ups in writing.
B. Preserve approved field samples and mock-ups for comparison purposes until the affected work is completed and accepted by the Authority. Finished work shall match the approved field samples and mock-ups.

1.3 SUBMITTALS
A. Comply with the requirements for samples, and process a transmittal form for each mock-up or sample panel as a record of the activity.
B. Transmit documentation regarding the mock-up and sample panels as specified for submittals.
C. Refer to Section 01330, “Submittals”, for Contracting Officer’s review and approval.

1.4 QUALITY ASSURANCE
A. NONCONFORMANCE
1. Completed work which does not exactly match approved field samples and mock-ups will be rejected, and shall be replaced with work which does exactly match the approved field samples and mock-ups at the Contractor's expense.
2. If the Contractor elects to start work before the Contracting Officer has approved the related field samples or mock-ups, the Contractor does so at the risk of having the work rejected by the Contracting Officer without compensation.

PART 2 - PRODUCTS

2.1 MATERIALS
A. As specified in individual Specification Sections.

PART 3 - EXECUTION

3.1 INSTALLATION
A. Construct and prepare field samples and jobsite mock-ups at designated locations at the jobsite or on the structure as directed by the Contracting Officer.

1. Take photographs of the existing conditions and substrates before beginning the field sample or mock-up.
2. Contractor shall have product manufacturers inspect and approve field samples and mock-ups, which involve their materials, for proper application or installation of the materials in accordance with their respective instructions and recommendations for the conditions or circumstances involved in the application or installation.
3. Contractor shall make arrangements with the respective product manufacturers to provide job or field service as specified in Section 01430, “Contractor’s Quality Assurance”.

B. Construct or prepare as many additional samples and mock-ups as may be required, as determined by the Contracting Officer, until desired features, textures, finishes, and colors are obtained. Approved samples and mock-ups shall serve as the standards of quality for the various affected units of work.

3.2 REMOVAL AFTER COMPLETION
A. Field samples and mock-ups not incorporated into the final construction shall be removed from the jobsite and structures after completion and acceptance of the affected work or as otherwise specified or directed by the Contracting Officer.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL
A. Separate measurement or payment will not be made for work required under this Section. Costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

END OF SECTION 01454
PART 1 - GENERAL

1.1 DESCRIPTION

A. Work specified in this section includes furnishing, installing, maintaining, and subsequently removing temporary facilities (including services required during construction) for use by the Contractor and the representatives of the Authority.

B. This section supplements the General Provisions Paragraph, "OPERATIONS AND STORAGE AREAS".

C. Work in or near Airports: Equipment type and heights, sign heights, hours of construction and sequencing, illumination and signal work in or near airports shall meet clearance and lighting restrictions of the Federal Aviation Administration and airport owner.

1.2 REFERENCED STANDARDS

A. Occupational Safety and Health Administration (OSHA)

1. 29 CFR 1926 – Safety and Health Regulations for Construction

2. 29 CFR 1926 Subpart F – Fire Protection and Prevention

B. Texas Department of Transportation (TxDOT)

1. Texas Manual on Uniform Traffic Control Devices (TMUTCD)

1.3 SUBMITTALS

A. Submit working drawings showing the proposed locations and sizes of staging area, offices, storage areas, shops, security fencing, stationary equipment, and similar facilities.

B. Submit floor plans for proposed Contracting Officer’s facility.

C. Submit a plan for temporary fire protection system.

1.4 UTILITY CONNECTIONS

A. Provide and maintain temporary utility services necessary for the performance of the Work and related operations. At the completion of the Work, remove all temporary utility services and terminate connections to main service lines in a manner acceptable to the utility companies.

B. Erect temporary partitions and closures as necessary to protect the existing facilities and the users/occupants thereof from weather and environmental nuisances caused by construction, such as dust and noise.

C. Provide temporary drainage from the Worksite in accordance with Section 01562, "Soil Erosion and Sediment Control".

1.6 TEMPORARY ELECTRICAL SERVICE

A. Provide power distribution throughout the Worksite as required to facilitate construction operations. Provide terminations for each voltage supply complete with circuit breakers, disconnect switches and other electrical devices as required to protect the power supply system.

B. Furnish, install, and maintain a temporary lighting system as required by the building trades installed in accordance with OSHA requirement to satisfy the requirements of safety and security. Provide temporary lighting system to afford illumination in all areas.

C. Install all temporary equipment and wiring for power and lighting in accordance with the applicable provisions of the governing codes.

D. Provide power centers for electrically operated and controlled construction facilities including tools, equipment, testing equipment, and interior construction lighting and ventilation equipment. Locate power centers so that power is available at any desired point with no more than 100 feet extension. Provide, as a minimum, one power center per floor level.

E. When the permanent electrical power and lighting systems are in operating condition, they may be used for temporary power and lighting for construction purposes if approved by the Contracting Officer in writing.

F. At the completion of the construction work or at such time after the Contractor makes use of the permanent electrical installation, remove temporary electrical service equipment, including restoration of existing source of supply.

1.7 TEMPORARY WATER SERVICE

A. Furnish water necessary for construction purposes and assure continuous water supply to the site for emergencies. Make temporary connections to existing mains; provide temporary meter; and make all arrangements and pay charges for the temporary water service including cost of installation and maintenance thereof.
B. When the permanent water supply and distribution system has been installed, it may be used as a source of water for construction purposes if approved by the Contracting Officer in writing.

C. At the completion of the construction work or at such time after the Contractor makes use of the permanent water installation, remove temporary water service equipment and piping, including restoration of the existing source of supply.

1.8 TEMPORARY ENCLOSURES

A. Provide temporary weather tight enclosures and temporary heating as required during construction to make the building weather tight and to protect the work from damage, and as necessary to ensure suitable working conditions for the construction operations.

B. Provide adequate ventilation (as required) to prevent accumulation of excess moisture in the building.

C. When the permanent air circulation system, or suitable portion thereof, is in operating condition, it may be used without refrigeration or chilling if approved in writing by the Contracting Officer. If such use is approved:

1. Provide temporary filters to adequately filter air being distributed through the duct work to the supply outlets; place disposable filters in front of all exhaust duct work.

2. Thoroughly clean the interior of the air handling units and ductwork prior to requesting acceptance of the Work.

D. Upon conclusion of the temporary period, remove all temporary piping, or other equipment and pay all costs in connection with repairing any damage caused by the installation or removal of temporary equipment; and thoroughly clean and recondition those parts of permanent heating and air circulation systems used for temporary service and install new filters.

E. Build where shown and as required by property owner, closed, dustproof, weatherproof, and burglar-proof temporary partitions and closures of suitable materials to isolate the Site from remainder of the structure. Comply with local building code requirements.

F. Provide emergency exits, with appropriate hardware.

G. Provide temporary protection against dust and damage.

H. Remove temporary protective installations upon completion of work and restore area.

1.9 TEMPORARY CONSTRUCTION OPENINGS

A. Provide openings in slabs, walls and partitions where required for moving in large pieces of equipment of all types. Close and restore all openings and finish them after the equipment is in place. Structural modification, if required, shall be performed in accordance with Section 01731, “Cutting and Patching”.

1.10 FIRE PROTECTION

A. Submit a plan for a temporary fire protection system for use during the term of the Contract, which is subject to approval by the Contracting Officer. This plan includes provisions for fire protection systems and equipment as required by OSHA 29 CFR 1926 Subpart F.

B. Store gasoline and other flammable liquids in Underwriters' Laboratories listed safety containers in conformance with the recommendations of the National Fire Protection Association (NFPA). Do not allow such storage, within buildings located on the site. Refer to Section 01560, “Environmental Protection”, for related requirements.

C. Take adequate precautions against fire throughout all operations. Keep flammable material to an absolute minimum and properly handle and store. Do not permit fires in any part of the Work. Do not store flammable/combustible materials within 50 feet of stored flammable liquids.

D. Perform construction work, including cutting and welding and protection during construction, in accordance with the published standards of the Factory Mutual Association and the National Fire Protection Association. Provide a sufficient number of Authority-approved non-freeze portable fire extinguishers distributed about the project.

E. At the earliest possible date, complete and make operable, the permanent standpipe system, as applicable, and incorporate into temporary fire protection system. At that time, furnish sufficient hose to provide adequate coverage as determined by the local Fire Department.

F. Make arrangements for periodic inspection by local fire protection authorities and insurance underwriters' inspection personnel; cooperate with and aid authorities and promptly carry out their recommendations.

1.11 MATERIALS HOIST AND OTHER EQUIPMENT

A. Provide material hoists (as required) for normal use by all trades and employ skilled operators. Provide all necessary guards, signals, and safety devices required for safe operations. Provide suitable runways from the hoists to each level where work is being done. The safe load capacity shall be shown on each hoist and a label showing safe operating procedures.
B. Furnish and maintain temporary ramps, scaffolds, and chutes; and other construction plants and equipment as required, for proper execution of the Work under the Contract.

C. For the construction and operation of the material hoist and other construction aids, conform to all applicable Federal, State, and Local safety codes and regulations.

1.12 CONTRACTOR’S FACILITY

A. In accordance with the General Provisions Paragraph, "OPERATIONS AND STORAGE AREAS", submit working drawings showing the proposed locations and sizes of staging area, offices, storage areas, shops, security fencing, stationary equipment, and similar facilities.

B. Contractor’s plant and equipment:

1. Submit a plan of the proposed plant layout for approval within 20 calendar days after receipt of NTP (Notice to Proceed). Do all necessary construction in connection therewith in a manner satisfactory to the Contracting Officer.

2. Provide and maintain sufficient construction plants and equipment at points where work is in progress to adequately meet demands of the Work and with ample margin for emergencies or overload. Provide plants and equipment of adequate size, capacity, and numbers, to the satisfaction of the Contracting Officer, to permit a rate of progress which will ensure completion of Work within the time specified in the Contract. The Contracting Officer has the right to order testing of all plants and equipment, and to reject or condemn any plant, apparatus, or staging which, in his opinion, is unsafe, improper, or inadequate. Whether the Contracting Officer exercises this authority or not, the Contractor is not relieved of his responsibility for the safe, proper, and lawful construction, maintenance, and use of such plant, apparatus, or staging. Rework condemned plants or equipment to an acceptable condition or remove from site and replace within 5 days from the date of instruction of the Contracting Officer.

3. The location of stationary equipment and the location of miscellaneous mobile equipment are subject to approval of the Contracting Officer.

C. Security: It is the responsibility of the Contractor to provide and maintain security of his facilities, utilities, plant, and equipment and the work during the entire contract period.

1.13 CONTRACTOR’S STAGING AREAS

A. Refer to Section 01010, “Summary of the Work”, for provisions regarding Contractor’s Staging Areas.

1.14 CONTRACTING OFFICER’S FACILITY

A. Provide, maintain, and service office facilities for the use of the Contracting Officer and staff in administrating the Contract (herein called “office”). The office shall be installed, ready for operation, within 20 days of Contractor receiving the Notice-to-Proceed. Obtain approval of the location of the office from the Contracting Officer. Unless directed otherwise, maintain office on location through completion of the Contract and for 30 calendar days after final completion after which remove office which shall become the Contractor’s property.

B. Permits and Inspections: Arrange for and comply with all necessary local permits and inspections including any incidental costs.

C. The office shall be secured and security shall be provided and maintained by the Contractor during the entire Contract period.

D. The office including entrance, toilet facilities, and parking shall be accessible by disabled individuals and shall comply with Americans with Disabilities Act (ADA) requirements.

E. The office shall have water service; electrical service; heating, ventilation and air conditioning (HVAC); and telephone service.

1. The telephone service shall consist of six telephones with five voice lines and one facsimile (fax) line. The T1 Line service will be provided by DART from the Contracting Officer’s facility to DART’s 1401 Pacific location.

F. During the entire Contract period, maintain the office, including janitor service on a daily basis, and supply consumables such as toilet paper, soap, paper towels, paper cups, light bulbs, etc., for the equipment provided.

G. Provide all-weather paved access to the office and an all-weather parking area with space for 15 vehicles adjacent to the office.

H. The office shall include separate toilet facilities for men and women. The toilet facilities shall be outfitted with water closet, lavatory, utility cabinets, hot and cold water supply, mirror, soap dispenser, paper towel holder, adequate light, HVAC, and a lockable door.

I. The offices and exterior doors shall all be keyed and lockable.

J. Floors shall be covered with flooring material such as resilient tile or sheet linoleum or wall-to-wall...
carpet. Floors shall withstand a load of 125 psf. Wall surfaces shall be neatly painted.

K. The level of lighting to be provided in the office shall be at least to the levels noted in the following:

1. Desktop: 100 footcandles.
2. Toilet Facilities: 60 watt incandescent fixture.

L. Wall receptacles: 120 Volt 2-ampere duplex receptacles, located at ten foot intervals around the perimeter of the office.

M. Computer Network Capability:

1. The computer network server room size shall be a minimum of 6 foot by 6 foot with a keyed and lockable heavy-duty door (opening outward). Keys shall be submitted to the Contracting Officer for delivery to DART Project Management IS Coordinator. The room shall have one wall covered with plywood (5/8 inch minimum). If one wall is an exterior wall that one shall be used (windows covered). The wood shall completely cover the wall with access holes created for switches and plugs. Provide the server room with its own HVAC vent and return and furnish with one utility table (30 inches by 60 inches, 30 inches high). Provide network relay rack (19 inches by 72 inches) for network computer equipment.

2. The Contracting Officer’s Facilities shall be cabled with Category level 5 cabling originating from the computer network server room and going to each desk location as well as a location for the network printer. Each individual cable end shall be terminated with an RJ-45 jack box using the EIA 568B wiring scheme and the computer network server room shall terminate cables to a 24 port category 5 patch panel. The data patch panel shall be wall mounted using a hinged stand off bracket and shall use the EIA 568B wiring scheme. Cable runs shall be routed underneath the floor up to the specified station. Prior to installation, a detailed layout diagram will be provided by the DART Proj/Mgt. IS Coordinator. Connections shall be tested and verified.

N. Office Square Footage and Layout:

1. Provide a minimum 2100 square foot office consisting of 5 lockable offices, 1 secretary and reception space, an open office work area (with 60 feet of low partitions arranged as directed) for inspectors, and 1 meeting room. Office shall also include computer network server room and toilet rooms as specified herein.

2. The meeting room shall be large enough to accommodate up to 18 people at any one time. The meeting room shall be furnished with a meeting table that can accommodate 18 persons, 18 side chairs, one white board (mounted) and 1 tack board.

3. The office shall have 2 coat closets; 1 coat closet equipped with rods, 10 plastic hangers, and 1 floor broom with dust pan.

O. Furnishings and Equipment: Furniture and equipment shall be new and as approved by the Contracting Officer. In addition to furniture and equipment specified elsewhere under this Article “Contracting Officer’s Facility”, furnish and equipment the office facilities follows:

<table>

</table>
P. Provide the following equipment complete with supplies including toner and paper and maintenance for the duration of Contract. Refer to the Contract Specifications for additional criteria for this equipment.

1. Fax machine with dedicated phone line.
2. Auto feed copy machine with scanning capabilities.

1.15 SANITARY

A. Sanitary Provisions: Provide toilet facilities for men and women available at all times. Locate portable facilities, insofar as practicable, secluded from public view. Keep toilet facilities clean and sanitary and in compliance with regulations of jurisdictional agencies.

1.16 ACCESS TO ADJACENT PROPERTY

A. Conduct construction operations in such a manner as to cause as little inconvenience as possible to owners of property affected by such operations. Refer to Section 01570, “Maintenance and Control of Traffic”, for access requirements.

B. Refer to Section 01010, “Summary of the Work”, for Contractor’s use of private property requirements.

1.17 ACCESS TO FIRE HYDRANTS AND FIRE ALARM BOXES

A. Whenever the Work is being carried on, give free access to each fire hydrant, fire extinguishers, fire alarm box and standpipe; when required, extend hydrants by suitable tubes or piping to an accessible point as approved and to the satisfaction of the jurisdictional fire department. Do not pile obstructions at any time or place within 15 feet of any fire hydrant or fire alarm box and, where materials are placed in the vicinity of a fire hydrant or fire alarm box and to such height as to prevent same from being readily seen, indicate the position of such hydrants or fire alarm boxes by suitable signs and lights, both day and night.

B. Safeguard, maintain, and protect the wires, cables, ducts, manholes, posts and poles, signals, and alarm boxes of others and DART. Do not cause interruption to the fire department fire alarm service, and in case of accident, promptly notify the fire department. Do not disturb fire department wire, cable, duct, manhole, post or pole, signal or fire alarm box except in the presence of a representative of the local fire department. In case such wire, cable, duct, manhole, post or pole, signal, or fire alarm box is disturbed, restore immediately to its original condition, and notify the Contracting Officer.

1.18 PROTECTIVE DEVICES

A. General:

1. Wherever necessary, shown or specified, erect and maintain signs, fences, barricades, and pedestrian bridges and provide watchmen and flagmen for the protection of or for performance of other contractors, maintaining public travel, the Worksite, adjoining property and adjoining public places.

2. Take positive measures to prevent entry into the site of the Work and storage areas by children, animals, and unauthorized adults and vehicles.

3. Provide protective devices in accordance with codes and regulations of jurisdictional agencies.

B. Fences:

1. In addition to the fencing indicated on the Drawings, furnish and construct approved wooden or metal fencing within the construction area to fence off pedestrian sidewalks, streets, and parking areas from operating areas as required for public safety and security of the site and as required by the Contracting Officer. Locate fencing for pedestrian sidewalks as shown on the Contractor’s Working drawings or as directed by the Contracting Officer.

2. Construct temporary fences of sound materials, neat in appearance and painted with two coats of approved exterior paint of approved color. Unless otherwise shown, provide fences 6 feet high consisting of a stud framework with a covering of tightly fitted plywood sheets. Provide the type of fence, whether fixed or movable, as shown on the Contractor’s Working drawings. Construct and maintain fences accessible to the public, so they are smooth, safe and do not splinter or catch clothing.

3. Immediately prior to completion of the Contract, restore site to original condition and repaint fencing shown to remain in place.

C. Barricades:

1. During the prosecution of the work, barricade or close excavations and openings in floors, walls, and other parts of the structures and excavations while such openings are not in regular use. Provide traffic area barricades to comply with the TMUTCD.
2. Barricade or close such openings before final acceptance of the Work.

3. Provide barricades substantial in character, neat in appearance, constructed of approved materials, and of approved size and arrangement.

4. Anchor barricades to the ground on all sides of excavations.

5. Provide flashing yellow lights and maintain on barricades at maximum intervals of 25 feet.

D. Pedestrian bridges: Construct bridges for pedestrians of suitable materials in accordance with local requirements, provide with handrails or with sides tightly boarded in accordance with such requirements and construct a minimum width of 6 feet or such greater minimum width as will accommodate the normal traffic flow at the particular location. Submit as part of Traffic Control Plans under Section 01570, "Maintenance and Control of Traffic", working drawings for required bridges.

1.19 PROTECTION OF PROPERTY

A. Requirements hereinafter specified are in addition to General Provisions Paragraph, "PROTECTION OF EXISTING SITE CONDITIONS".

B. Existing surfaces and facilities including building structures immediately outside the Contractor's Worksite:

1. Take positive action to protect existing surfaces and facilities from damage resulting from construction operations unless modifications to the surfaces or facilities are required as a part of the Contract.

2. Protect existing vegetation, including existing turf, not designated to be removed. Refer to Section 01532, "Tree and Shrub Protection and Care", for protection of trees and shrubs.

3. Where modifications to existing facilities or surfaces are required, provide such modifications in accordance with the applicable requirements of Section 01731, "Cutting and Patching".

4. Protect paving, landscaping, and utility facilities from damage. In regard to utility facilities, refer to Section 02760, "Maintenance, Support and Restoration of Existing Utility Facilities," for detailed requirements.

5. Protect finished surfaces, including jambs and soffits of openings used as passageways through which materials are handled, against possible damage.

6. Provide and maintain adequate protection for adjacent structures. When required by law, or for the safety of the Work, shore, brace, underpin, or otherwise protect those portions of adjacent structures which may be affected by the Work. Refer to Section 02150, "Underpinning, Support, and Restoration of Structures".

C. New Work:

1. Ensure finished surfaces of items are clean and not marred upon acceptance of the Work. Refinish all surfaces that have been damaged.

2. Do not permit traffic or material storage on roof surfaces. Where some activity must take place on the roof in order to perform the Work, provide and maintain adequate protection of the roof surfaces.

3. Provide and maintain protection against weather so as to preserve work, materials, equipment, apparatus, and fixtures free from injury or damage.

4. Do not load or permit any part of a structure to be so loaded as to either create an unsafe condition or affect its structural integrity.

5. Do not use items of equipment that are intended to form a part of the completed work as construction equipment without specific approval from the Contracting Officer in each instance.

D. Restoration and Repair of Damages:

1. Restore facilities which are removed during construction, which are to remain in place, to their pre-construction conditions.

2. Repair damage to surfaces or facilities which are to remain in place, as required by the Contracting Officer. Make repairs resulting in conditions equal in quality and strength to the previous conditions. Make repaired surfaces identical in color and texture to the adjacent existing materials, except that where materials cannot be matched, refinish the affected area and surrounding area to give a uniform appearance acceptable to the Contracting Officer and the owner of the damaged facility.
E. Salvaged Materials and Equipment:
   1. Maintain property control records for materials and equipment designated to be salvaged.
   2. Store and protect salvaged materials and equipment from damage. Replace salvaged materials and equipment which are broken or damaged as the result of Contractor's negligence during salvage operations, during storage, or when the Contractor is transporting salvaged items.
   3. Refer to Section 02072, “Removal and Restoration of Miscellaneous Existing Structures”, for detailed requirements regarding salvage of miscellaneous facilities.

1.20 MAINTENANCE OF WORK DURING CONSTRUCTION
   A. Contractor shall maintain the Work during construction and suspensions of work, if any, until the issuance of certificate of final completion for the entire contract. This maintenance shall include continuous and effective work performance as required, with adequate equipment and labor as well as security forces to the end that all parts of the Work be kept in safe and satisfactory condition at all times.
   B. Particular attention shall be paid to weather action and drainage both permanent and temporary at all times. Contractor shall use reasonable precautionary measures to avoid damage or loss that might result from accumulations and concentrations of drainage water and material carried by such water and such drainage shall be diverted or removed when necessary to protect the Work and the work area. Coordinate with the requirements of Sections 01560, “Environmental Protection”, and 01562, “Soil Erosion and Sediment Control.”
   C. Electrical and mechanical equipment shall be protected against weather, duly attended to, and maintained in satisfactory condition, including after testing, until the final acceptance of the entire Work. Maintenance shall include grease, oil, cleaning, and periodic operation, as appropriate. Contractor shall repair or replace at no cost to the Authority any work that is damaged or deteriorated due to Contractor's failure to comply with this Article.

PART 2 - PRODUCTS
   Not Used

PART 3 - EXECUTION
   Not Used.
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes specifications for the following:

1. Organization and mobilization of the Contractor's forces;

2. Transporting construction plant and equipment to the jobsite and setting up of same;

3. Transporting various tools, materials, and equipment to the jobsite; and

4. Erection of temporary buildings and facilities as required for field offices, staging, storage, and construction operations. Refer to Section 01500, "Temporary Facilities and Services", and Section 01580, "Project Signs" for specific requirements, as applicable.

B. Mobilization shall include mobilization of all construction equipment, materials, supplies, appurtenances, facilities, and the like, staffed and ready for commencing and prosecuting the Work; and the subsequent demobilization and removal from the jobsite of said equipment, appurtenances, facilities, and the like upon completion of the Work.

C. Mobilization shall also include assembly and delivery to the jobsite of plant, equipment, tools, materials, and supplies necessary for the prosecution of work which are not intended to be incorporated in the Work; the clearing of and preparation of the Contractor's work area; the complete assembly, in working order, of equipment necessary to perform the required work; personnel services preparatory to commencing actual work; obtaining permits as required under General Provisions Paragraph, "PERMITS AND RESPONSIBILITIES," and all other preparatory work required to permit commencement of the actual work on construction items for which payment is provided under the Contract.

1.2 SUBMITTALS

A. Refer to Section 01330, "Submittals", for submittal requirements and procedures.

B. Submit a plan of the proposed layout of the construction site, including fences, roads, parking, buildings, staging, and storage areas, within 20 days after the effective date of the Notice to Proceed.

1.3 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Delivery to the jobsite of construction tools, equipment, plant, temporary buildings, materials, and supplies shall be accomplished in conformance with local governing ordinances and regulations.

1.4 TOOLS AND SUPPLIES

A. Provide construction tools, equipment, materials, and supplies of the types and quantities necessary to facilitate the timely execution of the Work.

B. Provide personnel, products, construction materials, equipment, tools, and supplies at the jobsite at the time they are scheduled to be installed or utilized.

1.5 PLANT LOCATION

A. Locate plant, or plants, appropriately close to the portion of the Work for which it will be used.

1.6 DEMOBILIZATION

A. Upon completion of the Work, remove construction tools, apparatus, equipment mobile units and buildings, unused materials and supplies, plant, and personnel from the jobsite.

B. Restore areas utilized for mobilization to their original, natural state or, when called for in the Contract Documents, complete such areas indicated.

PART 2 - PRODUCTS

Not Used.

PART 3 - EXECUTION

Not Used.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Payment for mobilization will be made on a lump sum basis wherein no measurement will be made.

B. Payment for mobilization will be made in the following manner:

1. Payment for mobilization will be made in four equal portions:

   a. The first 75 percent will be paid in the first 3 progress payments, provided the Contracting Officer is satisfied the Contractor is making a
reasonable effort to mobilize for construction in a timely manner.

b. The last 25 percent will be paid when the Contractor has demobilized to the satisfaction of the Contracting Officer.

2. The value allocated to mobilization shall not exceed 3 percent of the Total Bid Amount.

END OF SECTION 01505
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes specifications for protection and care of existing trees and shrubs indicated to remain on the Contract Drawings. Protection includes protection of plant system above and below grade. Care includes watering and maintenance of protected vegetation and irrigation to ensure plant growth and health until final acceptance.

B. Existing vegetation to remain is designated on the Contract Drawings. Trees, shrubs, and vegetation to be removed are shown on the Contract Drawings and will be marked in the field prior to construction.

C. Refer to Section 02131, “Tree Pruning”, for provisions for pruning existing vegetation designated to remain.

1.2 DEFINITIONS

A. Barrier: A fence installed as a temporary divide for the purpose of preventing unauthorized access during the full period of construction.

B. Disturbance/Damage: Physical or visual change to the site or trees and shrubs, which, in the opinion of the Contracting Officer, is detrimental to the viability of the vegetation being protected. Equipment, material, or personnel may cause such disturbance. Damage includes protected plant which partially dies within the duration of the Contract, thereby damaging shape, size or symmetry.

C. Violation: Damage to trees and shrubs caused by any construction or delivery vehicle, construction material storage or disposal of solid or liquid debris shall be considered a violation to the Contract.

1.3 GUARANTEE

A. Guarantee existing trees and shrubs against damage until final acceptance of the Project. Repair damage, which, in the opinion of the Contracting Officer, can be satisfactorily corrected. Replace plant material that dies within the duration of the Contract, and replace damaged plant material which partially dies within the duration of the Contract, thereby damaging shape, size or symmetry. Guarantee replacement plants for duration of the Warranty of Construction described in the General Provisions.

B. Where chain link fencing is indicated on the Contract Drawings for tree and shrub protection or is otherwise required, provide 6 foot high, temporary chain link fencing, in accordance with Section 02830, Chain Link Fencing.

2.2 MISCELLANEOUS MATERIALS

A. Mulch: Coarsely shredded hardwood mulch.

2.3 REPLACEMENT PLANT MATERIALS

A. Trees 9 inch caliper or less that are damaged shall be replaced with a new tree of same size and species. Size will be determined by measuring caliper at 12 inches above grade for trees from 4 to 12 inch caliper and at 6 inches above grade for trees from 0 to 4 inch caliper.

B. Trees larger than 9 inch caliper that are damaged shall be measured at 4 feet above natural ground elevation, or from top of stump, if removed. Contracting Officer will assess the following damages for damaged or removed trees:

<table>
<thead>
<tr>
<th>Tree Size-Diameter</th>
<th>Value Each</th>
</tr>
</thead>
<tbody>
<tr>
<td>Greater than 9 to 12</td>
<td>$5,000</td>
</tr>
<tr>
<td>Greater than 12 to 15</td>
<td>$10,000</td>
</tr>
<tr>
<td>Greater than 15</td>
<td>$20,000</td>
</tr>
</tbody>
</table>

C. Replacement shrubs shall be replaced at the existing sizes.

D. Replacement of vines, grasses, or other vegetation shall be replaced in kind with the approval of the Contracting Officer.

PART 2 - PRODUCTS

2.1 BARRIER MATERIALS

A. Minimum 4 foot high orange plastic netting (“Snow Fence”) with steel posts.

PART 3 - EXECUTION

3.1 IDENTIFICATION AND VERIFICATION

A. Verify trees to be removed and trees to be protected and saved with the Contracting Officer prior to commencing site work. Clearly mark trees for removal and trees for protection.

B. Field verify and photo document the existing tree, shrub, and plant health with the Contracting Officer prior to commencing work.

3.2 PRESERVATION

A. Protect and preserve trees, shrubs, and vegetation to remain by the use of temporary enclosures, wrapping or other means. Protection shall be in place prior to any site work, demolition, or grading.
B. Obtain Contracting Officer’s approval of plant protection prior to starting any site work. Protect plants with approved barrier as indicated on the Contract Drawings. Spread and maintain mulch to a depth of two to three inches to cover 100 percent of the root zone.

1. Protect tree and shrub trunks, limbs, foliage, and root zones from damage. If fencing is not possible due to proximity of construction, then the Contractor shall wrap tree trunk with material sufficient to protect the trunk from damage. The Contractor may use 2x4 wood pieces wired together to protect the trunk to a minimum height of 8 feet above grade.

2. Protect the root zone from compaction and damage. In areas of vehicular traffic, place and maintain plywood boards in addition to the mulch to protect the root zone from damage.

3. When excavation is required in tree root zones, hand excavate whenever possible and avoid cutting of roots greater than 1 inch during construction. When it is not possible to avoid cutting roots, roots over 1-1/2 inch shall be coated on the faces with acceptable dressing for horticultural use for cut or damaged plant tissues.

C. Barrier: Protect vegetation to be saved by erecting a barrier around all existing vegetation in the construction area. Maintain barriers in place until all construction in the vicinity is completed and approved by the Contracting Officer. Barriers shall consist of either orange plastic netting or temporary chain link fencing. If barrier material is not designated on the Contract Drawings, then material shall be Contractor’s option, subject to approval by Contracting Officer.

1. Orange plastic netting: Set posts at 6 foot on center. Secure netting at each post with wire to provide a continuous barrier. Locate ends of netting at posts, lap ends, and fasten with wire to posts.

2. Install temporary chain link fencing as specified in Section 02830, “Chain Link Fencing”.

D. Repair injuries, abrasions and other damage to plants by cleanly removing broken members, lose and torn bark, and shape edges in order to permit drainage of rain water from wounds. Paint wounds with an approved tree wound paint.

E. Where depth of soil over root system of existing plantings is to be modified by final grading, provide the following:

1. Where increase of 1 foot or more in elevation is shown, spread continuous layer of rock aggregate, graded 1/4 inch to 2 inches, 6 inches deep from trunk to drip line of branches prior to installation of fill.

2. Provide proper aeration by installing within perimeter of spread, a system of 4 inch clay drain tile. Install vertically flush with soil surface and penetrating into layer of aggregate fill.

3. Construct stone wells around trunks as shown, as detailed or as approved. Extend stone wells vertically from rock fill layer to final grade, allowing sufficient space for trunk growth.

4. Install tree guard fencing at the tree drip line or as noted on the Contract Drawings.

F. Do not install gates in tree guard fencing. Do not stack or store any equipment inside the tree fence.

G. Do not clean construction equipment, dump liquids, nor perform field maintenance on vehicles in the vicinity of the trees to be preserved.

H. If tree designated to remain is damaged so as to cause death or severely injure the tree, then remove and replace the tree at no extra cost to the Contracting Authority. The replacement tree shall be the same caliper size and species as the tree removed, with the exception of trees larger than 9 inch caliper. For trees larger than 9 inch caliper, refer to Article entitled “Replacement Plant Materials” herein for details concerning assessment for trees. The Contractor shall provide a one-year warranty for the replacement tree.

3.3 REMOVAL OF TREE BRANCHES

A. Where tree limbs or branches impede construction, the Contractor may remove limbs only with the written approval of the Contracting Officer. Branches shall be removed according to recommended horticultural practices using a three cut process for limbs over 2 inches in diameter. Comply with “Pruning and Weed Removal” below.

B. Obtain Contracting Officer’s approval of branch removal in the field.

3.4 EXISTING TREE AND PLANT MAINTENANCE AND CARE

A. The Contractor shall be responsible for maintaining the health of the existing trees and vegetation during the Contract period.

B. Maintain existing trees, shrubs, and vegetation to remain during the construction by keeping fencing upright and secure. Provide protective fencing as indicated on the Contract Drawings and approved by the Contracting Officer.

C. Notify Contracting Officer at first sign of distress or if grass stops growing within protective fencing. Notify the Contracting Officer if protected trees start to show signs of stress, insects or disease, or decline.
D. Treat any Fire Ant mounds around or on top of a tree root zone immediately and physically remove mound. Do not allow mound to build on the tree trunk as this will cover the tree root flare and possibly cause injury or death. Ensure that any chemical application to the Fire Ant mound is safe for application atop tree root zones.

E. Pruning and Weed Removal:

1. Pruning shall be carried out by experienced pruning personnel. Pruning qualifications are specified in Section 02131, “Tree Pruning”.

2. Obtain approval in the field for extent of pruning from Contracting Officer. Remove all damaged and diseased branches.

3. Sterilize pruning tools between individual plants; take particular care in sterilizing tools for the genus Quercus. Paint all wounds on plants of the genus Quercus with wound paint as soon as possible. Paint deliberate wounds (pruning) within one hour and accidental wounds (storm or equipment damage or vandalism) as soon as they are observed.

4. Raise limbs to an acceptable height as approved by the Contracting Officer. Raise limbs to seven foot height for trees within 10 feet of parking or sidewalk.

5. Use no weed-eaters or edgers within 15 inches of any tree. Should the need for trimming be necessary within 15 inches of any tree, perform trimming by hand only.

6. Remove dead wood, broken branches, mistletoe, and suckers from trees as needed. Sterilize pruning tools between individual plants to keep down spread of disease. Paint all wounds of plants of the genus Quercus with wound paint as soon as possible. Paint deliberate wounds within one hour and accidental wounds due to storms, etc. as soon as they are observed.

7. Clean up after tree pruning and clearing activities. Remove and legally dispose of all debris off site.

3.5 WATERING

A. Water existing trees, shrubs and plants to remain as needed to maintain health, growth, and vigor throughout Contract period.

1. Deep root water trees once every two weeks during the months of June, July, August, and September. Adjust this watering to take into account the amount of rain or signs of stress.

2. Should drought of more than three weeks occur from October through May, provide deep root watering of existing trees. Unless it has rained at least 1/2 inch since the last watering, continue to deep root water.

3.6 SITE RESTORATION

A. Continue protection and care of trees, shrubs, and vegetation until final Acceptance.

B. Upon the approval of the Contracting Officer, remove barriers including posts and footings, wrapping, and other protective devices. Backfill holes resulting from removal of posts and footings. Fencing and other materials, with the exception of mulch, shall remain the property of the Contractor and shall be removed from the site.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this Section will not be measured for payment but will be paid for on a lump sum basis for “tree and shrub protection and care”.

B. Tree pruning performed as part of tree and shrub protection and care will be measured and paid for as specified under Section 02131, “Tree Pruning”.

C. Pruning performed for the Contractor’s convenience and pruning to help mitigate damage caused by the Contractor will not be measured and no payment will be made therefore.

D. Orange plastic netting and temporary chain link fencing for tree and shrub protection, including posts and footings, maintenance, removal, and disposal, will not be measured separately but will be paid for at the lump sum price for “tree and shrub protection and care”.

E. Assessments for trees larger than 9 inch caliper, which are damaged and not replaced, will either be deduced from the Contract Price or billed to the Contractor, at the Authority’s discretion.

END OF SECTION 01532
THIS PAGE INTENTIONALLY LEFT BLANK
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies the installation, maintenance, and removal of temporary street decking and its support system over excavated areas for the purpose of maintaining the flow of pedestrian and vehicular traffic during the construction period.

1.2 REFERENCED STANDARDS

A. American Association of State Highway and Transportation Officials (AASHTO):
   1. AASHTO HB-17 - Standard Specification for Highway Bridges

B. American Welding Society (AWS):
   1. AWS D1.1/D1.1M - Structural Welding Code Steel

C. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

D. Occupational Safety and Health Administration (OSHA)
   1. 29 CFR 1926 Subpart P - Excavations
      a. 29 CFR Part 1926.650 – Scope, Application and Definitions Applicable to this Subpart
      b. 29 CFR Part 1926.651 – Specific Excavation Requirements
      c. 29 CFR Part 1926.652 – Requirements for Protective Systems
   2. 29 CFR 1926 Subpart S – Underground Construction, Caissons, Cofferdams, and Compressed Air
      a. 29 CFR 1926.800 – Underground Construction

1.3 DESIGN CRITERIA

A. Design of temporary decking shall be performed by and working drawings and computations shall be signed and sealed by the Contractor’s engineer who shall be a Professional Engineer registered in the State of Texas.

1.4 SUBMITTALS

A. Working Drawings:
   1. Prior to installation of elements for temporary decking, submit working drawings and design calculations.
   2. Show proposed procedures and methods of constructing temporary decking including support system, anchorage system, and necessary construction details.
   3. After existing utility facilities have been located by field investigations make necessary revisions to working drawings to reflect actual site conditions and resubmit drawings.

B. Certification:
   1. If used materials are utilized, submit certified information concerning each previous use. The information shall include the purpose, duration, and type of loading.
   2. Submit certifications verifying that welding, welding inspector, and testing personnel have been qualified in accordance with AWS D1.1/D1.1M or other AWS standard, as applicable, within the last 12 months prior to start of fabrication and erection.

1.5 REGULATORY REQUIREMENTS AND PERMITS

A. Design and perform work of this section in accordance with OSHA 29 CFR 1926 Subpart P, 29
TEMPORARY DECKING

1.6 PROJECT CONDITIONS

A. Refer to Section 01500, "Temporary Facilities and Services" and Section 01570, "Maintenance and Control of Traffic", for traffic control, barricades, and protective device requirements. Coordinate with Traffic Control Plan.

B. Perform work in accordance with construction sequence and maintenance of traffic schedules as shown and requirements of the jurisdictional agencies.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Steel, Concrete, and Other Materials: Used materials are permitted in lieu of new materials provided they are sound and free from defects, which might impair their strength.

B. Timber: Structural lumber, visually graded in accordance ASTM D2555, minimum working stress 1,100 psi.

C. Skid-Resistant Surface: Provide skid-resistant surface having a Skid Number at 30 mph (SN30) of no less than 35 when measured in accordance with ASTM E274.

PART 3 - EXECUTION

3.1 DECKING INSTALLATION

A. Install and maintain decking at design elevations.

B. Provide and maintain skid-resistant surface.

C. Maintain decking free of snow, ice, water, mud, and debris.

D. Secure decking to maintain its location or position over or next to the work by an approved anchorage system. If decking is dislodged or becomes unsecured, take all necessary measures to secure decking and protect public, workers, and the Work.

E. Place premixed asphaltic patching material to provide smooth transitions between existing pavement surfaces and decking and elsewhere as required to provide proper drainage and prevent ponding of water.

F. As removal of pavement and sidewalk progress, furnish and install barricades in accordance with Section 01500, "Temporary Facilities and Services", and requirements of the jurisdictional agencies.

G. Along sides of decked areas for pedestrian walkways where such walkways are adjacent to vehicular traffic, install concrete barriers as shown.

H. Install wooden fence along sides of decked areas for pedestrian walkways where such walkways are adjacent to open areas, storage areas and other areas used by the Contractor. Paint barricades and fences, and maintain in good repair.

I. Provide walkways or galleries for full length of excavation when excavation reaches depth of approximately 15 feet.

J. Erect and maintain load limit and other signs, if needed, to restrict loading on decking, so that it does not exceed maximum design loading.

K. Remove temporary decking and support system when no longer required. Comply with requirements of Section 02160, "Support of Excavation", when removing support system.

3.2 WELDING

A. Welding shall only be performed by certified welders and in accordance with the requirements of the AWS D1.1/D1.1M.

3.3 FIELD QUALITY CONTROL

A. Allowable Tolerances:

1. Maintain surface elevations at abutting elements within plus or minus 1/4 inch.

2. Do not allow horizontal gaps in decking to exceed 3/8 inch.

3. Where necessary or expedient to raise elevation of temporary decking above elevation of existing street or sidewalk, do not grade in excess of ten percent on ramp approaches.

3.4 VENTILATION AND ILLUMINATION

A. When excavations are decked, provide ventilation and lighting as required by regulatory requirements, jurisdictional agencies, and utility company access requirements.

B. In areas covered by decking, supply and maintain illumination of sufficient intensity to permit safe and expeditious conduct of all phases of construction, and inspection of support system, lagging, bracing, and utilities maintained in place.

C. Provide ventilation and illumination which meets specified safety requirements.
PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Work specified in this section will not be measured but will be paid for at the lump sum prices for “Temporary Decking - Steel Plates” and “Temporary Decking - Bridge”. “Temporary Decking - Steel Plates” shall include temporary decking consisting of steel plates spanning excavation without support structure. “Temporary Decking - Bridge” will include all other temporary decking.

B. Maintenance and control of traffic, illumination, ventilation, anchorage, fences, and barricades will not be measured separately but will be considered as included in the lump sum prices paid for “Temporary Decking”.

END OF SECTION 01533
PART 1 - GENERAL

1.1 DESCRIPTION
A. Environmental protection considerations consist of, but are not limited to, the following factors:
   1. Natural resources including air, water, and land.
   2. Solid waste disposal.
   3. Noise and vibration.
   5. The presence of chemical, physical, and biological elements and agents that adversely effect and alter ecological balances.
   6. Degradation of the aesthetic use of the environment.
   7. Historical, archaeological, and cultural resources.
   8. Storm water discharges Texas Pollutant Discharge Elimination System (TPDES)

B. Storm Water Pollution Prevention: See Section 01562, “Soil Erosion and Sediment Control” for provisions regarding the TPDES General Permit TXR 150000, Relating to Discharges from Construction Activities, including requirement for Contractor’s Environmental Compliance Manager (ECM).

1.2 GENERAL
A. Provide and maintain environmental protection defined herein.
B. Comply with all applicable Federal, state, and local laws, ordinances, and regulations pertaining to environmental protection.
C. Compliance by subcontractors with the provisions of this and various other sections of these specifications is the responsibility of the Contractor.
D. Use of equipment from which factory-installed anti-pollution and noise control devices are removed or rendered ineffective, either intentionally or through lack of proper maintenance, is prohibited.
E. Furnish a certificate that all materials and operating equipment installed as a part of this project, the installation thereof, and all equipment used in the construction, are in compliance with all applicable local laws, ordinances, regulations, and permits concerning environmental pollution control and abatement.
F. Provide and maintain a rain gauge, approved by the Contracting Officer, for Authority use during environmental inspection.

1.3 PROTECTION OF NATURAL RESOURCES
A. General: It is intended that the natural resources within the project boundaries and outside the limits of permanent work be preserved in the pre-construction condition or be restored to an equivalent of the pre-construction condition, as approved by the Contracting Officer, upon completion of the Work. Confine onsite construction activities to areas defined by the drawings and specifications, and as approved by the Contracting Officer. Ensure off-site storage areas are included in the Storm Water Pollution Prevention Plan (SWP3) and locations shown on site map. If no temporary usage areas are defined, shown or otherwise approved, restrict operations to permanent construction areas and those areas noted as Construction Staging or Storage.

B. Spills and Releases:
   1. At all times, take measures to prevent oil or other regulated/hazardous substances from entering the ground, drainage areas, and local bodies of water. In the event of any accidental violation of the requirements of the regulatory agencies, notify immediately the Contracting Officer and the Authority’s Manager of Environmental Compliance and take remedial measures as directed. Contractor through its ECM shall determine whether a spill is reportable and shall initiate and complete remediation. Contractor (through its ECM) shall report spill as soon as possible no later than immediately following implementation of initial remediation or control but no later than within the time period stipulated by regulation. Costs for all cleanup and remediation activities shall be the responsibility of the Contractor.
   2. Do not spray, pour or otherwise release oil, antifreeze or other regulated/hazardous substances onto the ground, roadways, parking lots, storm drains, creeks, bodies of water or elsewhere. In the event of a release or spill, the Contractor shall comply with all regulatory reporting requirements, including those promulgated in the Texas Administrative Code (TAC), Chapter 327, Spill Prevention and Control.
C. Protection of Existing Waterways and Highways:

1. Do not dump debris or rubbish of any kind into or otherwise allow it to fall into any body of water, onto adjacent banks, or onto highways. This includes paint splatters and spillage during painting operations as well as sediments, debris, and other materials that may be carried in storm water runoff. Capture waste paint from cleaning paint equipment, remove from site, and dispose of properly. Take care to prevent damage and injury to personnel, vessels, and vehicles using waterways, highways, or pedestrian ways. Provide and maintain devices to prevent such occurrences. Promptly remove any material or items falling into any body of water, onto adjacent banks, or onto highways and immediately report to the Contracting Officer and the jurisdictional agency. Use spill control materials where appropriate, to control spillage from paint and related materials. Contractor shall at all times be in compliance with the TPDES General Permit TXR 150000, Relating to Discharges from Construction Activities, as well as the SWP3 developed for this Project. Refer to Section 01562, “Soil Erosion and Sediment Control” for detailed requirements regarding the TPDES storm water permit program.

2. Do not close streets, walks, or other passageways to public access due to construction, demolition, or other related activities until an alternative routing plan is filed and written approval given by the appropriate local authority. For detailed Maintenance and Control of Traffic Plan, refer to Section 01570, "Maintenance and Control of Traffic".

D. Land Resources:

1. Except in areas indicated to be cleared, do not remove, cut, deface, injure, or destroy trees, shrubs, and vegetation without special permission from the Contracting Officer. Do not fasten or attach ropes, cables, or guys to any existing nearby trees for anchorage. Do not grade or store soil or debris against trees, shrubs, or vegetation that is outside the area to be cleared.

2. The use of herbicides is not permitted unless otherwise specified.

3. Submit a plan for protecting existing trees and vegetation to remain and that could be injured, bruised, defaced, and otherwise damaged by construction operations. Plan shall be in accordance with Section 01532, "Tree and Shrub Protection and Care", and shall be referenced in the SWP3 under maintaining existing vegetation. Remove rocks that are displaced into uncleared areas.

4. Protect monuments, monitor wells, markers, and works of art prior to the start of operations.

5. Trees and other landscape features scarred or damaged by the Contractor's equipment and operations shall be repaired and restored in accordance with the approved SWP3 and Section 01532, “Tree and Shrub Protection and Care”. Submit for the Contracting Officer's approval the repair and restoration plan prior to its execution.

6. Construction Facilities:

a. Requirements of this subparagraph are in addition to General Provision paragraph, "OPERATIONS AND STORAGE AREAS", and Section 01500, "Temporary Facilities and Services Required During Construction".

b. The location of the Contractor's staging area, storage area, and other construction buildings on public or privately owned property required temporarily in the performance of the Work, if not shown on the drawings, require approval of the Contracting Officer. Store equipment and materials at the job site in conformance with applicable Federal, state, and local statutes, ordinances, regulations, and rulings of the proper jurisdictional authority. Do not store unnecessary materials, equipment or containers on the jobsite. Take care to prevent any structure from being loaded with a weight that will endanger its structural integrity or the safety of persons. Do not store materials on or encroach upon private property without the written consent of the owners of such private property.

E. Water Resources:

1. At all times, the Contractor shall comply with the terms and conditions of the Clean Water Act of 1977, including the TPDES Storm Water Discharge Permit and SWP3 for this Project. Refer to Section 01562, “Soil Erosion and Sediment Control”, for detailed requirements regarding the TPDES storm water-permitting program.

2. Permit no stream crossings except as indicated in the Contract Documents. If the Contracting Officer agrees in writing that stream crossing is unavoidable, properly design and obtain required permits and construct such crossings according to such design and permit restrictions. The SWP3 shall include the design of any stream
crossings including properly sized culverts that remain in place in low flows/minor storms and allow high flows from major storms to pass over. Remove temporary culverts or bridge structures, if used, upon completion of the project and repair the area in conformance with its original condition and as specified herein.

3. Protection of Existing Wetlands and Watercourses:
   a. Plan, schedule, and undertake work in a manner that will ensure the protection and preservation of existing wetlands and watercourses.
   b. Undertake work in and around wetlands and watercourses in a manner to prevent any detrimental impact upon existing wetlands and watercourses.

G. Fish and Wildlife Resources: Do not alter water flows or otherwise disturb native habitat near or adjacent to the project construction area.

H. Staging Areas:
   1. Do not use in connection with this Contract, for storage, as a staging area, or as a preparation site, any cultural resource facility, building, site, or cleared area that is, as of the date of this Contract, on or eligible for listing on the National Register of Historic Places (16 U.S.C., paragraph 470a), without the prior approval of the Contracting Officer.
   2. For the purpose of the preceding paragraph the term “cultural resource” includes districts, sites, building, structures, and objects significant in American history, architecture, archaeology, or culture.

I. Illicit Dumping by Others: Contractor shall inform the Contracting Officer in the event that trash, debris or any other type of waste material is dumped or otherwise deposited on the site. The following applies whether or not the Contractor is responsible for the waste material’s presence on the site. Contractor has 7 days to clean up illicit dumping on the site unless the ECM determines the schedule must be extended to safely and effectively clean up or remove the material. Contractor shall make arrangements to dispose of the waste material in an appropriate manner. If the material is suspected of being either hazardous or regulated, prior to its removal the Contractor shall conduct testing and handle the material appropriately. If applicable, copies of any and all waste manifests shall be transmitted to the Contracting Officer and the DART Environmental Compliance Section in a timely manner.

J. Historical and Scientific Specimens:
   1. Protect and preserve intact all historic architectural features indicated on the drawings, the SWP3, or designated by the Contracting Officer. Protect these features from damage, including, but not limited to that resulting from the elements, vandalism, and effects of excavation, demolition, removal, and construction operations. Remove reserved features in an appropriate manner to prevent damage, and pack or crate in a manner to protect from damage. Mark all containers with proper identification and deliver to designated on-site areas for storage or transfer to a warehouse. Replace or repair lost or damaged designated architectural features as directed by the Contracting Officer. Submit proposed protection and removal procedures for review by the Contracting Officer prior to commencing the Work. Provide procedures for: the identification and protection of historic architectural features to be removed; safe conduct of the Work; careful removal and disposition of preserved features; and the protection and storage of preserved features. Notify the Contracting Officer in writing of the Contractor’s proposed schedule of removal of designated items. Protect the Authority’s right of ownership with regard to all preserved items.
   2. If during the course of work, artifacts or other evidence of archaeological, historical, or scientific value are discovered or accidentally exposed, report such artifacts or evidence immediately to the Contracting Officer. Halt work in the immediate area and protect the artifacts or other evidence from damage, including that resulting from the elements, vandalism, and the effects of excavation, demolition, removal, and construction operations until such time as qualified officials are able to conduct appropriate investigations. Do not proceed with work in the immediate area until authorization to proceed is obtained from the Contracting Officer. Deliver any such evidence or artifacts found during construction operations or subsequent investigations required by this section into the custody of the Authority; these items shall not become the property of the Contractor. Any delay in the progress of work on the project as a result of encountering archaeological or historical artifacts is to be mitigated by the Authority in
1.4 PETROLEUM STORAGE REQUIREMENTS

A. Contractor is responsible for all oil and oil products brought onto the site, including those introduced by sub-contractors. For the purposes of this section, oil and oil products shall include, but not be limited to, motor oils, hydraulic oils, transmission fluids, fuel (diesel, gasoline, kerosene, etc.), grease, grease, guns, grease cartridges, form release oil (if petroleum based), used oils, and used oil filters.

B. Prior to commencement of any on-site activities, the Contractor shall review and address the following:

1. Follow all applicable petroleum storage requirements and regulations, including those for underground, aboveground and mobile tanks. The location of all storage containers shall be clearly marked on the SWP3 as outlined in Section 01562, “Soil Erosion and Sediment Control”.

2. Spill Prevention Control and Countermeasures Plan:
   a. Contractor through its ECM shall prepare and submit a Spill Prevention Control and Countermeasures Plan (SPCC) if the total (cumulative of all contractors on project) on-site oil or oil product storage capacity is expected to meet or exceed 1,320 gallons at any time during the project. Contractor shall and all other contractors on site will be required to communicate in a weekly meeting to assess the on-site storage to determine if the SPCC has been triggered. All containers with a capacity of 55 gallons or greater will be included in determining on-site capacity including those of the Contractor and subcontractors.
   b. At a minimum, the Contractor’s SPCC shall conform to the requirements of 40 CFR, Part 112, Oil Pollution Prevention, as well as any laws or regulations imposed by state or local authorities.
   c. The on-site oil and oil product storage capacity shall be cumulative and include all containers introduced by the Contractor as well as all subcontractors. Containers will include tanks, drums, cartons, etc.
   d. The SPCC shall include the Contractor’s plan for containing a catastrophic spill from his largest on-site tank and/or the largest mobile tanker delivering oil products to the site.
   e. Underground storage should be avoided but if used, comply with applicable regulations and cover under SPCC.

3. Containers, drums, and storage tanks shall be clearly marked as required by the authority having jurisdiction. At a minimum, markings shall include the contents of the container, drum, tank and/or other storage device. Markings shall be legible and permanently attached to the outside of the container. There shall be no unmarked drums or containers (including trash containers) on the site.

4. Maintain an inventory of oil and oil containing products stored on-site.

5. Submit a list of oil and oil products to be used and stored on-site. All oil and oil products will be stored in appropriate containers. Used oil filters, grease cartridges, plastic oil containers, etc. will be disposed of promptly and in an appropriate manner. Appropriate disposal may include recycling.

6. Oil and oil product storage containers shall be placed within secondary containment structures. Each secondary containment structure shall be sufficiently sized to confine the contents of the largest container, drum, or tank stored within and shall be impervious so that any spilled product will be retained. Spilled and/or leaked products shall be promptly removed from containment structures. Secondary containment structures shall be configured or situated to prevent storm water from entering. Storm water entering any secondary containment structures shall be considered contaminated and shall be disposed of appropriately by the Contractor.

7. All containers, storage tanks, hoses, and piping shall conform to EPA, TCEQ, and/or local regulations, guidelines and codes.

8. SPCC shall be prepared under the direction of, and signed and sealed by a Professional Engineer licensed in the State of Texas.

1.5 HAZARDOUS WASTE, REGULATED MATERIALS, AND TOXIC SUBSTANCES

A. DART construction projects are subject to regulations promulgated by Federal, state, and local, regulatory agencies. Agencies include but are not limited to the Texas Commission on Environmental Quality (TCEQ), Texas Department of Health (TDH), U.S. Environmental Protection Agency (EPA), Occupational Safety and Health
ENVIRONMENTAL PROTECTION

Administration (OSHA), U.S. Department of Transportation (DOT), municipal fire departments and storm water management departments. Following is a summary of environmental regulations that may impact DART construction projects. This summary is not intended to be exhaustive; discovery of additional regulations that may apply are the responsibility of the Contractor.

1. Construction and Fire Prevention Resolution and Amendments to the Codes by the judicial authority.
2. Title 31, TAC Chapters 334, and 335.
4. TCEQ - Soil Remediation/Reuse/Treatment Levels. Adopted regulations 3/3/93, TAC Section 334.481-510
5. TSCA - Toxic Substances Control Act.
7. API Publication 2219, Safe Operating Guidelines for Vacuum Trucks in Petroleum Service, 1999
8. API Publication 1604, Closure of Underground Petroleum Storage Tanks, 1996
12. OSHA 40CFR1926, Training Requirements for the Construction Industry, applicable sections.

B. Contractor and all sub-contractors, working on Authority construction projects, shall comply with all existing applicable environmental laws and/or regulations promulgated and enforced by Federal, state and local agencies. This includes, but is not limited to, the storage, handling, transport, and disposal of all hazardous waste, regulated materials and/or toxic substances.

1. Hazardous Waste and Regulated Materials:
   a. Hazardous waste is a broad term used to denote industrial by-products and waste materials discarded from homes, commercial establishments, and industrial facilities that pose a risk to human health, safety, property, and/or the environment. Encountering heavy metals (arsenic, barium, cadmium, chromium, lead, mercury, selenium, and silver) defined under the Resource Conservation and Recovery Act of 1976 (RCRA) is the most common occurrence for DART construction projects.
   b. Regulated materials are usually thought of as those materials that may pose a risk but are not classified as hazardous. For DART construction projects, the discovery of total petroleum hydrocarbon (TPH) contaminated materials, associated with gasoline stations, is the most common occurrence.

2. Toxic Substances: The Toxic Substances Control ACT (TSCA) of 1976 provided EPA with authority to require testing of chemical substances, both new and old, entering the environment and to regulate them where necessary. The chemical substances addressed by TSCA, which are most commonly encountered during a DART construction project are asbestos or polychlorinated biphenyls (PCB’s).

C. HAZCOM: Contractor shall maintain all applicable Material Safety Data Sheets (MSDS), as required under Federal, state and local laws. MSDS(s) shall be kept current and made available for on-site review.

1.6 RESPONDING TO HAZARDOUS WASTE, REGULATED MATERIALS, AND TOXIC SUBSTANCES

A. Authority personnel (Manager, Environmental Compliance and Construction Engineering Manager) shall be notified immediately in the event the Contractor, during the course of work, encounters or suspects the presence of hazardous waste, regulated materials, toxic substances, and/or underground storage tank. Contractor shall not perform any work in the area of suspected contamination prior to receipt of special instruction from the Authority through the Contracting Officer. Any delay in the progress of the Work as a result of encountering hazardous or regulated materials, toxic substances, and/or underground storage tanks
1.7 CONTROL AND DISPOSAL OF EXCESS MATERIAL, TRASH, DEBRIS, AND EFFLUENT

A. Dispose of excess excavated material that is approved by the Contracting Officer as clean fill onsite if the Contracting Officer approves an onsite soil disposal area. If no such site is approved, dispose of the material in accordance with the provision of Paragraph 1.7.C. herein. Small amounts of material generated by excavation for fencing will be exempted from this provision. In all cases the provisions of Article 1.3 hereinbefore apply to the onsite disposal of excavated material.

B. Pick-up trash and place in containers. Develop a schedule for emptying containers regularly. Conduct handling and disposal to prevent contamination of the site and other areas. Do not dispose of any material or otherwise contaminate wetlands. On completion, leave the disposed areas clean.

C. Dispose of rubbish and debris as follows: Transport all waste off the site and dispose of in a manner that complies with State, and local requirements. Secure a permit or license, if required by the jurisdictional authority, prior to transporting any material off the site. Submit copies of approval documents from appropriate Authorities to the Contracting Officer prior to use of the disposal sites. Do not burn waste materials on the site.

D. Effluent: Contractor shall take all necessary measures to assure compliance with the requirements and intent of the TPDES Permit obtained for this Project and with the SWP3 developed for this Project.

E. Wash Down of Concrete Trucks: Wash down shall be performed only at locations designated by the ECM and in accordance with applicable laws and regulations. Indicate location on SWP3, as applicable.

1.8 CONTROL AND DISPOSAL OF CHEMICAL AND SANITARY WASTES

A. Dispose of sewage through authorized connections to municipal sanitary sewage systems. Where such systems are not available, use chemical toilets or comparably effective units with wastes regularly emptied. Include provisions for pest control and for masking or eliminating odors.

B. Store chemical waste in separate corrosion-resistant, properly labeled containers. Remove from the Project Site and dispose of as necessary, but not less frequently than monthly. Provide for disposal of chemical waste, including paint-related material, in accordance with TCEQ regulations, in addition to standard established practices as approved by the Contracting Officer. Conduct fueling and lubricating of equipment and motor vehicles on-site in a manner that affords the maximum protection against spills and evaporation. Dispose of lubricants, including used oil, in accordance with approved procedures meeting Federal, state and local regulations. Provide spill control materials in fueling and lubrication areas; and use them when needed. Immediately notify the Contracting Officer and the Authority’s personnel (as required in Paragraph 1.6. herein) of oil and hazardous material spills that may be large enough to violate state, and local regulations.

1.9 DUST CONTROL

A. Do not use oil or any other petroleum product to control dust.

B. Keep dust down at all times including non-working hours, weekends, and holidays. Treat soil at the site, haul roads, and other areas disturbed by the Contractor's operations as well as materials stockpiled for the project with dust suppressors or cover to control dust. Power brooming for dust control will not be permitted; use street vacuuming machines. Air blowing shall only be permitted for cleaning off non-particle debris, such as that from reinforcing bars. Sandblasting shall not be permitted except as specified elsewhere. Only wet cutting of concrete block, concrete, and asphalt will be permitted.

C. Secure and cover trailers and other transport equipment to prevent loose soil, debris and other materials from becoming airborne during transit.

D. Stabilized construction entrances shall be used to prevent offsite tracking of sediments and debris as shown in the SWP3 for the site. Design of the stabilized construction entrance shall prevent all washing effluent from leaving the site. The ECM shall monitor the washing of vehicles at the stabilized entrances to prevent tracking and to evaluate the quality of effluent leaving the construction site from washing of vehicles.

1.10 VEHICLE AND EQUIPMENT EMISSION LIMITATIONS

A. Contractor shall adhere to applicable requirements for vehicle and equipment emission limitations.

1.11 CONSTRUCTION NOISE AND VIBRATION CONTROL

A. Perform construction operations in a manner minimizing noise and vibration. Provide working machinery and equipment with efficient noise control equipment and implement noise and vibration control measures as provided in Paragraphs 1.10 and 1.11 herein.
suppression devices, and other noise and vibration abatement measures necessary for protection of both employees and the public. Schedule operations in a manner that will minimize the disturbance to the public in areas adjacent to the Work to the greatest extent feasible. Restrict working hours as required by municipal ordinances. Protect employees and the public against noise exposure in accordance with the requirements of the Occupational Safety and Health Act of 1970 and the current statutory noise limits set by OSHA. Comply with all other applicable Federal, state and local laws, regulations and ordinances.

B. Require the use of machines with effective mufflers or enclosures and the selection of quieter alternative procedures. Compliance may also require the use of complete enclosures (tongue-and-groove plywood or sheathing as specified in Section 01500) around the Worksites or a combination of closed boarding and effective mufflers and/or enclosures. Arrange haul routes to minimize noise and vibration at residential sites, and if necessary, place operating limitations on machines and trucks if suitable routes cannot be found. Submit shop drawings of the Worksites and haul routes showing provisions for the control of construction noise to the Contracting Officer for approval.

C. Monitor work operation noise and vibration levels to assure they comply with the noise and vibration limitations specified. Retain records of these noise and vibration measurements for inspection by the Contracting Officer. Inform the Contracting Officer of any complaints received from the public regarding noise and vibration. Propose the remedy and recommend if remedial action is required. If action is warranted, submit a proposed remedy and schedule to the Contracting Officer for approval prior to commencement of such actions.

D. Definitions:

1. Daytime/Nighttime: Daytime refers to the period from 7:00 a.m. to 9:00 p.m. local time, daily except Sundays and legal holidays, or as defined by the local jurisdictional agency, whichever is more restrictive. Nighttime refers to all other times, including all day on Sunday and all day on legal holidays.

2. Noise Level Restrictions at Affected Structures. Conduct construction activities so that the noise levels 200 feet from the construction limits or at the nearest affected building, whichever is closer, do not exceed the levels listed hereafter in Tables 01560 - 1 and 01560 - 2.

3. Continuous Noise. Prevent noises from stationary sources, parked mobile sources, or any combination of sources producing repetitive or long-term noise lasting more than one hour from exceeding the limits of Table 01560 - 1.

4. Intermittent Noise. Prevent noises from non-stationary mobile equipment operated by a driver or from any source of non-scheduled, intermittent, non-repetitive, short-term noises not lasting more than one hour from exceeding the limits of Table 01560 - 2.

5. More Than One Limit Applicable. Where more than one noise limit is applicable, the more restrictive requirement shall be used for determining compliance.

E. Noise Emission Restrictions: Use only equipment meeting the noise emission limits listed in Table 01560 - 3 as measured at a distance of 50 feet from the equipment. Take the measurements in accordance with the latest revisions of SAE J366b, SAE J88, and SAE J952b or in accordance with the measurement procedures specified.

F. Vibration Level Restrictions:

1. Vibration Limits in All Areas. Conduct construction activities so that vibration levels at a distance of 200 feet from the construction limits or at the nearest affected building (whichever is closer) do not exceed the root-mean-square (rms) vibration velocity levels of 0.1 inch per second in any direction over the frequency range of 1 to 100 Hz.

2. Special Zones. In zones designated by the local agency having jurisdiction as a special zone or special premise or special facilities, the vibration level and working time restrictions imposed by the agency shall apply.

G. Noise and Vibration Control: The control measures listed below may be utilized to minimize the noise and vibration levels in all areas outside the construction limits in order to meet the specified limitations:

1. Shields, impervious fences, or other physical sound barriers that inhibit transmission of noise.

2. Sound retardant housings and/or enclosures placed around noise producing equipment.

3. Intake and exhaust mufflers installed on internal combustion engines and compressors.

4. Lining or covering hoppers, storage bins and chutes with sound-deadening material.

5. Minimizing the use of air or gasoline driven saws.

6. Conducting truck loading, unloading, and hauling operations so that noise and vibration is kept to a minimum.
7. Planning the route used by construction equipment and vehicles carrying concrete, or other materials over streets that will cause the least disturbance to residents. Advise the Contracting Officer in writing of the proposed haul routes prior to securing a permit from the local government, in accordance with Section 01570, "Maintenance and Control of Traffic".

8. Subject to the approval by the Contracting Officer, placing stationary equipment to minimize noise and vibration impact to the community.

9. Using vibratory pile drivers or augering for setting piles rather than impact pile drivers wherever feasible. If impact pile drivers must be used, the hours shall be limited to 8:00 a.m. to 5:00 p.m. weekdays in residential and semi-residential/commercial areas.

1.12 BLASTING

A. Blasting is expressly prohibited.

PART 2 - PRODUCTS

Not Used

PART 3 - EXECUTION

Not Used

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 01001, "General Requirements".

TABLE 01560 - 3
CONSTRUCTION NOISE EMISSION LIMITS

| TYPE OF EQUIPMENT                              | MAXIMUM NOISE LIMIT | Date Equipment Acquired | |
|------------------------------------------------|----------------------|-------------------------|
| All equipment other than highway trucks; including hand tools and heavy equipment | 95 dBA 90 dBA       | Before 1-1-1986         |
| Highway trucks in any operating mode or location | 90 dBA 87 dBA       | Before 1-1-1988         |

Note: Peak levels due to impact pile drivers may exceed the above noise emission limits by 10dBA.
THIS PAGE INTENTIONALLY LEFT BLANK
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies soil erosion and sediment control measures and stabilization practices required during construction in order to minimize the levels of pollutants in storm water run-off from DART construction sites.

B. Soil erosion and sediment control measures are required under Texas law, specifically Section 26.040 of the Texas Water Code and Section 402 of the Clean Water Act. Under the provisions of these laws, the Texas Commission on Environmental Quality (TCEQ) has developed the Texas Pollutant Discharge Elimination System (TPDES) General Permit TXR150000, relating to discharges from construction sites located in the State of Texas. Throughout this section, the TPDES General Permit TXR150000 with effective date March 5, 2013, will be referred to as the Construction General Permit (CGP). In the event TCEQ issues an update or otherwise a new permit, the Contractor shall adhere to any and all provisions, including those that may conflict with this section.

C. This section also specifies Contractor's responsibilities under the TPDES CGP. These responsibilities include assuming operational control of the site (as defined in the CGP), updating and maintaining a Storm Water Pollution Prevention Plan (SWP3), performing inspections, submitting various notices, and providing qualified personnel to assure compliance with Federal, state and local environmental regulatory requirements.

D. Contractor shall also be responsible for furnishing, installing, maintaining throughout construction, and removing temporary measures and practices defined in the CGP as Best Management Practices (BMPs). BMPs include silt fences, stabilized construction entrances, ditch checks, storm sewer inlet protection and other structural controls, as required; as well as temporary and permanent seeding, mulching, sodding, and other stabilization methods.

E. Contractor shall also develop appropriate procedural controls that will facilitate compliance with the CGP and the SWP3. These may include BMP maintenance, trash removal, and employee training.

1.2 REFERENCED STANDARDS

A. American Association of State Highway and Transportation Officials (AASHTO),

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM A116 - Standard Specification for Metallic Coated, Steel Woven Wire Fence Fabric
2. ASTM A392 - Standard Specification for Zinc-Coated Steel Chain-Link Fence Fabric
3. ASTM A491 - Standard Specification for Aluminum-Coated Steel Chain-Link Fence Fabric
6. ASTM D3776 - Standard Test Methods for Mass Per Unit Area (Weight) of Fabric
7. ASTM D3786 - Standard Test Method for Hydraulic Bursting Strength of Textile Fabrics- Diaphragm Bursting Strength Tester Method
8. ASTM D4355 - Standard Test Method for Deterioration of Geotextiles by Exposure to Light, Moisture and Heat in a Xenon Arc Type Apparatus
9. AASTM D4491 - Standard Test Methods for Water Permeability of Geotextiles by Permittivity
14. ASTM D4873 - Standard Guide for Identification, Storage, and Handling of Geosynthetic Rolls and Samples

D. Texas Department of Transportation (TxDOT): "Storm Water Management Guidelines for Construction Activities"

1.3 DEFINITIONS

A. The Definitions found in Part I of the CGP are included by reference and shall apply to this Section.

B. Jurisdictional Entities, as used herein, is defined as the US Environmental Protection Agency (USEPA), TCEQ, U.S Army Corps of Engineers (USACE), as well as the operators of the Municipal Separate Storm Sewer Systems (MS4) receiving discharge from the construction site. (The MS4 operator is usually the city in which the construction activities are occurring, however, it may also be another government entity, such as the Texas Department of Transportation or North Texas Tollway Authority.) This definition shall also include any other entity having legal jurisdiction or ownership over the project or any portion of thereof.

C. Construction Site Notice (CSN) shall be defined as the on-site contact information sheet required by the CGP. The CSN shall include all information required to be posted in public view. Contractor shall strictly adhere to placement requirements as specified in the CGP.

1.4 PERFORMANCE REQUIREMENTS (PERMIT APPLICABILITY AND COVERAGE)

A. Contractor shall be considered the “Primary Operator”. As Primary Operator, Contractor shall fulfill all requirements of the CGP as well as any other applicable laws, regulations, or ordinances.

B. Compliance with Storm Water Permitting Regulations:

1. Contractor shall comply with all requirements of the CGP in addition to other requirements stated elsewhere in this Specification as well as Specification 01560, "Environmental Protection".

2. Under this permit, TCEQ requires the development and implementation of an SWP3, including erosion and sediment controls, storm water management measures, other site controls and housekeeping BMPs, and prevention of prohibited discharges to storm water.

3. Contractor shall meet with all appropriate Jurisdictional Entities prior to commencing any onsite work activities. Jurisdictional Entities, in this case, shall include the operator(s) of the Municipal Separate Storm Sewer System (MS4) where the construction activity will occur. Contractor shall document this (these) meeting(s) and submit this documentation to the Contracting Officer’s Representative.

4. Jurisdictional Entities may impose additional storm water pollution prevention requirements under the provisions of their local ordinances or MS4 permit.

C. Notices of Intent (NOI), Notices of Termination (NOT), Notices of Change (NOC) Letters and CSNs shall be signed in accordance with 30 TAC (Texas Administrative Code), §305.44 (relating to Application for Permit).

D. Environmental Compliance Manager: Prior to commencing construction activities, the Contractor shall propose a qualified Environmental Compliance Manager (ECM) and receive concurrence from the Authority. The ECM shall be formally delegated the responsibility for assuring compliance with the CGP, the SWP3, as well as all other environmental requirements imposed by applicable Jurisdictional Entities.

1. The delegated ECM shall have acquired, through a combination of education, training, and experience, the knowledge necessary to ensure that the Contractor’s activities on the project site meet environmental regulatory requirements, as described in this Section, Section 01560, "Environmental Protection", as well as any other requirements imposed by applicable Jurisdictional Entities. Minimum qualifications for the ECM shall include familiarity, knowledge, and an understanding of:

a. Environmental construction issues, including the NPDES and/or TPDES storm water discharge permitting regulations (preferably the most current CGP),
b. Spill response and reporting requirements necessary to protect human health and the environment, which shall include regulatory deadlines for making notification to the applicable Jurisdictional Entities. (Contractor shall be fully responsible for completing all required notification requirements within the timeframes dictated by each applicable Jurisdictional Entity).

c. Applicable regulations and requirements governing product containers, storage, and disposal, as well as chemical and product management, including documentation requirements and applicability of product use.

d. The ECM shall have obtained competency recognition via college degree, certification, registration, and/or licensing from a recognized professional or technical association, state agency, or other Jurisdictional Entity. The ECM shall also have acquired the regulatory knowledge and field experience necessary to understand and ensure compliance with the requirements of applicable Jurisdictional Entities, particularly during environmental emergencies.

e. The ECM can be a direct employee of the Contractor or a third party environmental professional or qualified technician employed by a third party environmental consultant. In either case, the ECM shall only perform duties directly related to environmental compliance, be at the job site full time, and be delegated the comprehensive authority necessary to enforce the Contractor's compliance with the applicable Federal, state and local environmental laws, regulations and ordinances. Delegation shall be from, and the ECM shall report directly to, the Contractor's executive officer who signed the Authority's Contract, the CSN, and when applicable, the NOI. In no case shall the ECM be subordinate to the Contractor's superintendent or project manager. The ECM shall have full authority to stop work on the project in order to prevent or correct non-compliance with the CGP or other environmental regulations. The ECM shall only perform duties associated with ensuring environmental compliance for this project.

2. The duties of the ECM, relative to the CGP, shall be as follows:

a. Oversee the installation of storm water pollution prevention devices and BMPs to assure that they are installed as depicted in the SWP3, accompanying detail drawings, the recommendations of the manufacturer, or Jurisdictional Entity.

b. Supervise the repair and maintenance of temporary and permanent BMPs.

c. Prepare SWP3 modifications when BMPs either prove ineffective or are no longer necessary due to changed site conditions, or changes to the progress or sequence of construction.

d. Assure that field modifications to the baseline SWP3 are depicted on, and incorporated into, the updated SWP3 maintained on the project site.

e. Make annotations to the SWP3 denoting devices or controls that are temporarily removed to facilitate construction. These annotations shall explicitly state why the specific BMPs was removed and when it will be reinstalled.

f. Develop site inspection reports summarizing each inspection. A copy of the inspection results, including a list of all deficiencies, shall be provided to the Contracting Officer’s Representative at the close of the inspection. A formal written report shall be transmitted as soon as it is prepared, but no later than 7 days following the inspection. The formal report shall detail the actions taken to correct each deficiency as well as include photographic documentation noting BMP repair and maintenance. Minimum report content shall include the name(s) and qualifications of personnel making the inspection, the date of the inspection, and major observations relating to the implementation of the SWP3. Major observations shall include:

1) The locations of discharges of sediment or other pollutants from the site;

2) Locations of all BMPs;

3) Locations of BMPs that require maintenance, failed to operate as designed, or proved inadequate for a particular location;
4) Locations where additional BMPs are needed.

a. Prepare a formal written report including actions taken as a result of inspections, which shall be described within, and retained as a part of, the SWP3. Reports shall identify any incidents of non-compliance. Where a report does not identify any incidents of non-compliance, the report shall contain a certification that the site is in compliance with the SWP3 and the CGP. The report shall be signed in the manner required by 30 TAC §305.128.

3. The ECM shall also perform the duties specified in Section 01560, “Environmental Protection”.

E. Contractor shall conform to the requirements stipulated within the CGP and mandated by the Jurisdictional Entities and shall be solely responsible for responding to any citations, paying any fines, or otherwise addressing any written notices of non-compliance with the CGP as may be issued by TCEQ, EPA, or other Jurisdictional Entities.

F. Projects equal or greater than 5 acres or part of a larger common plan of development that is equal or greater than 5 acres shall be considered “Large Construction Activity”, as defined in the CGP, and shall comply with all CGP requirements, including:

1. NOI: As site operator, the Contractor (or subcontractor if subcontractor has operational control of site or portion of site) shall complete and submit an NOI and associated fees to TCEQ and all applicable Jurisdictional Entities. NOIs shall be submitted within the timeframes identified within the CGP. A copy of the NOI shall be included in the SWP3 documents maintained for the project. Contractor shall post the NOI for public information per CGP.

2. CSN: As site operator, the Contractor (or subcontractor if subcontractor has operational control of site or portion of site) shall complete and submit a CSN to the Jurisdictional Entities no later than 10 business days prior to the commencement of any on-site soil distributing activities, or as otherwise required by the CGP. A copy of the CSN shall be included in the SWP3 documents maintained for the project. Contractor shall post the CSN for public information per CGP.

3. Contractor shall be responsible for all subcontractors and ensure their compliance with the CGP and SWP3. Contractor shall determine if a subcontractor will meet the definition of “Operator” within the CGP. Subcontractors determined by the Contractor to be Operators shall comply with all Operator requirements stipulated in the CGP as well as those imposed by applicable Jurisdictional Entities.

4. Contractor shall be responsible for paying all permitting fees associated with its TPDES permit. Payment shall be made in a manner considered timely by the TCEQ. In the event a subcontractor files an NOI, the Contractor shall be responsible for assuring payment of fees by the subcontractor.

5. Contractor shall be responsible for posting and maintaining all notices and documents required by the CGP as well as applicable Jurisdictional Entities. Contractor shall also obtain a copy of DART’s Secondary Operator CSN from the Contracting Officer’s Representative and shall be responsible for posting and maintaining it as required by the CGP.

6. Prior to being granted "Substantial Completion of the project", the Contractor shall request through the Contracting Officer’s Representative a field inspection from DART’s Environmental Compliance Section (ECS). This inspection will determine if minimum stabilization requirements established by TCEQ and applicable Jurisdictional Entities have been met. Contractor shall furnish a copy of the final updated SWP3 at the beginning of the inspection. This final SWP3 shall note any BMPs that the Contractor proposes to leave in place. A punch list shall be developed during the inspection. "Substantial Completion" shall not be granted until after all items on the list have been addressed and written approval from ECS is received.

7. NOT: Upon receipt of written approval from ECS, the Contractor shall submit an NOT for its portion of the project to TCEQ and all applicable Jurisdictional Entities. A copy of the NOT shall be included in the SWP3 documents maintained for the project.

8. Contractor shall be responsible for ensuring submission of NOTs by subcontractors, as applicable. In no case shall the Contractor submit its NOT prior to that of all subcontractors.

G. Projects equal to 1 acre but less than 5 acres shall be considered "Small Construction Activity", as
defined in the CGP, and shall comply with all CGP requirements, including:

1. CSN: As site operator, the Contractor (or subcontractor if subcontractor has operational control of site or portion of site) shall complete and submit a CSN to the Jurisdictional Entities no later than 10 business days prior to the commencement of any on-site soil distributing activities, or as otherwise required by the CGP. A copy of the CSN shall be included in the SWP3 documents maintained for the project. Contractor shall post the CSN for public information per CGP.

2. Contractor shall be responsible for all subcontractors and ensure their compliance with the CGP and SWP3. Contractor shall determine if a subcontractor will meet the definition of "Operator" within the CGP. Subcontractors determined by the Contractor to be Operators shall comply with the CGP.

3. Contractor shall be responsible for posting and maintaining all notices and documents required by the CGP as well as applicable Jurisdictional Entities. Contractor shall also obtain a copy of DART’s Secondary Operator CSN from the Contracting Officer’s Representative and shall be responsible for posting and maintaining it as required by the CGP.

4. Prior to being granted “Substantial Completion of the project”, the Contractor shall request through the Contracting Officer’s Representative a field inspection from ECS. This inspection will determine if minimum stabilization requirements established by TCEQ and applicable Jurisdictional Entities have been met. Contractor shall furnish a copy of the final updated SWP3 at the beginning of the inspection. This final SWP3 shall note any BMPs that the Contractor proposes to leave in place. A punch list shall be developed during the inspection. “Substantial Completion” shall not be granted until after all items on the list have been addressed and written approval from ECS is received.

5. Site Termination: Upon receipt of written approval from ECS, the Contractor shall comply with CGP and complete the applicable portion of the CSN and submit a copy to Jurisdictional Entities within 30 days after the completion of the project. A copy of the completed CSN shall be included in the SWP3 documents maintained for the project.

6. Contractor shall be responsible for ensuring submission of the complete CSN by subcontractors, as applicable. In no case shall the Contractor submit its completed CSN prior to that of all subcontractors.

H. TCEQ Website: Additional information relating to the CGP, forms, and general information on storm water permitting requirements may be obtained from the TCEQ, either directly or from their website.

1.5 STORM WATER POLLUTION PREVENTION PLAN

A. The Authority has prepared a “Baseline” SWP3 for this project that meets the requirements of the CGP; the Municipal Storm Water Discharge Permit issued to the Jurisdictional Entity; and other local codes, standards and regulations.

B. Contractor shall prepare an “Erosion Control Plan” based on its intended sequence of construction activities as well as the storm water BMPs it proposes to use.

C. Contractor shall update and certify the SWP3 before performing any soil disturbing activities at the project site or delivering materials to its material storage areas. The updated SWP3 shall incorporate the Baseline SWP3, the Contractor’s Erosion Control Plan, related provisions of the Contract Documents, the CGP, NOI, CSN, and any additional items required by the CGP and/or applicable Jurisdictional Entities. Refer to Paragraph 1.5.I “SWP3 Modifications” herein for additional provisions.

D. Contractor shall install all BMPs per manufacturer’s specifications or the recommendations of an appropriate technical or Jurisdictional Entity. In no case shall soil disturbing activities take place prior to installation of BMPs.

E. In the event that a BMP proves ineffective in meeting the requirements or intent of the CGP, the Contractor shall propose and install alternate BMPs that will protect the quality of storm water being discharged from the site.

F. The location and installation dates of each BMP shall be recorded in the SWP3 by the Contractor’s ECM. BMPs shall be maintained throughout the construction process until project completion, or as otherwise directed by the Contractor’s ECM, an authorized Jurisdictional Entity, the CGP, the SWP3, or the Contracting Officer’s Representative.

G. Contractor’s ECM shall record and date annotations to the SWP3 denoting devices or controls that are temporarily removed to facilitate construction. These annotations shall explicitly state why the specific device or control was removed, when it was removed, and when it will be reinstalled.

H. Contractor shall be responsible for keeping the SWP3 current at all times, as required by the CGP. The information listed below shall be incorporated by the Contractor into the Baseline SWP3. Updates to the
SWP3 shall be documented within 7 days and shall be dated.

1. In addition to the detailed Erosion Control Plan site map or maps required by the CGP, site map(s) shall be annotated and shall include the following additional information:

a. Areas subject to clearing and grubbing, grading, excavation, and utility and infrastructure installation;

b. Locations for stockpiles of topsoil, fill soils, sands, aggregates and other similar construction materials;

c. Construction staging areas, office trailer locations, haul roads, and vehicle and construction equipment parking areas;

d. Locations for equipment repair and maintenance;

e. Storage areas for hazardous and regulated materials;

f. Storage areas for miscellaneous construction or waste materials;

g. The location of concrete batch plants as well as all specific BMPs installed to address runoff from these areas;

h. Locations of solid waste dumpsters and portable toilets for sanitary waste;

i. Areas where major construction activities have ceased (either temporarily or permanently, as identified in the CGP) and site stabilization practices are underway;

j. Off-site locations of material, waste, borrow, fill, or equipment storage areas shall also include including estimates of the total area of such sites;

k. Any additional items required by the CGP, Jurisdictional Entities, or as directed by the Contracting Officer’s Representative.

2. A construction sequencing plan or schedule exhibiting relevant dates for major grading, excavation and construction activities, the temporary or permanent cessation of these activities, and for the initiation of interim or permanent site stabilization practices. This plan or schedule shall be updated as necessary to reflect overall progress at the site and may reference the Construction Schedule specified in Section 01320, “Construction Schedule and Progress Reports” or 01321, “Construction Schedule and Progress Reports for Small Projects” as applicable.

3. A description of any construction or waste materials stored on-site or within 1 mile of the project site. If any hazardous and regulated materials, toxic substances, or other chemicals are stored on-site, the Contractor shall update the SWP3 to include proper storage, handling, and disposal procedures and show locations on site map. If the quantity or means of storage of oil and oil-products on site triggers the requirements for a Spill Prevention Control and Countermeasures Plan (SPCC), the Contractor shall provide a written SPCC that meets the requirements of the USEPA. Said SPCC shall be signed and stamped by a Professional Engineer licensed in the State of Texas. Refer to Section 01560, “Environmental Protection”, for detailed SPCC requirements including when an SPCC is required.

4. A description of any other potential pollutant sources not identified in the Baseline SWP3.

I. SWP3 Modifications: Contractor is responsible for determining means and methods of construction. Modification of BMPs shown within the Baseline SWP3, whether to facilitate construction or to conduct operations differently than were assumed during design and/or project planning, shall be consistent with the intent of the CGP as well as good engineering principles and practices. Contractor movement, relocation, or substitution of any BMP shown within the plans shall meet the requirements of this section, the Authority’s Standard Erosion and Sediment Control Detail Drawings, and applicable codes and regulations. Any change or substitution shall be noted on the SWP3 by the Contractor within 7 days after it has been implemented. Substitute BMPs that follow the following standards and guidelines may be acceptable:

2. TxDOT - Storm Water Management Guidelines for Construction Activities.

J. Each modification to the baseline SWP3 shall be signed and certified by the Contractor as required by 30 TAC § 305.44. The signed certification shall be retained as part of the SWP3 documentation.
K. Contractor shall maintain all BMPs identified in the SWP3 in effective operating condition. A schedule for maintaining BMPs conforming to the CGP shall be developed by the Contractor and incorporated into the SWP3. BMPs that are not functioning properly shall receive maintenance before the next anticipated storm event or as otherwise required under the CGP. Contractor shall document all maintenance, repairs, and their respective dates in the SWP3.

L. Contractor shall immediately address any deficiencies in implementation and adherence to the provisions of the SWP3 as determined during regular site inspections. In addition, any storm related damage to any BMPs (either temporary soil erosion and sediment control measures or permanent storm water management devices) shall be repaired as soon as is practicable, but not longer than 7 days following the date of the storm which caused said damage. Contractor shall implement alternative temporary soil erosion and sediment control measures when a particular control measure has failed repeatedly or completely as determined by the ECM. Any damage caused by construction operations or equipment shall be repaired immediately. Contractor shall also document damage repairs in maintenance logs that accompany inspection reports.

M. The Authority's development of the Baseline SWP3 and periodic audit of the Contractor's overall compliance shall not in any way relieve the Contractor of the responsibility to comply with the terms and conditions of the CGP and other applicable codes and regulations, including all notification and record keeping requirements.

N. When construction requires other contractors to work within the site or to take over portions of the site prior to completion of the contract, the Contractor shall cooperate with each contractor through the Contracting Officer's Representative(s) to coordinate overall storm water pollution prevention. The SWP3 shall be modified to recognize the areas of responsibility for each contractor, based on their work location and type. In addition, the contractors shall draw up and sign a Memorandum of Agreement formalizing their acceptance of responsibility for their respective portions of the site. Contractor shall continue to have operational control of its portion of the site and conform to CGP requirements.

1.6 SUBMITTALS

A. Regulatory Compliance Documentation: Submit the following documentation:

1. A copy of the completed and executed NOI filed with the TCEQ and the Jurisdictional Entities.
2. A copy of the proposed CSN.
3. Copies of any other documentation the Contractor is required to submit to the applicable Jurisdictional Entity(ies) for Municipal Storm Water Discharge Permit compliance, or to meet the requirements of local erosion and sediment control, storm water management or land development codes, ordinances and regulations.
4. Copy of Contractor's SWP3 Certifications.
5. Copies of the pre-construction inspection report and pre-construction photographs.
6. Copies of all inspection reports and deficiencies noted in SWP3. Each submitted inspection report shall also not those steps taken to correct the deficiencies.
7. A copy of the final SWP3 for the project, which has been updated and revised to reflect the site stabilization verification inspection.
8. A copy of the completed and executed CSN filed with the Jurisdictional Entity (ies) upon completion of the project.
9. A copy of the completed and executed NOT filed with TCEQ the Jurisdictional Entity (ies).
10. Copies of the information listed herein shall also be included as part of the SWP3 documents maintained for the project.
11. Documentation of all meetings between the Contractor and Jurisdictional Entities. Meeting documentation shall include signed attendance sheets.

B. SWP3 and Personnel Qualifications: These submittals shall be made to the ECS through the Contracting Officer's Representative.

1. Contractor shall submit prior to the Pre-Construction Conference, a copy of this section of the specifications and of the Standard Drawings showing which temporary soil erosion and sediment control products and structural control measures (BMPs) will be applied to the work. Non-applicable products and measures shall be crossed out.
2. Contractor's initial update of SWP3 and any subsequent on-going modifications.
3. The credentials of the ECM proposed by the Contractor as being responsible for CGP and SWP3 compliance. Submittal shall include a letter delegating appropriate authority to the ECM. Upon
approval of the ECM, this letter shall be filed with the applicable Jurisdictional Entities.

4. The credentials of the environmental inspector(s) and/or third party environmental or engineering subcontractor designated by the Contractor to perform site inspections. Submittal shall include a letter delegating appropriate authority to the inspectors and/or subcontractor. Upon approval of the inspectors and/or subcontractor, this letter shall be filed with the applicable Jurisdictional Entities.

5. The proposed NOI or CSN at least 14 working days prior to commencement of site work. Contractor shall not submit NOI to TCEQ, or CSN to the Jurisdictional Entities, prior to receipt of review comments from the Contracting Officer’s Representative.

C. Product Data and Test Reports:

1. Product Data: Submit copies of manufacturer’s specifications and installation instructions or catalog information (“catalog cuts”) for products furnished under this section. Submit product samples if requested.

2. Test Reports: Materials testing laboratory test reports exhibiting gradation and other appropriate physical and chemical properties as specified herein for stone, rock, and gravel filter material for used in stabilized construction entrances, rock berms, stone ditch checks, or as part of storm sewer inlet protection measures.

1.7 QUALITY ASSURANCE

A. Comply with the appropriate codes and regulations promulgated by regulatory agencies, including the EPA, the TCEQ, Texas Department of State Health Services (DSHS), MS4, and all other applicable Jurisdictional Entities.

PART 2 - PRODUCTS

2.1 SILT FENCE

A. Geotextile Filter Fabric:

1. In accordance with AASHTO M288, the following requirements shall apply:

   a. Geotextile filter fabric weighing approximately 0.02 to 0.05 pounds per square foot.

   b. Fabric: Shall consist of long-chain synthetic polymers composed of at least 95 percent by weight of polyolefins or polyesters.

   c. Filter fabric shall be formed into a stable network such that the filaments or yarns retain their dimensional stability relative to each other, including selvages.

   d. Fabric edges shall be selvaged.

   e. Physical properties: All property values listed below shall be minimum average roll values in the weakest principle direction (or cross direction, as indicated) except for grab tensile elongation and apparent opening size. Grab tensile elongation and apparent opening size shall be maximum average roll values as per Table 01562 - 1.

2. Labeling, shipment and storage: In accordance with ASTM D4873, including the following:

   a. Each roll of filter fabric shall include a product label clearly showing the name of the manufacturer or supplier, the product and style name, the roll number, and shall state that the geotextile is in accordance with the manufacturer’s certification.

   b. Each roll of filter fabric shall be wrapped with a material to protect the geotextile from damage due to shipment, water, sunlight, and contaminants. The integrity of the protective wrapping shall be maintained during periods of shipment and storage.

   c. During storage, rolls of filter fabric shall be elevated off the surface of the ground and adequately covered to further protect them from site construction damage; precipitation; extended exposure to ultraviolet radiation; chemicals, including strong acids or bases; flames, including welding sparks; temperatures in excess of 160 degrees F.; and any other potentially damaging physical or environmental conditions.

B. Wire Backing Support:

1. Woven Wire Mesh:

   a. Mesh Size: 4x4 - W1.4 x W1.4 minimum.

   b. Wire Size: 14 gauge minimum.

   c. Coated in accordance with ASTM A116, Class 3.

2. Chain Link Fence Fabric:

   a. Wire Size: 9 gauge minimum.
b. Coated in accordance with ASTM A392, Class 2 or ASTM A 491.

3. Hog Wire:
   a. Opening Size: 6 inches x 6 inches.
   b. Galvanized in accordance with ASTM A641.

C. Posts:
   1. Steel, T-section or L-section.
      a. Length: 4 feet minimum.
      b. Weight: 1.3 pounds per linear foot minimum.
      c. Fabricated with ground anchor plate and lugs or projections for fastening wire backing support.
      d. Factory painted with rust resistant primer and finish coat, or galvanized in accordance with ASTM A641.
   2. Wood:
      a. Length: 4 feet minimum.
      b. Diameter: 3 inches minimum or nominal cross-section of 2 inches by 4 inches for pine, 2 inches by 2 inches for hardwoods.

D. Fasteners:
   1. For attachment of wire backing support to posts:
      a. Steel Posts: T-clips or ring wire fasteners, galvanized in accordance with ASTM A641.
      b. Wood Posts: Staples with a minimum 3/4 inch wide crown and 1/2 inch long legs, galvanized as above.
      c. Tie-wire may be used with either steel or wooden posts.
   2. For attachment of geotextile filter fabric to wire backing support:
      a. Fabric ties recommended by geotextile fabric manufacturer.
      b. Hog rings, galvanized in accordance with ASTM A641.
      c. Nylon cord may be used to attach filter fabric to top of wire backing.

2.2 STABILIZED CONSTRUCTION ENTRANCE

B. Crushed Stone or Rock:
   1. Hard, clean, stone. Concrete rubble may be used provided it is free of reinforcing materials.
   2. Diameter: 3 to 5 inches, gradation per ASTM C136.

C. Wash Rack (optional): If required, see Reference No. 4 (TxDOT) in Paragraph 1.2B. for specified materials.

2.3 ROCK BERM

A. Rock: Shall meet requirements stated in Paragraph 2.2B. above with the following additions and exceptions:
   1. Angularity: Maximum length to width ratio of 3:1.
   2. Diameter: 4 to 8 inches if rock berm is to be placed in a flowing streambed. 3 to 5 inches for all other locations.

B. Woven Wire Sheathing:
   1. Wire Size: 20 gauge minimum.
   2. Opening Size: 1 inch maximum.
   3. Galvanized in accordance with ASTM A641. PVC coating also allowable upon

2.4 STONE DITCH CHECK

A. Well-graded crushed Stone, Rock or Recycled Material:
   1. Clean, hard, crushed stone or rock.
   2. Recycled, crushed concrete rubble may be used only if free of reinforcing steel, debris, cement fines, and other substances that may contribute to storm water pollution.
   3. Stone, Rock or Recycled Concrete: Diameter shall range from 1-1/2 inches through a maximum in inches equal to three times the width of the drainage channel bottom in feet.
   4. Diameter: 2 inches by 2 inches minimum for hardwood. Larger cross-sectional dimensions required if pine is used.
2.5 PIPE INLET PROTECTION

A. Crushed Stone, Rock or Recycled Material:
   1. Clean, hard, crushed stone or rock.
   2. Recycled, crushed concrete rubble may be used only if free of reinforcing steel, debris, cement fines and other substances that could contribute to storm water pollution.
   3. Stone Riprap: Diameter shall be nominal 6 inches.
   4. Filter Stone: Diameter shall be 1-1/2 or 2 inches.

2.6 INLET PROTECTION

A. Provide inlet protection in accordance with NCTCOG - "Storm Water Quality Best Management Practices for Construction Activities". Four variations of applications for inlet protection are listed including Filter Barrier Protection, Block and Gravel Protection, Wire Mesh and Gravel Protection, and Excavated Impoundment Protection shown on S-4 in Specification Section M, with Detail ID 2120-2150. Inlet protection improperly used on a slope will cause inlet to be bypassed, forcing flows to continue the slope, and overloading inlets below. Provide protection inlets on slopes by means shown in SWP3; typically provide BMPs upstream of inlets.

2.7 EROSION CONTROL MATTING

A. Jute Mats:
   1. Jute mats shall be composed of a woven jute yarn, free of any dyes.
   2. Unit weight: Minimum 2.7 pounds per square yard per ASTM D3776.

B. Fiber Mats:
   1. Fiber mats shall be composed of wood or coconut husk (coir) fibers and may be encased in netting made of nylon, cotton, or other suitable materials.
   2. Unit weight: Minimum 1.2 pounds per square yard per ASTM D3776.
   3. Tensile strength: Minimum 40 pounds per ASTM D4632.
   4. Elongation: Maximum 35 percent per ASTM D4632.

C. Synthetic Mats:
   1. Synthetic mats shall be made of non-woven polyvinyl chloride or polypropylene monofilaments that are bonded together into a three-dimensional web-like material designed to serve as an erosion control and revegetation mat.
   2. Porosity: Minimum 85 percent.
   3. Unit weight: Minimum 11 ounces per square yard per ASTM D3776.
   4. Tensile strength: Minimum 25 pounds in all directions, as measured by ASTM D5735.

D. Staples: For use in anchoring down matting material.
   1. Size: Minimum 10 gauge wire.
   2. Length: 6 to 10 inches.
   3. Shall be galvanized or zinc coated to inhibit corrosion.

2.8 TEMPORARY SEEDING

Temporary Seed Mix: Avena spp (oats) at 20 lbs./acre (no mulch required) or as otherwise specified within the Project Technical Specifications.

PART 3 - EXECUTION

3.1 PRE-CONSTRUCTION INSPECTION

A. Prior to the commencement of any on-site activities, the Contractor shall schedule and conduct a pre-construction inspection.

B. In conjunction with the Contracting Officer’s Representative and the Authority’s Environmental Compliance Section, conduct a pre-construction inspection of existing facilities, structures, and environmentally sensitive areas in the vicinity of the Worksite. This inspection shall document the pre-construction condition of vegetation, streets, creeks, storm drainage, etc, that may be affected by the project. Document the inspection with photographs, sketches, and narratives and assemble into a pre-construction inspection report. Photographic documentation shall include vegetation densities. Photographs shall comply with Section 01345, “Construction Photographs”.

C. The pre-construction inspection shall include the MS4 located within and adjacent to the Worksite. Note: The purpose of this inspection is to
document pre-existing drainage issues/problems that could later result in a fine or penalty being awarded by the Jurisdictional Entity. Contractor shall note the following:

1. Storm drains, culverts, swales and other components of the MS4 shall be inspected to verify that they are free of floatable trash, silt, debris, and functioning as originally intended.

2. Storm drains or culverts that do not function or appear not to function as originally intended.

4. The presence of construction on adjacent, up-gradient, or down-gradient properties. If construction on other properties is noted, the Contractor shall photographically document the general condition of these properties and their compliance with storm water regulations.

5. Pre-existing off-site tracking from the Worksite or surrounding properties.

6. Potential pre-existing contamination (i.e. any areas of soil discoloration or distressed vegetation).

7. Any other pre-existing condition that, by its nature, could be construed as a violation of the CGP.

3.2 BMPs (STRUCTURAL CONTROL MEASURES)

A. Examine the site conditions in areas where soil erosion and sediment structural control measures are to be installed. BMPs, as defined in the SWP3, shall be implemented prior to the commencement of any soil disturbing activity. Correct unsatisfactory site conditions as necessary to install BMPs.

B. The CGP requires sediment basins at common drainage locations, where feasible, serving areas with 10 or more acres disturbed at one time within a common drainage basin. Contractor shall install sediment basins as required by the CGP or note site conditions that make basin construction infeasible.

C. The installation of stabilized construction entrances may require minor grading and site preparation. If a wash rack is also required, it shall be installed in accordance with the provisions stated in TxDOT Storm Water Management Guidelines for Construction Activities.

D. Manufactured erosion and sediment control products such as straw wattles, check dams, and a variety of storm sewer inlet protection devices, are now commercially available. In the event Contractor chooses an “off-the-shelf” product, it shall be responsible for ensuring that it adequately protects the quality of storm water discharged from the site.

E. Inlet protection devices shall incorporate an overflow weir in their design and installation. Note: Erosion bales (straw or hay bales) shall not be used as a structural control measure for inlet protection.

3.3 STABILIZATION PRACTICES

A. Undertake temporary or permanent stabilization practices in order to maintain cover over site soils or to establish cover as soon as practicable in disturbed areas. In meeting this requirement, the Contractor shall minimize the amount of existing vegetated area that is disturbed or denuded, especially those areas outside the immediate zone of construction activity. Prior to its disturbance, the Contractor shall document existing vegetation cover through photography or video.

B. Complete stabilization practices, including temporary or permanent seeding, mulching, hydro-mulching, sodding, and other practices shown in the SWP3 or otherwise on the plans, as stated in Section 02931, “Seeding and Sodding - Non-Irrigated Areas”. Seed/grass shall be watered as necessary for germination.

C. As required under the CGP, erosion control and stabilization measures shall be initiated immediately in portions of the site where construction activities have temporarily ceased and will not resume for a period exceeding 14 calendar days. Stabilization measures that provide a protective cover shall be initiated immediately in portions of the site where construction activities have permanently ceased. TCEQ defines “immediately” to be “… as soon as practicable, but no later than the end of the next work day, following the day when the earth-disturbing activities temporarily or permanently ceased.” Stabilization measures shall be completed within the timeframe required by the CGP.

D. Close-out and final acceptance: Close-out of the project shall not be accepted by the Authority until the requirements of the CGP and applicable Jurisdictional Entities have been fulfilled.

3.4 PROTECTION AND MAINTENANCE

A. In addition to the specific protection and procedures stated or referenced in the Baseline SWP3, the following provisions shall apply:

1. Contractor shall only allow those off-site discharges specifically identified in the CGP.
2. Once installed, BMPs shall be repaired or replaced at the expense of the Contractor and shall function as necessary to protect the quality of storm water discharged from the site.

3. Locations on the site adjacent to surface waterways, wetlands, or other environmentally sensitive areas, or off-site areas subject to vehicle tracking of sediments, shall receive the highest maintenance priority, followed by the protection of drainageways and storm sewer inlets and outfalls.

4. Stockpiles used for the temporary storage of topsoil, fill soil, rock, or related construction materials shall be protected by perimeter BMPs and/or covered to prevent exposure to storm water. Temporary seeding of stockpiles may also be acceptable. Stockpiles include materials located off-site which may be maintained for the project. Excess spoil and other materials shall be promptly removed from the site.

5. Fugitive dust, including dust generated from soil stabilization operations or vehicle tracking, shall be controlled at all times by using water or special purpose products commercially manufactured for this use. If water is used to control dust generation, any excess or runoff must first be routed to a sediment trapping device before being allowed to leave the site. See Section 01560, "Environmental Protection" for more information on dust control requirements.

6. Contractor shall implement appropriate BMPs as necessary to minimize off-site tracking of soil, sediment, and debris. BMPs may include construction entrance stabilization measures, frequent adjacent street cleaning, and vehicle and equipment wash rack areas. Additional or alternate BMPs may be necessary to control the generation of fugitive dust related to off-site tracking. Contractor is responsible for clean up of any eroded or tracked sediment from streets, storm sewers and adjacent properties at no expense to the Authority.

7. Construction staging areas, haul roads, jobsite office trailer locations, and vehicle and equipment parking areas that have more than 25 vehicle trips per day shall be graveled, as well as monitored for vehicle tracking and fugitive dust generation.

8. During project construction, Contractor shall clean out, remove, and properly disposal of any sediment deposits or debris which may accumulate in the storm sewer inlets, manholes or in other areas of the site storm sewer system up to the point of system outfall or connection with the MS4.

3.5 INSPECTION REQUIREMENTS

A. Contractor shall conduct inspections at least once every 7 days. The inspection shall occur on a specifically defined day. Contractor shall comply with any revision in inspection frequency required by applicable Jurisdictional Entities at no additional cost to the Authority.

B. Inspections shall include disturbed areas of the site, stockpiles and material storage locations, areas where temporary and permanent soil stabilization practices have been implemented, BMPs, and storm water discharge locations.

C. The ECM shall be responsible for overseeing and documenting the results of each inspection. Refer to Paragraph 1.4.D entitled "Environmental Compliance Manager" for inspection report requirements.

D. Contractor shall provide, install, maintain, and monitor a rain gauge approved by the Contracting Officer's Representative. Said rain gauge shall be located where it will collect a representative amount of rainfall received by the site.

E. Contractor shall immediately address any deficiencies in implementation and adherence to the provisions of the CGP and SWP3 as determined during site inspections. BMPs shall be repaired as required by the CGP. Alternative BMPs shall be implemented when, as determined by the ECM, a particular control measure has failed repeatedly or become ineffective in protecting the quality of storm water discharged from the site.

F. Periodic site audits, performed by the Authority, do not relieve the Contractor of the responsibility to perform regular inspection and maintenance activities for the BMPs employed on the site. The Authority's audits also do not relieve the Contractor of the duty to comply with the terms and conditions of the SWP3, the CGP, the Municipal Storm Water Discharge Permit of the Jurisdictional Entity, or any other local erosion and sediment control or storm water management regulations or ordinances.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. BMPs, soil erosion and sediment structural control measures and stabilization practices required under this section shall be measured, and paid at the lump sum for "Soil Erosion and Sediment Control" as installed in accordance with the relevant detail drawing and
accompanying notes shown in the plan, and shall include maintenance through the period of the work, and removal and properly disposal of surplus material at the completion of construction and final stabilization of the site, or as required by the Contracting Officer.

B. Rock Filter Dams. Rock filter dams shall be measured by the linear foot along the centerline of the top of the dam.

C. Pipe Inlet Protection shall be measured by the cubic yard.

D. Inlet Protection shall be measured by the each.

E. Construction Exits shall be measured by the square yard of surface area.

F. Temporary Sediment-Control Fence shall be measured by the linear foot.

G. Erosion Control Matting. Erosion control matting will be measured by the square yard of surface area

H. No separate measurement or payment shall be made for the relocation or maintenance of structural control measures for the Contractor's convenience or due to intermediate stages in the construction sequence.

I. No separate measurement or payment will be made for alternate BMPs installed when BMPs prove ineffective.

J. Temporary seeding and associated maintenance, if required, shall not be separately measured and shall be considered as incidental to the Contract, except as otherwise specified. Permanent seeding shall be paid as outlined under Section 02930, "Seeding and Sodding - Irrigated Areas", or Section 02931, "Seeding and Sodding - Non-Irrigated Areas", as applicable.

K. There shall be no separate measurement for payment under this Section for the installation, protection, or maintenance of BMPs, or for performing final stabilization, at off-site locations where materials or equipment are stored for this project.

4.2 CHANGES IN PROJECT SCOPE

A. Refer to General Provisions Paragraph, "Changes". In the event the Authority makes changes to the work such that additional BMPs are required or specific BMPs are rendered unnecessary, the Contractor shall make appropriate modifications to the SWP3 and site BMPs, as necessary. Changes to either the SWP3 or site BMPS resulting from changes to the work shall be considered incidental to the Contract.

END OF SECTION 01562
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes specifications for maintaining an orderly flow of vehicular and pedestrian traffic through and around the areas affected by the Contractor's construction activity and protecting the public from incurring injury or property damage as a result of the Contract's construction operations.

B. For any occasion or event requiring special traffic control measures, the Contracting Officer will notify the Contractor in advance and the Contractor shall promptly comply and adopt necessary measures to ensure safe movement of vehicular and pedestrian traffic through work areas.

C. Details not shown on the Contract Documents and the approved Traffic Control Plans shall conform to the Texas Manual on Uniform Traffic Control Devices and the regulations of the jurisdictional authority.

D. Coordinate the Work in this Contract requiring traffic maintenance with traffic control procedures, requirements, and conditions for other contracts listed in the Contract Documents and as directed by the Contracting Officer.

E. Temporary decking over excavated areas is specified in Section 01533, "Temporary Decking".

1.2 REFERENCE STANDARDS

A. Texas Manual on Uniform Traffic Control Devices (TMUTCD).

B. US Department of Transportation, Federal Highway Administration (FHWA), Standard Alphabets for Highway Signs and Pavement Markings.

1.3 TRAFFIC CONTROL PLAN

A. The Vehicular and Pedestrian Traffic Control Plan or Plans (referred to herein as Traffic Control Plan) shall include the following information. Submit multiple plans as required to depict traffic control throughout each stage of construction. Refer to Article entitled "Submittals" herein for submittal requirements.

1. Vehicular including bicycles and pedestrian traffic routing, including detours.

2. Proposed location of barricades, lighting, signage, pavement markings, markers, signals, and other traffic control devices.

3. Details of nonstandard signs, including size of sign, letter size, type, and message.

4. Arrangements for access to buildings within and immediately adjacent to the construction site.

5. Arrangements for emergency exiting from buildings within and immediately adjacent to the construction site.

6. Anticipated traffic, bus zone, and driveway blockage resulting from construction operations. Include the anticipated loss of bus, passenger, and truck loading zones.

7. Locations where on-street parking will be permitted within the immediate vicinity of the site.

8. Arrangements for temporary passenger and commercial loading and unloading zones, and temporary bus stop zones, where existing zones will be blocked by construction activity.

10. Areas for material delivery and Contractor's staging areas access and egress points.

11. Locations of historic properties.

B. Draw the Traffic Control Plan to a scale of one inch equals 40 feet, and details in a larger scale, as necessary for clear understanding.

C. Submit with the Traffic Control Plan a list of telephone numbers and contact persons for those departments of the jurisdictional authority and others who shall be notified three days prior to scheduled street closure and as soon as possible prior to emergency access closure. Refer to Article entitled "Notifications" herein for more information.

D. If the Contract Drawings include suggested Construction Sequencing/Temporary Traffic Control Plans, the following provisions apply:

1. Upon review and acceptance by the Contractor, Contractor may use any suggested Construction Sequencing/Temporary Traffic Control Plans included in the Contract Drawings in obtaining the necessary approvals and permits from the jurisdictional authority.
2. If the Contractor desires to carry out construction activities differently than as designated in the Contract Drawings, he shall either submit copies of the appropriate Construction Sequencing/Temporary Traffic Control Plan drawings from the Contract Drawings, showing on the drawings any modifications he wishes to incorporate; or submit new drawings, showing alternate plans for sequencing construction activities and handling traffic, in accordance with the Traffic Control Plan submittal requirements described herein.

1.4 SUBMITTALS

A. Submit the proposed Traffic Control Plans described herein to the jurisdictional authority and Contracting Officer.

B. Schedule submittals of Traffic Control Plans which include the following closures or changes to traffic patterns sufficiently in advance of and obtain approval from the appropriate jurisdictional agency at least 30 calendar days prior to the time such closures and changes are scheduled to be made.

1. Any full closure of a street proposed to be closed to all but construction activity and emergency traffic.

2. Partial street closures for an extended period of time. "Extended period of time" is defined as overnight, weekends, holidays, or periods of inclement weather.

3. Temporary closing to traffic of part of any street, sidewalk or other access, or other changes to traffic patterns

C. Do not cause traffic, sidewalk, or bus zone disruptions before receiving approval of the Traffic Control Plan from the Contracting Officer, and applicable jurisdictional authorities.

D. Submit notice of intent to permanently close existing street to the jurisdictional authority, with copy to Contracting Officer, a minimum of 30 days in advance of each closing. Refer to Article entitled “Notifications” herein for detailed requirements.

1.5 GENERAL MAINTENANCE OF TRAFFIC REQUIREMENTS

A. Keep the areas adjacent to the construction site in such condition that traffic will be accommodated safely. Provide and maintain traffic control devices and services both inside and outside the project limits as needed to facilitate traffic guidance. Traffic control devices and services shall conform to the requirements set forth in the Contract Documents and in the TMUTCD.

B. Traffic Control Devices: Provide, erect, place, maintain, and adjust traffic control devices necessary to alert and forewarn the public of construction activities and potential hazards associated with them at all times. Do not work on or adjacent to the roadway until all necessary traffic control devices are in place.

1. Traffic control signs: Provide temporary traffic control signs as shown in the approved Traffic Control Plans and in compliance with TMUTCD standards which are standard signs of the jurisdictional authority. Adequately post each change in location of traffic with a minimum of two signs mounted on temporary or standard posts. Provide all signage in accordance with the requirements of TMUTCD.

2. Pavement Markings and Markers: Provide necessary temporary pavement markings and markers required in connection with temporary street work. Remove or obliterate existing or temporary pavement markings whenever vehicular traffic is moved to newly available pavement areas or to different traffic patterns.

3. Redirecting traffic: Directing, channeling, and shifting of traffic lanes as well as barricading of traffic in connection with this work will be subject to approval of the jurisdictional authority.

C. Replace any devices provided under this section that are lost, stolen, destroyed, or deemed unacceptable while their use is required on the Project without additional compensation. This includes services, foundations, utilities, and similar items that are disturbed, destroyed or otherwise rendered unusable during construction.

D. During nonworking hours and following completion of a particular construction operation, signs, except those necessary for the safety of the public, shall be removed or entirely covered with plywood sheeting or other material approved by the Contracting Officer so that the sign panel will not be visible.

E. Keep retroreflective sheeting clean on signs, drums, barricades, and other devices. Promptly correct scratches, rips, and tears in the sheeting.
F. If a vehicular or pedestrian signal within the Work area goes dark or fails to function properly, the Contractor shall:

1. Immediately call Police for any required Police control of the intersection and provide temporary flaggers until Police arrives.

2. Immediately notify the concerned office of the jurisdictional authority. (i.e., for the City of Dallas, "concerned office" is the Maintenance Division of Department of Transportation).

3. Immediately notify the Contracting Officer.

4. If signal failure is a result of the Contractor's Work, the Contractor shall be responsible for all costs incurred.

1.6 TRAFFIC CONTROL SYSTEM REQUIREMENTS

A. Schedule operations to minimize potential traffic backups. The Contracting Officer may suspend the performance of the work, either in whole or in part, should an inordinate traffic delay occur during a construction operation.

B. Maintain vehicular traffic at all locations to the greatest extent possible and reduce and reroute traffic only for the shortest time possible consistent with effective construction operations.

C. The required travel lanes shall not be blocked by the Contractor's activities, including trucks delivering materials.

D. Maintain the existing directional operation of the street system at all times, unless specially designated otherwise in the Contract Documents.

E. Make provisions to minimize disruption to adjacent properties including construct of temporary facilities to allow business functions to be maintained.

F. Temporary Street Closure Restrictions: No more than one complete street closure will be allowed at any particular time. Show proposed temporary closing to traffic of part of any street, sidewalk or other access, and other traffic pattern changes on the Traffic Control Plan.

G. Material Delivery Areas and Staging Area Access and Egress: Material deliveries and other related trucking activities shall occur in the Contractor's protected work area. Refer to Section 01500, "Temporary Facilities and Services", for provisions regarding staging areas. Material delivery areas and access and egress points of staging area are subject to the approval of the Contracting Officer. Coordinate access and egress with the Contracting Officer.

H. Traffic signal systems shall remain in operation at all times except as approved by the Contracting Officer. Obtain Contracting Officer's and jurisdictional authority's approval of temporary traffic signals prior to use of temporary traffic signals. Temporary signals shall be in compliance with Section 02590, "Traffic Signals".

I. Maintain existing street lighting wherever possible. Obtain approval from the local jurisdictional authority prior to disconnecting or relocating existing street lighting. If relocating existing street lighting is required or proposed to accommodate proposed construction, coordinate work with the Contracting Officer and jurisdictional authority to the satisfaction of both. Illuminate areas where street lighting is cut off by equipment, barriers, and similar obstructions.

J. Work in or near Airports: Equipment type and heights, sign heights, hours of construction and sequencing, illumination and signal work in or near airports shall meet clearance and lighting restrictions of the Federal Aviation Administration and airport owner.

K. Illuminate nighttime construction operations by use of a lighting system approved by the Contracting Officer and approved by the jurisdictional authority, if applicable. Position and operate the nighttime system to preclude glare to the approaching traveling public. Refer to Section 01010, "Summary of the Work", for work hour provisions.

L. Flaggers: Provide flaggers where required by approved Traffic Control Plan. When necessary, provide flaggers for controlling movement of equipment and materials to the worksite.

1. Flaggers shall be physically and mentally qualified, trained in their duties, efficient, and courteous, as outlined in the TMUTCD. Identify each flagger on duty with appropriate and distinctive apparel, including orange retroreflective vest and hat. Equip each flagger on duty with a highly visible, retroreflective "Stop/Slow" hand sign conforming to TMUTCD. Flags will not be permitted unless approved by the Contracting Officer. Flaggers shall be fluent in English so that verbal instructions to motorists may be provided.

2. Provide approved equipment for two-way radio communications between flaggers when they are not in plain view of each other, and make such equipment available...
to the Contracting Officer for use as may be necessary.

M. Traffic Pattern Changes: Prior to changing traffic patterns, provide the following:

1. Adequate personnel and equipment to remove and set up traffic control devices as approved by the Contracting Officer.
2. Acceptable two-way radio communications network other than citizen band units.
3. Remove paving equipment and related equipment from the travel lane.

N. Use Type A flashing warning lights only on "ROAD CONSTRUCTION AHEAD" signs, on barricades and drums (used singly), and on the first two barrier units or drums used in a series for delineation. Mount Type C steady burn warning lights on channelizing devices and use them in a series for delineation (except that the first two devices shall have Type A warning lights).

O. Deviations from Approved Traffic Control Plans: Deviations from approved Traffic Control Plans will be allowed for bona fide emergencies only and as approved by the jurisdictional authority and Contracting Officer.

1.7 MAINTENANCE OF ACCESS AND EGRESS

A. Maintain vehicular and pedestrian access to residences, businesses (including public buildings), and properties at all times. Where construction activities will require the temporary closures of building entrances, arrange access with the affected residents and establishments.

B. Maintain emergency access to and from buildings within and immediately adjacent to the construction site.

C. Maintain local access for emergency traffic such as police, fire, medical, and disaster units at all times. Maintain an emergency response route at all times which includes the following:

1. A 25 foot inside and 45 foot outside turn radius for Fire Department vehicles.
2. Provisions for emergency vehicles traveling two ways in any lane. Such provisions include:
   a. Maintenance of a non-skid surface on steel plates on the roadway and on steel plates on both sides of cross-street approaches.
   b. No stacking of steel plates.
   c. Maintenance of smooth transitions between steel plates and the roadway surface.
   d. Secure steel plates in position and re-secure immediately if steel plates become dislodged.
3. Provide smooth transitions between permanent paving, temporary decking, and temporary pavement to reduce jolts and bumps within the construction zone.

D. Maintain pedestrian movements through the construction areas as follows:

1. Unless noted otherwise, a minimum of three pedestrian crosswalks at each intersection at all times.
2. No residence or business shall be denied pedestrian access at any time (without owner's consent). Structures with multiple points of access (especially those with access from adjacent streets) may be subjected to restricted access with the prior written consent of the property owner (or building management if so empowered).
3. In areas where the removal of existing sidewalks is necessary, maintain access to adjacent businesses, entrances, and properties by temporary level or sloped walkways having a width of not less than 6 feet.
4. Include provisions for the safe movement of mobility and sight-impaired individuals, including temporary ramps.
5. Construct temporary walking surfaces of non-skid materials.
6. Provide fencing or similar confining barrier to prevent errant pedestrian entry into work areas, restricted areas, and vehicular traveled way.

1.8 SEQUENCING

A. Upon completion of a segment of work in the streets, restore traffic to a normal flow as soon as possible. The impact of work activities at intersections shall be kept to a minimum and restoration of cross-street traffic flow at intersections shall be a priority item.

B. Contractor's surface operations: Schedule surface operations so as not to be working intermittently
throughout the area. Carefully schedule excavation or construction activities and vigorously pursue to completion as required to permit opening of street areas to traffic as soon as possible without unnecessary delays.

C. Pavement Reconstruction: Excavate and construct intersections in stages as shown on approved Traffic Control Plan. Phase construction so that the required number of traffic lanes on each street are provided at all times during these operations.

1.9 NOTIFICATIONS

A. Coordination Notifications:

1. Notify the Authority and adjacent property owners and business establishments a minimum of 3 working days prior to work which will disrupt normal traffic and pedestrian flow patterns in their immediate areas.

2. Refer to Section 01010, “Summary of Work” for work sequence and constraints as supplementary requirements.

B. Street Closures Notifications:

1. Permanent Closures: Authorization for permanent closure of streets indicated on the Contract Drawings will be obtained by the Agency in the process of final plan approval by the jurisdictional authority and related Governmental action. However, the Contractor shall submit separate notifications of intent to physically close each of these streets as specified under the Article entitled “Submittals,” herein.

2. Temporary Closures: Three (3) working days prior to any street closure, partial street closure, or, as soon as known, for temporary emergency access closure, notify the jurisdictional authority’s applicable departments such as transportation, traffic, fire, police, sanitation, and ambulance service (if notification separate from fire department is required) and DART bus operations. Contract Specifications will list applicable departments and telephone numbers. Verify telephone numbers and determine the appropriate contact person for each department and include this information with its Traffic Control Plan submittal. Contact DART bus operations at (214) 828-6838.

PART 2 - PRODUCTS

2.1 TRAFFIC CONTROL DEVICES

A. Traffic control devices shall conform to the requirements set forth herein and as indicated elsewhere in the Contract Documents. Details not covered by the Contract Documents shall conform to the applicable provisions of the TMUTCD.

B. Retroreflective Material: Sign panels, barricades, cones, drums, vertical panels, and flagger paddles shall have retroreflective sheeting meeting the minimum requirements for Type C retroreflective material, as described in TMUTCD.

C. Sign Panels: Construction warning sign panels shall be orange with black legend unless otherwise indicated in the TMUTCD. Regulatory signs used during construction operations shall be fabricated in the colors specified in the TMUTCD.

1. Sign panels: Fabricate sign panels from 0.75-inch thick plywood or other material acceptable to the Contracting Officer with retroreflective sheeting on the face side. Panels shall be true, square, and free from warping, bending, blemishes, and punching. Drill holes prior to final surface preparation and application of retroreflective sheeting.

2. Sign Legends: Text on temporary traffic control signs shall be 4 inches series D or larger, as specified in FHWA Standard Alphabets for Highway Signs and Pavement Markings.

D. Sign Posts: Fabricate sign posts from untreated soft wood, or other materials acceptable to the Contracting Officer.

E. Barricades: Construct Type II and III barricades of wood or plastic. The Type II barricades shall collapse when tipped over. Barricade markings shall conform to TMUTCD.

F. Cones: Cones shall be a minimum of 18 inches in height with a broadened base and shall be capable of withstanding impact without damage to the cones or vehicles. Cones shall be orange colored and highly visible both in daylight and darkness. Cones shall be capable of remaining upright during normal traffic flow and wind conditions in the area where they are used. Retroreflection requirements shall be in accordance with TMUTCD.

G. Vertical Panels: Construct vertical panels of wood or other material acceptable to the Contracting Officer.
H. Drums: Drums shall be plastic and shall be approximately 36 inches in height and have a minimum diameter of 18 inches. Drum markings shall conform to TMUTCD.

I. Temporary Guardrail: Temporary guardrail shall conform to TMUTCD. Used guardrail material will be permitted, subject to the approval of the Contracting Officer.

J. Temporary Concrete Barriers: Temporary concrete barriers shall conform to the requirements of TMUTCD. The barrier shall have white or yellow reflector units as applicable, approximately 1 inch by 3 inches in size, firmly mounted to the top of each barrier, at ten-foot centers.

K. Warning Lights (flashing or steady burn): Warning lights shall be Type A (low intensity flashing) or Type C (steady burn), as specified in the plans and meeting the requirements of the TMUTCD.

L. Provide temporary pavement markings and markers in conformance with Section 02580, "Pavement Markings and Delineators".

M. Provide the temporary pavement composition and patching and related aggregate base conforming to the requirements of the jurisdictional authority.

PART 3 - EXECUTION

3.1 GENERAL

A. Execute Traffic Control Plans and comply with other traffic maintenance requirements as specified herein.

B. Prior to the start of construction operations, install pavement markings and markers and erect signs, barricades, and other traffic control devices as required by the Contract Documents and approved Traffic Control Plans. Operate traffic control devices only when they are needed, and only those devices that apply to conditions actually in existence shall be used. Cover existing signs to the satisfaction of the Contracting Officer, whether signs are permanent or temporary, that conflict with the traffic operations proposed for the current stage of construction. Uncover signs as soon as traffic conditions warrant their use.

C. Remove existing pavement markings which conflict with proposed pavement markings for a particular phase of construction. Perform removal by sandblasting or other approved method that does not materially damage the surface or texture of the pavement. Make the removal pattern in an uneven shape that does not perpetuate the outline of the removed markings. Repair damage to the surface at the Contractor's expense using methods acceptable to the Contracting Officer. Remove accumulations of sand or other material that might constitute a traffic hazard. Upon completion, lightly coated with a coal tar emulsion (or approved equal) sandblasted areas on bituminous surfaces.

D. Equipment Storage: During non-work hours, park equipment either in the staging areas, or at least 30 feet from the edge of lanes open to the public. Where due to land features or right-of-way, it is not feasible to meet these restrictions, and work is expected to resume within 24 hours, park equipment (except rubber-tire equipment) a minimum of 10 feet from the edge of open lanes, as approved by the Contracting Officer. Place three or four Type II barricades, with Type A warning lights, on the pavement side of the equipment. Park rubber-tire equipment a minimum of 30 feet from traffic lanes open to the public or store at approved staging areas.

E. Temporary pavement and patching: Construct, maintain and remove temporary pavement, patching, and aggregate bases required to safely and expeditiously handle vehicular and pedestrian traffic within or adjacent to the Worksite.

F. Upon completion of the Work, unless directed otherwise, remove temporary construction and installations specified in this Section, clean up, and restore area. Include restoration of facilities to their original condition or better.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this Section will be paid for on a lump sum basis for "Maintenance and Control of Traffic" wherein no measurement will be made.

B. Warning devices, flaggers, signs and lights, barricades, and other precautionary measures in regard to installation of temporary decking, water distribution systems, storm sewer systems, sanitary sewer systems, and traffic signal systems will be considered included in lump sum and unit prices paid for temporary decking and the respective utility system.

C. Temporary pavement markings and temporary reflectorized traffic buttons will not be paid for separately, but will be considered subsidiary to the work of this Section.

D. Asphaltic concrete pavement and aggregate bases for temporary pavement will not be measured for payment, but will be considered subsidiary to work of this Section.
E. Temporary decking specified under Section 01533, "Temporary Decking", required for maintenance of traffic will be paid for under Section 01533, "Temporary Decking".

F. Temporary traffic signals will be paid for in accordance with Section 02590, "Traffic Signals".

END OF SECTION 01570
SECTION 01580
PROJECT SIGNS

PART 1 - GENERAL

1.1 DESCRIPTION

A. Work specified in this section includes providing, displaying, and subsequently removing project signs and supplements the Addendum to General Provisions Paragraph, "PROJECT SIGNS".

1. Project signs displayed at the Worksite shall be as specified herein and shown on the Contract Drawings and as directed by the Contracting Officer.

B. Maintain the project signs and supports, keep clean, repair deterioration and damage throughout the duration of the Contract.

C. The following shall not be displayed at the Worksite:

1. Separate Contractor's, subcontractor's, or supplier's signs or advertisements.

2. Signs which flash, blink, rotate, or otherwise draw unusual attention, except where required by safety regulations.

1.2 SUBMITTALS

A. Submit shop drawings showing size of sign, complete layout, lettering and size, and colors.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Project signs shall be fabricated from the following materials:

1. Plywood face: High-density overlay type, with overlay each side, 3/4 inch nominal plywood thickness.

2. Paint: Exterior, gloss, alkyd enamel. Provide two coats on sign faces, backs, and edges, and one coat on posts.

3. Wood posts: Douglas fir, S4S, nominal four inches by four inches, length as required. Paint the entire post. Provide posts in sizes and depths of embedment as specified.

4. Sign may be mounted otherwise if approved by the Contracting Officer.

B. Lettering shall conform to the following requirements:

1. Type: Lettering shall be of the "Futura" typeface (refer to the Contract Drawings for requirements).

2. Letter size: Proportioned as shown in the Contract Drawings.

3. Colors: As indicated in the Contract Drawings and approved.

4. Symbols: Use only those symbols shown in the Contract Drawings.

2.2 FABRICATION AND INSTALLATION

A. Sign panel: Cuts and edges shall be square, clean, with defects patched before painting.

B. Image: Symbol or type may be screened or hand painted. No screen patterning, paint build-up, bleed-thru, or drips and runs will be allowed. Hand-made patterns must be carefully cut and true to the symbols provided therein. Only clear, crisp sign painting is acceptable. Hand-painted typography shall be true to the font design.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Posts: Sign posts shall be embedded in compacted earth three feet minimum.

B. Locate project sign at the direction of the Contracting Officer.

C. Provide and install project signs as shown on the Contract Drawings and as directed, within 30 days after Notice to Proceed (NTP).

3.2 REMOVAL

A. Remove sign, framing supports, and foundation at completion of Project and restore the area.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 01001, "General Requirements".

END OF SECTION 01580
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes administrative and procedural requirements for the selection of products for use in the Project; product delivery, storage, and handling; manufacturers' standard warranties on products; special warranties; product substitutions; and comparable products.

B. Administrative procedures for handling requests for substitutions made after award of Contract are included in Section 01630, "Product Substitution Procedures".

C. Procedures for receiving and installing products furnished by the Authority are included in Section 01640, "Authority-Furnished Materials and Equipment".

1.2 Definitions

A. Products: Items purchased for incorporating into the work, whether purchased for the Project or taken from previously purchased stock. The term "product" includes the terms "material," "equipment," "system," and terms of similar intent.

1. Named Products: Items identified by manufacturer's product name, including make or model number or other designation, shown or listed in manufacturer's published product literature that is current as of the date of the Contract Documents.

2. New Products: Items that have not previously been incorporated into another project or facility, except that products consisting of recycled-content materials are allowed, unless explicitly stated otherwise. Products salvaged or recycled from other projects are not considered new products.

3. Comparable Product: Product that is demonstrated and approved through the submittal process, or where indicated as a product substitution to have the indicated qualities related to type, function, dimension, in-service performance, physical properties, appearance, and other characteristics that equal or exceed those of the specified product.

B. Substitutions: Changes in products, materials, equipment, and methods of construction from those required by the Contract Documents and proposed by Contractor. Refer to Section 01630, "Product Substitution Procedures".

C. Basis-of-Design Product Specification: A specific manufacturer's product named and accompanied by the words "basis of design," including make or model number or other designation, to establish the significant qualities related to type, function, dimension, in-service performance, physical properties, appearance, and other characteristics for purposes of evaluating comparable products of other named manufacturers.

D. Manufacturer's Warranty: Preprinted written warranty published by the individual manufacturer for a particular product and specifically endorsed by the manufacturer to the Authority.

E. Special Warranty: Written warranty required by or incorporated into the Contract Documents, either to extend the time limit provided by the manufacturer's warranty or to provide more rights for the Authority.

1.3 QUALITY ASSURANCE

A. Compatibility of Options: If the Contractor is given the option of selecting between two or more products for use on the Project, the product selected shall be compatible with products previously selected, even if previously selected products were also options.

1.4 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Deliver, store, and handle products using means and methods that will prevent damage, deterioration, and loss, including theft. Comply with the manufacturer's written instructions.

1. Schedule delivery to minimize long-term storage at the Project site and to prevent overcrowding of construction spaces.

2. Coordinate delivery with installation time to ensure minimum holding time for items that are flammable, hazardous, easily damaged, or sensitive to deterioration, theft, and other losses.

3. Deliver products to the Project site in an undamaged condition in the manufacturer's original sealed container or other packaging system, complete with labels and instructions for handling, storing, unpacking, protecting, and installing.

4. Inspect products on delivery to ensure compliance with the Contract Documents and to ensure that products are undamaged and properly protected.
PRODUCT REQUIREMENTS

5. Store products to allow for inspection and measurement of quantity or counting of units.

6. Store materials in a manner that will not endanger Project structure.

7. Store products that are subject to damage by the elements under cover in a weather tight enclosure above ground, with ventilation adequate to prevent condensation.

8. Comply with the product manufacturer's written instructions for temperature, humidity, ventilation, and weather-protection requirements for storage.

9. Protect stored products from damage.

1.5 ASBESTOS

A. The asbestos restrictions and documentation requirements found in TX Regulation 25 TAC 295.34(i) and (j) shall apply to work of the Contract including those areas of the work classified as public buildings and areas not classified as public buildings. The additional restriction shall apply: Asbestos containing materials or parts shall not be incorporated in the work except when there is no alternative material or part.

B. When use of asbestos containing material is incorporated in the work, the following documentation provision shall apply in addition to the requirements of TX Regulation 25 TAC 295.34(i) and (j): Contractor shall submit documentation, satisfactory to the Contracting Officer, showing that there is no alternative material or part.

1.6 PRODUCT WARRANTIES

A. Warranties specified in other Sections shall be in addition to, and run concurrently with, other warranties required by the Contract Documents. Manufacturer's disclaimers and limitations on product warranties do not relieve the Contractor of obligations under requirements of the Contract Documents.

B. General Warranty: Special warranties specified in each section shall not deprive the Authority of other rights the Authority may have under other provisions of the Contract Documents and shall be in addition to, and run concurrently with, other warranties made by the Contractor under requirements of the Contract Documents.

C. Special Warranties: Prepare a written document that contains appropriate terms and identification, ready for execution. Submit a draft for approval before final execution.

1. Manufacturer's Standard Form: Modified to include Project-specific information and properly executed.

2. Refer to Divisions 2 through 16 Sections for specific content requirements and particular requirements for submitting special warranties.

D. Submittal Time: Comply with requirements in Section 01770, "Contract Closeout".

PART 2 - PRODUCTS

2.1 PRODUCT SELECTIONS

A. General Product Requirements: Provide products that comply with the Contract Documents, that are undamaged and, unless otherwise indicated, that are new at time of installation.

1. Provide products complete with accessories, trim, finish, fasteners, and other items needed for a complete installation and indicated use and effect.

2. If available, and unless custom products or nonstandard options are specified, provide standard products of types that have been produced and used successfully in similar situations on other projects.

3. The Authority reserves the right to limit selection to products with warranties not in conflict with requirements of the Contract Documents.

4. Where products are accompanied by the term "as selected," the Contracting Officer will make the selection.

5. Where products are accompanied by the term "match sample," the sample to be matched will be made available by the Contracting Officer. The product match shall be subject to the approval of the Contracting Officer.

B. Descriptive Specification Requirements: Where Specifications describe a product or assembly, listing exact characteristics required, without use of a brand or trade name, provide a product or assembly that provides the characteristics and otherwise complies with Contract requirements.
C. **Performance Specification Requirements:** Where Specifications require compliance with performance requirements, provide products that comply with these requirements, and that are recommended by the manufacturer for the application indicated. Where the product is specified for a specific application, general overall performance is also required.

1. Manufacturer's recommendations may be contained in published product literature or by the manufacturer's certification of performance.

D. **Compliance with Standards, Codes and Regulations:** Where Specifications only require compliance with imposed code, standard or regulation, select product that complies with standards, codes or regulations specified.

E. **Visual Matching Specification:** Where Specifications require matching an established sample, select a product (and manufacturer) that complies with requirements and matches the Contracting Officer's sample. The Contracting Officer's decision will be final on whether a proposed product matches satisfactorily.

1. If no product available within specified category matches satisfactorily and complies with other specified requirements, comply with provisions of the Contract Documents on "substitutions" for selection of a matching product.

F. **Visual Selection Specification:** Where Specifications include the phrase "as selected from manufacturer's colors, patterns, textures" or a similar phrase, select a product (and manufacturer) that complies with the specified requirements.

1. **Standard Range:** Where Specifications include the phrase "standard range of colors, patterns, textures" or similar phrase, Contracting Officer will select the color, pattern, or texture from the manufacturer's product line that does not include premium items.

2. **Full Range:** Where Specifications include the phrase "full range of colors, patterns, textures" or similar phrase, the Contracting Officer will select the color, pattern, or texture from the manufacturer's product line that includes both standard and premium items.

### 2.2 **PRODUCT OPTIONS**

A. For Products specified by naming a minimum of three manufacturers with brand names or model numbers, select one of products and manufacturers named, which complies with Contract Documents.

1. Requests for manufacturer's products not listed must be submitted as Substitutions.

B. For Products specified by naming only one Product or manufacturer, Contractor must submit a request for substitution for a Product or manufacturer not specifically named.

C. For Products specified by naming only one Product and manufacturer and indicated as "no substitute", there is no option.

D. For Products specified only by reference standard, select a product meeting that standard.

E. For Products specified as Basis-of-Design Products: Where Specification paragraphs or subparagraphs titled "Basis-of-Design Product" are included and also introduce or refer to a list of manufacturers' names, provide either the specified product or a comparable product offered by one of the other named manufacturers. Drawings and Specifications indicate sizes, profiles, dimensions, and other characteristics that are based on the product named. Comply with the provisions in the "Comparable Products" Paragraph under the Article entitled "Definitions" to obtain approval for use of an unnamed product.

### PART 3 - EXECUTION

#### 3.1 **GENERAL INSTALLATION PROVISIONS**

A. Comply with manufacturer's installation instructions and recommendations, to the extent that those instructions and recommendations are more explicit or stringent than requirements contained in the Contract Documents.

B. Inspect materials or equipment immediately upon delivery and again prior to installation. Reject damaged and/or defective items.

C. Provide attachment and connection devices, and methods necessary for securing work. Secure work true to line and level. Allow for expansion and building movement.

D. Provide uniform joint widths in exposed work. Arrange joints in exposed work to obtain the best visual effect. Refer questionable choices to the Contracting Officer for final decision.
E. Recheck measurements and dimensions before starting each installation.

F. Install each component during weather conditions and Project status that will ensure the best possible results. Isolate each part of the completed construction from incompatible material as necessary to prevent deterioration.

G. Where mounting heights are not indicated, install individual components at standard mounting heights recognized within the industry, including ADA, for the particular application indicated. Refer questionable mounting height decisions to the Contracting Officer for final decision.

H. Handle, install, connect, clean, condition and adjust products in accordance with manufacturer's instructions and in conformity with specified requirements.

   1. Should job conditions or specified requirements conflict with manufacturer's instructions, consult with the Contracting Officer for clarifications.

   2. Do not proceed with work without clear instructions.

I. Perform work in accordance with manufacturer's instructions. Do not omit any preparatory step or installation procedure unless specifically modified or exempted by the Contract Documents.

J. Clean exposed surfaces and protect as necessary to ensure freedom from damage and deterioration at time of Substantial Completion.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

END OF SECTION 01600
PART 1 - GENERAL

1.1 DESCRIPTION
A. This Section specifies administrative and procedural requirements for handling requests for substitutions made after award of the contract.

1.2 DEFINITIONS
A. Definitions in this Article do not change or modify the meaning of other terms used in the Contract Documents.

B. Substitutions: Requests for changes in products, materials, equipment, and methods of construction required by Contract Documents proposed by the Contractor after award of the contract are considered requests for substitutions. The following are not considered substitutions:

1. Revisions to Contract Documents requested by the Authority or the Contracting Officer.
2. Specified options for products and construction methods included in the Contract Documents.
3. Contractor's determination of and compliance with governing regulations and orders issued by governing authorities.
4. Value engineering change proposals. Refer to the General Provisions Paragraph, "VALUE ENGINEERING".

1.3 SUBMITTALS
A. Submit three copies of each request for product substitution complete with a properly executed form and all supporting data.

B. Substitution Requests: Identify product or fabrication or installation method to be replaced. Include the applicable Specification Section number and title, and drawing numbers and titles.

1. Substitution Request Form: Use form provided at end of this Section.
2. Documentation: Show compliance with requirements for substitutions and the following, as applicable:
   a. Statement indicating why the specified material or product cannot be provided.
   b. Coordination information, including a list of the changes or modifications needed to other parts of the work and to the construction performed by Authority and separate contractors that will be necessary to accommodate the proposed substitution.
   c. Detailed comparison of significant variances created by the proposed substitution with those of the work specified. Significant variances may include attributes such as performance, weight, size, durability, visual effect, or other specific features and requirements indicated.
   d. Product Data, including drawings and descriptions of products, and fabrication and installation procedures.
   e. Samples, where applicable or requested.
   f. List of similar installations for completed projects with project names and addresses and names and addresses of architects/engineers and owners.
   g. Material test reports from a qualified testing laboratory indicating and interpreting test results for compliance with requirements indicated. Refer to Section 01450, "Quality Control", for requirements for Contractor's qualified testing laboratory.
   h. Research/evaluation reports evidencing compliance with building code in effect for Project, from a model code organization acceptable to authorities having jurisdiction.
   i. Detailed comparison of Contractor's Construction Schedule using the proposed substitution with products specified for the work, including its effect on the overall contract time. If specified product or method of construction cannot be provided within the contract time, include a letter from the manufacturer, on the manufacturer's letterhead, stating the lack of availability or delays in delivery.
   j. Cost information, including a proposal for the change, if any, in the contract sum.
   k. Contractor's certification that proposed substitution complies with requirements in the Contract Documents and is appropriate for the applications indicated.
   l. Contractor's waiver of rights to additional payment or time that may subsequently become necessary because of failure of
the proposed substitution to produce indicated results.

PART 2 - PRODUCTS

2.1 SUBSTITUTIONS

A. Bids shall be based upon providing materials and products, identified in these Specifications or indicated on the Drawings.

B. Contractor's submittal and the Contracting Officer's acceptance of shop drawings, product data or samples for construction activities not complying with the Contract Documents does not constitute an acceptable or valid request for substitution, nor does it constitute approval.

C. Timing: The Contracting Officer will consider requests for substitution if received within 60 days after the Notice to Proceed. Requests received after that time may be considered or rejected at the discretion of the Contracting Officer.

D. Conditions: The Contracting Officer will consider a Contractor's request for substitution when the following conditions are satisfied. If the following conditions are not satisfied, the Contracting Officer will return requests without action, except to record noncompliance with these requirements:

1. The requested substitution offers the Authority a substantial advantage in cost, time, energy conservation, or other considerations, after deducting any additional costs or responsibilities the Authority must assume. The Authority's additional responsibilities may include redesign and evaluation services, increased cost of other construction to the Authority, and similar considerations.

2. Requested substitution does not require extensive revisions to the Contract Documents.

3. Requested substitution is consistent with the Contract Documents and will produce the indicated results.

4. Substitution request is fully documented and properly submitted.

5. Requested substitution will not adversely affect the Contractor's Construction Schedule.

6. Requested substitution has received necessary approvals of authorities having jurisdiction.

7. Requested substitution is compatible with other portions of the work.

8. Requested substitution has been coordinated with other portions of the work.

9. Requested substitution provides the specified warranty.

10. If requested substitution involves more than one contractor, requested substitution has been coordinated with the other contractors, is uniform and consistent, is compatible with other products, and is acceptable to all contractors involved.

E. Burden of proof of equality rests with the Contractor.

F. By making request for substitution, the Contractor:

1. Represents and warrants that the Contractor has personally investigated the proposed substitution product and determined that it is equal to or superior in all respects to the one specified;

2. Represents and warrants that Contractor will provide the same warranties or bonds for the substitute that the Contractor would have provided for the one specified.

3. Certifies that cost data presented is complete and includes all related costs under this Contract, except for Contracting Officer's redesign cost, and waives all claims for additional costs related to the substitution which may subsequently become apparent; and

4. Will coordinate installation of the accepted substitute, making such other changes as may be required to make the work complete in all respects.

G. The Contracting Officer will review requests for substitutions with reasonable promptness, and notify the Contractor, in writing, of decision to accept or reject the requested substitution.

H. The Contracting Officer reserves the right to accept or reject proposed substitutions. Each request shall state the amount of savings, if applicable, to the Authority, if the substitution is accepted.

I. Cost of testing required for analysis of the proposed substitution shall be paid for by the Contractor at a testing agency selected and approved by the Contracting Officer.

J. Should the substitution be accepted, the Contractor shall be responsible for making the necessary adjustments to the Work which may be affected as result of the substitution at no additional cost to the Authority.

K. Contractor warrants that the substituted material or system will perform the same as the originally specified material or system would have performed. Should the accepted substitution fail to perform as required, the Contractor shall replace the substitute material or system with the one specified and bear the costs incurred thereby.
PART 3 - EXECUTION

Not Used.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

From: ___________________________ Date: ___________________________

Re: ___________________________ Contract For: ___________________________

Specification Title: ___________________________ Description: ___________________________

Section: _________ Page: _________ Article/Paragraph: ____________

Proposed Substitution: __________________________________________

Manufacturer: ___________________________ Address: ___________________________ Phone: ___________________________

Trade Name: ___________________________ Model No.: ___________________________

Installer: ___________________________ Address: ___________________________ Phone: ___________________________

History: ☐ New product ☐ 2-5 years old ☐ 5-10 yrs old ☐ More than 10 years old

Differences between the proposed substitute and the specified product:

☐ Point-by-point comparative data attached.

Reason for not providing the specified item: ___________________________

Similar Installation:

Project: ___________________________ Designer: ___________________________

Address: ___________________________ Owner: ___________________________

Date Installed: ___________________________

Proposed substitution affects other parts of the work: ☐ No ☐ Yes; explain ___________________________

Savings to Authority for accepting the substitution: ___________________________ ($ ____________).

Proposed substitution changes to contract time: ☐ No ☐ Yes [Add] [Deduct] ____________ days.

Supporting Data Attached: ☐ Drawings ☐ Product Data ☐ Samples ☐ Tests ☐ Reports ☐

Page 1 of 2

Form 1630
The Undersigned certifies:

- Proposed substitution has been fully investigated and is determined to be equal or superior in all respects to the specified product.
- Same warranty will be furnished for the proposed substitute as for the specified product.
- Same maintenance service and source of replacement parts, as applicable, is available.
- Proposed substitution will have no adverse effect on other trades and will not affect or delay scheduled progress.
- Cost data as stated above is complete. Claims for additional costs related to accepted substitution, which may subsequently become apparent are to be waived.
- Proposed substitution does not affect dimensions and functional clearances.
- Payment will be made for changes to design, including A/E design, detailing, and construction costs caused by the substitution.
- Coordination, installation, and changes in the work as necessary for the accepted substitution will be completed in all respects.

CONTRACTING OFFICER’S REVIEW AND ACTION

☐ Substitution approved - Make submittals in accordance with Specification Section 01330.
☐ Substitution approved as noted - Make submittals in accordance with Specification Section 01330.
☐ Substitution rejected - Use specified materials.
☐ Substitution Request received too late - Use specified materials.

Signed by: ________________________________ Date: ________________________________
Additional Comments: ________________________________

☐ Contractor ☐ Subcontractor ☐ Supplier ☐ Manufacturer ☐ Contracting Officer
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes specifications for the acceptance, pick up, loading, transporting, unloading, handling, storage, protection, and utilization of materials and equipment furnished by the Authority for installation by the Contractor, including installation supervisors.

B. Refer to Section 01600, “Product Requirements”, for handling, storage, and other pertinent requirements.

1.2 ABBREVIATIONS

A. Authority-furnished materials may be referred to herein and in other Sections of the Specifications, where applicable, by the abbreviation AFM.

B. Authority-furnished equipment may be referred to herein and in other Sections of the Specifications, where applicable, by the abbreviation AFE.

1.3 AUTHORITY-FURNISHED MATERIALS AND EQUIPMENT

A. The materials and equipment to be furnished by the Authority for installation by the Contractor are specified in the Contract Specifications, Section 01640, “Authority-Furnished Materials and Equipment”.

1.4 CONTRACTOR’S RESPONSIBILITIES

A. Requirements: The Contractor shall assume custody of, and provide protection for, all Authority-furnished materials and equipment from pick up or delivery, as applicable, and acceptance by the Contractor until Substantial Completion of the Work and the return of any excess materials and equipment.

B. Protection: Protect all Authority-furnished materials and equipment while in custody from theft, vandalism, loss, and damage during unloading, storing, handling, distributing, and installing the materials and equipment. Lost or damaged materials and equipment, as documented by the Authority, shall be replaced by the Contractor at no additional cost to the Authority.

C. The Contractor shall provide all labor, equipment, and materials necessary to pick up, load, transport, unload, handle, stockpile, and store Authority-furnished materials and equipment. Handling shall be in accordance with the respective manufacturer’s recommendations as furnished by the Contracting Officer.

D. Storage Plan: Prepare a storage plan for each storage area where Authority-furnished materials and equipment are proposed to be stored or stockpiled. The plan shall be in sufficient detail to demonstrate that efficient handling and security provisions have been provided, that supporting soils will not be overloaded, and that materials will not be overstressed due to bending or shear. A running inventory of the materials on hand shall be provided and kept, and the Contractor shall notify the Contracting Officer at least 30 days in advance of any anticipated shortages.

E. AFM and AFE Acceptance: Inspect Authority-furnished materials and equipment at time of pick up (or delivery if delivery of the specific AFM or AFE to the Contractor by others is specified), and submit certification to the Contracting Officer showing the quantity of accepted materials and equipment. Set aside all damaged materials and equipment, and immediately notify the Contracting Officer in writing of the damage and circumstances of discovery. If delivery of AFM or AFE is, Contractor shall inspect Authority-furnished materials and equipment.

F. Inventory Records: Prepare and maintain perpetual inventory records of Authority-furnished materials and equipment, and assign stock number, date of receipt from the Authority, and approximate date of construction placement. All checkout and returns of Authority-furnished materials and equipment or other transfer of materials and equipment between the Contractor and the Authority shall be accompanied by an inventory record form.

G. Excess Materials: Upon Substantial Completion of the Work, the Contractor shall transport, unload, and stockpile, all excess Authority-furnished materials and equipment to a delivery location within a 50 mile radius of the jobsite, as determined by the Contracting Officer.

1.5 INSTALLATION FACILITIES, TOOLS, AND MATERIALS

A. The Contractor shall furnish all facilities, tools, equipment, materials, and services needed to complete the installation of Authority-furnished materials and equipment, and such other tools, equipment, materials, and services as required to complete the Work.

B. Authority-furnished materials and equipment shall be installed accurately and efficiently to avoid waste, such as that due to incorrect or inaccurate installations. Wasted materials and equipment, as documented by the Contracting Officer, shall be
replaced by the Contractor at no additional cost to the Authority.

1.6 INSTALLATION INSTRUCTIONS

A. The Contracting Officer will provide the Contractor with installation instructions and drawings from the manufacturers of Authority-furnished equipment.

PART 2 - PRODUCTS

Not Used.

PART 3 - EXECUTION

Not Used.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Separate measurement or payment will not be made for work required under this Section. Costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

END OF SECTION 01640
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes specifications for pre-construction inspection.

B. Contractor will be responsible for other surveys as required prior to commencement of the Work. Refer to Section 01722, “Field Engineering”.

C. Monitor existing structures for damage and movement as and where indicated in Section 02316, “Geotechnical Instrumentation”.

D. Where necessary to safeguard adjacent structures and property, provide underpinning and support in accordance with Section 02150, “Underpinning, Support, and Restoration of Structures”.

1.2 SUBMITTALS

A. Submit copies of the pre-construction inspection report to the Contracting Officer.

1.3 AUTHORITY’S INSPECTION

A. Conditional inspection of buildings or structures in the vicinity of the Project, which may possibly be affected by the Work, will be performed by the Authority. These surveys will be conducted to:

1. Define and document existing property conditions and

2. Assist the Authority in resolving possible disputes over property conditions.

1.4 PRE-CONSTRUCTION INSPECTION

A. In conjunction with the Contracting Officer and the Authority’s designers, conduct a pre-construction inspection of existing facilities, structures, and environmentally sensitive areas in the vicinity of the Worksite. Document the inspection with photographs, sketches, and narratives and assemble into an inspection report submitted to the Contracting Officer. Photographic documentation shall include vegetation densities. Photographs shall comply with Section 01345, “Construction Photographs”.

PART 2 - PRODUCTS

Not Used.

PART 3 - EXECUTION

Not Used.
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes specifications for survey services as required for layout and performance of the Work.

B. The work includes providing field engineering services as required to verify lines, levels, grades, and elevations, and that the work was constructed and installed accurately within specified tolerances.

C. The work includes maintaining Authority-provided monuments and bench marks and establishing and maintaining new temporary and permanent monuments and bench marks to facilitate the work of this Contract, work of adjacent and follow-on contracts, and for the Authority’s on-going use. Refer to Section 02110, “Survey Markers and Monuments” for related requirements.

D. The work includes verifying constructed work including verifying alignment and grades of structures, stations, and trackbed in preparation for turn-over to follow-on contracts.

E. The work also includes survey services for obtaining field measurement of work quantities to be determined by survey.

1.2 REFERENCED STANDARDS

A. The work of this Section shall be in accordance with the following referenced standards and manuals.

C. Federal Geodetic Control Committee (FGCC):

D. Texas Board of Professional Land Surveyors (TBPLS):
   1. TBPLS - Rules, Regulations and “Minimum Standards of Practice”

E. Texas Society of Professional Surveyors (TSPS):
   1. TSPS - Manual of Practice for Land Surveying in the State of Texas

1.3 SUBMITTALS

A. Survey notes, drawings, and calculations shall be completed as the work progresses and one signed copy of each survey document shall be submitted to the Authority for record purposes. Surveys submitted shall include a dated certification signed and sealed by a Professional Land Surveyor registered in the State of Texas attesting to the survey’s accuracy and purpose.

B. Construction survey notes shall be provided to the Contracting Officer within 48 hours after completion of the Contractor’s survey.

C. As-Built Survey: Submit drawings showing all final centerline, station, and other Contractor-installed monumentation, properly prepared and submitted to the Contracting Officer for approval. Depict actual as-built conditions of the constructed improvements and said improvements relationship or conformance with the Contract Documents. Illustrate the horizontal and vertical (if appropriate) location of all improvements and indicate and clearly dimension all nonconformance or variations from the Contract Documents.

D. Submit a survey plan for establishing, controlling, and checking the layout for all work.

E. Submit monthly when the request for payment is submitted, a survey showing actual as-built conditions for all work indicating its conformance to the Contract Documents. Include survey data of actual conditions required by quantitative records of actual work; damage and settlement surveys; surveys of adjacent construction; and similar data as required by the Contracting Officer. Submit three copies.

1.4 QUALIFIED SERVICES

A. Surveying services and field engineering services shall be performed under the direct supervision of a State of Texas Registered Professional Land Surveyor.

1.5 SURVEY CONTROL

A. DART Coordinate System: The Authority has established the Texas Coordinate System of 1983 (NAD 1983), North Central Zone as the basis for it’s horizontal system and National Geodetic Vertical Datum of 1988 (NGVD 1988) as the basis for it’s vertical system. The official scale factor on DART Buildout II Projects is 1.000136506, to convert from grid to surface values. All coordinates and distances shall be published as surface values.
B. Horizontal Datum: The horizontal control for all alignments shall be based on survey control points established under the direction of the Authority. Coordinates for control points established for the system shall be located on NAD 83, Texas Coordinate System, North Central Zone (Lambert Grid), as established by the National Geodetic Survey (NGS).

1. The accuracy of the horizontal ground control and of supporting ground surveys as a minimum shall be Second Order, Class I, in accordance with the FGCC Standards and Specifications for Geodetic Control Networks.

2. GPS relative positioning accuracy as a minimum shall be Order C Class 2-I as defined in FGCC Geometric Geodetic Accuracy Standards and Specifications for Using GPS Relative Positioning Techniques.

C. Vertical Datum: The vertical control shall be based on the NGVD 1988 Datum, as defined by the NGS descriptions with the most recent adjustments.

1. The accuracy of the vertical ground control and of supporting ground surveys shall be as a minimum Second Order, Class I, as defined above.

1.6 LINES AND GRADES

A. Only such primary control lines, monuments, and bench marks will be set by the Authority as the Authority determines to be necessary to control establishment of the lines and grades required for completion of the Work. In general, these will consist of the primary horizontal and vertical control points indicated on the Contract Drawings. Contractor shall establish work points for all major structures, all track alignments, and all roadway alignments. Contractor shall set survey monuments at each end of station platforms to establish platform finish horizontal and vertical alignment based on the Authority control datum.

B. Contractor shall carefully preserve primary control monuments set by the Authority. In case such monuments are destroyed or damaged, they will be replaced at the Authority's earliest convenience. Contractor will be charged for the cost of replacing or restoring monuments destroyed or damaged by the Contractor's operations. This charge will be deducted from any monies due or to become due the Contractor.

C. Contractor shall temporarily suspend work at such points and for such reasonable times as the Authority may require for resetting monuments, and the Contractor will not be entitled to any additional compensation or extension of time therefore.

D. All other stakes or markers required to establish the lines and grades required for the completion of the Work shall be the responsibility of the Contractor.

1.7 SURVEYS FOR LAYOUT AND PERFORMANCE

A. Surveying Requirements: Perform all surveys for layout and performance of the Work, reduce the field notes, and make all calculations and drawings necessary to carry out such work. Contractor shall check the relative positions of all Authority-provided primary monuments and bench marks to be used and shall report any damaged or out-of-position monuments to the Contracting Officer at once. Contractor shall check such relative positions each time the Contractor uses such monument or bench mark.

B. Datum: Contractor shall be responsible for correctly locating all lines and grades and for performing all measuring as required for the construction and completion of the Work from established reference points and information is shown on the Contract Drawings.

C. Equipment: Contractor's instruments and other survey equipment shall be accurate, suitable for the surveys required, and in proper condition and adjustment at all times, per manufacturer's instructions.

D. Field Notes and Records: Furnish certified copy of all survey records to the Contracting Officer at intervals required by the Contracting Officer. Furnish each field notebook to the Contracting Officer when filled or completed.

1. Record deviations which are accepted by the Contracting Officer on the record drawings.

2. Furnish the Contracting Officer with a plan sheet showing the horizontal distance, azimuth, and angle from the control points indicated to the references indicated.

3. Electric or unprocessed field will be accepted. Additional "hard copies" plots, sketches, spread sheets or processed data are required in specific situations or even on a routine basis if deemed necessary for checking or archiving.

E. Use by the Contracting Officer: The Contracting Officer may at any time use line and grade points and markers established by the Contractor. Contractor's surveys are a part of the work and may be checked by the Contracting Officer at any time. Contractor shall be responsible for any lines, grades, or measurements which do not comply with specified or proper tolerances, or which are otherwise defective, and for any resultant defects in the work. Contractor shall conduct resurveys or check surveys to correct errors indicated by review of the field notebooks or by check surveys performed by the Contracting Officer.

1.8 SURVEYING ACCURACY AND TOLERANCES IN SETTING SURVEY STAKES

A. Surveying Accuracy: Control traverse field surveys and computations, including surveys of control lines to determine horizontal and vertical alignment of major structure components, shall meet the accuracy requirements for Second Order, Class I Surveys as
specified by the FGCC. Staking for construction or equipment installations shall meet the accuracy requirements for Second Order, Class II Surveys as specified by FGCC.

B. Tolerances: The tolerances generally applicable in setting survey stakes shall be as set forth in Paragraph 1.8.A above. Such tolerances shall not supersede stricter tolerances required by the Contract Drawings or Specifications, and shall not otherwise relieve the Contractor of responsibility for measurements in compliance therewith.

1.9 MONUMENTATION

A. In accordance with Paragraph 1.6A. herein, monuments will be provided by the Authority to establish the centerlines of tracks.

B. The Contracting Officer will furnish the Contractor with horizontal coordinate values to 1/100 of a foot and vertical values to 1/100 of a foot for all existing baseline monuments.

C. Do not use controls for surveys other than the monumentation described above unless otherwise approved by the Contracting Officer.

1.10 TRACKWORK SURVEYING REQUIREMENTS

A. The following trackwork surveying requirements apply to preparation for trackwork construction.

1. Verify layout information shown in relation to the existing Authority provided monuments and existing structures before proceeding with layout of the actual work. As the work proceeds, check every major element of work for line. Bring discrepancies in location of structures to the attention of the Contracting Officer before starting trackwork. Maintain an accurate surveyor's field book of such checks, make available for the Contracting Officer's reference.

2. Verify the actual grade line and the profile of the top of the subballast. Variations from the design grade line and profile of less than plus or minus 1/2 inch to be compensated for by the quantity of ballast or the thickness of concrete slab at no additional cost to the Authority. Variations more than plus or minus 1/2 inch shall be reported to the Contracting Officer for direction.

1.11 FINAL ALIGNMENT AND TRACK INSPECTION

A. Survey of the track to verify that the horizontal alignment, vertical alignment, and superelevation are within the tolerances specified for each type of track construction.

B. Areas found to exceed the tolerances shall be resurveyed after deficiencies are corrected.
SECTION 01731  
CUTTING AND PATCHING

PART 1 - GENERAL

1.1 DEFINITION

A. This section specifies the cutting and patching of nominally completed and/or previously existing work in order to accommodate the coordination of work, to install other work, to uncover other work for access or inspection, to obtain samples for testing, or for similar purposes; and excludes integral cutting and patching during the manufacturing, fabricating, erecting, and installing of individual units of work.

1. Demolition is a related category of work, which may require cutting and patching as specified in this section.

2. Excavation and the associated operations of dewatering, bracing, backfilling, and surface restoration, are separate categories of work.

B. Refer to other sections of the Specifications for specific cutting and patching requirements and limitations applicable to individual units of work.

1. Refer to Division 15 and 16 of these Specifications for additional requirements and limitations pertaining to the cutting and patching of mechanical and electrical work, respectively.

3.1 INSTALLATION

A. Structural Work: Do not cut and patch structural work in a manner resulting in a reduction of load-carrying capacity or load/deflection ratio.

B. Operational and Safety Related Components: Do not cut and patch operational elements and safety-related components in a manner resulting in a reduction of capacities to perform in the manner intended or resulting in decreased operational life, increased maintenance, or decreased safety.

C. Visual Requirements: Restore or refinish work which has been cut or patched as near as possible to its original condition, using new materials. Restore or repair continuous surfaces to the nearest intersections and refinish entire assemblies.

D. Do not proceed with cutting and patching for which submittals are required until such submittals have been approved by the Contracting Officer.
3.3 CUTTING

A. Cut work by methods least likely to damage work to be retained and adjoining work.

1. In general, where mechanical cutting is required, cut work with saws or rotary tools, not with impact tools. Core drill openings larger than 1-1/2 inch diameter through concrete work.

2. Comply with the requirements of applicable sections of Division 2 of these Specifications where cutting and patching requires excavating and backfilling.

B. Fittings: Cut products as required for fitting and adjusting to provide for finished installation complying with specified tolerances and finishes.

3.4 PATCHING

A. Patch with seams which are durable. Comply with specified tolerances for the work. Where feasible, inspect and test patched areas to demonstrate integrity of work.

B. Restore exposed finishes of patched areas; and, where necessary, extend finish restoration onto retained work adjoining in a manner which will minimize evidence of patching.

3.5 INSPECTION

A. Request Contracting Officer's inspection of cutting and patching and obtain his approval prior to any further action with or about the cut and patched product.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

A. Cutting and Patching is incidental to the work being performed and will not be measured separately.

4.2 PAYMENT

A. Cutting and Patching is incidental to the work being performed. No separate payment will be made.

END OF SECTION 01731
PART 1 - GENERAL

1.1 DESCRIPTION
A. This Section includes specifications for performing operations necessary for, and properly incidental to, site cleanup during construction and final cleaning of the facilities and the site prior to acceptance of the Work by the Authority as specified herein and in other sections when specified.

1.2 CLEANING AND CLEANUP DURING CONSTRUCTION
A. The entire site of the Work, including the Contractor's work and storage areas, shall be kept in a neat, clean, and orderly condition at all times during the course of this Contract. The Contracting Officer may, at any time during construction, order a general cleanup of the site as a part of the Work, and there shall be no additional cost to the Authority. The Contractor shall provide general daily clean up and disposal service for removal of waste, rubbish, trash, and debris away from the jobsite.

B. Perform cleaning of facilities and ancillary buildings as required during construction to prevent accumulations of dust, dirt, soil, trash, and debris, so that a clean and safe working environment will be present at all times.

C. Walkways or designated pathways for authorized visitors shall be kept broom clean at all times. Walkways over exposed earth surfaces shall also be kept neat and free of pebbles and other obstacles to walking comfortably, equivalent to broom clean of paved surfaces.

1.3 DUST CONTROL
A. Clean interior spaces prior to the start of finish painting and the application of other finishes, and continue cleaning as required until such work is completed.

B. Schedule operations to prevent dust and other contaminants, resulting from cleaning operations, from adhering to set or newly finished surfaces.

1.4 DISPOSAL OF DEBRIS
A. Dispose of waste, trash, and debris in a safe, acceptable manner, in accordance with applicable laws and ordinances and as prescribed by authorities having jurisdiction. Bury no waste material and debris on the site. Burning of trash and debris on the site will not be permitted.

B. Location of disposal site for trash and debris and length of haul are the Contractor's responsibility.

1.5 FINAL CLEANING OF STATION FACILITIES AND ANCILLARY BUILDINGS
A. Prior to final inspection by the Authority, and after construction work is essentially complete, thoroughly clean station facilities and ancillary buildings and structures, utilizing professional building cleaners where appropriate.

B. Items to be cleaned include glass, doors, hardware, opening frames, grilles, trim, exposed metal surfaces, plastics, concrete, pavers, floor coverings, light fixtures and plates, plumbing fixtures and trim, and finish surfaces throughout the construction.

C. Vacuum-clean where appropriate and remove spots, smears, dust, debris, hand prints, and defacements of every sort, including those of vandals. Use commercial cleaning compounds where necessary.

D. Follow the recommendations of the manufacturers of the materials and items to be cleaned for cleaning, polishing, and treatment such as waxing or sealing. Polish stainless steel and other non-ferrous metal surfaces.

E. Clean permanent filters of the air-conditioning system and replace disposable filters of units operated during construction. Clean ducts, blowers, and coils if units were operated without filters during construction.

1.6 FINAL SITE CLEANUP
A. Prior to final inspection, thoroughly clean the entire site and put it into a clean and neat, acceptable condition. Remove from the site construction waste and unused materials, dunnage, loose rock and stones, excess earth, and debris of any description resulting from the Work.

B. Hose down and scrub clean where necessary pavement and paved walks. Remove oil and grease stains.

C. Thoroughly remove mortar droppings from concrete slabs and pavement where they occur. Hose down and scrub clean concrete flatwork and exposed vertical surfaces of concrete and masonry.

D. Free and clear new and existing drainage systems.

E. Clean and protect conduit openings.
PART 2 - PRODUCTS

Not Used.

PART 3 - EXECUTION

Not Used.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 01001, “General Requirements”

END OF SECTION 01740
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes specifications for performing all operations necessary for and incidental to closing out the Contract work and assisting in the Contracting Officer’s final inspection.

B. Refer to General Provisions Paragraphs, “USE AND POSSESSION PRIOR TO COMPLETION” and “FINAL ACCEPTANCE”.

1.2 BENEFICIAL OCCUPANCY

A. Refer to General Provisions Paragraph, “USE AND POSSESSION PRIOR TO COMPLETION”. The Authority may take possession or use any completed or partially completed part of the work under construction. Such occupancy neither relieves the Contractor of the responsibility for completing the work in accordance with the contract, nor removes contractual warranties or guarantees of construction.

B. Beneficial Occupancy is preceded by inspections of the work areas to be possessed by the Authority and other agencies. Such inspections will usually result in a work list being developed. Reference procedures established in Article entitled “Substantial Completion Inspection”, utilizing the work list in lieu of the punch list.

C. The Contracting Officer will make arrangements for maintenance, heat, utilities, and insurance prior to Beneficial Occupancy.

D. The Contractor shall sign and return the Certificate of Beneficial Occupancy prepared by the Contracting Officer. This Certificate establishes a Beneficial Occupancy Date (BOD) as the Authority takes occupancy.

1.3 SUBSTANTIAL COMPLETION - GENERAL

A. Substantial Completion (when recognized by the contract) is defined as the point at which all work is sufficiently completed to allow full use of the contracted items for their intended purpose. Intended purpose is defined to mean useable from an operational and safety standpoint. This includes the ability for follow-on contractors to perform their tasks without the Authority incurring any liability for additional costs or delays as a result of incomplete work.

B. Substantial Completion Requirements: To be considered substantially complete, the following items shall be addressed (as applicable).

   1. Physical completion
   2. Successful testing of the work
   3. Submittal of permits, certificates of occupancy and other certificates, as required.
   4. Submittal and approval of required submittals
   5. Inspection Tags: Mount “green” inspection tags on 8-1/2 x 11 paper, identify as to item that was inspected, and submit.
   6. Operating instructions for equipment shall be properly mounted and posted as specified in Section 01786, “Operation and Maintenance Instructions”.
   7. Required operations and maintenance manuals shall be submitted as specified in Section 01786, “Operation and Maintenance Instructions”.
   8. Guaranties and warranties shall be submitted to the Contracting Officer, as specified in the General Provisions and various sections of the Specifications.
   9. Submittal of spare parts, maintenance materials, keys, special tools, testing equipment, and required surplus material.
   10. Submittal of a list of subcontractors and vendors with contact names, phone numbers, addresses and description of work performed.
   11. Temporary facilities, except as may be required for punch list work, shall be removed from the site.
   12. The site and applicable appurtenances and improvements shall be cleaned as specified in Section 01740, “Cleaning”.
   13. Non-Conformance Reports, Audit Finding Reports, and Corrective Action Reports have been addressed and closed.

C. When the Contractor believes that the work required by any designated part of the contract has been substantially completed in accordance with the contract, the Contractor shall make a written request to the Contracting Officer for an inspection.

1.4 PRE-SUBSTANTIAL COMPLETION INSPECTION (PRE-SCI)

A. Prior to the scheduled date of a Substantial Completion Inspection, the Contractor shall request that the Contracting Officer make arrangements for inspections with the Authority, end user, the Authority’s designer, and other agencies as required. The intent of these inspections is to review current work list items in manageable sized groups and to determine if the work is ready for a Substantial Completion Inspection. Items documented during Pre-SCI’s will be provided to the Contractor so that these items may be completed prior to the Substantial Completion Inspection.
1.5 SUBSTANTIAL COMPLETION INSPECTION (SCI)

A. Substantial Completion Inspection (SCI): Substantial Completion is determined by a series of inspections of the project features, including the Storm Water Pollution Prevention Plan. The Contracting Officer will establish the dates of these inspections based on the Contractor’s readiness for the inspection. The Contractor shall cooperate with the Contracting Officer in the coordination of attendees. The makeup of the inspection team will depend upon the nature of the work being inspected, but normally will include the Contractor, the Contracting Officer, representatives of other DART divisions, and outside agencies as deemed appropriate. The Contractor shall be represented by its principal superintendent and such Subcontractors and Suppliers as may be necessary to answer the questions of the Contracting Officer’s inspection team.

B. The Contracting Officer will organize, schedule, and guide the inspection teams. Following inspections, the Contracting Officer will prepare a "first draft" punch list and distribute within 72 hours to all members of the inspection group. The Contractor shall review the draft list for completeness and accuracy, adding additional information as necessary. Draft lists, with supporting references, shall be returned to the Contracting Officer within 72 hours of receipt.

C. If the inspection team concurs that the work is substantially complete, the Contracting Officer will complete the "Certificate of Substantial Completion". The Contracting Officer will retain the certificate and a copy will be given to the Contractor. If the inspection team does not find the work substantially complete, the SCI will be treated as a Pre-SCI and a new SCI will be scheduled.

D. Punch list: Punch list items will be entered and tracked by the Contracting Officer.

E. Following preparation, punch lists will be formally transmitted to the Contractor for immediate action. Once a list is forwarded to the Contractor, no new items will be added or deleted. New items will be addressed as latent defects or warrantees.

F. The Contractor shall return a copy of the punch list within one week after receipt indicating the forecast completion date. Obtain the Contracting Officer’s sign-off of individual items as they are completed.

G. Certificate of Substantial Completion: A Substantial Completion (SC) Certificate will be issued for each area that has been contractually designated as having a specified completion date, as well as for overall contract completion. The date of inspection resulting in issuance of the Certificate is the date of Substantial Completion. Each SC Certificate issued prior to the final certificate shall be marked “Partial”. The final SC Certificate shall be marked “Final”.

H. The Substantial Completion Certificate, if necessary, will contain the following documents:

1. Punch list.
2. A list of outstanding Change Orders, problem statement, and claims.
3. A list of outstanding operation and maintenance manuals, warranties, guarantees, and permits.
4. A list of outstanding test results.
5. A list of spare parts, maintenance materials, keys, special tools, testing equipment, and required surplus material.
6. A list of outstanding QC documentation.

I. Post-Substantial Completion Inspection and Turnover: Following a completed SCI, record documentation and deliverables shall be transferred to the Contracting Officer within the time deemed appropriate by the Contracting Officer.

1.6 SUBSTANTIAL COMPLETION INSPECTION FOR EQUIPMENT

A. The following procedures apply to a Substantial Completion Inspection for the purpose of accepting possession of equipment prior to final completion of the facility housing the equipment:

1. The DART representative will accept the equipment.
2. DART operations will maintain the equipment after acceptance.
3. The Contracting Officer will control the keys to the facilities containing the equipment on behalf of the Authority.
4. The Contracting Officer will retain authority to provide access by other contractors required to work in the facilities containing the equipment and by the DART Operations personnel who will maintain the equipment.

1.7 FINAL INSPECTION

A. Final Inspection: When all requirements of the previously prepared punch lists have been completed, the Contractor shall request final inspection for full completion. Prior to scheduling the final inspection, the Contracting Officer will verify full completion. When satisfied, the Contracting Officer will arrange for and conduct the final inspection accompanied by the Contractor and other participants of previous inspections.
B. Final Inspection/Acceptance by Third Parties:

1. The Contractor shall request in writing to the Contracting Officer final inspection by third parties of work of performed on their facilities.

2. Prior to making such request for final inspection, the Contractor shall have successfully completed testing of subject facilities, documented the testing, completed all punch list items in regarding to the facilities, completed related as-built drawings, and performed cleaning of facilities, as applicable.

1.8 RISCAL COMPLETION

A. Variations in Quantities: The final payment estimate cannot be prepared until the Contracting Officer and the Contractor have reached final agreement on all quantities of unit price items. All variations between individual contract quantities, as adjusted by contract modifications, and the final measured or calculated quantities may be subject to the General Provisions Paragraph “VARIATIONS IN ESTIMATED QUANTITIES”.

B. A contract modification is not necessary for any variation in an estimated quantity when the Contractor and the Contracting Officer agree that the actual quantity is equitably paid by application of the contract unit price and there is no change in contract time. However, a modification summing-up all overruns and under-runs is required before final payment.

C. Deliverables: The final payment cannot be issued until the Contracting Officer is satisfied that the following contract deliverables have been received in full compliance with the contract:

1. Record documents submitted as specified in Section 01785, “Project Record Documents”. Including required certification of Record (As-Built) Drawings and Specifications.

2. Tabulation of Tests, test reports, and other QC documents.

3. Final as-built progress schedule (if required by contract).

4. Operation and Maintenance Manuals and Training.

5. Warranties and guarantees.

6. Certificates of inspection and acceptance of relocation, modifications, and new work performed have been obtained from utility companies, public agencies, and others.

7. Spare parts, maintenance materials, keys, special tools, testing equipment, and required surplus material.

9. If performance bond is in place, letter from bonding company regarding warranty provision (if required by contract).

10. Final payroll documents and certifications.

11. Completed Storm Water Pollution Prevention Plan (including Notice of Termination).

D. Claims and Changes: Before the final contract amount can be determined and the final payment made, all changes shall be negotiated and finalized by contract modification. All outstanding claims shall be identified.

1.9 FINAL ACCEPTANCE

A. Recommendation for Final Acceptance: Refer to General Provisions Paragraph “FINAL ACCEPTANCE”. When the Contractor considers that all portions of the contract are in complete conformance with contract requirements, Contractor shall request that the Contracting Officer prepare a letter to the Authority recommending final acceptance and payment.

B. Closeout Package: The following items will be transmitted to the Contractor. The Contractor shall complete applicable items and return to the Contracting Officer.

1. Final Acceptance Letter

2. Contractor’s Affidavit of Payment of Debts and Claims

3. Contractor’s Affidavit of Release of Liens

4. Contractor’s Release Form

5. Consent of Surety Company to Final Payment

C. Contractor’s Releases: In accordance with the contract, the Contractor shall submit an affidavit that all applicable bills have been paid, thereby releasing the Authority from all claims arising by virtue of the contract, other than any claims specifically stated on the Contractor Release Form. Fiscal close-out of the contract will not necessarily be delayed pending decision on claims that are before the Authority.

D. Final Payment: After completion of the foregoing requirements, the Contractor shall prepare the final pay application.

PART 2 - PRODUCTS

Not Used.

PART 3 - EXECUTION

Not Used.
PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 01001, “General Requirements”

END OF SECTION 01770
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes specifications for preparation, maintenance, completion, and submission of project "as-built" drawings, specifications, and related documents for record purposes as required.

1.2 REFERENCED STANDARDS

A. Institute for Electrical and Electronic Engineers (IEEE)

B. Dallas Area Rapid Transit (DART)
   1. DART Light Rail Project Design Criteria Manual – Volume III: Drafting (CADD) Standards (DART CADD Standards)

1.3 SUBMITTALS

A. Contractor shall submit the following sets for approval by the Contracting Officer prior to final payment for the contract.
   2. Working (As-Built) Specifications: original markup.
   4. Record (As-Built) Specifications: original markup.
   5. Record Shop Drawings Including Product Data.
   6. As-Built Survey.

B. Submit the following record documents prior to substantial completion:
   1. Record Sample Submittal.
   2. Miscellaneous Record Submittals.

1.4 MAINTENANCE OF RECORD DOCUMENTS

A. Maintain at the jobsite 1 copy of the following documents for record purposes:
   1. Conformed Contract Documents. One set of prints and specifications (Working (As-Built) Drawings and Specifications) shall be maintained for recording "as-built" revisions and special features.
   2. Changes.
   3. Approved Shop Drawings including product data.
   4. Clarifications or Explanatory Details and Specifications.
   5. Inspection Reports.
   7. Field Test Reports and Records.
   8. Inspection Tags: Mount “green” inspection tags on 8-1/2 inch by 11 inch paper, identify as to item that was inspected, and submit a copy as they are received in the field.

B. Store documents used for record purposes in the Contractor’s field office or other approved location, apart from documents used for construction. Do not use record documents for construction purposes. Protect from deterioration in a secure fire and heat-resistive location.

C. Provide files and racks for storage of documents.

D. Maintain documents in clean, dry, legible condition.

E. Label each document “as-built” or “Record Documents” as appropriate.

F. Provide access to Working (As-Built) Drawings and Specifications for the Contracting Officer’s inspection during normal working hours

1.5 WORKING (AS-BUILT) DRAWING SET

A. Maintain at the job site, a current working (blueline or blackline) set of as-built drawings, reflecting any and all changes, revisions, clarifications, and actual field conditions to date. The Authority will accept in-progress drawings based on redlines or CADD electronic files for review and certification of ongoing preparation and maintenance of as-built documents.
B. Contractor shall maintain an index to the drawing set which shall be manually updated upon receipt of revised drawings. This index shall show, at a minimum, the drawing number, revision number, sheet number, and any drawings deleted. Revised drawings shall be inserted into the working set immediately. The working set shall be maintained in current construction status as the project progresses.

C. For preparation and maintenance of the working set, the Contractor shall physically and legibly draw or mark on the most recent design-issued drawing revision with dark pencil to fully and accurately record the permanent construction as actually made and shall include to the following specific items.

1. Transfer all construction identification information, dimensions, and materials from RFI's, clarifications, field adjustments, and revisions.

2. Include only those RFI's that change locations or dimensions of the work on the working and record as-built sets. Clarification RFI's which do not change what is indicated on the plans shall not be noted on the drawings.

3. Field changes of facility dimension and detail not otherwise recorded by contract change or modification drawings.

4. Give particular attention to concealed work that would be difficult to measure and record at a later date. No work shall be permanently concealed until the required information has been recorded and verified by the Contracting Officer.

5. Show underground utilities by station and offset, not real world coordinates. Reference buried and concealed piping underground services and utilities to permanent construction or permanent surface control points. Record concurrent with actual installation complete plan and profile information (including layout geometry adequate to reestablish the locations and depths of the new and existing man-made improvements, list of fittings, material types and sizes) of utilities. Include changes of direction and elevations of utilities.

6. Dimension locations of all concealed appurtenances from visible accessible features of structures.

7. Show as-built information for each utility on the contract drawings for that particular utility only. As-built conditions for a utility shall not be shown on other utility drawings. In other words, as-built conditions for water lines will be shown on water line drawings, but shall not also be duplicated on electrical or communications drawings where the waterline might also be shown. Utility composite drawings shall not be marked with as-built conditions. These drawings shall be annotated to refer to specific utility drawings for as-built conditions for a particular utility.

8. Where the Contract Drawings are not of sufficient size, scale, or detail, the Contractor shall furnish its own drawings for incorporation of details and dimensions.

9. Nomenclature and labels shall correspond to actual labels on installed equipment.

10. Each connection to each piece of equipment, junction box, or terminal block shall be identified by function and color code.

11. Dimensions, physical details, connections, and other information pertinent to system diagnostics, maintenance, or troubleshooting shall be shown.

D. Incorporate Request for Information (RFI’s) responses when a design-issued drawing revision has not been received, is not required or is not appropriate at the time of receipt of the RFI response:

1. If an RFI affects a drawing, the information shall be transferred to the Working (As-Built) Drawing set.

2. If an RFI response is too extensive to be drawn on the face of the drawing:
   a. The area affected by the change shall be clouded and reference made to the specific RFI on the face of the drawing.
   b. This shall be supported by a legible copy of the RFI, with the RFI number clearly shown, copied onto a full-size (22 inches by 34 inches) sheet of paper. This copy will be inserted directly behind the affected drawing, followed by sequential character, (i.e., 250a, 250b) until all inserted pages affecting the specific drawing are included.

3. If an RFI affects more than one drawing, the change shall be drawn on the face of each drawing affected or a legible copy of the RFI shall be inserted behind each drawing so affected. The copies will bear the appropriate page number(s).

4. The information changed by the RFI response may appear in a later design-
issued drawing revision, if appropriate. Until that time, the Contractor will continue to carry the RFI response information forward on later revision(s) of the drawing.

E. Sketches: Incorporate a sketch provided with an approved and issued contract change in the following manner:

1. The information changed by the use of the sketch will be included in the next revision of the specific drawing issued by the Authority.

2. In all other respects, sketches shall be incorporated into the as-built drawing in the same manner as RFI response specified above. The only difference being that the contract change number shall be referenced on the face of the drawing, instead of the RFI number.

3. If a copy of the sketch is attached, it shall be legible and shall show the originating change number.

F. When a design-revised drawing is received, the Contractor shall verify that it is complete and accurate to date for design changes, including RFI and sketches used during construction.

G. Upon approval of the contents of the as-built set by the Contracting Officer, the Contractor shall transfer the as-built information to the record vellum copy as provided in Article entitled “Record (As-Built) Drawing Set” herein.

H. Contractor shall submit current original Working (As-Built) Drawings to the Authority as electronic files.

1. The files shall be digital electronic Computer Aided Design and Drafting (CADD) files created by Bentley Systems, Inc., use most current version of MicroStation software.

2. Digital electronic CADD files shall be created in compliance with the most current version of the Authority’s CADD Standards.

3. Digital electronic CADD files shall be provided to the Authority on CD ROM disk or DVD and each CD ROM or DVD shall:
   a. Be provided in a protective cover.
   b. Have an exterior label.
   c. Contain an index of the CD ROM OR DVD’s contents that lists each file name along with a file description.

d. PDF’s of the drawings shall be included and all PDF’s, electronic CADD files and hard copies shall match one another.

4. The electronic files shall be named using the accepted naming convention specified in the current DART CADD Standards.

1.6 RECORD (AS-BUILT) DRAWING SET

A. At Notice to Proceed (NTP), the Authority will provide a vellum set of drawings for the Contractor’s use for reproduction, as well as for final submittal of Record (As-Built) Drawing deliverable. As contract changes occur and drawings are revised, the Authority’s Configuration Management Section (through the Contracting Officer) will provide vellum copies of the associated drawings to the Contractor for placement in the vellum set. The superseded vellum shall be pulled from the set and retained for record purposes.

B. Contractor shall maintain a full size vellum set of Contract Drawings in clean, undamaged condition.

C. Contractor shall use prints of the full-size drawings for its Working (As-Built) Drawing set and shall transfer the information from the Working (As-Built) Drawing set to the full-size Record (As-Built) Drawing set (vellum) for final delivery to the Contracting Officer.

D. Contractor shall mark with black ink (preferred) or dark pencil to show actual installations which vary from the work as shown on the latest design-issued revision, clouding the area(s) affected and assigning the next sequential revision number for each drawing to identify it as the record (as-built) submittal. The revision number shall appear in three places on a drawing:

   1. In the revision description block, lower left-handed corner, by assigning the next sequential number for the specific drawing. In the description area, indicate “Record (As-Built) Submittal” and enter the appropriate date.

   2. In the revision number block, lower right-handed corner, by lining through the current revision number and entering the same number on each drawing as entered in Paragraph 1. above.

   3. On the face of the drawing, by each cloud or connected to each cloud by leader lines.

E. Contractor shall update the index to reflect the actual contents of the Record (As-Built) Drawing set to accurately reflect the contents therein, by drawing number, revision number, and sheet number. Any drawings that have been deleted shall be so indicated on the index.
F. Each cover sheet, index sheet and drawing sheet in the Record (As-Built) Drawing set shall be stamped with a Contractor-provided certification stamp worded exactly as in Figure 01785-1 and sealed and signed by a Professional Engineer registered in the State of Texas.

G. The cover and index sheets shall be signed by an officer of the Contractor’s organization, certifying compliance with the as-built conditions.

H. Organize record (as-built) drawing sheets into manageable sets; bind with durable paper cover sheets; print suitable titles, dates, and other identification on the cover of each set.

I. Contractor shall submit Record (As-Built Drawings to the Authority as electronic files.

1. The files shall be digital electronic Computer Aided Design and Drafting (CADD) files created by Bentley Systems, Inc., use most current version of MicroStation software

2. Digital electronic CADD files shall be created in compliance with the Authority’s CADD Standards.

3. Digital electronic CADD files shall be provided to the Authority on CD ROM OR DVD and each CD ROM OR DVD shall:
   a. Be provided in a protective cover.
   b. Have an exterior label.
   c. Contain an index of the CD ROM OR DVD’s contents that lists each file name along with a file description.
   d. PDF’s of the drawings shall be included and all PFR’s, electronic CADD files and hard copies shall match one another.

4. The electronic files shall be named using the accepted naming convention specified in the current DART CADD Standards.

5. Contractor shall provide 1 set of electronic files for sheet files (drawings) and 1 set of electronic files for reference files. The electronic, MicroStation files must match the hard copy submitted to the Authority. The electronic, MicroStation files will not be accepted. PDF’s of the drawings and specifications will also be submitted with the electronic CADD files.

6. During the progress of the Work, maintain 1 electronic copy and 1 hard copy of the latest annotated source code of software and application.

1.7 WORKING (AS-BUILT) SPECIFICATIONS

A. During the progress of the work, maintain at the job site a current working copy of the Specifications reflecting current construction status for Contracting Officer’s review, including Amendments Addendums, contract changes, and RFI’s that affect the project and are not for clarification only and similar modifications issued in printed form during construction. Maintain Working (As-Built) Specifications in 1 or more large-ring, 3-ring binder or binders.

B. Contractor shall markup in dark pencil variations in the actual work in comparison with the text of Specifications and modifications, selection of option, and similar information on work where it is concealed or cannot otherwise be readily discerned at a later date by direct observation. Note, related working (as-built) drawing information where applicable.

C. Record information, changes, and notes in the specifications in blank areas, such as page margins or the backs of opposite pages, or on separate sheets inserted in the binder.

D. In applicable specification sections, record the manufacturer, trade name, catalog number, and supplier of each product and item of equipment actually furnished and installed.

E. The record specifications shall be complete and shall include all applicable Contract Documents other than drawings.

F. Contract Changes:

1. Contract Changes shall be incorporated into the front of the record specifications in reverse chronological order. Use appropriate page dividers to identify Contract Changes and to separate Contract Changes from the Specifications.

2. In addition, changes to the Specifications effected by Contract Change shall be annotated on the affected page or pages of the Specifications or adjacent thereto.

G. Upon completion, transfer the current information to the Record (As-Built) Specifications copy as directed in Article entitled “Record (As-Built) Specifications”.

1.8 RECORD (AS-BUILT) SPECIFICATIONS

A. Contractor shall use the Working (As-Built) Specifications and transfer the information to the Record (As-Built) Specifications, using black ink for final delivery to the Contracting Officer.

B. Contractor shall update the table of contents to reflect the actual contents of the Record (As-Built) Specifications to accurate reflect the contents
therein by section number. Any sections that have been added or deleted shall be so indicated on the table of contents.

C. The cover and table of contents pages shall be signed by an officer of the Contractor organization, certifying compliance with the as-built conditions.

D. Organize Record (As-Built) Specifications into manageable binders; print suitable titles, dates, and other identification on the cover of each binder.

1.9 OTHER RECORD SUBMITTALS

A. Record Shop Drawings Including Product Data: During the progress of the Work maintain 1 copy of each shop drawing and product data submittal, and mark-up variations in the actual Work in comparison with the submitted information. Submittals shall be clearly revised, completed, and brought up to date, showing permanent construction as actually made. Include both variations from the manufacturer's instructions and recommendations for installation. Give particular attention to concealed products and portions of the Work that cannot otherwise be readily discerned at a later date by direct observation. Note related Changes and mark-up of Record (As-Built) Drawings and Specifications. Upon completion of mark-up, submit complete set to Contracting Officer for record.

1. One complete full-size set of approved Shop Drawings, including manufacturers' printed catalog cuts and data, shall be collected and maintained for record purposes. Maintain in clean, undamaged condition.

2. All pages of catalog cuts shall be clear, legible, and permanent.

3. Shop Drawings shall be filed and maintained separate from Contract Drawings. Shop Drawings shall be filed in 9 inch by 12 inch file folders to the greatest extent possible and shall be indexed in accordance with the Contract Specifications as herein before specified.

4. Shop Drawings shall be delivered in new boxes as specified in Article entitled “Submission of Documents” herein.

B. Record Sample Submittal: Immediately prior to the time(s) of substantial completion, the Contracting Officer and the Contractor will meet at the Site, and determine which of the submitted samples maintained by the Contractor during the progress of the Work shall be transmitted for record purposes.

C. Miscellaneous Record Submittals: Immediately prior to the time(s) of substantial completion, complete miscellaneous records and place in good order, properly identified and bound or filed, ready for continued use and reference. Submit to the Contracting Officer for record.

D. As-Built Survey: Refer to Section 01722, “Field Engineering – Surveying”, for requirements.

1.10 SUBMISSION OF DOCUMENTS

A. At completion of the Work, and before requesting final inspection, deliver as-builts and record documents to the Contracting Officer.

B. Record documents shall be delivered neatly and efficiently filed and packaged in appropriate file storage cabinets or boxes, 12 inches by 15 inches in size. Boxes shall be type manufactured for file folder storage, shall have covers and cutout handles, and shall be accurately identified as to the contents. Include a packing list of all boxes and their contents. As-built drawings shall be folded correctly, with title block clearly visible on top, to fit neatly in the 12-inch by 15-inch boxes. Record (As-built) Drawings shall not be folded.

C. Submission of record documents shall be accompanied with a transmittal letter, in triplicate, containing the following information:

1. Date of submission.

2. Project title and number.

3. Contractor’s name and address.

4. Title and number of each record document. (Shop Drawings may be grouped in basic categories or divisions of work and by box identification.)

5. Certification that each document as submitted is complete and accurate.

6. Signature of Contractor, or its authorized representative.

1.11 WORKING (AS-BUILT) SOFTWARE AND APPLICATION LOGIC

A. During the progress of the Work, maintain 1 electronic copy and 1 hard copy of the latest annotated source code of software and application logic source code and listings for the Authority’s review. The code and listings shall be kept on site at the Contractor’s Field Office, in 3-ring binders. Code and logic for each process shall be kept in a separate notebook. Electronic copies corresponding to the listing shall be kept in pockets in each of the binders. The contractor shall discuss with DART the software to be used and shall be agreed upon by the Authority and the contractor.
1.12 RECORD (AS-BUILT) SOFTWARE AND APPLICATION LOGIC

A. Contractor shall use the approved Working (As-Built) Software and Application Logic and transfer the information to the Record (As-Built) Software and Application set for final delivery to the Contracting Officer.

B. Contractor shall update the index to reflect the actual conditions of the Record (As-Built) Software and Application set by location name/number and revision number.

C. An officer of the Contractor’s organization, certifying compliance with as-built conditions, shall sign the cover and index pages.

1.13 RECORD SET

A. The following As-Built Software Documentation shall be provided for any software item supplied under this Contract:

1. A Software Design Description (SDD) document:
   a. Contractor shall provide a traditional SDD document in accordance with IEEE 1016.
      1) The Authority may consider a Contractor alternative SDD submittal if the Contractor’s SDD Submittal provides the IEEE 1016 Standard SDD technical content.
      2) The Authority retains the unilateral right to approve or disapprove any Contractor alternate SDD submittal.
   b. The Software Design description shall be submitted in 8.5 inch by 11 inch laser-quality printed format in 1 or more 3-ring binders. A key to the specification method(s) shall be provided with each binder. A table of contents shall be included. Four laser-quality printed copies of the Software Design Description and 2 electronic copies on CD ROM OR DVD shall be provided.

2. Software Version Description Document:
   a. The Software Version Description Document shall be submitted in 8.5 inch by 11 inch laser-quality printed format.
   b. Four laser-quality printed copies of the software Version Description Document and 1 electronic copy on CD ROM OR DVD shall be provided.

   c. Printed copy shall be bound in 1 or more 3-ring binders.
   d. A key to the specification method(s) and a table of contents shall be provided with each binder.

3. Software Listings Document:
   a. Software listings shall be organized consistent with the Software Version description Document and shall describe current inventories and history of all software revisions loaded onto a particular platform.
   b. The Software Listings Document shall be submitted in 8.5 inch by 11 inch laser-quality printed format.
   c. Four laser-quality printed copies of the Software Listings Document and 1 electronic copy on CD ROM OR DVD shall be provided.
   d. Printed copy shall be bound in 1 or more 3-ring binders.
   e. A key to the specification method(s) and a table of contents shall be provided with each binder.

4. Software source code shall be provided in machine readable format, shall correspond to the software listings, and shall be organized consistent with the Software Version Description Document. Four laser-quality printed copies of the machine-readable software source code and 1 electronic copy on CD ROM OR DVD and all tools to view and/or modify the code shall be provided.

PART 2 - PRODUCTS

Not Used.

PART 3 - EXECUTION

Not Used.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 01001, “General Requirements”

B. Refer to Section 01220, “Measurement and Payment”, for submittal of as-built certification with each pay request.
FIGURE NO. 01785-1

Record (As-Built) Certification Stamp

To be used by the Construction Contractor

Record (As-built) Certification

"Having checked this submission, we certify that it conforms to the requirements of the contract in all respects, except as otherwise indicated."

Company Name: __________________________________________
Officer of Firm Signature: __________________________
Date: _________________________________________________
Officer of Firm Name (typed): __________________________
Title of Officer (typed): _________________________________
Seal of Professional Engineer of Construction Contractor, including signature and date, thereby sealing record (as-built) drawings for accuracy of as-built condition reflected herein, must be placed below:

Stamp size shall to be 2” x 4” for full-size drawings and 1-1/2” x 3” for half-size (11” x 17”) drawings. The title of the stamp, company name, and statement regarding sealing shall to be font size 12; all else shall be font size 10.

END OF SECTION 01785
PART 1 - GENERAL

1.1 DESCRIPTION

A. Operation and Maintenance Manuals and training provided under this Section shall provide the Authority’s personnel with the knowledge to operate, maintain, troubleshoot, and repair the installed equipment and systems provided by these Specifications.

B. Provide the following for each make and model of equipment and system installed or modified under this contract:

1. Posted operating and maintenance instructions for installed equipment and systems.

2. Preparation and submission of an Operation and Maintenance Manual(s) for installed equipment and systems hereinafter referred to as the O&M Manual.

3. Operation and maintenance training.

C. Manuals

1. General and specific content requirements for equipment and system manuals required under this Contract can be found in these Specifications.

2. Information to be provided shall include all required information required for the operation, maintenance, troubleshooting, repair, and restore of the equipment and systems.

3. Provide where directed, printed sheets under framed clear acrylic plastic, giving brief, concise operating and maintenance instructions for all items of mechanical and electrical equipment and similar equipment and specialty items, as applicable, at their respective locations.

D. Training Program

1. The Authority will assign supervisory, maintenance, and other personnel to the Contractor's training classes as required, at an Authority location with adequate seating and required lighting.

2. Each training course shall be held on consecutive days, excluding weekends and holidays. Each day’s training shall be for 8 hours, unless otherwise specified. Training schedule shall accommodate all personnel on all shifts. Specific training days and availability shall be coordinated with the Authority at least 2 weeks prior to commencement. Instructors present at the class location shall conduct training.

3. Courses shall include hands-on training. The Authority will provide transportation to the field locations to allow for hands-on training if required.

4. Course instructors shall be certified professional instructors and shall have performed training in similar systems before, and shall be adept in the use of the training and test equipment employed in the training program.

5. The Authority reserves the right unto itself to videotape all training sessions for its own use. Video taped training material will become the property of the Authority and shall not be subject to Contractor copyright protection.

6. In addition to the personnel specified to receive training herein, up to 2 additional personnel may observe and participate on any or all training classes, including hands-on training.

1.2 SUBMITTALS

A. Manuals

1. Refer to Section 01330, "Submittals", for submittal requirements and procedures, “minimum 21 days” to “minimum 30 days” for review.

2. A minimum of 60 days prior to the Contractor's request for final inspection in accordance with Section 01770, “Contract Closeout”, submit to the Contracting Officer 6 complete bound sets of instructions for each equipment and its component parts, including manufacturers’ certificates, warranty slips, parts lists, descriptive brochures, and maintenance and operating instructions, printed on 20-pound bond white paper, for all equipment and systems installed, tabbed and identified for easy reference. Preprinted material, photo copies not acceptable, provided by the manufacturer may be used as provided if approved by the Contracting Officer. All copies of manuals shall be legible with no portions of the text obscured or deleted.

3. Even though the O&M Manual is referred to herein in the singular, provide the Manual in as many volumes as necessary to accommodate all the information needed to complete the Manual. It may be more appropriate to submit certain items
of equipment, such as elevators and escalators, in separate volumes.

4. Defects discovered on review will be indicated in the O&M Manual or otherwise communicated to the Contractor in writing upon return of the O&M Manual set.

5. Within 30 days after receipt of an O&M Manual marked "Approved as Noted – Correct and Resubmit" or "Disapproved", revise the Manual in accordance with the directions for revision and resubmit 6 sets of the revised Manual for review. The Contracting Officer will review and return the resubmitted O&M Manual in the same manner and time as specified above for the original submittal.

6. Within 30 days after receipt of the O&M Manual marked "Approved as Noted - Confirm", revise the Manual in accordance with revisions noted, if any, and furnish 6 sets of the O&M Manual in final form. The original 6-set submittal shall not be considered included in the 8 sets of the Manual in final form. Equipment will not be accepted until the final O&M Manuals are submitted.

7. Final copies of all manuals shall be submitted for Authority approval. Contractor developed manuals shall be provided in an Authority approved machine-readable format, suitable for microfilming. When available, manufacturer manuals and technical data shall be provided in an Authority approved machine-readable format. Final copies of all manuals shall also be provided electronically, in both their native software format and PDF format, complete with any associated appendices.

B. Format: O&M Manual(s) shall include title page, table of contents, and frontispiece; information covering description, installation, operation, preventive maintenance, corrective maintenance, overhaul, parts list, and list of recommended spare parts; and an appendix. Each separate volume shall have a title page, contents page, frontispiece, and other information specified herein.

1. Title Page: Include the name and function of the equipment, manufacturer's identification number, and the Contract Specifications number and title.

2. Table of Contents: List sections and subsection titles of the O&M Manual with reference to the page on which each starts and a list of included drawings.

4. Print Operation for O&M Manuals: Print O&M Manuals on high quality gloss paper, oil resistant with mylar reinforced binding. Pages shall be 8-1/2 by 11 inches in size or folded to that size, and placed in a 3-ring binder. Reduce drawings included with manuals to 11 inches by 17 inches and fold to open cut clear of the main text. Each binder shall not be filled more than 2/3 of its capacity. Bind each manual of each set in a heavy-duty 2 inch, 3-ring vinyl-covered binder and include pocket folders for folded sheet information. Mark identification on both the front and spine of each binder. Photo copies not acceptable.

C. Training Plan: Contractor shall submit 6 copies of the complete training plan, at least 60 days prior to the scheduled start of the course for Authority approval. The training plan shall include the following information:

1. Proposed schedule for each course, including syllabus for training and lesson plan

2. Resumes of personnel proposed to be instructors for each course

3. Statement of the purpose of the training

4. Overview of the subjects to be covered in each course

5. Overview of the hands-on experience to be included as part of each course

6. List of the manuals, As-Built Documentation, and other printed materials to be utilized as training aides

7. Description of the pre-requisite knowledge for each course

D. Training Course Program: Contractor shall submit 6 copies of the complete program for each course, at least 60 days prior to the scheduled start of the course for Authority approval. Each training program shall contain the following information:

1. Detailed outline of the material to be covered in the course and the duration in hours of the training for each topic

2. Course scheduling plan to cover all shift personnel.

3. Copies of all visual aides, manuals, As-Built Documentation, and other printed materials to be used during the course.

4. Detailed descriptions of the procedures to be performed by students during hands-on
training, including test equipment to be used.

5. Specific pass/fail criteria for the course, including a sample test, and a statement of the knowledge and skills students should possess at the conclusion of the course.

6. Instructor Evaluation Survey

E. Training Materials: Contractor shall deliver all training materials to the Authority 5 days prior to the commencement of the associated training class.

1. Delivery location of associated materials shall be coordinated with the Authority personnel.

2. Sufficient copies shall be provided to accommodate all class attendees as well as auditors.

3. The Authority reserves the right to duplicate all training material to accommodate additional personnel.

4. Additional personnel may be added to the attendance roster at no additional cost to the Authority.

PART 2 - PRODUCTS

2.1 MANUALS FOR INSTALLED EQUIPMENT AND SYSTEMS

A. Contractor shall provide new custom manuals for each piece of equipment and system provided under this Contract.

B. General requirements in addition to those specified in other sections of this contract include:

1. Manufacturer’s standard O&M Manuals, documentation, and configuration software, as applicable, provided with each furnished equipment and system.

2. Manufacturer’s Contact Information

3. Manufacturer’s Basic Product Information, including:

   a. Literature describing each piece of equipment, including drawings and diagrams, physical function description of the equipment, major assemblies and subassemblies, and giving manufacturer’s model number and drawing number.

   b. Catalogue cut sheets, illustrated parts list and parts breakdowns.

4. Prior to final acceptance, Contractor shall obtain a letter addressed to the Authority from each manufacturer of major equipment and systems stating the Authority will be informed of manufacturer’s revised operations and maintenance recommendations, callbacks, availability of new software, and similar items in regard to the equipment and systems provided under the Contract.

   a. All manufacturers’ revisions shall submitted no later than 60 days following such revision. Such revisions shall be issued by replacement pages to the final O&M Manual, or by reissue of the O&M Manual, at the Contractor’s Option.

5. Safety Procedures and Precautions

   a. Ensure safety procedures and precautions are included by using a standard highlighting method.

   b. Include procedures and precautions required to prevent damage to equipment, injury to personnel, or unsafe operational conditions.

2.2 O&M MANUALS GENERAL REQUIREMENTS

A. Organize O&M procedures in such a manner that all required preventive maintenance activities be accomplished without interference with operations. Emphasize in these procedures accessibility, ease of equipment or component removal and replacement, visual indications of component deterioration, and localization of failures.

B. Identify O&M tasks including recommended periodic maintenance, precautions to be observed during maintenance work, degree of on-line repairs, numbers, qualifications and skills of personnel, special tools and test equipment, and estimates of maintenance time.

C. Prepare O&M manuals providing detailed instruction for the operation of each installed equipment and system condition; maintenance and safety actions required to ensure the operational requirements of the systems or item of equipment. Identify any safety markings, tags or similar identifiers to be maintained on any equipment.

D. Prepare O&M manuals with vendor instructions and data covering the O&M of individual equipment and system provided. Include all configuration and software documents or CD-ROM or DVD’s supplied with the equipment. Use this data as the training material for the individuals tasked to operate the installed equipment and
E. Include in the manuals system-level step-by-step O&M procedures to be performed by journeyman operators or technicians, and provide the following elements, as required:

1. Equipment Description: Complete description of all systems with shop drawings, data sheets, bill of materials, flow, emergency instructions, spare parts listing, warranties, guarantees, wiring diagrams, recommended turn-around cycles, control and electrical circuit and wiring diagrams.

2. Installation Instructions: Installation instructions shall cover pre-installation inspection, installation, testing, and calibration; and preparation for operation, both for initial installation and for installation after overhaul.

3. Operation Information: This information describes the system operation, including operating parameters, interfaces with other systems, major equipment, and their physical and operating characteristics. The information shall also include performance specifications and operating limitations.

4. Pre-operation Checkout: Include the required steps or tasks to completely check out the system and prepare it for operation following a shutdown condition.

5. Operator’s Instructions: Operator’s instructions shall cover startup, shutdown and all procedures required to ensure safe operation. Repeat these instructions in a durable printed notice and mount in the operator's area.

6. Preventive Maintenance: Describe all maintenance to be performed on a periodic basis, e.g., cleaning, lubrication, adjustments, inspection, calibration, voltages and amperage. Prepare scheduled maintenance checklists for each unique type of maintenance significant equipment. Submit the checklists to the Authority approval prior to implementation.

7. Maintenance Information: Describe all maintenance instructions, step-by-step, that can be performed on installed equipment, including adjustments, repair, overhaul, disassembly, reassembly, replacement, and repairs that can be performed. A list of special tools which are required for the maintenance shall be included with the maintenance information.

8. System Restore: Describe step-by-step procedures for complete system restore in case of a catastrophic failure. Identify any specific tools required for system restore. Provide details of all user configurable settings for each piece of equipment.

F. Logistics Data:

1. Provide a logistics plan of O&M, including the required data on requirements for O&M logistics, support and procedures. Logistics plan shall include the following:
   a. Identification of the extent to which preventive maintenance is performed on installed equipment as opposed to corrective maintenance performed at a maintenance facility.
   b. Identification of equipment requiring special handling or unique maintenance procedures.
   c. Determination of procurement lead times based on total order and shipping time to site for critical equipment and spares, and minimum and maximum inventory requirements.
   d. Identification of O&M personnel skills levels.
   e. Identifications of training requirements.
   f. Formulate and recommend operating rules for personnel.

2. Vendor Data: Submit the following types of data and incorporate in the O&M manuals:
   a. Manufacturers' brochures, catalogs, charts, performance curves, service and parts bulletins.
   b. Complete vendor list for each system subassembly.
   c. Installation: Parts breakdowns, drawings and service instructions, removal and installation procedures.
   d. Operations: Standard and emergency operating procedures, hazards from unsafe operations, emergency release/stop functions.
   e. Preventive maintenance and inspection requirements and procedures including cleaning.
instructions, special tools and test equipment
f. Shop drawings and other special drawings such as wiring diagrams, system schematics, assembly drawings, and inter-connection wiring diagrams.
g. Performance data, e.g., maximum, minimum, and recommended speeds, capacities, voltage, amperage, wattage, temperatures, and other related operating information.
h. Disassembly and assembly procedures
i. Calibration instructions, including points of application, frequency, method of calibration, and special tools required.
j. Troubleshooting procedures.
k. Repair and overhaul instructions.
l. Include industry or generic part numbers with component parts.
m. Special tools and test equipment.

3. Special Tools and Test Equipment:
Provide a list of special tools and test equipment for each equipment item, including tools and equipment designated specifically for use with the item, or usual tools and equipment required for operation maintenance of the items but not normally available to maintenance journeyman. Include following data on the list for each item:

a. Nomenclature
b. Purpose
c. Manufacturer's part number or drawing number
d. Manufacturer's name and address
e. Quantity recommended by manufacturer
f. Unit price
g. Recommended source of supply
h. Estimated lead-time

4. Parts and Spare Parts List: Coordinating with the requirements of this section and requirements specified in Section 01790, “Spare Parts and Maintenance Materials”, provide a complete parts list and a list of recommended spare parts. For each item include the following data:

a. Manufacturer’s parts numbers and catalog item numbers if applicable, for identifying parts.
b. Contact information, name, address and telephone number(s), for both Manufacturer and local vendor of parts.
c. Parts or assemblies obtained from another manufacturer shall be identified by the name of that manufacturer and its identifying part number.
d. Size, capacity, and other characteristics of each part shall be provided as required for identification.
e. Include prices for all recommended spare parts.

PART 3 - EXECUTION

3.1 SUPERVISOR FAMILIARIZATION AND OPERATIONS TRAINING REQUIREMENTS

A. Contractor shall develop and provide Familiarization and Operations Training thoroughly describing the installed equipment and systems under this contract.

B. Personnel and Course Composition

1. Training shall consist of at least 2 classes, each class designed for 3 operational personnel supervisors, 3 maintenance personnel supervisors, and 2 auditors [16 total personnel]. Each class shall be at least 8 hours in length, unless otherwise Authority approved.

2. Auditors shall be provided the same class materials, handouts, and access to the instructor, hands-on activity or demonstration as class participants.

C. Training Goals: The goal of the Initial Familiarization and Operations Training is to provide the Authority's O&M supervisors with a high-level understanding of the installed equipment and systems sufficient for the supervisors to perform the following functions:

1. Assign maintenance personnel required for routine maintenance and troubleshooting.
2. Assist maintenance personnel with use of manuals and As-Built Documentation.

3. Evaluate actual system performance vs. intended system performance.

4. Coordinate with equipment manufacturers support personnel for obtaining warranty support and troubleshooting support.

3.2 TECHNICIAN FAMILIARIZATION AND OPERATIONS TRAINING REQUIREMENTS

A. Contractor shall develop and provide Familiarization thoroughly describing the installed equipment and systems under this contract.

B. Personnel and Course Composition

1. Training shall consist of at least 2 classes, each class designed for 12 maintenance technician personnel and 2 auditors for a total of 28 total personnel. Each class shall be at least 16 hours in length, unless otherwise Authority approved.

2. Auditors shall be provided the same class materials, handouts, and access to the instructor, hands-on activity or demonstration as class participants.

C. Training Goals: Initial Familiarization and Operations Training goal shall be to provide the Authority's O&M technicians with a high-level understanding of the installed equipment and systems, sufficient to perform the following functions:

1. Perform routine maintenance and troubleshooting.

2. Identify single points of failure and restore the affected subsystem in case of a catastrophic failure or incident.

3. Become familiar with the use of manuals and As-Built Documentation.

4. Test and evaluate actual system performance vs. intended system performance.

5. Coordinate with equipment manufacturers support personnel for obtaining warranty support and troubleshooting support.

3.3 OTHER O&M TRAINING REQUIREMENTS

A. Personnel and Course Composition: Training shall consist of at least 2 classes, each class at least 16 hours in length, and shall support up 12 technician personnel and 2 auditors in each class.

B. Course Goals: Each training course shall provide maintenance personnel with the knowledge and skills required to:

1. Gain a thorough understanding of the operation of the equipment.

2. Gain familiarity with the specific components and their role.

3. Gain familiarity with drawings and other design and installation documentation.

5. Be adept at using all tools, test equipment and built-in diagnostics and monitors.

6. Be adept at performing preventative maintenance.

7. Be adept at identifying the root cause of a subsystem failure and restoring the affected subsystem in the event of a catastrophic failure or incident.

8. Gain familiarity with the equipment or systems safety procedures and the potential for creating unsafe conditions during operation or maintenance.

PART 4 – MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this Section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith shall be considered incidental to the Work specified under Section 01001, “General Requirements”.

END OF SECTION 01786
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes specifications for the furnishing and delivering of the spare parts and maintenance materials specified in the various sections of these Specifications as necessary to maintain the equipment and provide for emergency repairs for two years after the date of Acceptance of the Work by the Authority.

B. This Section also includes providing all keys, special tools, and test equipment required to access, start, operate, monitor, maintain, and repair the equipment.

C. Various specific and detailed requirements for parts lists, spare parts lists, spare parts, maintenance materials, keys, special tools, and test equipment are specified in the individual Sections of these Specifications, as applicable, and in the Contract Specifications.

D. Coordinate the work of this Section with the work specified in Section 01786, “Operation and Maintenance Instructions”, for Spare Parts Lists.

E. Keys for finish hardware are specified in Contract Specifications Section 08710, “Door Hardware”.

1.2 SUBMITTALS

A. General: Refer to Section 01330, “Submittals”, for submittal requirements and procedures.

B. Spare Parts Lists:

1. Prepare a form listing of recommended spare parts on a Recommended Spare Parts List (RSPL) for each individual piece of equipment that is of a maintenance significant nature.

   a. Examples of Spare Parts are:

      1) One each of every lamp used in each light fixture
      2) One each of every type of circuit breaker or fuse used in electrical panelboard or fusible disconnect switches
      3) Recharge kit for chemical ground rods
      4) Required tools for maintaining electrical equipment
      5) Spare keys for unlocking electrical panels or cabinets

b. The equipment that each spare part is associated with shall be clearly noted.

2. Evaluate parts listed on the RSPL and advise the Contracting Officer of the Spare Parts quantities (minimum/maximum) required for a 24 month operation period (this period starts at the date of final acceptance). Base the evaluation upon the schedules shown, vendor data, interchangeability between sets, remote location of the Worksite and Operations and Maintenance (O&M) analysis to support maintenance of systems. Show a zero requirement in the minimum/maximum columns when none is required for any listed item. Indicate manufacturing lead time required for major items in RSPL that are critical to operation. The schedules show minimum required spare parts. Incorporate these quantities into the RSPL submittal to the Contracting Officer.

3. Use the RSPL form in submitting other spares requirements such as consumables, furnishings, tools, and materials to the Contracting Officer for approval.

4. Purchase spare parts designated by the Contracting officer from the Spare Parts Allowance. Spare parts shall be billed at the invoiced cost from the supplier.

5. The Spare Parts List shall be organized in accordance with the Contract Specifications, by Section number and title.

   a. The Spare Parts List shall include the part’s generic name or description, its trade name, Contractor’s part number, manufacturer’s name, manufacturer’s part number, retail price, quantity, and correlation with the pertinent Contract Specifications, Contract Drawings, and Maintenance Manuals specified in Section 01786, “Operation and Maintenance Instructions”.

   b. Spare parts shall be grouped by equipment category. Replacement parts common to more than one category shall be cross-referenced and indexed. Such common parts shall have only one part number.
C. Maintenance Materials List:
   1. Prepare and submit a complete list of maintenance materials as specified in the various individual Sections of these Specifications, and in the Contract Specifications.
   2. The Maintenance Materials List shall be organized in accordance with the Contract Specifications, by Section number and title. Include the quantities to be furnished.
   3. Where maintenance materials are specified as a percentage of the materials installed, such percentages shall be translated to actual quantities of materials in the Maintenance Materials List.

D. Keys, Special Tools, and Test Equipment List:
   1. Prepare and submit a complete list of the keys, special tools, and test equipment as specified in the various individual Sections of these Specifications, and in the Contract Specifications.
   2. The Keys, Special Tools, and Test Equipment List shall be organized in accordance with the Contract Specifications, by Section number and title.

1.3 SPARE PARTS

A. Requirements:
   1. Provide specific spare parts as specified in the individual Sections of the Contract Specifications.
   2. Spare parts shall be identical to the parts installed in the Work.

B. Quantities: Except when specific quantities are specified in the individual Sections of the Contract Specifications, provide quantities based on reliability requirements, replacement lead time, the Contractor's recommendations, and the following requirements:
   1. Wear: Provide spare parts for components which may be expected to require regular replacement under normal maintenance schedules, such as mechanical parts subject to continuous operation.
   2. Consumability: Provide spare parts for components with a life-expectancy of less than 5 years.

C. One-Time Limited Service: Provide spare parts which normally require replacement after performing their function one time, such as fuses.

4. Long Lead Time: Provide spare parts for components which are not readily available from distributors, such as for custom-fabricated components. Long lead time shall be understood to mean longer than six weeks from receipt of order to delivery.

5. Exchange Assemblies: Provide assemblies which will be exchanged with malfunctioning units for installed equipment, and which must be inventoried as complete assemblies.

C. Spare parts can only be used for repairs during the warranty period with written authorization of Contracting Officer. Spare parts so used shall be replaced at Contractor's expense.

1.4 MAINTENANCE MATERIALS

A. Requirements:
   1. Provide maintenance materials as specified in the individual Sections of the Contract Specifications.
   2. Maintenance materials shall be identical to the materials installed in the Work.

B. Quantities: Provide quantities of materials as specified in the individual Sections of the Contract Specifications.

1.5 KEYS, SPECIAL TOOLS, AND TEST EQUIPMENT

A. Requirements: Provide sufficient keys, special tools and wrenches, and special test equipment and gages as required to access, start, maintain, and repair all the installed equipment, appliances, systems, and assemblies as specified in the individual Sections of the Contract Specifications.

   1. In addition to those tools specified, special tools shall include any tools not readily available from local tool supply vendors.

B. Quantities: Provide quantities of keys, special tools, and test equipment as specified in the individual Sections of the Contract Specifications.

1.6 BAR CODE

A. Spare parts with the manufacturer's or supplier's serial number or other identification shall also be identified with bar codes, coded in accordance with the Authority's Bar Coding System (AIAG Auto
Industry Code 39) or equivalent. The System details will be provided by the Contracting Officer.

1.7 PACKAGING

A. Comply with applicable requirements of Section 01600, "Product Requirements". Spare parts, maintenance materials, keys, special tools, and test equipment shall be securely packaged in boxes, with the boxes clearly labeled as to the contents. Such labeling shall include: location and description of the equipment and the item, complete listing of all items in the box, and the quantity of each item included in the box.

1.8 DELIVERY

A. Ensure that the spare parts ordered are delivered to the Worksite before final acceptance of the facility by the Contracting Officer.

B. Deliver spare parts, maintenance materials, keys, special tools, and test equipment to the warehouse location or locations specified in the Contract Specifications. Provide unloading service at the designated storage location for delivered products.

C. Prepare formal receipts for such delivered products, and have them signed by the authorized Authority Representative at the location. A copy of such receipts shall be submitted to the Contracting Officer for information and record.

1.9 STORAGE

A. Spare parts, maintenance materials, keys, special tools, and test equipment may be stored temporarily at the site of the work in suitable storage facilities until time to deliver these products to the locations designated in the Contract Specifications. Such storage shall comply with the requirements specified in Section 01600, "Product Requirements".

PART 2 - PRODUCTS

Not Used.

PART 3 - EXECUTION

Not Used.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Separate measurement or payment will not be made for work required under this Section except as provided for under the Spare Parts Allowance. Costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

B. Spare parts purchased from the Recommended Spare Parts List will be paid for under the Spare Parts Allowance. Spare parts compensated for under the Spare Parts allowance will not include those specific spare parts specified in individual Sections of the Contract Specifications and subject to the provisions of Article 1.3, Spare Parts, herein. Items purchased under the Spare Parts Allowance will not include maintenance materials specified in individual Sections of the Contract specifications.

END OF SECTION 01790
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes specifications for demolition, removal and disposal of surface and subsurface structures and facilities, including backfilling of excavations and depressions to restore site to final grade.

B. The work shall include the abandonment of utilities to be left in place and removal of pavement, sidewalks, curbs, posts, pole foundations, structural steel and concrete, concrete foundations, fences, walls, utilities, utility structures and other facilities designated to be removed or the removal of which is necessary for the accomplishment of the project as shown on the Contract Drawings and as specified herein.

C. Removal and subsequent restoration of existing facilities are specified in Section 02072, "Removal and Restoration of Miscellaneous Existing Facilities".

D. Clearing and grubbing are specified in Section 02100, "Site Preparation".

E. Track, track ballast and other railroad appurtenances removal are specified in Section 02469, "Track Demolition and Signal Equipment Removal".

1.2 DEFINITIONS

A. Demolition: Complete removal and disposal of existing facilities from areas to be cleared and grubbed and from other areas as shown.

B. Existing facilities: Includes buildings, portions of buildings, sheds, foundations, pavements, sidewalks, curbs and gutters, signs, posts, fences, bridges, abutments, piers, and other structures which may interfere with construction. Also includes utility facilities such as drainage, sewerage, manholes, inlets, and other utility facilities including underground and overhead utility appurtenances.

C. Salvage: Refer to Article entitled "Definitions" in Section 02072, "Removal and Restoration of Miscellaneous Existing Facilities".

D. Selective Demolition: Removal and disposal of portions of existing buildings.

1.3 SUBMITTALS

A. Submit Demolition Plan including procedures and operational sequence, methods and equipment for demolition, removal and disposal of structures and facilities, including salvage if required, for review and approval by the Contracting Officer. Demolition Plan shall include procedures for backfilling and shoring and underpinning, as applicable.

1. Submit copy of request to utility companies owning or agency controlling services and appurtenances affected by demolition work for discontinuance of services along with certificates of severance over an agreed time schedule.

2. Submit demolition permit from the jurisdictional agency or owner.

3. Submit traffic permit from the jurisdictional agency for transport of debris.

4. Submit permit for disposal of debris.

5. Submit written releases from each owner of property where demolition debris will be deposited absolving the Authority of responsibility in connection with such disposal. Submit releases at least 15 days prior to disposal. Releases shall be signed by owners of property on which material will be deposited.

6. Submit proposed rodent control program.

1.4 REGULATORY REQUIREMENTS AND PERMITS

A. Comply with codes and regulations of jurisdictional authorities.

B. The Contractor shall obtain special permits and licenses and give notices required for performance and completion of the demolition and removal work, hauling, and disposal of debris.

1.5 JOB CONDITIONS

A. The Authority assumes no responsibility for the condition of the existing structures to be demolished.

B. Utilities: Arrange with the appropriate utility owner for the removal, rerouting, or capping of utility and comply with its regulations.
C. Maintenance and Control of Traffic

1. Incorporate arrangements for maintenance and control of traffic as required for demolition work including road closures and hauling of debris in Traffic Control Plan as specified in Section 01570, "Maintenance and Control of Traffic". Execute Traffic Control Plan and perform other measures as required to maintain and control traffic.

2. Keep traffic areas free from debris and spillage of materials.

D. Protection and Restoration:

1. Prevent damage to above and below ground pipes, conduits, wires, cables, and structures which are not designated for removal. Repair or replace damaged items.

2. Provide protective devices as specified in Section 01500, "Temporary Facilities and Services".

3. Provide safe passageways for the public around the demolition area and conduct operations to prevent injury to the public and damage to adjacent buildings, structures, and other facilities.

4. Protect sidewalks, utilities, streets, and facilities adjacent to the work from damage caused by settlement, lateral movement, undermining, washout, and other hazards created by demolition operations. Do not leave sidewalks, utilities, streets, and facilities adjacent to the work in a dangerous condition as a result of the demolition operation.

5. Maintain, support and restore utilities in accordance with Section 02760, "Maintenance, Support, and Restoration of Existing Utility Facilities".

6. For Selective Demolition inside buildings, construct dustproof partitions to separate areas where dirty or dusty operations are performed. Protect walls and floors with suitable coverings when necessary.

E. Below Grade Conditions:

1. Drawings and related documents may represent surface and subsurface conditions at the site and adjoining areas. The known surface and subsurface conditions are as indicated, and shall be compared with actual conditions before commencement of work.

2. Existing utilities and drainage systems below grade are located from existing documents and from surface facilities such as manholes, valve boxes, area drains and other such surface fixtures. It is the responsibility of the Contractor to verify existing utilities prior to demolition.

3. If existing active services encountered are not indicated or otherwise made known to the Contractor and interfere with the permanent facilities under construction, immediately notify the Contracting Officer in writing, requesting instructions on their disposition. Take immediate steps to ensure the services provided is not interrupted, at no additional cost to the Authority and do not proceed with the work until instructions are received from the Contracting Officer.

4. Thicknesses of existing pavements are from previous construction documents, and do not imply the actual depth or thickness of the total pavement or base material, where it occurs. Remove pavement of whatever thickness as required, at no additional cost to the Authority.

F. Environmental Protection: In accordance with Section 01560, "Environmental Protection".

PART 2 - PRODUCTS

2.1 MATERIALS

A. Materials used for backfill shall conform to the requirements of Section 02220, "Grading, Excavating and Backfilling".

B. Controlled Density Fill (CDF):

1. Controlled Density Fill (CDF): Mixture of Portland cement, fly ash, aggregates, water and admixtures, which have been batched and mixed. Use CDF for inplace abandonment of utilities.

2. Proportions: For one cubic yard. Batch weights may vary depending on specific weights of aggregates.

   a. Maximum Gallons of Mixing Water per Cubic Yard: 40

   b. Lbs. of Cement per Cubic Yard: 80

   c. Lbs. of Fly Ash per Cubic Yard: 300
d. Lbs. of 3/4 Inch Coarse Aggregate per Cubic Yard: 1400

e. Lbs. of Sand per Cubic Yard: 1400

3. Batch CDF to provide a flowable, non-segregating mix, with a 5 to 8 inch slump. Provide CDF with a minimum compressive strength of 300 psi

4. CDF mixture different than the above proportions may be submitted by the Contractor to the Contracting Officer for approval.

PART 3 - EXECUTION

3.2 BUILDING DEMOLITION

A. Buildings:

1. Demolish buildings in place, unless otherwise approved by the Contracting Officer.

2. Demolish in an orderly and careful manner, as required to accommodate new work, including that required for connection to existing features. Protect existing structural members. Refer to Section 01731, “Cutting and Patching”, for additional requirements.

3. Perform demolition in accordance with applicable rules of the jurisdictional agency.

4. Rebuild and repair demolition performed in excess of that required at Contractor’s expense.

B. Undertake rodent control and extermination program in demolition areas.

C. Unless otherwise shown, take possession of and dispose of building materials, fixtures, and equipment in, attached to or belonging to, buildings and structures to be demolished.

D. Party Walls:

1. Where building wall being demolished is a party wall with another building not to be demolished, prevent damage to other building, and avoid interference with its occupants.

2. Restore and waterproof exposed party walls in accordance with applicable building code for exterior walls of particular type of construction involved.

3. Effect remedial measures for anchoring, bracing, or buttressing so that existing party walls do not become unsafe and dangerous because of demolition operation. If such work does not correct unsafe or dangerous conditions, remove and replace wall and perform necessary work to properly enclose structure that is to remain standing, at no cost to the owner of such property.

E. Cellars and Foundations:

1. Break concrete and masonry cellar floors into pieces or, where approved, punch holes of not less than one-square-foot area through full thickness of floor approximately at 10 foot centers.
2. Remove wooden cellar floors.

3. Unless otherwise shown, remove foundation and cellar walls 12 inches minimum below final grade.

4. After breaking or removing cellar floors, fill cellar spaces with durable free-draining fill material, consisting of particles no one of which exceeds 8 inches in its greatest dimension. Masonry rubble obtained from demolition work may be used if it meets this requirement. Place fill material in layers each of 8-inch loose maximum thickness, fill voids in each lift with approved, free draining material, compact each layer in accordance with Section 02220, "Grading, Excavating, and Backfilling".

5. Correct subsidence in filled areas by placing and compacting additional fill.

6. The Contracting Officer may waive the requirement to fill cellar voids where cellar structures will be subsequently excavated for construction.

### 3.3 REMOVAL OF PAVEMENTS, SIDEWALK, CURBS, AND GUTTERS

A. Demolish pavement, sidewalks, curbs, and gutters within demolition area shown to underside of pavement and dispose of resulting debris.

B. Fill resulting excavations, holes, and depressions to existing grade or alternative as shown using fill material conforming to requirements of Section 02220, "Grading, Excavating, and Backfilling".

C. Adequately drain resulting surfaces.

D. Saw cut neat lines in concrete between demolition and existing to remain.

### 3.4 SELECTIVE DEMOLITION

A. Perform Selective Demolition in accordance with Section 01731, "Cutting and Patching", and requirements specified herein.

### 3.5 BRIDGE DEMOLITION

A. Concrete, Brick or Stone Structure:

1. Unless otherwise shown on the Contract Drawings or approved by the Contracting Officer, structures or portions of structures shall be removed by breaking the material into sizes capable of being safely removed.

2. Portions of structures below the permanent ground line, which will not interfere in any manner with the proposed construction, may be left in place, but removal shall be carried at least 1 foot 6 inches below the permanent ground line and neatly squared off. Reinforcement shall be cut off flush with the surface.

B. Steel Structures:

1. Steel structures or steel portions of structures shall be dismantled in sections of such weight and dimensions which will permit convenient handling and hauling.

2. Steel may be dismantled by flame cutting or other methods approved by the Contracting Officer.

3. If existing metal bridge structures scheduled to be demolished are determined to be contaminated with lead-based paint or other hazardous materials, structures shall be disposed of as scrap metal pursuant to hazardous waste regulations including 40CFR, Part 260 through 263, (Subchapter I).

C. Timber Structures: Unless otherwise indicated, timber piles shall be either pulled or cut off at a point not less than two feet below the permanent ground line, at the Contractor's option.

### 3.6 DISPOSAL OF REMOVED MATERIALS AND DEBRIS

A. Remove debris resulting from demolition work and dispose of it in accordance with applicable laws and ordinances and as prescribed by authorities having jurisdiction.

B. Disposing by burying or burning of trash and debris on the site will not be permitted.

C. Remove debris resulting from demolition work from the site at frequent intervals so that its presence will not delay the progress of the work or cause hazardous conditions for workers and the public.

D. Removed debris shall become the property of the Contractor and shall be removed from the Authority's property and disposed of in a legal manner with written permission of property owner where such material is to be deposited. Location of disposal site and length of haul shall be the Contractor's responsibility.

E. Provide copies of permits or licenses showing compliance to state and local requirements for disposing.
PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Demolition described in this section will not be measured but will be paid for at the lump sum price for "Demolition".

END OF SECTION 02050
SECTION 02072
REMOVAL AND RESTORATION OF MISCELLANEOUS EXISTING FACILITIES

PART 1 - GENERAL

1.1 DESCRIPTION
A. This section applies when existing surface facilities are designated to be removed and restored to their original condition in accordance with the Specifications. The work of this section includes removing, restoring, reinstalling, relocating (where shown on the Contract Plans), or replacing miscellaneous existing facilities on public and private property which are removed during construction; and salvaging materials designated to be salvaged.

1.2 DEFINITIONS
A. Miscellaneous Facilities include the following: streets, parking lots, entrance walkways, steps, sidewalks, curbs, fence walls, railing, fences, mailboxes, parking meters, benches, newspaper racks, traffic and bus signs, lighting poles, flag poles, street lighting, traffic signalization system, trash receptacles, and other facilities as indicated on the Contract Drawings.

B. Salvage: To remove and store material and equipment for future use in this or other Authority Contracts. Salvage also includes removing, storing, transporting, and turning over material and equipment to the Authority or to others for future use.

C. Restoration: To rebuild the item of work to its original condition to serve its intended purpose, or better, in its original location or as directed.

1.3 SUBMITTALS
A. Submit Demolition Plan as specified in Section 02050, "Demolition".

B. Upon delivery of salvaged items, submit the following: Inventory of all salvaged materials. When salvaged materials are delivered for storage, give 1 copy of inventory to the receiver at the delivery point and two copies to the Contracting Officer.

1.4 REGULATORY REQUIREMENTS AND PERMITS
A. Comply with codes and regulations of jurisdictional authorities.

B. Contractor shall obtain all special permits and licenses and give all notices required for performance and completion of the demolition, removal, and restoration work.

1.5 JOB CONDITIONS
A. Below Grade Conditions: Contractor shall verify locations of existing utilities and drainage system below grade. Refer to Section 02760, "Maintenance, Support, and Restoration of Existing Utility Facilities", for requirements for locating and protecting utilities.

B. Maintenance and Control of Traffic
1. Incorporate arrangements for maintenance and control of traffic as required for demolition and restoration work including road closures and hauling of debris in Traffic Control Plan as specified in Section 01570, "Maintenance and Control of Traffic". Execute Traffic Control Plan and perform other measures as required to maintain and control traffic.

2. Keep traffic areas free from debris and spillage of materials.

C. Protection and Restoration:
1. Prevent damage to above and below ground pipes, conduits, wires, cables and structures which are not designated for removal. Repair or replace damaged items.

2. Provide protective devices as specified in Section 01500, "Temporary Facilities and Services Required During Construction".

3. Provide safe passageways for the public around the demolition area and conduct operations to prevent injury to the public and damage to adjacent buildings, structures, and other facilities.

D. Coordination: Plan and coordinate work in accordance with the requirements of Section 01500, "Temporary Facilities and Services Required During Construction".

PART 2 - PRODUCTS

2.1 MATERIALS FOR RESTORATION
A. New materials, unless otherwise approved, shall conform to existing undisturbed materials in quality, color, and finish. Refer to and comply with the sections of the specifications referenced in Part 3 - Execution, herein, and the requirements of the jurisdictional authority.

B. Where re-installation of salvaged signs, fences, or similar items is required, furnish new posts, hardware and accessories, and concrete footings.
PART 3 - EXECUTION

3.1 REMOVALS
A. Remove work to extent shown minimizing damage to work which is to remain in place.
B. Repair existing surfaces, damaged during work, by cleaning and restoration to match existing.
C. Unless otherwise specified, items removed but not to be salvaged will become the property and responsibility of the Contractor for disposal off-site.

3.2 SALVAGE
A. Protect finish of salvaged items during removal, transport, storage, and re-installation.
B. Clean salvaged items of foreign material and store and protect from damage in or at accessible points within right-of-way or as shown in Contract Drawings.
C. Repair or replace salvaged items which are damaged or destroyed.
D. Where salvaged items are not designated for re-installation as part of the work of the Contract, deliver such materials to the Authority’s or jurisdictional authority’s storage area. Prepare inventory of delivered salvaged items.

3.3 SIGNS, POLES, RAILINGS, AND FENCES
A. Salvage signs, flagpoles, railings, and fences where shown.
B. Provide temporary sign for each permanent sign removed in accordance with approved working drawings or Traffic Control Plan. Remove on restoration of permanent sign.
C. Reinstall items in their original locations or in new locations shown. Reinstall or replace chain-link fences in accordance with Section 02830, "Chain Link Fencing". Reinstall or replace items to equal or exceed their pre-removal condition.
D. Remove lighting poles as shown, store at the Site, and reinstall at locations shown and directed.

3.4 STEPS, WALLS, AND COPINGS
A. Salvage steps and copings of wall components where shown and rebuild them to match existing.
B. To maintain continuity of quality and appearance between existing and new construction, where new reinforcing steel, concrete, and masonry construction is necessary, provide in accordance with applicable sections of the specifications including:

1. Section 03100 – Concrete Formwork,
2. Section 03200 – Concrete Reinforcement,
3. Section 03300 – Cast-In-Place Concrete,
4. Section 03305 – Portland Cement Concrete,
5. Section 03350 – Concrete Finishing, and
6. Division 4 – Masonry.

3.5 SIDEWALKS AND CURBS
A. Restore sidewalks and curbs to lines and grades which existed originally or to new lines and grades shown.
B. Replace asphalt and concrete sidewalks and curbs to match lines, grades, thickness and construction existing prior to removal. Perform work in accordance with:

1. Sections 02230 – Base for Pavements,
2. Section 02511 – Bituminous Pavement,
3. Section 02525 – Combined Curb and Gutters, Curb Ramps, and Walks,
4. Section 02550 – Concrete Pavement,
5. Section 03100 – Concrete Formwork,
6. Section 03200 – Concrete Reinforcement,
7. Section 03300 – Cast-In-Place Concrete,
8. Section 03305 – Portland Cement Concrete, and
9. Section 03350 – Concrete Finishing.
C. Restoration of sidewalk and curb shall include compaction of subgrade and restoration of aggregate base.

3.6 STREETS, PARKING AREAS, AND DRIVEWAY PAVEMENTS
A. Unless otherwise shown, restore streets, parking area and driveway pavements to lines, grades, thickness and construction existing prior to removal or construction. Perform work in accordance with Sections:

1. Section 02230 – Base for Pavements,
2. Section 02511 – Bituminous Pavement,
3. Section 02550 – Concrete Pavement,
4. Section 03100 – Concrete Formwork,
5. Section 03200 – Concrete Reinforcement,
6. Section 03300 – Cast-In-Place Concrete,
7. Section 03305 – Portland Cement Concrete, and
8. Section 03350 – Concrete Finishing.

C. Restoration of pavement shall include compaction of subgrade and restoration of aggregate base.

3.7 JOINTS BETWEEN EXISTING AND RESTORED WORK

A. Make joints between existing and restored work structurally adequate, smooth, and compatible.
B. Use saw to cut straight line at joints between existing and new paving surfaces.

3.8 PARKING METERS

A. Parking meter heads will be removed and re-installed by the jurisdictional authority. Request and coordinate removal and re-installation of parking meter heads with the jurisdictional authority.
B. Remove and dispose of existing meter posts and install new posts for relocated meters in accordance with the requirements of the jurisdictional authority.

3.9 LIGHTING/SIGNALIZATION PEDESTALS

A. Construct temporary reinforced concrete pedestals for lighting and signalization systems in accordance with the requirements of the jurisdictional authority.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work of this section with the exception of demolition work itself will not be measured but will be paid for at the lump sum price for “Surface Restoration”. “Surface Restoration” shall include removal, salvage, and re-installation of existing items; replacement of existing removed items and materials with new; repair or replacement of damaged/destroyed items; and disposal of unusable items.
B. Demolition work in this section will be paid for under Section 02050, “Demolition”.

END OF SECTION 02072
SECTION 02100
SITE PREPARATION

PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies clearing and grubbing work and landscape and landscape irrigation system removal, replacement, and maintenance.

1.2 REFERENCED STANDARDS
A. American National Standards Institute (ANSI):
   1. ANSI Z60.1 - Nursery Stock.

1.3 DEFINITIONS
A. Definitions pertaining to trees, shrubs, and other plants: ANSI Z60.1.
B. Clearing: Removal from areas shown of all trees not reserved by the Authority, brush, down timber, rotten wood, rubbish and other vegetation and objectionable material from area shown and disposal of removed items off the site.
C. Grubbing: Removal from below the surface in areas shown of the natural ground of stumps, roots, logs, stubs, brush, organic materials and debris to a depth of not less than one foot below natural ground surface, and disposal of removed items off the site.
D. Trimming: This work requires the removal of branches from trees and brush that extend into the right of way and interfere with the construction. Trim trees and shrubs and apply wound paint in accordance with Section 01532, "Tree and Shrub Protection And Care", or Section 02131, "Tree Pruning", as applicable.
E. Limits: Limits of clearing and grubbing include excavation or embankment, including all ditch areas and stream or channel change areas, and other areas as shown. Clear all other areas within the easement and right of way of all rubbish and other objectionable materials, taking care not to disturb the ground surface except where rubbish or objectionable item is embedded in soil. In that case, limit soil disturbance to immediate area of item.

1.4 SUBMITTALS
A. Submit traffic permit from the jurisdictional agency for transport of debris.
B. Submit permit for disposal of debris.
C. Submit written releases from each owner of property where demolition debris will be deposited absolving the Authority of responsibility in connection with such disposal. Submit releases at least 15 days prior to disposal. Releases shall be signed by owners of property on which material will be deposited.

PART 2 - PRODUCTS

2.1 TREE WOUND PAINT
A. As specified under Section 02131, "Tree Pruning".

PART 3 - EXECUTION

3.1 TREE PRESERVATION
A. Protect and preserve trees, shrubs, and plants not to be removed in accordance with Section 01532, "Tree and Shrub Protection and Care". Protect other surface features in accordance with the General Provisions, "Protection of Existing Site Conditions."

3.2 LANDSCAPE IRRIGATION SYSTEMS
A. Coordinate with property owners when existing landscape irrigation system to be removed connects with irrigation system to remain in operation. Ensure that existing irrigation system to remain remains in operation or provide temporary irrigation until irrigation system is restored to operation.
B. Where shown, or when encountered, remove, cap, and test landscape irrigation systems in accordance with Section 02975, "Landscape Irrigation System".
C. Restore landscape irrigation system in accordance with Section 02975, "Landscape Irrigation System", when required.

3.3 CLEARING
A. Existing vegetation to remain is designated on the Contract Drawings. Trees, shrubs, and vegetation to be removed are shown on the Contract Drawings and will be marked in the field prior to construction. Remove trees, shrubs, and vegetation designated to be removed. Remove brush, down timber, rotten wood, rubbish, and other vegetation and objectionable material within the defined limits. Dispose of removed items off site.
B. Cut off trees 1 foot below natural ground surface.
C. Prune trees so as to prevent damage to trees, shrubs, and other features which are to be preserved.
3.4 GRUBBING

A. Remove from below the surface, stumps, roots, logs, stubs, brush, organic materials, and debris to a depth of not less than one foot below the natural ground surface within the defined limits, and dispose of removed items off site.

3.5 REMOVAL OF TREE BRANCHES

A. Remove tree branches which extend over neat lines of structures and are less than 20 feet above top of rail or existing surface whichever is higher.

B. Remove tree branches which create a hazardous condition.

C. Remove additional branches as directed, to present balanced appearance of tree.

D. Treat scars resulting from removal of tree branches with tree wound paint.

3.6 DISPOSAL

A. Remove trees, logs, branches, brush, stumps and other debris resulting from clearing and grubbing operations to disposal location(s) outside the Project's right-of-way.

B. Dispose of debris off the Site only with permission of property owner where such debris is to be deposited and in accordance with codes and regulations of the jurisdictional authorities.

C. Burning or burying debris on the Worksite is prohibited.

3.7 CLEAN-UP

A. Remove and dispose of protective materials, enclosures, and guards upon completion of the Work.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work of this section will not be measured but will be paid for under the lump sum price for “Site Preparation.” “Site Preparation” will include removal of tree branches and tree wound treatment performed as a part of site preparation. Removal of tree branches to present balanced appearance to trees pruned as part of site preparation will be considered as incidental to “Site Preparation” and no additional measurement or paid will be made.

B. Demolition work discussed in this section will be measured and paid for under Section 02050, “Demolition.”

C. Tree and shrub protection and care will be paid for as specified under Section 01532, “Tree and Shrub Protection and Care”, including fencing associated with tree and shrub protection and pruning specified herein to prevent damage to trees and shrubs which are to be preserved.

END OF SECTION 02100
SECTION 02110
SURVEY MARKERS AND MONUMENTS

PART 1 - GENERAL

1.1 DESCRIPTION

A. This section includes specifications for furnishing and installing survey control and right-of-way markers and monuments. Monuments shall be fiber-reinforced resin with integral marker, cast-in-place concrete, or precast concrete.

1.2 REFERENCE STANDARDS

1.3 SUBMITTALS

A. Shop Drawings: Submit prior to fabrication. Include list of legends.
B. Samples: Marker (disk) with sample legend.
C. Product Literature: Submit for marker, epoxy grout, and fiber-reinforced resin monument. Include installation instructions for grout and for resin monument.

1.4 QUALITY ASSURANCE

A. Source Quality Control: Prior to delivery inform the Contracting Officer when materials and markers will be ready for inspection at place of manufacture.

PART 2 - PRODUCTS

2.1 CONCRETE

A. Concrete: Mix S-7, as specified in Section 03305, “Portland Cement Concrete”.

2.2 MARKERS

A. One-piece cast aluminum, bronze, or brass containing no lead.
B. Diameter and Legend Layout: See DART Survey Monument in the Contract Drawings.
C. Stem: 3/4 inch diameter solid shaft with split flared end.
D. Top: 1/8 inch thick at the outer edges domed to 5/16 inch thickness at the center.
E. Edges and top surface free from burs or blemishes.

F. Manufacturers:
2. Surv-Kap, Inc.
4. Or approved equal.

2.3 FABRICATION

A. Legend: Provide markers as specified with imprinted or stamped legend.

1. Manufacturer to prestamp legend shown for various survey markers and monuments using characters of size and type shown.
2. Press legend into the upper surface of disk. Raised letter will not be permitted.

B. Precast concrete monuments:

1. Precast concrete, eight inches square by length shown, with 1/2 inch chamfered edges.
2. One 41 inch long, No. 4 steel reinforcing bar centered in casting.
3. One marker embedded into the top of precast concrete unit.

C. Fiber-reinforced resin markers and monuments:

1. Head: Synthetic resin-reinforced fibrous glass with lettering as shown, incised v-shaped into top, with marker cast integral in head as shown.
2. Support stem: Steel tube, 1.8 inches in diameter, 36 inches long protected by plastic sheath with helical screw and steel spike.

PART 3 - EXECUTION

3.1 METAL DISKS FOR MARKERS

A. Set survey markers or monuments at locations indicated in the Contract Drawings and as specified in Section 01722, “Field Engineering - Surveying”. If point number has not been stamped by manufacturer, stamp point numbers on completed markers.
B. When markers are set in concrete pavements, roadways, walls, and structures, set stem in drilled hole and secure with approved epoxy grout.

C. At other locations, cast markers into tops of precast monuments and cast-in-place monuments as specified; set monuments in ground at locations shown.

1. Place concrete per Section 03300, "Cast-In-Place Concrete".

3.2 PRECAST CONCRETE MONUMENTS

A. Install precast concrete monuments at locations and to elevations shown or as directed.

B. Set markers and monuments as shown. Compact bottom of excavation for monuments to prevent settlement. Backfill around monument with excavated material; compact.

3.3 FIBER-REINFORCED MONUMENTS

A. Install fiber-reinforced monuments at locations and to the elevations shown or as directed.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this Section for survey markers including drilling hole in concrete pavements, roadways, walls, and structures, will be measured by and paid for at the unit price for "survey marker" per each. Epoxy grouting marker in drilled hole, in precast concrete monument or in cast-in-place monument will be considered as included in the unit price for "survey marker".

B. The work described in this Section for survey monuments including precast concrete monument, cast-in-place monument, and resin monument, not including associated survey marker, will be measured by and paid for at the unit price for "survey monument" per each.

END OF SECTION 02110
PART 1 - GENERAL

1.1 DESCRIPTION
A. The work of this section includes pruning and thinning trees and shrubs and pruning girdling roots. Tree pruning work includes the following:
   1. Class III - Coarse Pruning
   2. Class IV - Cutting Back or Drop Crotch Pruning
   3. Removal of mistletoe
B. Prune and thin trees where noted on the Contract Drawings and as required by the Contracting Officer.
C. Perform associated work such as deep root feeding and disposal.

1.2 REFERENCED STANDARDS
A. American National Standards Institute (ANSI):
   1. ANSI A300 - Tree Care Operations - Tree, Shrub and Other Woody Plant Maintenance - Standard Practices

1.3 DEFINITIONS
A. Branch Collar - Wood tissue that forms around the base of a branch between the main stem and the branch. Usually as a branch begins to die the branch collar begins to increase in size.
B. Callus - New growth made by the cambium layer around all of a wound.
C. Cambium Layer - Growing point between the bark and sapwood.
D. Closure - Refers to the roll of the callus growth around the wound areas.
E. The Cut - The exposed wood area that remains after the branch has been removed.
F. Cut Back - Specified reduction of the overall size of the tree or individual branches, but may include the overall reduction of the sides as well as the top of the tree.
G. Dormant - A condition of non-active growth. Deciduous trees are considered to be dormant from the time the leaves fall until new foliage begins to appear.
H. Girdling Roots - Located above or below ground level, whose circular growth around the base of the trunk or over the individual roots applies pressure to the bark area, thereby choking or restricting the flow of sap.
I. Lifting - The removal of lower branches for under clearance.
J. Parent Stem - The main trunk system of the tree.
K. Precut or Precutting - The removal of the branch at least 6 inches beyond the finished cut, to prevent splitting into parent stem or branch.
L. Pruning - The removal of dead, dying, diseased, live interfering, objectionable and weak branches in a scientific manner.
M. Sap Flow - The definite course assumed by sap in its movement through a tree.
N. Scars or Injuries - Natural or man-made lesions of the bark in which wood is exposed.
O. Suckers - Abnormal growth of small branches usually not following the general pattern of the tree.
P. Thinning Out - The removal of live branches to reduce wind resistance and to create more space.
Q. Topping – Reduction of central leader or primary leaders and accompanying branches to reduce tree height and spread.
R. Tracing - Careful cutting of the bark along the lines of sap flow to encourage closure and to be the outline of the wound area.
S. Trimming - Same as Pruning.
T. Tree Drip Line - Imaginary line extended down to the ground from the tip of the outermost branches.

1.4 SYSTEM DESCRIPTION
A. Class III - Coarse Pruning: Coarse pruning shall consist of the removal of dead, diseased or obviously weak branches, 2 inches in diameter or greater.
B. Class IV - Cutting Back or Drop Crotch Pruning (not topping or pollarding) shall consist of the reduction of tops, sides, under branches or individual limbs. This practice is to be undertaken only in cases of utility line interference, or where certain portions of the roots or root systems have been severed or severely damaged, or when there is unusual and rapid tree growth, where it is necessary to reduce
the topsides or under branches, or for specific topiary training or dwarfing.

C. Removal of mistletoe from trees designated on drawings.

1.5 QUALITY ASSURANCE

A. Pruning shall be performed by tree company and workers who, through related training and on-the-job experience are familiar with the techniques and hazards of this work including trimming, maintenance, repairing or removal, and equipment used in such operations.

1.6 PROTECTION OF EXISTING TREES AND VEGETATION

A. Protect and care for existing trees indicated to remain in place in accordance with Section 01532, “Tree and Shrub Protection and Care”.

B. When excavation is required in tree root zones, hand excavate whenever possible and avoid cutting of roots greater than 1 inch, to the extent possible. Use machine excavation in tree root zones only where specifically permitted by the Contracting Officer. When it is not possible to avoid cutting roots, roots over 1½ inch shall be coated on the faces with acceptable dressing for horticultural use for cut or damaged plant tissues.

C. Refer to Section 01532, “Tree and Shrub Protection and Care”, for provisions for replacement of damaged plant materials and assessment of damages.

PART 2 - PRODUCTS

2.1 EQUIPMENT

A. Equipment requirements listed include the following items, unless so stated.

1. Pruning tools shall be maintained in good working order, cutting edges shall be sharp.

2. Acceptable tools shall be pole pruners, hand pruners, 12 inch handsaws, or chain saws.

3. Contractor shall be proficient with the use of ropes and saddles.

2.2 DEEP ROOT FEEDING AND CHEMICAL SPRAYS

A. High pressure feeding: Peters, Rapid Gro, or approved equal, a mixture of 3-1/3 pounds per 100 gallons shall be used.

B. The process shall be liquid soil injection of 5 percent iron humus, kelp (sea weed), Sulfur, and root stimulator.

C. Chemical Spray: Preventative bore spray with a Lindan additive.

2.3 TREE AND ROOT WOUND PAINT

A. Tree wound paint shall be asphaltum dressing or orange shellac.

B. Root wound paint shall be orange shellac.

PART 3 - EXECUTION

3.1 GENERAL PRUNING DIRECTIONS

A. Use no climbing spurs or irons in pruning operations.

B. Make cuts sufficiently close to the trunk or parent limb, without cutting into the branch collar or leaving a protruding stub, so that closure can readily start under normal conditions. Clean cuts shall be made at all times.

C. Precut branches too heavy to handle to prevent splitting or peeling the bark. Where necessary in order to prevent tree or property damage, branches shall be lowered to the ground by proper ropes or equipment.

D. At direction of Contracting Officer, remove the weaker or least desirable of crossed or rubbing branches. Such removal shall not leave large holes in the general outline of the tree.

E. Treatment of cuts and wounds, where necessary, shall be with tree wound paint for cuts greater than 1/2 inch. A thin layer of dressing shall be used, and care taken to treat only the exposed wood.

F. Disinfect tools with methyl alcohol at 70 percent (denatured wood alcohol diluted appropriately with water) or hydrogen peroxide solution after each cut and between trees where there is known to be a danger of transmitting the disease on tools. Due to danger from oak wilt and oak decline, oaks (genus Quercus) shall be pruned only during cold, dry weather in winter, or hot, dry weather in mid-summer.

G. Inspect old injuries. Those not closing properly and where the callus growth is not already completely established shall be traced where required by the Contracting Officer. Where required by the Contracting Officer, for cosmetic purposes, the wound shall be treated with a thin coat of wound dressing.

H. Report girdling roots visible to the eye to the Contracting Officer. When required by the Contracting Officer, treat visible girdling roots as follows:

1. Cut root at either end.
2. Notch entire root in center with a chisel.
3. Remove entire root without injuring the bark or parent stem.

I. Report the presence of any structural weakness, disease conditions, decayed trunk or branches, split crotches or branches, in writing to the Contracting Officer.

J. Tree root cuts shall be cut flush to soil line and coated with dressing. Do not allow roots to dry out, add mulch to cover roots and keep moist.

3.2 THINNING
A. Commence thinning only upon approval by the Contracting Officer.
B. In reducing overall size, attention shall be given to the symmetrical appearance. Top is to be higher and sides reduced in order to maintain a tree-like form unless otherwise noted.
C. When thinning or cutting back trees, shape the plant typical of its species.
D. On thin bark trees, just enough limbs shall be removed to get the effect wanted without admitting too much sunlight to the trunk of the tree or the top of large branches. Care shall be taken with the following species: Live oaks, Red oaks, and other trees susceptible to sun scald; particularly those species growing in different geographical areas to that which they are native. Whenever possible, perform thinning on susceptible species only during the dormant season.
E. In lifting the lower bottom branches of trees for under clearance, take care to give a symmetrical appearance, and make no cuts so large that they will prevent normal sap flow.
F. When required by the Contracting Officer, in lieu of lifting lower branches of trees for under clearance, maintain safety of such trees by installing cabling and bracing as described in American Nurserymen Association “Pruning Standards”.

3.3 DEEP ROOT FEEDING AND CHEMICAL SPRAYING
A. Soil beneath tree canopy shall be injected on an injection grid 2 feet on center at 5 gallons per caliper inch at diameter, breast high.
B. The deep root feeding shall be verified in the field by a certified Arborist.

3.4 MISTLETOE REMOVAL
A. Using thinning-type pruning cuts, remove infected branches at their point of origin or back to large lateral branches. Infected branches need to be cut at least one foot below the point of mistletoe attachment in order to completely remove embedded haustoria (rootlike structures below bark). Field verify extent of severe pruning with Contracting Officer’s Technical Representative.
B. Disinfect tools with methyl alcohol at 70 percent (denatured wood alcohol diluted appropriately with water) or hydrogen peroxide solution after each cut of mistletoe and between trees.
C. Mistletoes infecting a major branch or the trunk where it cannot be pruned may be controlled by cutting off the mistletoe flush with the limb or trunk. Then wrap the area with a few layers of wide, black polyethylene to exclude light. Use twine or tape to secure the plastic to the limb, but do not wrap it too tightly or the branch may be damaged. In some tree species callus tissue will form under the plastic, further weakening the limb. Broadleaf mistletoe requires light and will die within a couple of years without it. It may be necessary to repeat this treatment, especially if the wrapping becomes detached or if the mistletoe does not die.

3.5 DISPOSAL OF WASTE MATERIALS
A. Waste or spoils from pruning operations shall be removed from the site and disposed of by the Contractor.

PART 4 - MEASUREMENT AND PAYMENT
4.1 GENERAL
A. The unit prices described herein for tree pruning will include all materials and equipment except for those materials and equipment listed under separate unit prices.
B. “Tree Pruning Foreman”, “Tree Pruning Technician”, “Tree Pruning General Labor”, “Small Equipment - Chainsaw”, “Small Equipment - Tree and Brush Chippers”, “Crew Truck”, and “Dump Truck HAulor” will be measured and paid for at the unit prices per hour. The unit price per hour for “Crew Truck” and “Dump Truck Hauler” shall include vehicle, fees, fuel, operator, and associated costs. Equipment will be paid for the actual hours in use.
C. Dumping fees will be measured and paid for at the unit price per trip for “Dumping Fees”.
D. Deep root feeding chemicals will be measured and paid for at the unit price per gallon.
E. Tree pruning required under Sections 02100, “Site Preparation”, 02900, “Landscaping - General”, 02950, “Landscape Planting”, and 02981 Landscape Maintenance - Irrigated Areas”, will not be measured and paid for at the unit prices specified herein but will be paid for under the lump sum prices for “Site Preparation” and “Landscaping” and unit price for “Landscape Maintenance”.

END OF SECTION 02131
SECTION 02140
DEWATERING

PART 1 - GENERAL

1.1 DESCRIPTION

A. This section includes specifications for designing, furnishing, installing, maintaining, operating, and removing temporary dewatering systems as required to lower and control water levels and hydrostatic pressures during construction.

B. This section also includes testing, treating, and disposing of pumped water.

1.2 REFERENCED STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM A536 - Standard Specification for Ductile Iron Castings

2. ASTM C33 - Standard Specification for Concrete Aggregates

3. ASTM D1785 - Standard Specification for Poly(Vinyl Chloride) (PVC) Plastic Pipe, Schedules 40, 80, and 120

1.3 DEFINITION FOR PIEZOMETERS

A. Piezometers for general monitoring:

1. Instruments consisting of a wellpoint, standpipe, and filter layer in which groundwater levels are sounded for general monitoring of the adequacy of dewatering.

2. Locations shown for piezometers are suggested and can vary as approved.

B. Control piezometers:

1. Piezometers used to supplement those used for general monitoring in mined earth and mixed face tunnel applications.

2. Control piezometers are identical in construction and installation to piezometers shown and specified for general monitoring.

C. Design dewatering system to take into account locations designated on the Contract Drawings where general lowering of groundwater will not be permitted and locations where there are limitations with respect to lowering groundwater laterally.

3. Control piezometer locations shown have been preselected, as determined by nature of specific groundwater problem areas peculiar to the project. Control piezometers are used to establish and verify drawdown requirements shown to be achieved in advance of tunneling, as specified.

4. Locations shown for control piezometers can be varied as field conditions necessitate, but under no circumstances by more than 5 feet, unless otherwise approved.

1.4 DESIGN CRITERIA

A. The Contractor shall be responsible for the design and adequacy of the dewatering system. Select dewatering system to accomplish groundwater control as specified and as required by the Contracting Officer.

B. Design the dewatering system to perform as follows:

1. Provide dewatering system which will effectively reduce hydrostatic pressure and lower groundwater levels below excavation levels including underpinning pits, but excluding mined tunnels, as necessary for safe and proper prosecution of the Work and which will result in obtaining stable, substantially dry subgrade, for prosecution of subsequent operations.

2. Design and provide dewatering system for tunnels for the specific means and methods planned to construct tunnel as necessary for safe and proper prosecution of the Work.

3. Design dewatering methods so that after initial development, the quantity and size of soil particles will decrease until no soil particles are present in the water being pumped, after 12 hours initial pumping.

4. Methods of dewatering may include sump pumping; single or multi-stage well point systems; eductor and ejector type systems; deep wells; and combinations thereof.
1.5 SUBMITTALS

A. Working Drawings: Type of dewatering system proposed, showing arrangement, location, and depths of proposed system, complete description of equipment and materials to be used, procedure to be followed, complete description of system to treat effluent prior to discharge into a storm sewer, standby equipment, standby power supply, procedures for detection of movement, types and sizes of filters, design calculations demonstrating adequacy of design, and proposed location(s) of points of discharge of water.

B. Documentation:

1. Permits from jurisdictional agencies.
2. Records of observations of dewatering system, groundwater piezometers, observation wells, and settlement markers. Submit observation records promptly, regularly and as directed. Submit records of dewatering system, groundwater piezometers, and observation wells on forms provided by the Contracting Officer throughout the period that dewatering system is in operation.
3. Qualification of specialists responsible for groundwater control on mined earth tunnel projects.

1.6 PERMITS AND REGULATORY REQUIREMENTS

A. Obtain permits from jurisdictional agencies.
B. Comply with the requirements of Section 01560, "Environmental Protection".
C. Comply with EPA requirements.

1.7 JOB CONDITIONS

A. Subsurface Conditions: Results of subsurface investigations and groundwater level readings are available from the Authority.
B. Coordination with Other Contractors:

1. Coordinate installation and operation of dewatering system and piezometers with others concerned and with other Authority contractors, if applicable.
2. If an adjoining Authority contract requires installation of portions of the dewatering system or piezometers within Contract limits, allow access to the Site for this work and facilitate the work.

PART 2 - PRODUCTS

2.1 PIEZOMETERS

A. Standpipe: PVC, rigid, Schedule 40, ASTM D1785; minimum inside diameter 1.875 inches.
B. Standpipe Slip Coupling: PVC, ASTM D2466.
C. Well Screen:

1. PVC.
2. Free of metallic components.
3. Continuous-slot construction.
4. Slot size: 0.006 to 0.020 inch.
5. Minimum inside diameter: 1.875 inches.
6. Johnson-UOP, Inc.; Thorofare, N.J.; or equal.
D. Well Screen Pipe Cap: PVC.
E. Solvent Cement: ASTM D2564.

2.2 FILTER FABRIC

A. Composed of polypropylene and polyethylene continuous-filament fibers.
B. Constructed as a random, non-woven fiber mixture.
C. Fibers held together by heat bonding.
D. In accordance with Paragraph “Geotextile Filter Fabric” of Section 02700, “Storm Sewer Systems”.

2.3 REINFORCED TAPE

A. Continuous plastic film.
B. Continuous linear filament reinforcement.
C. Pressure-sensitive adhesive.
D. Maximum width: 1/4 inch.
E. Mystik, Borden Co.; Scotch, 3M Company; or equal.

2.4 CURB COCK BOX

A. Cast iron: ASTM A536.
B. Inside diameter 3.0 inches, length 23 inches.
C. Locking cover with 'DART' logo as shown.
DEWATERING

2.5 FILTER MEDIUM
A. Fine aggregate: ASTM C33.

2.6 GROUT
A. Neat Cement Grout: As approved based on the requirements of Section 03305, "Portland Cement Concrete".

2.7 CONCRETE
A. Lean Concrete: In accordance with Mix M-1 in Section 03305, "Portland Cement Concrete".

PART 3 - EXECUTION

3.1 GENERAL
A. Select and install dewatering system to accomplish groundwater control as specified and as required by the Contracting Officer.
B. Conduct dewatering operations to prevent in designated locations the general lowering of groundwater and lowering groundwater laterally, as applicable.
C. Take approved measures to minimize movement of adjacent areas caused by dewatering operations.
D. Take measures to prevent damage to properties, buildings, structures, sewers, and other utility installations, pavements, sidewalks, and work resulting from groundwater pumping including measures in accordance with Section 02150, "Underpinning, Support and Restoration of Structures".
E. Modify system if, after installation and while in operation, it causes or threatens to cause damage to existing buildings, structures, utilities, and facilities.
F. Select, install, and maintain water treatment facilities, as necessary, prior to discharging water from the construction areas into the storm drainage. Prior to discharging water in storm sewer, treat the effluent as required under Section 01560, "Environmental Protection".
G. Do not allow deleterious substances within the water to discharge into the storm sewer system or outfall area.
H. Keep area free of standing water during periods of dry weather.

3.2 SURFACE DRAINAGE
A. Intercept and divert surface drainage away from excavations, piezometers, and observation wells by use of dikes, curb walls, ditches, pipes, sumps, or other means.
B. Design surface drainage systems to prevent erosion, unwanted water flow, and erosion on or off the Site. Refer to Section 01562, "Soil Erosion and Sediment Control", for related requirements.
C. Remove surface drainage system when no longer required.
D. Remove debris and restore site(s) to original conditions.

3.3 DRAINAGE OF EXCAVATED AREAS
A. Provide and maintain ditches of adequate size to collect surface, subsurface, and seepage water which may enter excavations. Divert water into sump so that it can be drained or pumped into a treatment facility prior to water running into drainage channels or storm sewers as approved by the jurisdictional agency.
B. Install settling basins, treatment system, or other approved apparatus, as necessary, to reduce the amount of fines, particles, or effluent which are carried by water that is diverted into storm sewers.
C. Should storm sewer become blocked or its capacity restricted by dewatering operations, make arrangements with jurisdictional agency to clean sewer and appurtenances at the Contractor's expense.
D. When no longer necessary, backfill and seal drainage ditches, sumps, and settling basins with approved material in accordance with requirements of Section 02220, "Grading, Excavation and Backfilling".

3.4 DEWATERING
A. Install dewatering system in accordance with approved working drawings. When control piezometers are used in conjunction with a predrainage dewatering system, space dewatering units so that control piezometers fall halfway between the two closest units.
B. Demonstrate by approved methods, that no soil particles are present in the water being pumped, after 12 hours of initial pumping.
C. Dispose of precipitation and subsurface water away and clear of the Worksite. Keep excavation dry.
D. Maintain continuous and complete effectiveness of the installation.

E. Maintain the water level at such an elevation that no damage to a structure can occur because of excessive hydrostatic pressure.

F. If necessary and approved, reduce the extent of dewatering in order to maintain a minimum water level of 5 feet below the prevailing level of backfill which is being placed, provided that the water level does not result in an uplift pressure exceeding 80 percent of the downward pressure produced by the weight of structure and its backfill in place.

G. At locations of control piezometers where mined earth tunnel sections occur, draw the water level down as shown at least 48 hours in advance of tunnel excavation using specified methods.

H. For tunnels, do not reduce nor stop dewatering until a permanent lining has been installed and approved.

3.5 PIEZOMETERS

A. Prior to dewatering operations, install piezometers of a type as shown at specified locations or as directed, and to the depths shown or approved.

B. Construction:

1. Assemble required number of workable lengths of standpipe sections using solvent cement and couplings.

2. Cement a well screen to the bottom of standpipe.

3. Cement a well screen cap to the bottom of well screen.

C. Installation:

1. Drill a minimum 8 inch diameter hole without using drilling mud.

2. Maintain stable bore hole prior to and during installation of piezometer. Use borehole casing where required to maintain stable borehole.

3. Position and center the standpipe and well screen assembly in the hole using a centralizer, if necessary, with a minimum annular space of 2 inches. Couple and cement previously prepared lengths of standpipe in order to position bottom of piezometer at the required depth.

4. Withdraw casing gradually as filter medium is placed in order to ensure against collapse of hole.

5. In like manner, withdraw casing gradually, as backfill of neat cement grout is tremied into place.

6. Set curb cock box flush with ground surface using lean concrete.

7. Do not use fire hydrants as water source unless an authorized meter with a backflow prevention device is used.

D. Prove proper functioning of piezometers prior to dewatering. In the presence of the Contracting Officer, demonstrate that each is functioning properly by adding or removing water and measuring the rates of fall and rise of water levels in standpipes.

E. While dewatering system is in operation, periodically prove continued proper functioning of each piezometer and observation well by performing rising or falling head tests on a schedule as directed.

F. Take an initial set of reference water level readings to determine the prevailing stable groundwater condition prior to dewatering. Thereafter, maintain and submit records of observations as specified.

G. Depending upon subsurface conditions, operate dewatering system so that the groundwater level in piezometer is maintained continuously within the prescribed limits to ensure adequacy of drawdown.

H. Protect and maintain piezometers and observation wells in good operating condition until completion of the Contract.

I. Promptly replace any piezometer that is damaged or destroyed.

J. Terminate piezometer readings when so directed.

3.6 PORTIONS OF SYSTEM TO BE LEFT IN PLACE

A. Leave such portions of dewatering system in place as are required to remove water from the areas of adjacent contracts areas when required in the Contract Documents.
B. Upon completion of the Work, leave piezometers in place and in working condition, with secured covers. Finish piezometer casings flush with pavement or finish grade.

3.7 PORTIONS OF SYSTEM TO BE REMOVED

A. Upon completion of the Work, unless otherwise directed, demolish well by pulling out or drilling out PVC piezometer standpipe and screen. Backfill void with sand-cement grout from bottom to 2 feet below ground surface. Remove and dispose of cock box, concrete pad, concrete plug and other debris in accordance with Section 02050, "Demolition".

B. Backfill remaining space with compacted earth and cap as necessary and restore surface to its original condition in accordance with Section 02220, "Grading, Excavation and Backfilling".

3.8 DETECTION OF MOVEMENT

A. Install settlement markers on each footing, building corners, wall or surrounding structures capable of being read to an accuracy of 0.005 foot. Record readings not less than once a week. Stop work, notify Contracting Officer, and take immediate action if movement of the structure occurs.

B. Take measurements prior to installing dewatering system to establish base elevations.

C. Measure to ascertain if dewatering operations has caused or is causing movement in adjacent areas.

D. Provide protective benchmark for vertical control that is not subject to movement for use as reference.

3.9 MONITORING

A. Observe and record average flow rate and time of operation of each pump used in dewatering system. Where necessary, provide appropriate devices, such as flow meters, for observing flow rates. Record data on a form provided by the Contracting Officer during the period the dewatering system is in operation.

B. Monitor quality of discharge from dewatering system to determine if soil particles are being removed by system.

C. Observe and record elevation of groundwater in piezometers and the previously installed observation wells on the form furnished by the Contracting Officer, during the period that the dewatering system is in operation. Sound depth to bottom of each piezometer and observation well monthly to ensure that fine soil particles are not penetrating screen and building up in standpipe.

D. During initial period of dewatering, make specified observations daily, seven days a week depending on field conditions. If, after, dewatering operations have stabilized, reduce observations to longer intervals as directed.

3.10 REPAIR AND REPLACEMENT

A. Damage, disruption, erosion, or interference to work area and adjacent facilities resulting from dewatering operations shall be restored to original or better condition at the Contractor’s expense.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work specified in this section will not be measured separately for payment, and all costs in connection therewith will be considered incidental to the excavation or earthwork to which the dewatering pertains.

END OF SECTION 02140
SECTION 02150
UNDERPINNING, SUPPORT, AND RESTORATION OF STRUCTURES

PART 1 - GENERAL

1.1 DESCRIPTION

A. This section includes specifications for providing shoring, underpinning, sheeting, piling, and lagging as required to safeguard adjacent structures and property from settlement and damage including prevention of cave-ins and earth slough.

B. This section also covers the work necessary to restore job conditions equivalent to that prior to the start of Work.

1.2 REFERENCED STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

B. International Organization for Standardization (ISO):

1. ISO 17025 - General Requirements for the Competence of Testing and Calibration Laboratories

1.3 DEFINITIONS

A. Underpinning: Permanent supporting structure designed to transmit foundation loads to lower bearing levels necessary to securely maintain structure being underpinned. Also includes restoration of structure upon completion of work. Grouting is not an acceptable means of underpinning. Grouting may be considered a method of temporary support.

B. Temporary support: Construction required and designed to prevent movement of the structures until the completion of underpinning, and during maintenance or other construction work.

C. Maintenance: Maintenance consists of construction methods short of underpinning such as temporary footing or column jacking, compaction grouting, consolidation grouting, ground reinforcement, or other means to limit structural settlement to the displacement limits specified. Maintenance shall include restoration of the structures upon completion of such work.

D. Restoration: Correction by repair or replacement of structure which is damaged, removed, or altered by the Contractor in furtherance of his operation equivalent to condition existing prior to start of Work unless otherwise shown or specified.

E. Structures: Structures shall be defined as including buildings, surface and underground structures that may be affected by the Contractor's operations.

F. Structure categories:

1. Category 1 Structures: Structures for which underpinning is required.

2. Category 1A Structures: Structures for which the installation of maintenance systems is required.

3. Category 2 Structures: Structures that are likely to be affected by construction operations, the Contractor has the option of supporting temporarily, underpinning, or installing maintenance systems. The decision rests solely with the Contractor who is entirely responsible for results.

4. Category 3 Structures: Structures that may be affected by construction operations. The structures may not initially require underpinning, temporary support, or installation of maintenance systems. The decision rests solely with the Contractor who is entirely responsible for the results.

G. Displacements:

1. Displacements are vertical movements or, if data are available, the resultant of vertical and horizontal movements measured at either the exposed surface of a structure or within the soil overburden within 5 feet of the structure foundation.

2. Displacements are movements that result from the Contractor's operations that occur prior to, during, or after underpinning, or installation of temporary support or maintenance systems.

3. Monitor construction to detect movements. Structures will be reclassified into a category requiring more restrictive measures of protection if extreme displacement limits defined hereafter are exceeded.

H. Owner: As used herein “owner” shall be understood to mean the owner of the property outside the Project's right-of-way and area.
1.4 DESIGN REQUIREMENTS

A. The design and installation of underpinning, temporary support, and maintenance systems of structures is the sole responsibility of the Contractor.

B. Prior to designing underpinning, temporary support, and maintenance systems, verify by field investigation foundation loads, locations, sizes, and conditions of existing structures and footings requiring underpinning and temporary protection. Verify locations of existing utilities.

C. Prior to the start of tunnel, shaft, or trench excavation, prepare working drawings and calculations, and submit to the Contracting Officer for approval.

D. Working drawings and computations shall be signed and sealed by the Contractor's engineer whose qualifications are specified under “Quality Assurance” herein.

E. Obtain additional information necessary for the design, including test borings and foundation plans.

F. Provide vibration isolation and other noise and vibration migrations where required by Contract Documents, agreements with owners, and elsewhere as required to prevent damage to structures and contents.

1.5 DISPLACEMENT LIMITS

A. The displacement limits and the required action to be taken in the event a limit is reached are defined as follows for each structure category where not indicated on the Contract Drawings:

B. Structure Category 1:

1. Extreme Displacement Trend Limit: Trend of lateral and/or vertical displacements that indicates that 1/2 inch displacement will be exceeded.

2. Action to be taken: Cease excavation and/or other construction operations that result in further settlement until corrective measures are implemented.

C. Structure Category 1A:

1. Extreme Displacement Trend Limit: Trend of lateral and/or vertical displacements that indicates that 1 inch displacement will be exceeded.

2. If remedial methods of maintenance fail to arrest further displacements, reclassify to Structure Category 1. Cease excavation and other construction operations that result in further settlement until structure is underpinned.

D. Structure Category 2:

1. Extreme Displacement Trend Limit: Trend of lateral and/or vertical displacements that indicates that 1 inch displacement will be exceeded.

2. Action to be taken: Install maintenance systems to prevent further displacements.

3. If maintenance system does not prevent displacements, reclassify to Structure Category 1A. Cease excavation and other construction operations that result in further settlement until modified maintenance systems are installed to arrest further displacements.

E. Structure Category 3:

1. Displacement Trend Limit: Trend of lateral and/or vertical displacements that indicates that 1/2 inch displacement will be exceeded.

2. Action to be taken: Increase frequency of monitoring of all Category 3 structures that may be affected by the Contractor's operations.

3. Extreme Displacement Trend Limit: Trend of lateral and/or vertical displacements that indicates that 3/4 inch displacement will be exceeded.

4. Action to be taken: Reclassify to Structure Category 1A.

1.6 SUBMITTALS

A. Working Drawings and Computations:

1. Submit working drawings showing method, staging, and necessary details, including computations for construction of underpinning and temporary support of each structure on which work is to be accomplished, as well as vibration isolation and method of transferring structural load to piles.
2. Prepare and submit a written schedule and procedure, along with detailed drawings of the proposed excavations, shoring, and underpinning work for review.

3. Submit details of shop assemblies when required for restoration of structures.

B. Documentation:

1. Submit written understandings with each structure’s owner signed by the owner signifying owner’s agreement.

2. Submit copies of agreements, rights, permits, and consents necessary to effect underpinning work before starting work on each affected structure.

C. Certificate of Design: Prior to beginning any tunnel, shaft, or trench excavation, submit a Certificate of Design for underpinning, temporary support, and/or maintenance systems as specified hereunder.

D. Monthly Certification: Submit certification signed and sealed by the Contractor’s engineer that the work during the previous month was put in place and is performing in accordance with the design prepared by the Contractor’s engineer. Document within the certification any changes or deviations from the design and the basis for such changes. Submit a copy of this certification to the Contracting Officer no later than the 5th day of each month for work performed during the previous month.

E. Reports of Field Quality Control: Refer to Article entitled “Field Quality Control” herein. Submit weekly description and record of examinations of structures classified in Categories 1, 1A, or 2. Submit weekly reports of monitoring and inspection of underpinning, temporary support, and maintenance systems.

F. Monitoring Program: Submit readings to Contracting Officer at the end of each day that readings are made. Submit readings in tabular and graphical form to allow displacement trend to be observed.

G. Submit qualifications of the Contractor’s engineer proposed for the design of underpinning, support, and maintenance systems.

1.7 QUALITY ASSURANCE

A. Perform underpinning operations with qualified personnel under continuous supervision of a Professional Engineer, licensed in the State of Texas, and experienced in such work.

B. Qualifications of Contractor’s Engineer: Design of underpinning, temporary support, and maintenance systems shall be prepared by a Professional Engineer licensed in the State of Texas whose qualifications include 10 years of documented experience in the design and construction of underpinning, temporary support, and maintenance systems. Submit proof of licensing and qualifications to Contracting Officer. Contractor’s engineer shall be qualified to substantiate extent of underpinning work.

1.8 CONSENTS, PERMITS AND APPROVALS

A. In addition to the General Provisions Paragraph, “Permits And Responsibilities,” obtain in the Contractor’s own name, agreements, rights, permits, and consents necessary to effect underpinning work. Obtain permits required by jurisdictional agencies. Permits shall name property owner and the Authority as co-applicants, when applicable, and the Contractor as their agent. Submit copies to Contracting Officer.

1.9 JOB CONDITIONS

A. Protection: Provide barricades as specified in Section 01500, “Temporary Facilities and Services,” including temporary canopies, decks, and other structures intended for protection of pedestrians, the segregation of vehicular traffic, and to prevent public access to hazardous areas.

B. Coordination with Structure Owners:

1. Prior to starting work on structure, confer with owner or owner’s authorized representative, and obtain concurrence with underpinning procedures and sequence of operations including the following items:

   a. Means of access to the construction area.

   b. Permitted areas of operations.

   c. Time restrictions for performance of work which may disturb occupants.

   d. Scheduling of time and durations of outages of utilities and other services to premises as well as of operation of systems within premises.

2. Notify the Contracting Officer three days prior to intended conferences with owner.
PART 2 - PRODUCTS

2.1 PILING
   A. In accordance with Section 02360, “Driven Piles”.

2.2 SHORING AND BRACING
   A. Provide heavy timber posts, beams, planks, boards, pipe struts, pin piles and accessories as required.

2.3 LAGGING AND SHEETING
   A. Provide heavy timber boards, planking or sheathing as required. Lagging boards shall be secured in place by steel H-piles with boards inserted between the H-flanges.

2.4 CONCRETE AND GROUT
   A. In accordance with Section 03305, “Portland Cement Concrete”, Mix S-1, 4,000 psi.
   B. Grout: As specified in Section 03305, “Portland Cement Concrete”. Type to be specified by Contractor's Engineer.

2.5 REINFORCEMENT
   A. In accordance with Section 03200, “Concrete Reinforcement”.

2.6 STRUCTURAL STEEL
   A. In accordance with Section 05120, “Structural Steel - Bridges”.

2.7 VIBRATION ISOLATION
   A. Closed-cell neoprene isolation board conforming to ASTM D1056, Grade SC E 45 BMZ
   B. No cracks after exposure to air containing 100 ppm of ozone for 100 hours at 104 degrees F with samples under 20 percent strain tested in accordance with ASTM D1149.
   C. Water absorption: Not exceeding one percent by weight.
   D. Bonding Adhesives for Vibration Isolation Material: As recommended by the vibration isolation material manufacturer.

2.8 EQUIPMENT
   A. Capacity of jacks and jacking equipment shall exceed that required for the imposed loads and shall be provided with calibration gages.
   B. Provide proof that equipment has been calibrated by company that meets requirements of ISO 17025.

PART 3 - EXECUTION

3.1 GENERAL
   A. Underpinning, temporary support, or maintenance systems shall be constructed in accordance with designs prepared by the Contractor's engineer.
   B. Maintain safety, stability, and integrity of structures of whatever nature regardless of location, which may be affected by this work.
   C. Verify locations and maintain existing utility facilities as specified in Section 02760, “Maintenance, Support, and Restoration of Existing Utility Facilities”.

3.2 TEMPORARY PARTITIONS AND CLOSURES
   A. Build where shown and as required by property owner, closed, dustproof, weatherproof, and burglarproof temporary partitions and closures of suitable materials to isolate the site from remainder of the structure. Comply with local building code requirements.
   B. Provide emergency exits, with appropriate hardware.
   C. Provide temporary protection against dust and damage from underpinning operations.
   D. Remove temporary protective installations upon completion of work and restore area.

3.3 EXCAVATION
   A. Excavate underpinning pits in accordance with Section 02220, “Grading, Excavating, and Backfilling”.
   B. Support excavated surfaces in accordance with Section 02160, “Support of Excavation”.
   C. Provide and maintain protective fencing and decking in accordance with Section 01533, “Temporary Decking”.
   D. Dewatering: In accordance with Section 02140, “Dewatering”.

3.4 UNDERPINNING
   A. Perform pinning, shoring, cribbing, and posting, as necessary, to ensure that movements damaging to the structure do not occur prior to and during underpinning operations.
B. Place dry pack mortar, concrete, and reinforcing steel in accordance with Sections 03100, 03200 and 03300.

C. Install structural steel shapes in accordance with Section 05120, "Structural Steel-Bridges".

D. Install piling where shown in accordance with Section 02360, "Driven Piles".

E. When jacking piles, establish adequate controls to detect movement of structure being underpinned. Maintain suitable equipment and methods continuously available to contain movement should it occur.

F. Remove obstructions encountered when installing steel shell piling by drilling or spudding. Blasting is prohibited. Comply with General Provisions, "Differing Site Conditions".

G. Test installed piling where shown and take remedial action necessary to obtain loading.

H. Use underpinning piles for underpinning purposes only, unless approved.

I. Transfer structural load to piles in accordance with approved procedures.

J. When transfer of loading has been completed and approved, clean pits of foreign matter.

3.5 CONCRETE PIERS, WALLS, AND END CAPS

A. Install underpinning walls, piers, and pile caps as indicated on approved working drawings, with the bottom at the indicated bearing elevation and the top approximately three inches below the structure to be underpinned. Dry pack the space within three days after concrete placement is completed. Do not remove support of existing structure until concrete piers, walls, or pier caps have attained design strength.

3.6 VIBRATION ISOLATION

A. Place vibration isolation material where shown using boards supplied in lengths sufficient for one-piece installation. Apply bonding adhesive at rate recommended by manufacturer of board.

3.7 BACKFILL

A. Place concrete backfill to limits shown.

B. Place and compact earth backfill in accordance with Section 02220, "Grading, Excavating, and Backfilling".

3.8 DETECTION OF MOVEMENT

A. Implement monitoring program as specified in Section 02316, "Geotechnical Instrumentation". Provide, install, and maintain monitoring equipment to detect horizontal or vertical movement of structures.

B. Inscribe or firmly affix on each column, pile cap, or wall to be underpinned or supported, visual methods of determining movements. Method used is optional but to be capable of being read to within 0.005 foot.

C. Take readings daily or more often, if necessary, during progress of underpinning or support operations, and for a period of four weeks after completion of such operations. Frequency of readings may be reduced at specific location(s) with prior approval.

3.9 FIELD QUALITY CONTROL

A. Examination of Structures: Conduct examination of structures classified in Categories 1, 1A, and 2 accompanied by a designated representative of the Contracting Officer. Examine and record by photographs or videotapes the exterior and accessible interior surfaces adjacent to construction, and the sidewalk and/or roadway pavement adjacent to these structures and to construction. Underground pipelines and utilities classified in Categories 1, 1A, or 2 shall be exempted from this examination unless required elsewhere in the Contract Documents.

B. Monitor and inspect the construction and installation of all underpinning, temporary support, and maintenance systems. Monitoring and inspection shall include, at a minimum, weekly inspections of the system(s) by the Contractor's engineer. Refer to Article entitled "Submittals" herein for requirements for monthly certification.

3.10 RESTORATION AND CLEAN-UP

A. Repair damage to structures caused by work, whether caused by displacement or other construction activities, and to restore structures to condition existing prior to start of work.

B. Restore ground and building surfaces to their original condition.

C. Remove debris and construction materials. Leave Site in a neat presentable condition in accordance with Section 02100, "Site Preparation".
PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section including underpinning of columns and underpinning of walls, floors, and decks will not be measured but will be paid for at the lump sum price for “Temporary Support, Maintenance, and Restoration”.

B. Settlement measurement, excavation, backfilling, dewatering, and other work described in this section will be included in the lump sum price for “Temporary Support, Maintenance, and Restoration”.

END OF SECTION 02150
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies support for cut-and-cover, open cut, and shaft excavation for facilities other than utility trenches. The design and installation of support of excavation is the sole responsibility of the Contractor.

B. Support for utility trenches is specified under Section 02221, “Utility Excavation and Backfill.”

1.2 REFERENCED STANDARDS

A. American Welding Society (AWS):
   1. AWS D1.1/D1.1M - Structural Welding Code - Steel

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A36/A36M - Standard Specification for Carbon Structural Steel
   2. ASTM A416/A416M - Standard Specification for Steel Strand, Uncoated Seven-Wire for Prestressed Concrete
   3. ASTM A722/A722M - Standard Specification for Uncoated High-Strength Steel Bar for Prestressing Concrete
   4. ASTM D4380 - Standard Test Method for Density of Bentonitic Slurries

1.3 SUPPORT SYSTEM DESIGN REQUIREMENTS

A. Support system shall consist of soldier piles and lagging, sheet-piling, or slurry-trench concrete walls, secured in place by means of bracing members such as wales, struts, shores, and ground anchors.

B. Design of support systems shall be performed by and working drawings and computations shall be signed and sealed by the Contractor’s engineer who shall be a Professional Engineer licensed in the State of Texas.

C. The design shall be in accordance with the recommendations of the Geotechnical Report and shall consider surcharges due to adjacent buildings, traffic, construction loads, and any other loading which may increase the lateral pressure on the support system.

D. Specified slopes shall take into account the time the excavation is to be open, and shall be adequate to safeguard nearby structures and utilities. Adequate erosion protection shall be provided.

E. The design shall be in accordance with recognized design standards such as ACI and AISC and provide adequate safety factors.

F. Utility supports shall be as required by the applicable utility company. Refer to Section 02760, “Maintenance, Support, and Restoration of Existing Utility Facilities”.

G. The design and construction of the system shall be as required to prevent loss of ground which would affect nearby structures and utilities.

H. Design of support systems shall be coordinated with design of underpinning and support of structures specified in Section 02150, “Underpinning, Support, and Restoration of Structures”.

I. Approval of Contractor’s plans and methods of construction does not relieve the Contractor of the responsibility for adequacy of support.

1.4 SUBMITTALS

A. Working Drawings and Calculations:
   1. Submit a proposed design and calculations, prepared and sealed by a Professional Engineer registered in the State of Texas, to the Contracting Officer.
   2. Submit the Contractor’s excavation support system equipment fabrication and installation procedures.

B. Documentation:
   1. When the proposed support system for excavation extends beyond the vertical projection of the property lines shown and into the adjoining property, obtain permission of owner in writing.
   2. Submit copies of permits with drawings.

C. Mix Designs: Submit proposed mix designs and test data indicating that proposed mixes comply with specified requirements. Test data shall not be more than 6 months old.

D. Obtain approval of submittals by the Contracting Officer prior to initiating excavation.
1.5 REGULATORY REQUIREMENTS
A. Design and perform support of excavation work in accordance with OSHA Safety and Health Standards and Texas Trench Excavation Safety Law.

1.6 JOB CONDITIONS
A. Location of Underground Facilities and Structures:
1. Contractor shall verify locations of underground facilities and structures. Locations shown for utility facilities are taken from the various utility records and are approximate.
2. Verify locations of existing utilities in accordance with Section 02760, "Maintenance, Support and Restoration of Existing Utility Facilities".
B. If existing utility facilities interfere with proposed method of support, notify the Contracting Officer. Do not modify the support system or relocate such facilities prior to receiving written approval.

PART 2 - PRODUCTS

2.1 STEEL SHEET PILING
A. Continuous interlocking type with cross section selected for intended use in accordance with Section 02360, "Driven Piles", except that welding shall be as per AWS D1.1/D1.1M.

2.2 SOLDIER PILES
A. In accordance with Section 02360, "Driven Piles", and Section 02375, "Drilled Shaft Foundation Piers".

2.3 CONCRETE
A. In accordance with Section 03300, "Cast-In-Place Concrete", and Section 03305, "Portland Cement Concrete", Mix S-1.

2.4 REINFORCEMENT
A. In accordance with Section 03200, "Concrete Reinforcement".

2.5 TIMBER LAGGING
A. Structural grade, minimum allowable flexural stress of 1,100 psi.

2.6 STRUCTURAL STEEL
A. In accordance with Section 05120, "Structural Steel - Bridges": ASTM A36 minimum.

2.7 ROCK BOLTS
A. Materials required shall be clearly identified on Contractor’s working drawings and approved by the Contracting Officer.
B. Steel Bars: Uncoated high strength steel bar for prestressing concrete in accordance with ASTM A722.

2.8 GROUND ANCHORS
A. In accordance with Section 03365, "Prestressed Concrete".
B. Steel bars: ASTM A722.
C. Steel strand: Uncoated stress relieved or low relaxation strand conforming to ASTM A416.

2.9 ANCHORAGES AND COUPLINGS FOR GROUND ANCHORS
A. In accordance with Section 03365, "Prestressed Concrete".

2.10 GROUT
A. In accordance with Section 03365, "Prestressed Concrete". Type to be specified by Contractor’s Engineer who is designing the system.

2.11 BENTONITE POWDER
A. In accordance with ASTM D4380.

2.12 MIXES
A. Lean Concrete: Portland cement and mineral or soil aggregate proportioned so that concrete achieves 1000 psi compressive strength at 28 days.
B. Concrete for Slurry Trench Walls: Tremie concrete of strength necessitated by design, with the following additional requirements:
1. Minimum cement factor: Seven bags per cubic yard.
2. Water-cement ratio: As necessary for strength and durability.
3. Sand proportion: As necessary to produce optimum results.
5. Slump: 6 inches plus or minus 1 inch.
6. With water-reducing or fluidizing agents as necessary.

C. Bentonite Slurry:
1. Stable suspension of powdered bentonite, or equal, and natural silts and clays in water.
2. Density: 64 pcf minimum, 85 pcf maximum.
3. Marsh funnel flow rate: 40 seconds minimum, 80 seconds maximum viscosity.
4. Fluid loss: 0.85 ounces maximum in 30 minutes.
5. pH: 7.0 to 11.0
6. Shear strength:
   a. By shearometer: 0.3 to 2.25 Lbf.
   b. By fan viscometer: 0.9 to 90 Lbf.

3.2 SHEETING, SHORING, AND PILING

A. Install soldier piles by pre-boring or other pre-excavation methods. Install soldier piles only in those areas where approved. Install piles vertical within tolerance of 1 foot from plumb per each 100 feet. Take appropriate measures to stabilize excavation to preclude loss of ground. Provide pre-bored holes for soldier piles adequate to accommodate pile section as approved. Extend hole to necessary depth below top of subgrade.

B. Carry bottom of support system to depth below main excavation to be adequate to prevent lateral movement. In areas where additional excavation is required below main excavation subgrade, make provisions to prevent movement of main excavation supports.

C. Minimum pile penetration for multiple layered horizontal bracing support systems shall be determined as follows:
   1. Install soldier piles so that tips are at least 5 feet below top of subgrade.

D. After seating soldier piles in pre-excavated holes, encase piles with concrete (Mix S-1) specified herein, up to lowest point of excavation adjacent to pile location. Fill remainder of hole with lean concrete, completely encasing pile.

E. Use timber lagging, steel sheeting, or precast reinforced concrete members secured in place for sheeting of excavations.

F. Do not permit height of unlagged face to exceed 15 inches if water flows from face of excavation or if soil in face moves toward excavation area.

G. Carefully perform excavation for installation of sheeting to minimize formation of voids. Separate sheeting members only to extent necessary to permit packing behind them.

H. Pack behind sheeting as installation progresses to establish tight contact between excavation face and sheeting. Pack openings between sheeting members with straw or other suitable material to allow free drainage of water without loss of soil or sand packing.

I. If unstable material is encountered during excavation, take suitable measures to contain it in place and prevent ground displacement which may cause damage.

J. Maintain sufficient quantity of material on hand for sheeting, shoring, bracing, and other operations for protection of work, and for use in case of accident or emergency.
K. Support System for Vertical Shafts Which Penetrate Soil/Rock Interface:

1. Soldier piles:
   a. Install soldier piles to obtain tip elevations as approved by the Contracting Officer based on examination of coring results.
   b. For shafts where pilot core borings indicate top of unweathered bedrock varies by more than 3 feet in elevation, set tips of soldier piles at least 10 feet below lowest point of top of unweathered bedrock.
   c. In drilling soldier pile holes, use equipment that has the capacity to penetrate materials having an average unconfined compressive strength of six to eight kips per square inch and that may reach even greater values in some locations.

2. Ring beams and lagging or liner plate: If shaft excavation is supported by ring beams or liner plates, install rings or liner plate to at least 10 feet below average elevation of top of unweathered bedrock, as approved by the Contracting Officer based on examination of the rock in the advancing excavation.

L. After work is completed, work will be surveyed to establish completed conditions for monitoring purposes in accordance with Section 01722, "Field Engineering - Surveying".

3.3 SLURRY WALLS

A. Slurry Trench Equipment:
1. Use equipment capable of removing from trench foreign material embedded in soil as well as natural materials, including boulders, where necessary. Arrange equipment to permit free vertical passage of slurry within trench and to prevent development of suction or pressure.
2. Furnish trench inspection tools adequate to ensure that trench has been excavated to dimensions shown on approved working drawings and that cuttings and foreign material have been removed.
3. Use slurry mixing equipment capable of producing with mechanical agitation a stable suspension of bentonite and water.
4. Transport slurry to panels by temporary pipeline or other approved methods.
5. Furnish slurry circulation equipment to provide circulation and agitation of the slurry throughout full depth of excavated panels. Do not agitate slurry by air.
6. Use slurry reclaiming equipment which will remove detrimental quantities of excavated material from slurry to ensure use of clean slurry in trenches. Recirculate reclaimed slurry to trenches in a continuous operation regardless of slurry density. Monitor slurry and control its capability of retaining solid particles in suspension.

B. Field Quality Control:
1. Make tests on samples of in-place slurry to determine density, viscosity, filtration, and sand content in accordance with ASTM D4380.
2. Maintain quality of bentonite slurry compatible with soil characteristics of trench walls.

C. Construction:
1. Construct slurry trench walls by displacement of bentonite slurry with tremie concrete.
2. Construct walls of reinforced concrete or plain concrete embedded with structural steel. Where soldier piles are used in construction of walls, it is permissible to consider piles as reinforcement.
3. Provide sufficient embedment of walls below subgrade of excavation to prevent loss of ground due to piping under wall or lateral movement of wall.
4. Perform preparatory work to discover, protect, maintain, relocate and restore utility facilities and other obstructions in vicinity of slurry walls.
5. Use construction methods ensuring that slurry materials employed during trench excavation and placing of tremie concrete are contained and controlled to prevent leakage and spillage of slurry and excavated materials into basements, vaults, utilities, and other facilities.
6. Excavate slurry wall trenches in panels of width and depth shown on approved working drawings with maximum panel.
length of 18 feet. Reduce panel length when excavating adjacent to facilities sensitive to settlement.

7. Maintain level of slurry in panels no more than 5 feet below top of trench during excavation operations and until tremie placement is essentially completed.

8. Progress construction with no more than one unexcavated panel and one tremie-filled panel with concrete cured at least 72 hours, between two slurry panels under active excavation.

9. Keep slurry circulated or agitated during drilling and excavating and immediately prior to concreting. Continuously maintain slurry requirements even during nonworking periods and stoppages. If stoppage occurs in the operation causing slurry in panel to remain uncirculated and unagitated for more than 24 hours, backfill panel until operation can be resumed.

10. Place concrete by tremie method either by gravity flow or by pumping. As soon as possible after placement of concrete is commenced, position and maintain the bottom of the pipe not less than 5 feet below the upper surface of concrete being placed. Equip tremie pipe with bottom valve or other device to prevent mixing of slurry with concrete inside tremie pipe. Aluminum pipe is prohibited.

11. Inspect trenching in the presence of the Contracting Officer prior to concreting. Ensure that settled cuttings and excavated material have been removed.

12. Start placement of concrete in panels within 12 hours after completion of panel excavation and proceed continuously until concreting is completed.

13. When wales are used, obtain tight bearing between wales and wall and ample bearing area with wedges and dry pack for load transfer.

14. Accomplish preloading by approved procedures. Transfer load by jacking applied symmetrically to braces without introducing eccentricity.

15. Introduce jacking load into braces immediately after each tier of braces has been installed and before excavation has progressed more than 2 feet below bottom of bracing tier. Make provision to fix preload into each brace by shim plates, wedges, blocking, or other approved device.

16. After concrete invert slab has been placed and attains sufficient strength to receive loads from slurry walls, remove tiers of bracing above invert level, provided the following conditions exist:
   a. Remaining tiers are capable of resisting total load calculated from trapezoidal pressure diagrams shown.
   b. Calculated deflection of the walls between tiers of bracing, assuming forces indicated by the trapezoidal pressure diagrams, does not exceed 1/2 inch.

17. Construct tight joints between adjacent pours of concrete in slurry wall to minimize loss of fines from retained earth. Take necessary care to accomplish this in terms of properly excavating trench and cleaning abutting face of hardened concrete or surfaces of structural members if used. Provide approved method of water stopping.

18. Seal leaks encountered in walls as excavation progresses, if leaks are of sufficient size to permit penetration of fines and loss of ground. Procedures may include grouting outside or through wall.

19. Dispose of unsuitable excavated material and debris in accordance with Section 02220, "Grading, Excavating, and Backfilling".

20. Dispose of slurry waste offsite by means of sealed tanks and in accordance with the regulations of the jurisdictional agencies.

3.4 WALES, STRUTS, AND ANCHORS

A. Install and maintain primary support members in tight contact with each other and with surface being supported.

B. Preloading:
   1. Except for ground anchors and slurry wall bracing, preload primary bracing members including struts, shores and similar members
at installation to 50 percent of design load, which for this purpose is maximum load that bracing member will have to carry. Preload tiebacks and slurry walls as specified for those installations.

2. Use procedures that produce uniform loading of bracing member without appreciable eccentricities or overstressing and distortion of members of wall system.

3. Make provisions for permanently fixing load in each member using steel shims or wedges welded into place.

4. Accomplish preloading by jacking support in place against soldier piles or wales.

5. Do not use wooden wedges to preload bracing member.

6. Include in preloading system means to determine within five percent amount of preload induced into bracing members.

C. Excavate to no more than 2 feet below point of support about to be placed. Install support and preload immediately after installation and prior to continuing excavation.

D. When removing struts, do not increase vertical spacing unless invert slab has been in place for at least 48 hours and support system is adequate to safely support adjacent structures and works.

3.5 SUPPORT SYSTEM WITH TIEBACKS

A. Install tieback system in accordance with approved working drawings. Install anchorage in soil no closer than a plane extending upward at an angle of 45 degrees to the horizontal from outer limit of lowest depth of excavation.

B. Stress tiebacks to proof loads equal to 140 percent of maximum design load and maintain proof load for 30 minutes prior to reducing to design load. Reject tiebacks which lose more than five percent of proof load during 30 minute period.

C. Apply proof loads in increments of five tons at one minute intervals and provide means to measure load application with accuracy of plus or minus five percent.

D. After reducing tieback load to design load, encase anchors in grout maintaining design load until anchors are fixed in place.

E. In transfer of loads from jacks to support system, use fixation method which will limit load loss to no more than five percent of design load.

F. Preliminary and Creep Tests on Tiebacks:

1. Reapply proof loads equal to 140 percent of design load at each level of support in excavation on first installation on each side of excavation at horizontal intervals not exceeding 500 feet and wherever there is significant difference in soil in which tiebacks are installed.

2. As specified for proof loading, apply proof loads in increments of five tons at one minute intervals. Provide means to measuring load applications with an accuracy of plus or minus five percent of design load. Maintain proof load for 24 hours prior to reducing it to design load.

3. Make records of axial movement with incremental applications of load as well as amount and time of load fall-off with no pumping of jack or axial movement during 24 hour period that proof load on tieback system is maintained. If during 24 hour period axial deformation of tieback system exceeds 0.02 inch or decrease in jack pressure without pumping is more than five percent after correcting for temperature changes during the test period, redesign tieback system to satisfy requirements.

G. Rock Bolts:

1. Tension rock bolts to their design load as approved to permit checking of each loading by the Contracting Officer.

2. If grouted rock bolts are used, after loading has been approved, pressure-grout each permanent rock bolt in place using methods and equipment which will ensure elimination of air from bolt hole.

3. If fully resin-encapsulated bolts are used, use slow setting resin to allow the Contracting Officer sufficient time to approve loading prior to gelation.

H. Vertical Support System with Tiebacks:

1. Install piles or other vertical support system members incorporated in a system utilizing tiebacks so that they are capable of resisting vertical components of tieback loads without significant settlement during excavation and construction.

2. Install vertical support members so that settlements will not be caused by construction. In general, install members to be end-bearing in stratum below maximum depth of excavation and capable of
carrying total vertical loads without assistance of skin friction at depth of excavation.

3.6 **LAGGING**

A. Unless otherwise required, provide timber lagging of 3 inches minimum thickness where it spans soldier piles placed at distances 5 feet to 7 feet on centers and for excavation depths up to 25 feet. Increase minimum lagging thickness to 4 inches for excavation below 25 feet in depth.

B. For other conditions and types of lagging, submit design details for approval.

3.7 **SUPPORT OF EXCAVATION AT INTERFACES**

A. Construct, maintain, and remove all or parts of support system at limits of the Contract, at interface with the Authority's adjacent contracts, as may be necessitated by construction schedules and sequence of operations of respective contracts.

B. In the event excavation is commenced at an interface prior to the commencement of excavation on adjacent contract, design, construct, and maintain end support system making provisions as follows:

1. Install near face of cofferdam on line separating contracts. Allow no part of support system to project into the next contract except thickness of supporting wall, e.g. soldier piles and lagging, and tiebacks if approved.

2. Provide support system adequate to support backfill and restoration loads with installation of a reasonable bracing system by adjacent contractor during excavation for his contract.

C. If excavation has commenced on adjacent contract at interface prior to excavation on this Contract, make provisions as follows: Coordinate removal of such portions of cofferdam which have been installed in adjacent contract and support and maintain remainder as necessary to effect juncture of contracts.

3.8 **FIELD QUALITY CONTROL**

A. Tests:

1. Conduct tests and obtain approval prior to use of tieback system for excavation support.

2. The Contracting Officer may furnish and install certain instruments to monitor performance of tieback or rock-bolt system.

B. Remove components of support system which penetrate or encroach on permanent structure without endangering stability of support.

C. Welding: In accordance with Section 05120, "Structural Steel - Bridges".

D. Provide and maintain convenient access and appropriate means for the Contracting Officer to accomplish these observations.

3.9 **REMOVAL OF SUPPORTING SYSTEM**

A. When removing support of excavation system, wholly or in part, do not disturb or damage adjacent buildings, structures, construction, or utility facilities. Fill voids immediately with lean concrete or with approved backfill compacted to density specified in Section 02220, "Grading, Excavating, and Backfilling".

B. Leave first support immediately above invert slab of subway structure in place for at least 48 hours after placement of invert concrete. Leave support immediately above top of roof slab of structure in place for at least seven days after placement of roof slab concrete unless the Contracting Officer approves earlier removal.

C. Remove other supports above roof structure only after backfill has been placed and compacted to required density to within 6 feet of bottom of support.

D. Except as specified below, remove supporting system to depth of 6 feet below surface. Remove supporting systems at intersections of streets and at temporary access ramps to a depth of 8 feet.

E. Where top of Authority structure extends into 6 foot or 8 foot limit, remove adjacent supporting systems to a depth flush with the top of the Authority structure or 1 foot below the surface, whichever is greater. Increase removal depths where necessary to accomplish work in this Contract.

**PART 4 - MEASUREMENT AND PAYMENT**

4.1 **GENERAL**

A. The work specified in this section as support systems for excavation over 5 feet in depth will not be measured directly, but shall be considered as incidental to other items of work.
B. Support of excavation if required for depths not exceeding 5 feet will not be measured, but considered incidental to excavation.

C. Support of excavation for utility trenches will be measured and paid for as specified in Section 02221, "Utility Excavation and Backfill".

END OF SECTION 02160
SECTION 02220
GRADING, EXCAVATING AND BACKFILLING

PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section specifies grading, excavating, constructing embankments and backfilling for roadways, and structures, and disposing of excess excavated material.

B. For utility excavation and backfill, see Section 02221, "Utility Excavation and Backfill".

1.2 REFERENCE STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM C33 - Standard Specification for Concrete Aggregates

2. ASTM D698 - Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/ft³ (600 kN-m/m³))

3. ASTM D1557 - Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft³ (2,700 kN-m/m³))

5. ASTM D4318 - Standard Test Methods for Liquid Limit, Plastic Limit, and Plasticity Index of Soils

6. ASTM D4491 - Standard Test Methods for Water Permeability of Geotextiles by Permittivity

7. ASTM D4533 - Standard Test Method for Trapezoid Tearing Strength of Geotextiles

15. ASTM D6023 - Standard Test Method for Unit Weight, Yield, Cement Content and Air Content (Gravimetric) of Controlled Low Strength Material (CLSM).

B. Standard Specifications for Public Works Construction, North Central Texas Council of Governments, as revised (NCTCOG Standard Specifications).

C. Texas Department of Transportation, Standard Specifications for Construction of Highways, Streets, and Bridges (TxDOT Standard Specifications).

1.3 DEFINITIONS

A. Grading consists of the following:

1. Excavation of earth, concrete, asphalt paving, and rock for grading.

2. Shaping and constructing embankments and fills.

B. Earth excavation: Excavating in materials of whatever nature except rock as defined below.

C. Rock excavation: Excavating material in place which cannot be loosened nor broken down by using earth excavating equipment and which requires rock excavating equipment for its removal.

D. Borrow: Materials obtained by the Contractor from designated or approved sources other than required excavation.

E. Approved material: Materials for embankment, fill, and backfill specified herein as approved for the particular application by the Contracting Officer.
F. Surplus excavated material: Approved excavated material which is not used in embankments or as fill within the Project Limits.

G. Unsuitable material: Material which does not meet specified requirements for use for embankment fill, backfill, general site fill, trench backfill or wall backfill; and is prohibited for use in the Work.

H. Undercut Excavation: Unsuitable material excavated below contract elevation.

I. Common Excavation: Excavation below existing ground line to Contract specified grade.

J. Authorized excavation: Excavating to neat lines and limits shown and specified; excavating unsuitable material when required by the specifications.

K. Unauthorized or excess excavation: Excavated materials which would otherwise be left in place, but removal of which is required because the Contractor's operations have rendered them unstable; excavation which is not specified as authorized excavation, such as excavation beyond neat lines and bottoms of footings as shown on the Contract Drawings, or excavations made by the Contractor for the Contractor's convenience.

L. Unclassified Street Excavation: Required excavation within the limits of streets, alleys, parking lots, stations, trackway, and Authority right-of-way (except excavation specifically described and provided for elsewhere in the specifications), the removal and proper utilization or disposal of all excavated material within those limits; and the shaping and furnishing of all earthwork in conformity with the lines and grades of the streets, alleys, parking lots, stations, trackway, and Authority right-of-way as shown on the Contract Drawings.

M. Unclassified Common Excavation: Excavation, regardless of the material encountered, below existing ground line to Contract specified grades which is neither unclassified street excavation nor unclassified structural excavation.

N. Unclassified Structural Excavation: Structural excavation and removal of materials encountered, regardless of their nature or the manner in which they are removed, necessary for the construction of structures which shall be from finish grade in areas of cut, and from natural grade in areas of fill.

O. Authorized Unclassified Overexcavation: Excavation beyond the neat lines shown on the plans when authorized by the Contracting Officer for the purpose of removing unsuitable subgrade materials. Does not include materials described as "Unauthorized or excess excavation".

P. Embankment, Fill and Backfill: Placement of approved materials to specified controls from original grade or authorized excavated grade (not including stripping) to contract elevations.

Q. Salvage: Materials shown to be salvaged in accordance with Section 02072, "Removal and Restoration of Miscellaneous Existing Facilities" and Division 1, GENERAL REQUIREMENTS.

1.4 SUBMITTALS

A. Test Results: At least seven calendar days in advance of desired date of approval, submit test results of material proposed for fill, backfill, controlled low strength material (flowable fill), and embankment certifying that the material complies with the Specifications. Tests shall be performed by an independent testing laboratory approved by the Authority and complying with Section 01450, "Quality Control".

B. Submit sample, specification data, and manufacturer's installation instructions for non-woven filter fabric to the Contracting Officer for approval.

C. Submit manufacturer and model number of power-actuated compactors proposed for use in confined areas adjacent to structure.

D. Submit documentation of permits for disposal of excavated material:

E. Submit written releases from each property owner where excavated material will be deposited absolving the Authority from responsibility in connection with such disposal. Submit releases at least seven calendar days prior to disposal of material. Releases shall be signed by owners of property on which material will be deposited.

1.5 REGULATORY REQUIREMENTS

A. Perform excavation work in accordance with OSHA Safety and Health Standards and Texas Trench Excavation Safety Law.

1.6 JOB CONDITIONS

A. Existing Drainage:

1. Refer to Section 01562, "Soil Erosion and Sediment Control", for related requirements.

2. Preserve, protect, and maintain existing operable drains and sewers during grading operations.

B. Refer to Section 01500, "Temporary Facilities and Services Required During Construction" for requirements for barricades and other protective devices.

C. Location of Underground Facilities and Structures:
1. Contractor shall verify locations of underground facilities and structures. Locations shown for utility facilities are taken from the various utility records and are approximate.
2. Verify locations of existing utilities in accordance with Section 02760, "Maintenance, Support and Restoration of Existing Utility Facilities".

D. Toxic, Hazardous, and Combustible Substances:
1. Comply with the requirements of Section 01560, "Environmental Protection".
2. During excavation, provide equipment and carry out such tests as necessary to detect presence of toxic, hazardous, and combustible substances. Refer to Special Provisions, "Environmental Testing," for related requirements.
3. Take action to safeguard persons and property in accordance with rules and regulations of jurisdictional agencies and utility owners.
4. Promptly notify utility owners when problems concerning their facilities become apparent.

E. Ramps:
1. Construct temporary ramps as necessary to provide access to work area.
2. Locate such access ramps in Contractor's storage, operations, and access areas or within excavation for structure and maintain traffic as specified.
3. Support ramp excavation in accordance with Section 02160, "Support of Excavation".
4. When ramps are in use, station properly equipped flagmen at ramp entrances to keep unauthorized vehicles and persons from entering work area.
5. When work necessitating entrance or exit of vehicles via ramps is not being performed, protect entrances and exits of ramps by warning signs and barricades in accordance with the General Requirements.
6. Upon completion of work necessitating use of ramps, remove support elements of ramp system in accordance with Section 02160, "Support of Excavation" and backfill excavated ramp areas.

F. Excavation Near Surface and Underground Structures: Control excavation in areas near all structures including buildings, underground and overhead utilities, bridges, pavement, and track to maintain stability and function of structures. If underpinning is necessary, perform excavation work in accordance with Section 02150, "Underpinning, Support, and Restoration of Structures" so that condition of surrounding area remains unimpaired.

PART 2 - PRODUCTS

2.1 MATERIALS FOR EMBANKMENT, FILL, AND BACKFILL

A. Embankment Fill:
1. Well graded soil-aggregate mixture comprising stone, gravel, sand, lean clay, fat clay, or combinations of such materials.
2. Prohibited material: Organic matter, debris, cinders, frozen material, and as required by the jurisdictional agencies.
3. Liquid Limit: 70 percent maximum when placed in embankments with side slopes equal to or steeper than 4 Horizontal to 1 Vertical (4H:1V). For slopes flatter than 4H:1V, liquid limit shall not exceed that of native soils present where fill will be placed.
4. Plasticity Index: Between 7 and 40 percent when placed in embankments with side slopes equal to or steeper than 4 Horizontal to 1 Vertical (4H:1V). For slopes flatter than 4H:1V, plasticity index shall not exceed that of native soils present where fill will be placed.
5. Particle Size: 4 inches maximum, but not exceeding 1 inch within one foot of finished grade.

B. Select Fill:
1. For use for retaining wall backfill.
2. Clayey sand or sandy clay, or silty fine sand, free of roots, grass, trash or other organic
material, contaminated soils, debris, or other materials that would prevent proper compaction of select fill.

3. Plasticity Index: Not to exceed 15 percent.
4. Liquid Limit: Not to exceed 40 percent.

C. Structural Select Fill:
1. For use at flatwork subgrades, trench backfill, and where indicated on the Contract Drawings.
2. Clayey sand, sandy clay, or Austin Chalk Limestone, free of roots, grass, trash, and other organic material. Crushed stone or gravel stone up to 4 inches maximum size is permissible, but not exceeding 1 inch in size within 0.5 feet of finished grade.
3. Clayey Sand or Sandy Clay:
   a. Plasticity Index between 5 and 15 percent.
   b. Liquid Limit not to exceed 40 percent.
4. Austin Chalk Limestone:
   a. Gradation:
      | Grain Size | Percent Retained |
      |------------|-----------------|
      | 4 inches   | 0               |
      | 1.75 inches| 0-45            |
      | No. 4      | 35-75           |
      | No. 40     | 50-85           |
   b. Plasticity Index: Maximum 20 percent.

D. Controlled Low Strength Materials (Flowable Backfill):
1. Mixture of natural sand or manufactured sand, cement, and/or fly ash, and water. Flowable mixture shall have a minimum slump of 5 inches.
2. Materials used shall be granular with 100 percent passing a 3/4 inch sieve.
3. Plasticity Index: Not to exceed 12 percent.
4. Cement content shall be minimum 100 lbs per cubic yard unless otherwise indicated on the Contract Drawings.
5. Unconfined compressive strength per ASTM D4832 shall be between 250 and 450 psi after 28 days unless otherwise indicated on the Contract Drawings.

E. Cement Treated Base
1. Mixture of crushed stone or crushed concrete, binder, cement, and water to produce a base course per TxDOT Standard Specifications, Item 276, “Portland Cement Treated Base (Plant Mixed)”.
2. Crushed stone shall be Type A, Grade 1, per TxDOT Item 247, “Flexible Base,” unless otherwise indicated on the Contract Drawings.
3. Cement treated base shall be Strength M, 500 psi at 28 days, with minimum cement content of 5 percent unless otherwise indicated on the Contract Drawings.
4. Cement treated base shall be plant mixed.

2.2 NON-PUMPING SUBBASE
A. As specified in the NCTCOG Standard Specifications, as revised.

2.3 PERVERSIOUS MATERIAL
A. Natural, clean, free draining sand conforming to the requirements of ASTM C33 except the following:
   1. Material passing Size 100 sieve not to exceed eight percent.
   2. Material passing Size 200 sieve not to exceed five percent.

2.4 SOIL DRAINAGE MATERIAL
A. Clean, crushed, rock, gravel, with 1-1/2 inches maximum particle size and maximum two percent by weight passing Size 4 sieve. Crushed concrete shall not be used as a soil drainage material.

2.5 IMPERVIOUS MATERIAL
A. Lean clay and fat clay material with minimum 65 percent by weight passing Size 200 sieve.
B. Plasticity Index: 30 percent minimum, determined in accordance with ASTM D4318.

2.6 NON-WOVEN FILTER FABRIC
A. Use non-woven material for subgrade stabilization at locations indicated on the Contract Drawings.
B. Shall adhere to the following requirements:

2.7 SOURCE OF MATERIALS

A. Use materials excavated under this Contract for embankment, fill, and backfill if they meet specified requirements. If sufficient material meeting these requirements is not available from this Contract, obtain material meeting specified requirements.

B. If borrow areas are provided by the Contracting Officer within the right-of-way, dress and shape such areas to ensure positive drainage when borrow operations are completed.

C. Use only material whose quality, source, and zone of placement in the fill have been approved.

PART 3 - EXECUTION

3.1 GENERAL

A. The existing topographic features used in the design of this project are based on aerial mapping. The Contractor shall use appropriate equipment in sufficient quantity and size to perform the work as specified and shown.

B. Keep haul routes clean in accordance with the General Requirements and in accordance with Section 01560, “Environmental Protection”.

C. Storage of Excavated Material In Floodways: The Contractor shall not store or deposit surplus excavation or any other material in any area designated as a Flood Plain or along natural drainage ways. Materials so deposited shall be removed and the area restored to its natural condition at the sole expense of the Contractor.

3.2 EARTH EXCAVATION

A. Excavate in sequences and stages which will not impair permanent facilities or temporary facilities, and surfaces.

B. Excavate to neat lines or set back lines for mixed face conditions and grades shown. If approved, slopes may be flattened as a matter of expediency.

C. When excavation has reached required grades, notify the Contracting Officer, who will make an inspection of conditions. Where excavation to the finished graded section results in a subgrade or slopes of unsuitable materials, remove such materials below the grade as shown on Contract Drawings, as specified herein, or as directed. Replace unsuitable material with approved fill material and compact as specified in Article 3.10, herein.

D. When excavation has reached required grades for roadways, trackbeds, mechanically stabilized earth (MSE) wall subgrade, retaining wall subgrade, and other subgrades, the Contracting Officer will require the Contractor to proof roll the exposed surface using a fully loaded 20 ton rubber tired truck to detect all soft and compressible areas. If soft and compressible areas are detected, perform the following additional steps:

1. Excavate and remove materials from soft and compressible areas until suitable materials are encountered.

2. Replace these overexcavated areas with approved materials to reestablish final grade for the subgrade consisting of soils similar to the existing surrounding soils and zones of proposed fill above subgrade.

3. Proof roll exposed surfaces and continue detection, removal, and replacement of unsuitable foundation materials until stabilized and suitable subgrade is established.

4. Perform overexcavation, if required by the Contracting Officer, to remove rock, ballast, boulders, debris, and other unsuitable foundation materials encountered below specified limits of excavation for new subgrade.

E. Prepare subgrade for placement of additional fill as specified in Article 3.7 herein.
F. Preparation of Subgrade Below Sub-ballast: Refer to Article 3.8, herein.

G. Support sides of excavation as specified in Section 02160, "Support of Excavation".

H. Protect, support, and maintain utility facilities as specified in Section 02760, "Maintenance, Support, and Restoration of Existing Utility Facilities".

I. Proceed with caution in areas of utility facilities; expose them by hand excavation or other methods acceptable to the facility owner.

J. Maintain excavation free from water in accordance with Section 02140, "Dewatering".

K. Remove excavated materials to fill, embankment, stockpile, or disposal locations. Keep temporary placement of excavated materials at least two feet from the edge of excavation.

L. Fill unauthorized and excess excavations with approved materials and compact as specified. Perform material and compaction tests in accordance requirements of this Section.

3.4 REMOVAL OF SUBSURFACE OBSTRUCTIONS

A. Remove subsurface obstructions where indicated in the Contract Documents and when required by the Contracting Officer.

B. Prior to removal of parts of subsurface obstructions, which extend into Contract limits, build permanent closure walls where shown around such obstructions to separate areas to be left intact from areas to be removed.

3.5 EMBANKMENT, FILL, AND BACKFILL

A. Place, compact, and test embankment, fill, and backfill in 8-inch loose layers, for entire width except as otherwise specified herein. Note, all fill and backfill under the Contract shall be compacted in layers as specified herein with the exception of sub-ballast. Install sub-ballast for the trackbed as specified in Section 02451, "Sub-Ballast".

B. Do not allow accumulation of large pieces of material at one location. Fill voids and crevices with finer materials.

C. Compaction in Confined Areas and Adjacent To Structures:
   1. In confined areas, use approved power-actuated compactors to achieve required density.
   2. Compact embankment, fill, and backfill materials within 5 feet of retaining walls, abutments, and other structures, using lightweight compactors.
   3. Do not overstress structures.
   4. Obtain Contracting Officer's approval prior to backfilling against new structures. Refer to Article 3.5Q, herein for detailed requirements for the timing of backfill operations against new cast-in-place concrete structures.

D. Prior to compaction, adjust moisture content of material within specified limits as specified in Article 3.10, herein, by drying or watering either at material source or on fill.

E. Leave struts, braces, lagging, and timbersheathing in place as long as needed to support excavation and adjacent facilities and structures. Remove
these struts and braces, and similar supports at appropriate time during or before backfilling.

F. Where utility facilities and structures are supported in place, use special equipment and techniques as required to achieve the compaction specified in Article 3.10, herein, under and around the utility facilities and structures.

G. Backfill coated pipe so as not to damage coating by using 6 inch minimum layer of pervious material or stone free soil under and over the pipe.

H. Do not place backfill on subsurface structures until requirements for curing and waterproofing have been complied with and, if required, until test cylinders for particular structure indicate that concrete has attained specified compressive strength.

I. When backfilling against structures, place material approximately simultaneously on both sides of structures to equalize opposing horizontal pressures.

J. When backfilling on tops of structures, place material in 6 inch lifts.

K. Under concrete floors and other slabs on grade, place drainage material directly on prepared subgrade which meets density and elevation requirements specified in Article 3.10, herein.

L. Prior to placing embankment against slope greater than one foot vertical to four foot horizontal, cut benches into existing slope. Height of bench shall not exceed 2 feet unless otherwise approved.

M. Maintain embankment, fill, and backfill in stable, well-drained condition.

N. Where approved by the Contracting Officer, Contractor may dispose of surplus excavated material by widening embankments and flattening slopes.

O. Where pervious material will be exposed to erosion, cover it with 12-inch layer of approved impervious material compacted in place.

P. Backfill for soil reinforcement of Mechanically Stabilized Earth (MSE) walls shall be as specified in Section 02872, “Mechanically Stabilized Earth Retaining Wall.” Backfill material beyond the limits of MSE wall soil reinforcement shall be “Embankment Fill” as specified in this Section.

Q. Backfilling Against Cast-In-Place Concrete Structures: Obtain Contracting Officer’s approval prior to backfilling. Backfill shall be placed as soon as practicable following the attainment of the required compressive strength and lapse of time specified in Table 02220-1, except as otherwise noted on the Contract Drawings. In no case shall backfilling occur later than 30 days after the concrete placement unless the excavated openings are maintained in a drained condition. Excavation openings shall be made as dry as practicable at the time of backfilling by dewatering method in accordance with Section 02140, “Dewatering.” Backfill shall be placed in such a manner as to deter the impoundment of water and to facilitate existing drainage.

R. Controlled Low Strength Flowable Backfill:
   1. Mix flowable mixture in a pug mill, concrete mixer, or transit mixer.
   2. Minimum temperature at point of delivery 50 degrees F.
   3. Protect from freezing for a period 36 hours after placement.
   4. Allow the flowable mixture to set prior to placement of any overlying material.

3.6 BORROW

A. For additional quantities, when required and approved, obtain borrow materials from approved or designated sources.

B. Provide appropriate drainage for borrow operations and excavate in accordance with the approved plans.

C. Perform no surplus excavation in borrow operations. Avoid excavation of unsuitable materials.

3.7 PREPARATION OF GROUND AS SUBGRADE

A. Where the subgrade is on original ground; in soil cut; where embankment and fill is less than 1 foot, fulfill compaction and moisture requirement as specified in Article 3.10, herein, for 8 inches minimum below final subgrade.

B. If necessary, scarify original ground and adjust moisture content prior to compacting.

C. Sand or other granular leveling material shall be specifically prohibited beneath pavement areas.

3.8 PREPARATION OF SUBGRADE BELOW SUB-BALLAST

A. After excavation and embankment have been completed in accordance with these specifications, the Contractor shall prepare the subgrade beneath the sub-ballast as follows:
1. For clayey soils with a Plasticity Index greater than 15, provide 6 inches of lime stabilization in accordance with Section 02243, “Soil Stabilization: Lime Treatment”.

2. Where different backfill materials or foundations exist below the sub-ballast due to rock, walls, or other structures, provide a uniform depth of 24 inches of similar select or specified fill materials beneath the sub-ballast and place filter fabric between the prepared and proof rolled subgrade and the sub-ballast. Limits of proposed filter fabric on subgrade as indicated on the Contract Drawings are approximate. The actual longitudinal and lateral extents may vary. Install fabric in accordance with manufacturer’s installation instructions.

3.9 FINISHING

A. Construct subgrades in landscape areas as follows:
   1. Plant areas: 0.4 foot below established finished grade.
   2. Lawn areas: 0.2 foot below established finished grade.

B. On completion of work, clean ditches and channels.

C. Slope and shape borrow areas to provide positive drainage.

D. Remove unsuitable and surplus excavated materials to locations outside the Project's right-of-way in accordance with Section 02100, “Site Preparation”.

E. Leave site in neat, presentable condition.

3.10 COMPACTION

A. Maintain moisture content of embankment, fill, and backfill material during compaction within minus 2 to plus 3 percent of optimum moisture content of material.

B. Compact each layer of embankment, fill, and backfill to 95 percent of maximum dry density as determined in accordance with ASTM D698, with moisture content within tolerance specified.

C. Compact each layer of fill below cast-in-place retaining walls and mechanically stabilized earth retaining walls that are 15 feet or higher to 95 percent of maximum dry density as determined in accordance with ASTM D1557, with moisture content within tolerance specified.

D. Compact fill below retaining walls less than 15 feet high to 95 percent of maximum dry density as determined in accordance with ASTM D698.

3.11 DISPOSAL

A. Dispose of waste material, trash and debris off site. Obtain written permission and releases from owner of the property where such waste materials are to be deposited and in accordance with the codes and regulations of the jurisdictional authorities. Submit copies of this information to the Contracting Officer prior to proceeding with the work.

3.12 FIELD QUALITY CONTROL

A. Allowable Tolerances:
   1. Construct finished subgrade to vary not more than 0.05 foot above or 0.10 foot below elevation shown.
   2. Construct finished grade: 0.1 foot plus or minus of the elevation shown.

B. Test Method: Determine the maximum dry density and the optimum moisture content in accordance with ASTM D698, except where specified to be in accordance with ASTM D1557.

C. Compaction Test Frequency:
   1. For each fill area less than 5,000 square feet, perform a minimum of three tests for each layer of compacted fill.
   2. For fill areas in excess of 5,000 square feet, perform a minimum of one test for every 5,000 square feet for each layer of compacted fill.
   3. For all subgrades, perform a minimum of one test for every 5,000 square feet.

D. Testing shall be at the expense of the Contractor.

E. Testing shall be performed to requirements for testing laboratories established in Section 01450, “Quality Control”.

F. Controlled Low Strength Material Flowable Backfill Test Frequency:
   1. One set of three cylinders shall be made for each 100 cubic yards or fraction thereof of Controlled Low Strength Material per ASTM D5971 placed in single day.
   2. Compressive strength shall be measured in accordance with ASTM D6023.
3. When indicated on plans or requested by Contracting Officer, unit weight, yield, cement content and air content of Controlled Low Strength Material shall be determined in accordance with ASTM D6023.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

A. General:

1. Measurement associated with Grading, Excavation and Backfill will be from ground line after clearing and grubbing. Clearing and grubbing is paid for under Section 02100, Site Preparation, and is not measured under this Section.

2. Where compaction is required, no measurement shall be made prior to the specified compaction of the work complete-in-place.

3. Except as otherwise specified herein, the work described in this Section including fill, backfill, compaction, and quality control will not be measured separately, and all costs in connection therewith will be considered incidental to the corresponding pay items of work.

B. Subgrade:

1. Subgrade, slopes, and foundation preparation will not be separately measured for payment, but all costs in connection therewith will be considered incidental to the material structure to be placed or constructed.

2. Undercut Excavation: In the preparation of the subgrade when unsuitable material must be removed from an area where undercut is not shown on the Contract Drawings, excavation of such undercuts will be measured by the cubic yard of “Undercut Excavation.” Replacement of the excavated unsuitable material by approved material and compaction as specified shall not be measured separately, and all costs in connection therewith shall be considered incidental to the work related to the excavation of undercuts.

C. Excavation:

1. Excavation will not be classified and will not be measured except when provided herein. Excavation shall include removal of all materials encountered regardless of their nature or the manner in which they are removed. There will be no extra compensation for rock excavation.

2. Measurement of undercut excavation and authorized unclassified overexcavation will not include compensation for expansion of materials, but will be based on excavation volume in its original position (insitu).

3. Unclassified street excavation: Authorized unclassified street excavation will not be measured.

4. Unclassified common excavation will not be measured.

5. Structural excavation shall not be measured for payment, but will be considered subsidiary to the other items of work. Unless the limits of excavation are indicated on the Contract Drawings, structural excavation shall be below the lower of the existing ground line or common excavation line to the bottom of the footing as indicated on the Contract Drawings. Such excavation shall be limited by vertical planes two feet outside the neat lines of the structural footings.

   a. Structural facilities include retaining walls, concrete slope paving, noise barrier wall, sign foundations, manholes, drainage structures, abutments, column foundations, footings and other structures.

   b. No measurement will be made of any excavation necessary for placing forms or falsework except as provided herein.

   c. No measurement or separate payment will be made for removal and disposal of materials from drilled shafts for foundation piers and all such work shall be subsidiary to completion of drilled shafts.

6. Refer to Section 02221, “Utility Excavation and Backfill”, for measurement and payment provisions for utility trench excavation.

D. Embankment, Fill, and Backfill:

1. Embankment (fill) will not be measured separately for payment but shall be considered subsidiary to Unclassified Street Excavation and Unclassified Common Excavation.
2. Backfill necessary for the structural facilities will not be measured for payment, but shall be considered subsidiary to other items of work.
   a. Structural facilities include retaining walls, concrete slope paving, noise barrier wall, sign foundations, manholes, drainage structures, abutments, column foundations, footings, and other structures.

3. Refer to Section 02221, “Utility Excavation and Backfill”, for measurement and payment provisions for utility trench backfill.

4. Measurement for backfill of authorized unclassified overexcavation other than with on-site material will be made as specified for the material required specifically in that area as approved.

5. Select fill, not incidental to work specified elsewhere, will not be measured.

E. Borrow: Borrow quantities will not be measured.

F. Pervious material, not incidental to work specified elsewhere, will be measured by the cubic yard complete-in-place.

G. Soil drainage material, not incidental to work specified elsewhere, will be measured by the cubic yard complete-in-place.

H. Impervious material, not incidental to work specified elsewhere, will be measured by the cubic yard complete-in-place.

I. Non-woven filter fabric shall be measured by the square yard of surface area covered, complete-in-place, as installed by the manufacturer's recommendations.

J. Measurement, when applicable, of excavation, embankment, fill, backfill, and borrow will not include any additional quantities due to the action of the elements or the carelessness of the Contractor, such as additional quantities caused by slips, slides, cave-ins, silting, or unauthorized overexcavation.

K. Excavation for the Contractor's convenience or unauthorized excavation outside the limits indicated in the Contract Documents, and backfill of such excavations will not be measured for payment.

L. Re-excavation and re-handling of stockpiled material will not be measured for payment, but will be considered incidental to the earthwork to which it pertains.

M. Demolition and Disposal:

1. Removal of existing facilities, such as, parking surfaces, sidewalks, curbs, etc., will be considered under Section 02050, “Demolition”, and will not be measured under this Section.

2. Disposal of surplus excavated materials and unsuitable materials will not be separately measured for payment, but costs in connection therewith will be considered incidental to the work described in this Section.

4.2 PAYMENT

A. Payment will be made for the following items at the lump sum and unit prices.

1. Undercut excavation, per cubic yard.

2. Unclassified Street Excavation, per lump sum.

3. Unclassified Common Excavation, per lump sum.

4. Authorized Unclassified Overexcavation, per cubic yard.

5. Select fill, per lump sum.

6. Borrow, per lump sum.

7. Pervious material, per cubic yard.

8. Soil drainage material, per cubic yard.

9. Impervious material, per cubic yard.

END OF SECTION 02220
THIS PAGE INTENTIONALLY LEFT BLANK
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies trench excavation, trench support systems, and trench backfill for utility excavations. Unless a design for the support system is shown in the Contract Documents, design and installation of trench support systems is the responsibility of the Contractor.

B. Pipe and conduit installation and bedding or encasement requirements are shown on the Contract Drawings and specified in applicable sections of the specifications.

1.2 REFERENCED STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

2. ASTM D698 - Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/ft³ (600 kN-m/m³))

B. Standard Specifications for Public Works Construction, North Central Texas Council of Governments, as revised (NCTCOG Standard Specifications).

1.3 SUPPORT SYSTEM REQUIREMENTS

A. Comply with support system design requirements specified in Section 02160, “Support of Excavation”.

B. Provide positive trench excavation support for all trenches in excess of five vertical feet in depth.

C. Provide positive trench excavation support for all trenches less than five vertical feet in depth where determined by site or soil conditions, or when directed by the Contracting Officer.

1.4 SUBMITTALS

A. Documentation:

1. Submit shop drawings of manufactured trench boxes (including reinforcement details).

2. Submit copies of permits with drawings.

B. Trench Safety Plan: Submit for approval a trench safety plan signed and sealed by a Professional Engineer qualified to do such work and licensed in the State of Texas.

C. Working Drawings and Calculations: Submit working drawings and calculations for devices used to provide trench safety such as trench shields and shoring systems signed and sealed by a Professional Engineer licensed in the State of Texas.

D. Test Results: Submit test results indicating that flowable backfill meets specified requirements. Test results shall be less than 6 months old.

1.5 REGULATORY REQUIREMENTS

A. Design and perform trench excavation and support of excavation work in accordance with OSHA Safety and Health Standards Texas Trench Excavation Safety Law.

1.6 JOB CONDITIONS

A. Location of Underground Facilities and Structures:

1. Contractor shall verify locations of underground facilities and structures. Locations shown for utility facilities are taken from the various utility records and are approximate.

2. Verify locations of existing utilities in accordance with Section 02760, “Maintenance, Support and Restoration of Existing Utility Facilities.”

B. If existing utility facilities interfere with the proposed method of support, notify the Contracting Officer. Do not modify the support system, nor modify or relocate such facilities without the approval of the Contracting Officer.

PART 2 - PRODUCTS

2.1 TRENCH BOX

A. Furnish box with a manufacturer’s depth certification plate permanently attached to the inside face of the box. At a minimum, the certification plate will provide the following information:

1. Manufacturer’s name, model, and serial numbers.

2. Maximum depth of excavation and soil conditions for which the box is certified.
2.2 MANHOLE BOX
   A. Furnish fabricated manhole box which meets, at a minimum, the requirements specified for the trench box specified above, unless otherwise shown or noted.

2.3 STEEL SHEETPILING
   A. Continuous interlocking type with cross section selected for intended use and imposed loads in accordance with Section 02160, "Support of Excavation".

2.4 CONCRETE
   A. In accordance with Section 03305, "Portland Cement Concrete", Mix S-2.

2.5 REINFORCEMENT
   A. In accordance with Section 03200, "Concrete Reinforcement".

2.6 TIMBER LAGGING
   A. Structural grade, mill stamped with minimum allowable flexural stress of 1,100 psi in accordance with Section 02160, "Support of Excavation".

2.7 STRUCTURAL STEEL
   A. In accordance with Section 05120, "Structural Steel - Bridges": ASTM A36 minimum.

2.8 IMPORTED TRENCH BACKFILL
   A. Imported trench backfill shall consist of either of these two materials, at the Contractor's option:
      1. Select fill in accordance with Section 02220, "Grading, Excavating, and Backfilling".
      2. Flowable backfill as specified in Section 02220, "Grading, Excavating, and Backfilling", Paragraph 2.1 D.

PART 3 - EXECUTION

3.1 TRENCH EXCAVATION
   A. Perform excavation for utility trenches in all materials, including rock, to the line and grade shown.
   B. Proceed with caution in areas of utility facilities exposing them by hand excavation or other means acceptable to utility owner. Protect, support, and maintain existing utilities in the trench excavation in accordance with Section 02760, "Maintenance, Support, and Restoration of Existing Utility Facilities".
   C. Where conditions do not allow sloping of excavation, install either an approved manufactured or approved Contractor fabricated trench box, manhole box, sheeting, shoring, or bracing, in accordance with approved submittals.
      1. Support trench excavation within the property limits either by sheeting, lagging, or trench box as specified; or by lay back excavation; as approved by the Contracting Officer. Lay back side slopes on trench excavation only with the approval of the Contracting Officer.
      2. Support trench excavation outside the property limits by sheeting, lagging, trench box, or manhole box, as approved.
   D. Where necessary to prevent unacceptable deformation of the trench sidewalls, slopes, or when directed by the Contracting Officer, backfill the voids between the exposed sidewall, slope, and the exterior faces of the trench or manhole boxes. Backfill with approved materials and in accordance with Section 02220, "Grading, Excavating, and Backfilling".
   E. Where conditions require, pre-excavate for trench support installation.
   F. Permit no equipment, construction materials, and stockpiled excavated materials in the proximity of the trench perimeters in excess of the approved load limits.
   G. For rainy weather and where site conditions warrant, take precautions and prevent surface-water run-off from entering the excavation. Perform dewatering in accordance with Section 02140, "Dewatering".
   H. If ground water is encountered, control the water in accordance with Section 02140, "Dewatering", to prevent or eliminate seepage in the excavation invert, or through the excavation sidewalls or slopes.
   I. Provide means of exit, in trenches 5 feet, or deeper, which ensures a 25 foot maximum lateral movement when exiting.
   J. Maintain trench supports (sheeting, shoring, bracing, or trench boxes) in place until the work is completed.
K. Provide protective devices and barricades as specified in Section 01500, "Temporary Facilities and Services".

3.2 SHEETING, SHORING, AND PILING

A. Install soldier piles and sheet piling as specified in Section 02360, "Driven Piles".

B. Where required, use timber lagging or steel sheeting secured in place for sheeting of trench excavations. Install lagging and sheeting as specified in Section 02160, "Support of Excavation".

C. Follow excavation closely with placement of sheeting and lagging as specified in Section 02160, "Support of Excavation".

D. Do not allow maximum height of unsheeted or lagged face of trench excavation to exceed 4 feet in predominantly clayey soils and 3 feet in sandy soils.

3.3 WALES, STRUTS, AND BRACING

A. Use wales, struts, or bracing as required, to provide primary support of trench excavation faces retained by soldier piles, sheeting or sheet piles.

B. Install primary support as specified in Section 02160, "Support of Excavation".

C. When primary support is required by site conditions, excavate to no more than 2 feet below the point of support about to be placed. Install support and preload immediately after installation and prior to continuing excavation.

D. When removing struts, do not increase vertical spacing unless invert slab has been installed for at least 48 hours, and support system is adequate to safety support adjacent structures and works.

3.4 LAGGING

A. Unless otherwise required, install lagging as specified in Section 02160, "Support of Excavation".

B. For other conditions and types of lagging, submit design details for approval.

3.5 TRENCH OR MANHOLE BOX

A. Excavate trenches to be supported by either trench or manhole box in accordance with Section 02220, "Grading, Excavating, and Backfilling".

B. Set trench or manhole box in place prior to initiating work within the excavation.

C. Where necessitated by site or Contract conditions, and when approved by the Contracting Officer, stack or extend boxes in accordance with the manufacturer's recommendations.

D. Where conditions permit, slope bank above the top of box to the approved angle of repose.

E. Unless otherwise approved by the Contracting Officer, immediately after removal of trench or manhole boxes, backfill excavation and compact in accordance with Section 02220, "Grading, Excavating, and Backfilling" or backfill with flowable backfill as specified herein.

F. When trench excavation remains open, install protective devices and barricades as specified in Section 01500, "Temporary Facilities And Services Required During Construction".

3.6 WELDING

A. Welding: Perform all welding in accordance with Section 05120, "Structural Steel - Bridges".

3.7 REMOVAL OF SUPPORTING SYSTEM

A. When removing support of trench excavation system, wholly or in part, do not disturb nor damage adjacent buildings, structures, construction, and utility facilities. Fill voids immediately with lean concrete in accordance with Section 03305, "Portland Cement Concrete", Mix M-1 or with approved backfill compacted in layers to density all as specified in Section 02220, "Grading, Excavating, and Backfilling".

B. When invert concrete is placed, leave support in place for at least 48 hours after concrete placement.

C. Except when using trench boxes, remove supports only after backfill has been placed and compacted to required density, as specified in Section 02220, "Grading, Excavating, And Backfilling".

D. Except as specified below, remove supporting system to depth of 6 feet below surface.

1. Remove supporting systems at intersections of streets and at temporary access ramps to a depth of 8 feet.

2. Where tops of existing and constructed structures extends over 5 feet limit, remove adjacent supporting systems to a depth flush with the top of the structure or 1 foot below the surface, whichever is greater.
3. Increase removal depths where necessary to accomplish this Work.

3.8 BACKFILL

A. Backfill trenches in the public right of way in accordance with the requirements of the jurisdictional agency.

B. Backfill trenches outside the public right-of-way with excavated material, but do not use organic matter, debris, cinders, nor frozen material. When needed, utilize imported trench backfill as specified herein.

C. Place and compact backfill in maximum 8 inch loose layers. Compact backfill to 95 percent of maximum dry density as determined in accordance with ASTM D698.

D. Compact backfill at moisture contents within minus 2 to plus 3 percent of optimum moisture as determined by ASTM D698.

E. Where utility facilities and structures are supported in place, use special equipment and techniques to achieve specified compaction, as per Section 02220, "Grading, Excavating, And Backfilling", under and around them.

3.9 FIELD QUALITY CONTROL

A. Trench Backfill Compaction Test Frequency:

1. For trench lengths less than 150 feet, minimum of one test for each layer of trench backfill.

2. For trench lengths in excess of 150 feet, perform a minimum of one test for every 150 linear feet for each layer of trench backfill.

3.10 CLEAN-UP

A. Remove trench support system as trench is backfilled.

B. Dispose of excess material in an approved manner in accordance with Section 02100, “Site Preparation”.

C. Do not store equipment or materials in the street, on public property, or on private property without written permission of the jurisdictional authority or owner of the private property.

3.11 DISPOSAL

A. Dispose of waste material, trash and debris off site. Obtain written permission and releases from owner of the property where such waste materials are to be deposed and in accordance with the codes and regulations of the jurisdictional authorities. Submit copies of this information to the Contracting Officer prior to proceeding with the work.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work of this section including excavation and backfill (with the exception of support system for utilities exceeding 5 feet depth), will not be measured or paid for directly, but all costs in connection therewith will be considered subsidiary to the utility work. There will be no extra compensation for rock excavation.

B. Support system for excavation for utilities (including excavation for trenches and manholes) exceeding a depth of 5 feet will be measured and paid for at the unit price per linear foot of “Trench Support System”.

C. Support of excavation for utilities if required for depths not exceeding 5 feet will not be measured or paid for directly, but considered subsidiary to the utility work.

D. Maintenance, support, and relocation of existing utility facilities will be paid for under Section 02760, “Maintenance, Support, and Restoration of Existing Utility Facilities”.

END OF SECTION 02221
SECTION 02230
BASE FOR PAVEMENTS

PART 1 - GENERAL

1.1 DESCRIPTION
A. This Section includes specifications for furnishing, placing, shaping, and compacting aggregate base on previously constructed subgrade.

1.2 REFERENCED STANDARDS
A. Texas Department of Transportation (TxDOT)
   a. Item 247 – Flexible Base
2. TxDOT Manual of Testing Procedures
   a. TEX-113-E - Laboratory Compaction Characteristics and Moisture-Density Relationship of Base Materials.

1.3 SUBMITTALS
A. Certified Test Results: At least seven calendar days in advance of desired date of approval, submit certified test results performed by an independent testing laboratory certifying that the proposed base material complies with the specifications. Test results shall not be more than 30 days old.
B. Source of Material: Not less than 10 calendar days prior to the beginning of work of this Section, submit name and location of source of material to be used.
C. Documentation: Submit delivery tickets from each load delivered to the Worksite which include, as a minimum the supplier, material and its composition, and material weight.

PART 2 - PRODUCTS

2.1 FLEXIBLE BASE:
A. General: Flexible base shall be in accordance with Item 247, TxDOT Standard Specifications.
B. Physical Requirements:
   1. Type: Type A, crushed or broken aggregate.
   2. Gradation: Grade One.

2.2 SOURCE QUALITY CONTROL
A. Once the material has been approved, do not change source of supply without authorization, and then only after receiving approval of the new source material.
B. Approval of a source of supply does not relieve the Contractor from the obligation to furnish material which conforms to the specified requirements.

PART 3 - EXECUTION

3.1 INSTALLATION
A. Install and compact in accordance with TxDOT Standard Specifications Item 247. Compaction shall be not less than 98 percent density as determined in accordance with TEX 113-E at plus or minus 2 percent optimum moisture as determined by TEX 113-E.

3.2 MAINTENANCE
A. Maintain base density and grade for pavement in specified conditions until succeeding pavement course is placed.

3.3 FIELD QUALITY CONTROL
A. Contractor shall perform field tests to determine compliance with requirements for compaction and moisture content of aggregate base. Testing frequency shall be as specified in Section 02220, “Grading, Excavating, and Backfilling”.
B. Contractor shall measure thickness of the aggregate base (refer to Section 01450, "Quality Control"). Perform a minimum of one test for each unit of 2000 square yards of aggregate base installed at a location selected by the Contracting Officer. For units of aggregate base less than 2000 square yards, perform a minimum of one test. In that unit where the base is deficient by more than 1/2 inch in thickness, the deficiency shall be corrected to meet the required grade and thickness using a method approved by the Contracting Officer.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL
A. Work described in this Section will not be measured but will be paid for at the lump sum price for “Base for Pavements” for each thickness of flexible base indicated on the Contract Drawings.
B. No additional payment will be made for any base of a thickness exceeding that required by Contract Drawings.

END OF SECTION 02230
SECTION 02242
SOIL STABILIZATION: PORTLAND CEMENT TREATMENT

PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes specifications for the stabilization of subgrade, subbase, and base through the addition of Portland cement. The work includes furnishing and applying cement, mixing, placing, wetting, and compacting materials to achieve the required density, finishing, curing, protection, and maintenance of the completed course.

B. This item includes work in native soil, embankment, bases, and existing paving structures.

1.2 REFERENCE STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM D698 - Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft·lb/ft³ (600 kN·m/m³))

B. Standard Specifications for Public Works Construction, North Central Texas Council of Governments, as revised (NCTCOG Standard Specifications).

C. Texas Department of Transportation (TxDOT), Manual of Testing Procedures:
   1. Tex-120-E - Section 20 - Soil-Cement Testing

1.3 DESIGN REQUIREMENTS

A. Design Mix Criteria: Minimum design strength is shown on the Contract Drawings. Preliminary tests, using soil samples collected from the area to be stabilized, in accordance with TxDOT Test Method Tex-120-E, shall be performed to establish percent of Portland cement to be used, and confirm that the proposed mix design achieves the minimum design strength as shown on the Contract Drawings.

1.4 SUBMITTALS

A. Submit proposed mix design and preliminary test results demonstrating that mix design achieves minimum design strength required. Refer to Article entitled “Design Requirements” herein for preliminary test requirements. After approval of the mix design strength make no change in the mix without written authorization from the Contracting Officer.

B. Submit technical data for type of cement to be used.

C. Submit plan for method, equipment and procedure to be used for stabilization work.

1.5 JOB CONDITIONS

A. Do not prepare or place cement stabilization treatment if the ambient temperature is below 40 degrees F and falling.

B. When approved by the Contracting Officer, the mix may be prepared when the ambient temperature is above 35 degrees F and rising.

PART 2 - PRODUCTS

2.1 MATERIALS FOR FILL

A. Approved material as defined and in accordance with Section 02220, “Grading, Excavating, and Backfilling”. Fill materials to receive soil cement shall be “select fill” as defined in Section 02220, “Grading, Excavating, and Backfilling”.

B. Portland Cement: Either Type I, II or III Portland cement in accordance with Section 03305, “Portland Cement Concrete”. The Contractor, at his option, may use bulk cement, provided that the Contracting Officer's approval of the apparatus for handling, weighing, and spreading the cement is obtain prior to the start of the work.

C. Water: Potable, free of organics and other deleterious materials which will affect hardening of the treated soil.

PART 3 - EXECUTION

3.1 GENERAL

A. Cement treated subgrade shall be compacted to at least 95 percent of maximum dry density as determined by ASTM Test Method D698 at moisture content within minus 2 and plus 4 percentage points of optimum.

B. When Portland cement is added to the base, subbase, or soil materials provided under pertinent specifications, the specification applicable to that item shall govern except that manipulation of the materials and application cement shall be as required herein.
3.2 PREPARATION

A. Prior to placing base or subbase material, shape the subgrade to conform to the typical sections, lines, and grades shown in accordance with Section 02220, “Grading, Excavating, and Backfilling”.

B. Remove unsuitable soil and other material in accordance with Section 02220, “Grading, Excavating, and Backfilling”.

C. Prepare subgrade in accordance with Section 02220 “Grading, Excavating and Backfilling”.

3.3 APPLICATION

A. Streets and pavements, where required to have cement treated subgrade, shall receive the depth of Cement Treated Subgrade indicated on the Contract Drawings.

B. Guideways shall receive 8-inches of Cement Treated Subgrade where indicated on the Contract Drawings.

C. Cement shall not be used to stabilize soil subgrades where the total soluble sulfates in the soils to be treated are greater than 0.3 percent or 3,000 parts per million (ppm) by soil weight. The soluble sulfate level shall be determined by Test Method TEX-620J.

3.4 COMPACTION

A. Compact cement stabilized subgrade to at least 98 percent or as otherwise required by the jurisdictional authority of maximum dry density as determined in accordance with ASTM D698, except as otherwise specified, with moisture content within minus 2 to plus 4 of optimum.

B. For TxDOT pavements, compact to 95 percent of optimum density as determined by Test Method TEX 120-E, Part II.

3.5 FIELD QUALITY CONTROL

A. Allowable Tolerances:

1. Construct finished grade to 0.1 foot plus or minus of the elevation shown on plans.

2. Cement stabilized soils shall have 100 percent of soil particle sizes passing 1-3/4 inch sieve and minimum of 60 percent of particle sizes passing No. 4 sieve. Non-slaking aggregates retained on No. 4 sieve shall be removed prior to performing tests.

3. Cement stabilized depths shall be within plus or minus 1/4-inch of specified thickness.

B. Test Method:

1. Determine the maximum dry density and the optimum moisture content of cement stabilized soils in accordance with ASTM D698.

2. In TxDOT right-of-way, determine the maximum dry density and the optimum moisture content of cement stabilized soils in accordance with Test Method TEX-120-E.

C. Compaction Test Frequency:

1. In railroad guideways and two lanes of roadway pavement, one density and moisture test, one soil gradation test, and one cement depth check shall be performed every 300 linear feet.

2. In parking lots, one compaction density and moisture test, one gradation test, and one cement depth check shall be performed for each 5,000 sq. ft.

D. Testing shall be at the expense of the Contractor.

E. Testing shall be performed to requirements for testing laboratories established in Section 01450, “Quality Control”.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work of this Section, cement treatment for materials in place, will be measured by and paid for at the unit price per square yard of “Cement Manipulation” to lines as shown on the typical sections for the each thickness indicated on the Contract Drawings. Payment will include materials with the exception of Portland cement which will be measured and paid for separately.

B. Portland cement incorporated in the cement treatment will be measured by and paid for at the unit price per ton of “Portland Cement for Soil Stabilization”.

END OF SECTION 02242
SECTION 02243
SOIL STABILIZATION: LIME TREATMENT

PART 1 - GENERAL

1.1 DESCRIPTION
A. This Section includes specifications for stabilization of base and subbase through the addition of hydrated lime or lime slurry. The work includes furnishing, applying, mixing, placing, and compacting of lime in base or subbase and finishing, curing, protection, and maintenance of the completed course.

1.2 REFERENCED STANDARDS
A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM D698 - Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/ft³ (600 kN-m/m³))
B. Standard Specifications for Public Works Construction, North Central Texas Council of Governments, as revised (NCTCOG Standard Specifications).
C. Texas Department of Transportation: Standard Specifications for Construction of Highways, Streets, and Bridges (TxDOT Standard Specifications).
D. Texas Department of Transportation, Texas Test Methods (TEX):
   1. TEX-121- E - Section 21 - Soil-Lime Testing.
   2. TEX-600-J - Section 2 - Sample and Testing Hydrated Lime, Quicklime and Commercial Lime Slurry.
   3. TEX 620-J - Section 15 - Determining Chloride and Sulfate Content in Soils.

1.3 DEFINITIONS
A. Type A, Hydrated Lime, a dry powdered material consisting essentially of calcium hydroxide.
B. Type B, Commercial Lime Slurry, a liquid mixture of essentially hydrated lime solids and water in slurry form.

1.4 DESIGN REQUIREMENTS
A. Design Mix Criteria:
   1. Optimum lime content shall be determined in accordance with ASTM D6276.
   2. Field application rate for soils with a Plasticity Index of 40 percent or less shall be the optimum lime content plus one percentage point by soil weight.
   3. Field application rate for soils with a Plasticity Index greater than 40 percent shall be the optimum lime content plus 1.5 percentage points by soil weight.

B. Lime application rates in the right-of-way of another jurisdictional authority shall meet requirements of that jurisdictional authority.

1.5 SUBMITALS
A. Submit proposed design mix of lime or lime slurry stabilization including percentages of hydrated lime or lime slurry to be used and optimum lime content test results demonstrating that mix design achieves minimum soil pH required. Refer to Article entitled “Design Requirements” herein for lime application rate requirements.
B. Submit technical data for type of lime to be used.
C. Testing shall be performed to requirements for testing laboratories established in Section 01450, “Quality Control”.

PART 2 - PRODUCTS

2.1 MATERIALS
A. Hydrated lime and lime slurry shall meet the physical and chemical properties as described in TxDOT Item 264 and as tested in accordance with TEX-600-J.
B. Type A, Hydrated Lime: In accordance with Item 264 of the TxDOT Standard Specifications: Hydrated Lime and Lime Slurry, unless otherwise approved.
C. Type B, Commercial Lime Slurry: In accordance with Item 264 of the TxDOT Standard Specifications: Hydrated Lime and Lime Slurry, unless otherwise approved.

1. Grade 1: Dry Solids Contents: Minimum 31 percent by weight of the slurry.
2. Grade 2: Dry Solids Contents: Minimum 35 percent by weight of the slurry.
SOIL STABILIZATION: LIME TREATMENT

3. Grade 3: Dry Solids Contents: Minimum 46 percent by weight of the slurry.

D. Water: Potable and free of odor, organics, and deleterious materials which may affect hardening of the treated soil.

PART 3 - EXECUTION

3.1 GENERAL

A. Construction within DART right-of-way shall be in complete accordance with the NCTCOG Standard Specifications. Construction within the right-of-way of other jurisdictional authorities shall conform to the requirements of the jurisdictional authority.

B. When lime is added to the base, subbase, or soil materials provided under pertinent specifications, the specification applicable to that item shall govern except that manipulation of the materials and application and mixing for lime shall be as required herein.

3.2 PREPARATION

A. Prior to placing base or subbase material, shape the subgrade to conform to the typical sections, lines, and grades shown in accordance with Section 02220, "Grading, Excavating and Backfilling".

B. Remove unsuitable soil and other material in accordance with Section 02220, "Grading, Excavating and Backfilling".

C. Prepare subgrade in accordance with Section 02220, "Grading, Excavating and Backfilling".

3.3 APPLICATION

A. Streets and pavements, where required to have lime treated subgrade, shall receive the depth of Lime Treated Subgrade indicated on the Contract Drawings.

B. Guideways shall receive 8-inches of Lime Treated Subgrade where indicated on the Contract Drawings.

C. Lime shall not be used to stabilize soil subgrades where the total soluble sulfates in the soils to be treated are greater than 0.3 percent or 3,000 parts per million (ppm) by soil weight. The soluble sulfate level shall be determined by Test Method TEX-620J.

3.4 COMPACTION

A. Compact lime stabilized subgrade to at least 98 percent or as otherwise required by the jurisdictional authority of maximum dry density as determined in accordance with ASTM D698, except as otherwise specified, with moisture content within minus 2 to plus 4 of optimum.

B. For TxDOT pavements, compact to 95 percent of optimum density as determined by Test Method TEX 121-E, Part II.

3.5 FIELD QUALITY CONTROL

A. Allowable Tolerances:

1. Construct finished grade to 0.1 foot plus or minus of the elevation shown on plans.

2. Lime stabilized soils shall have 100 percent of soil particle sizes passing 1-3/4 inch sieve and minimum of 60 percent of particle sizes passing No. 4 sieve. Non-slaking aggregates retained on No. 4 sieve shall be removed prior to performing tests.

3. Lime stabilized depths shall be within plus or minus 1/4-inch of specified thickness.

B. Test Method:

1. Determine the maximum dry density and the optimum moisture content of lime stabilized soils in accordance with ASTM D698.

2. In TxDOT right-of-way, determine the maximum dry density and the optimum moisture content of lime stabilized soils in accordance with Test Method TEX-121-E.

C. Compaction Test Frequency:

1. In railroad guideways and two lanes of roadway pavement, one density and moisture test, one soil gradation test, and one lime depth check shall be performed every 300 linear feet.

2. In parking lots, one compaction density and moisture test, one gradation test, and one lime depth check shall be performed for each 5,000 sq. ft.

D. Testing shall be at the expense of the Contractor.

E. Testing shall be performed to requirements for testing laboratories established in Section 01450, "Quality Control".
PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Base, subbase, and soil materials provided under other Sections of the Specifications will be measured and paid for under those other Sections. The manipulation of the materials and application and mixing for lime as specified in this Section will be measured and paid for as specified herein.

B. The work of this Section, lime treatment, will be measured by and paid for at the unit price per square yard of "lime manipulation" to lines as shown on the typical sections for each thickness indicated on the Contract Drawings. Measurement will include all materials (including cover materials for curing) with the exception of lime, which will be measured and paid for separately.

C. Lime incorporated in the lime treatment will be measured by and paid for at the unit price per the ton of "Lime" of each type.

1. When Type A, Hydrated Lime is used, the quantity of lime will be measured by the ton dry weight.

2. When Type B, Commercial Lime Slurry is used, the quantity of lime shall be calculated from the required minimum percent "dry solids content" based upon the use of Grade 1, Grade 2, or Grade 3 as follows:

   a. Grade 1: The "Dry Solids Content" shall be 31 percent delivered on the road.

   b. Grade 2: The "Dry Solids Content" shall be 35 percent delivered on the road.

   c. Grade 3: The "Dry Solids Content" shall be 46 percent delivered on the road.

END OF SECTION 02243
PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes: Geogrid reinforcement and geotextile separation of sub-ballast course and subgrade in the construction of rail track systems. Design requirements for geogrid reinforcement and geotextile, such as geogrid and geotextile types, sub-ballast thickness, subgrade preparation and associated details, shall be as shown on the contract drawings. Work consists of:

1. Providing supplier representative for pre-construction conference with the Contractor and the Contracting Officer.
2. Furnishing geogrids and geotextile as specified herein and required by the Contract Drawings.
3. Storing, cutting, and placing geogrids and geotextiles in accordance with these specifications and in reasonably close conformity with the lines, grades, and dimensions shown on the Contract Drawings or as established by the Contract Administrator.

B. Alternates: Alternate geogrid materials shall not be used unless submitted to the Contracting Officer and approved in writing by the Contracting Officer at least 14 days prior to the bid letting. In order to be considered, submittal packages for alternate geogrid materials must include:

1. Independent certified test results stating that the alternate geogrid material satisfies the performance requirements in Paragraph 1.4B of this Section and the Torsional Stiffness requirements in Article 2.2 of this Section.
2. A list of 10 comparable projects that are similar in terms of size and application, are located in the United States, and where the results of using the specific alternate geogrid material can be verified after a minimum of 3 years of service life.
3. A sample of the alternate geogrid material and certified specification sheets.
4. Recommended installation instructions.
5. Additional information as required by the Contracting Officer.

1.2 REFERENCED STANDARDS

A. American Association of State Highway and Transportation Officials (AASHTO):

1. AASHTO HB-17 - Standard Specification for Highway Bridges

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM D4354 - Standard Practice for Sampling of Geosynthetics for Testing
2. ASTM D4355 - Standard Test Method for Deterioration of Geotextiles by Exposure to Light, Moisture and Heat in a Xenon ARC Type Apparatus
3. ASTM D4759 - Standard Practice for Determining the Specification Conformance of Geosynthetics
4. ASTM D5732 - Standard Test Method for Stiffness of Nonwoven Fabrics Using the Cantilever Test
5. ASTM D5818 - Standard Practice for Obtaining Samples of Geosynthetics from a Test Section for Assessment of Installation Damage

C. Corps of Engineers (COE):

1. Methodology for Measurement of Torsional Rigidity.

D. Geosynthetic Research Institute (GRI):

1. GRI GG1- Standard Test Method for Geogrid Rib Tensile Strength
2. GRI GG2 - Standard Test Method for Geogrid Junction Strength

E. U.S. Environmental Protection Agency (EPA):

1. EPA 9090 - Compatibility Test for Wastes and Membrane Liners

1.3 DEFINITIONS

A. Geogrid: A biaxial polymeric grid formed by a regular network of integrally connected tensile elements with apertures of sufficient size to allow
interlocking with surrounding soil, rock, or earth and function primarily as reinforcement.

B. Geotextile: A non-woven product consisting of polymer fibers made into a flexible, porous fabric by standard weaving machinery or matted together in a random manner.

C. Minimum Average Roll Value: Value based on testing and determined in accordance with ASTM D4759.

D. True Tensile Strength in Use: True tensile strength at indicated strain levels measured as true resistance to elongation when initially subjected to load determined in accordance with ASTM D6637 without deforming test materials under load before measuring such resistance or employing “secant” or “offset” tangent methods of measurement so as to overstate tensile properties.

E. Junction Efficiency: Load transfer capability determined in accordance with GRI GG1 and GG2 as modified by AASHTO HB-17, and expressed as a percentage of ultimate tensile strength.

F. Flexural Stiffness (also known as Flexural Rigidity): Resistance to bending force determined in accordance with ASTM D5732, using specimens of width two ribs wide, with transverse ribs cut flush with exterior edges of longitudinal ribs (as a “ladder”), and of length sufficiently long to enable measurement of the overhang dimension.

G. Torsional Stiffness (also known as Torsional Rigidity or Secant Aperture Stability Modulus): Resistance to in-plane rotational movement measured by applying a 20 kg cm moment to the central junction of a 9 inch by 9 inch specimen restrained at its perimeter (COE Methodology for measurement of Torsional Rigidity). Values shown are minimum average roll values.

H. Resistance to Installation Damage: Resistance to loss of load capacity or structural integrity when subjected to mechanical stress in installation in a clayey sand (SC), a well graded sand (SW), and crushed stone classified as a poorly graded gravel (GP). The geogrid shall be sampled in accordance with ASTM D5818 and load capacity shall be determined in accordance with ASTM D6637. Values shown are typical values.

I. Resistance to Long Term Degradation: Resistance to loss of load capacity or structural integrity when subjected to chemically aggressive environments measured via EPA 9090 immersion testing. Values shown are typical values.

J. Resistance to UV Degradation - Resistance to loss of load capacity or structural integrity when subjected to 500 hours of ultraviolet light and aggressive weathering in accordance with ASTM D4355.

1.4 SUBMITTALS

A. Submit geogrid and geotextile product samples approximately 4 inches by 7 inches or larger.

B. Submit geogrid and geotextile product data sheets and certifications from the Manufacturer that the geogrid and geotextile products supplied meet the requirements of Article 2.2, of this Section.

C. Submit Manufacturer’s installation instructions and general recommendations.

1.5 QUALITY ASSURANCE

A. Pre-Construction Conference: Prior to the installation of the geogrid, the Contractor shall arrange a meeting at the site with the geogrid material supplier and, where applicable, the geogrid installer. The Authority and the Contracting Officer shall be notified at least 3 days in advance of the time of the meeting. A representative of the geogrid supplier shall be available on an as needed basis during construction.

1.6 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Storage and Protection

1. Prevent excessive mud, wet concrete, epoxy, or other deleterious materials from coming in contact with and affixing to the geogrid materials.

2. Store at temperatures above 20 degrees F.

3. Rolled materials may be laid flat or stood on end.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. An approved source of geogrid is The Tensar Corporation, Morrow, GA or approved equal.

B. Substitutions: See Section 01600, “Product Requirements” and Paragraph 1.1B, of this Section.

2.2 MATERIALS

A. Geotextile: The geotextile shall conform to the requirements in Article 2.4, of Section 02450, “General Track Construction”.

B. Submitgeogrid and geotextile product data sheets and certifications from the Manufacturer that the geogrid and geotextile products supplied meet the requirements of Article 2.2, of this Section.
B. Geogrid: The geogrid shall have the following characteristics:

<table>
<thead>
<tr>

</tbody>
</table>

D. Correct orientation (roll direction) of the geogrid shall be verified by the Contractor. Geogrid and geotextile may be temporarily secured in place with staples, pins, sand bags or backfill as required by fill properties, fill placement procedures or weather conditions or as directed by the Contracting Officer.

3.4 SUB-BALLAST PLACEMENT OVER GEOGRID

A. Sub-ballast shall be placed in lifts and compacted as directed under Section 02451, “Sub-Ballast”. Sub-ballast shall be placed, spread, and compacted in such a manner that minimizes the development of wrinkles in the geogrid and/or movement of the geogrid.

B. A minimum loose sub-ballast thickness of 6 inches is required prior to operation of tracked vehicles over the geogrid. Turning of tracked vehicles should be kept to a minimum to prevent tracks from displacing the sub-ballast and damaging the geogrid. Rubber-tired equipment may pass over the geogrid reinforcement at slow speeds (less than 10 mph) when integrally-formed geogrids are used. When coated geogrids or geogrids composed of small-diameter fibers are used, rubber-tired equipment shall not be allowed directly on the geogrid. Sudden braking and sharp turning movements shall be avoided.

3.5 REPAIR

A. Any geogrid or geotextile damaged during installation shall be replaced by the Contractor at no additional cost to the Authority.

B. Coated geogrids shall not be used if the coating is torn, shedding, cracked, punctured, flawed or cut, unless a repair procedure is carried out as approved by the Contracting Officer. The repair procedure shall include placing a suitable patch over the defective area or applying a coating solution identical to the original coating.

3.6 PROTECTION

A. Follow the Manufacturer’s recommendations regarding protection from exposure to sunlight.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Geogrid reinforcement of sub-ballast will be measured by and paid for at the unit price for “Geogrid Reinforcement of Sub-Ballast” per square yard. Geotextile under Geogrid will be considered as incidental to “Geogrid
Reinforcement of Sub-Ballast® and will not be measured for payment.

END OF SECTION 02246
SECTION 02271
DITCH LINING AND SLOPE PROTECTION

PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies installing ditch lining and slope protection.

1.2 REFERENCED STANDARDS
A. American Association of State Highway and Transportation Officials (AASHTO):
   1. AASHTO T85 - Standard Method of Test for Specific Gravity and Absorption of Coarse Aggregate
   2. AASHTO T96 - Standard Method of Test for Resistance to Degradation of Small-Size Coarse Aggregate by Abrasion and Impact in the Los Angeles Machine
   3. AASHTO T104 - Standard Method of Test for Soundness of Aggregate by Use of Sodium Sulfate or Magnesium Sulfate
B. American Concrete Institute (ACI):
   1. ACI 305R - Hot Weather Concreting
   2. ACI 306.1 - Standard Specification for Cold Weather Concreting
   3. ACI 347 - Guide to Formwork for Concrete
C. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM C32 - Standard Specification for Sewer and Manhole Brick (Made From Clay or Shale)
   2. ASTM C33 - Standard Specification for Concrete Aggregates
   3. ASTM C97 - Standard Test Methods for Absorption and Bulk Specific Gravity of Dimension Stone
   5. ASTM C171 - Standard Specification for Sheet Materials for Curing Concrete
   6. ASTM D698 - Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lb/ft3 (600 kN-m/m3))

1.3 SUBMITTALS
A. Product Data: Submit product data including manufacturer’s literature, test data, mix designs, and source for the proposed materials, as applicable to the work:
   1. Bricks
   2. Concrete Masonry Units
   3. Stone Riprap
   4. Gabions Wire and Stone
   5. Aggregates for Aggregate Filter and Sand Cushion
   6. Filter Fabrics
B. Mix Designs: Submit mix designs for proposed concrete in accordance with Section 03305, “Portland Cement Concrete” and Section 03300, “Cast-in-Place Concrete”.
C. Certification: Certifications for aggregates, admixtures, and cement to be utilized for the placement of concrete, grout, and mortar. These certifications shall be less than six months old for the initial submittal and shall be submitted quarterly for approval by the Contracting Officer.

1.4 QUALITY ASSURANCE
A. After approval of source, do not change source without Contracting Officer’s approval.

1.5 JOB CONDITIONS
A. Placement of grout or mortar is prohibited when the temperature is below 40 degrees F or predicted to fall below 40 degrees F unless suitable covering and heat are provided to maintain the work and materials above 40 degrees F for a continuous period of 72 hours.

PART 2 - PRODUCTS

2.1 CONCRETE WORK
A. Formwork: Section 03100, “Concrete Formwork”.
B. Reinforcing Steel: Section 03200, “Concrete Reinforcement”.
2.2 AGGREGATES AND SAND CUSHION

A. Aggregate for Subgrade Foundation: ASTM C33, coarse aggregate, No. 4, typical. Where shown, use layers of No. 4 and No. 67 in combinations and proportions determined by field conditions and as approved.

B. Aggregate for Typical Grout and Mortar: As specified in Section 03305, "Portland Cement Concrete."

C. Aggregate for Stone Riprap Grout: The aggregate shall be a mixture of clean sand and gravel, or of crushed stone and sand, or of chat and sand, as approved. Finer aggregate may be used provided the ratio of cement to the material passing the No. 4 sieve is not greater than 1 to 3 by volume. The mixture shall be uniformly graded from coarse to fine and meet the following gradation requirements:

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>Percent</th>
</tr>
</thead>
<tbody>
<tr>
<td>Passing 3/4 inch sieve</td>
<td>100</td>
</tr>
<tr>
<td>Passing No. 4 sieve</td>
<td>40 to 60</td>
</tr>
</tbody>
</table>

D. Aggregate filter:

1. Coarse aggregate, ASTM C33, Size 357.

2. Use only tough, durable materials free of thin, flat, elongated, soft friable particles, and free of organic matter.

E. Sand cushion for concrete block: Section 03305, "Portland Cement Concrete".

2.3 BRICK

A. Brick: ASTM C32; solid brick; Grade SS; 2-1/4 inches by 3-3/4 inches by 8 inches.

2.4 CONCRETE MASONRY UNITS

A. Concrete Masonry Units: Section 04220, "Concrete Masonry Units".

2.5 GABIONS

A. Wire mesh: Galvanized steel wire of 0.105 minimum diameter, 60,000 pounds per square inch tensile strength, and galvanized at rate of 0.80 ounces per square foot. Wires twisted to form non-raveling hexagonal openings of uniform size, not to exceed 4-1/2 inches in length or 8 square inches in area of mesh opening. Horizontal dimension uniform, not to exceed 36 inches. Gabion dimensions shall not vary more than 3 percent from manufacturer's stated size.

B. Tie devices: Malleable iron or steel, producing frictional force of 160 pounds per foot of spacing. Sized to conform to requirements of jurisdictional agency.

C. Stone: Durable, free from cracks and seams, unweathered, weighing between 4 pounds (4 inch average diameter) and 30 pounds (8 inches average diameter); except 5 percent may vary more or less; and 50 percent to exceed 10 pounds. Stone size shall conform to the following table:

<table>
<thead>
<tr>
<th>Basket Thickness (Inches)</th>
<th>Size of Stones (Inches)</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>3 to 5</td>
</tr>
<tr>
<td>9, 12, 18</td>
<td>4 to 7</td>
</tr>
<tr>
<td>36</td>
<td>4 to 12</td>
</tr>
</tbody>
</table>

2.6 STONE RIPRAP

A. Stone shall be hard durable and free of fractures; angular in shape; weather-resistant; and free from overburden, spoil, shale and organic material. Stone shall meet the following requirements:

1. Water absorption: 3.0 percent maximum when tested in accordance with AASHTO T85.

2. Specific gravity: 2.5 minimum when tested in accordance with AASHTO T85.

3. Resistance to abrasion: Grade B maximum when tested in accordance with AASHTO T96.

4. Soundness: 20 percent maximum loss when tested in accordance with AASHTO T104.

B. Size: Weight distribution of pieces provided as determined by ASTM C97 and in accordance with the following: Class I: Stone used in this class shall weigh from 50 to 150 pounds with at least 60 percent weighing 100 pounds or more, except that approximately 10 percent of the stone may weigh 50 pounds or less.

C. Size for 18 inches: Weight distribution of stone riprap, as determined by ASTM C97, shall fall within the following requirements:

<table>
<thead>
<tr>
<th>Wt (percent smaller than)</th>
<th>Upper Wt (Lbs)</th>
<th>Lower Wt (Lbs)</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>
<td>275</td>

</tr>
<tr>
<td>50</td>
<td>80</td>
<td>53</td>
</tr>
<tr>
<td>15</td>
<td>40</td>
<td>17</td>
</tr>
</tbody>
</table>

D. Size for 36 inches: Weight distribution of stone riprap, as determined by ASTM C97, shall fall within the following requirements:

<table>
<thead>
<tr>
<th>Wt (percent smaller than)</th>
<th>Upper Wt (Lbs)</th>
<th>Lower Wt (Lbs)</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>

</tr>
</tbody>
</table>
2.7 GEOTEXTILE FILTER FABRIC  
A. As specified in Section 02700, “Storm Sewer Systems”. Application type: Erosion Protection.

2.8 FILTER BLANKET  
A. Aggregate conforming to the following gradation:

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>Percent Passing</th>
</tr>
</thead>
<tbody>
<tr>
<td>2 inch</td>
<td>100</td>
</tr>
<tr>
<td>1-1/2 inch</td>

2.9 MORTAR AND GROUT MIXES  
A. General Requirements:
   1. Mix dry in specified proportions by volume. Control and maintain accurate measurement throughout progress of work.
   2. Add sufficient water as specified to produce approved consistency as specified herein under “Proportions.”
   3. Do not mix in amount exceeding that which can be used within 1 hour after introduction of water.
   4. Do not retemper mix that has begun to set or use such mix in the work.
   5. Where shown, specified, or directed, mix pigment into dry mix to attain color selected by the Contracting Officer. Pigment not to exceed 10 percent of dry batch weight of cement.

B. Proportions:
   1. Typical Mortar: 1 part Portland cement, 2-1/2 parts sand and water sufficient to produce stiff workable mix.
   2. Typical Grout: 1 part Portland cement, 2-1/2 parts sand and water sufficient to produce plastic flowable mix.

3.1 SLOPE PROTECTION  
A. Excavate or fill slopes to the required cross section, lines, and grades.

3.2 STONE RIPRAP  
A. Complete stone riprap placements in conjunction with slope construction without appreciable lag which may subject the surface to erosion.

B. Place stone riprap after placing and compacting aggregate filter or after placing geotextile filter fabric.

C. Place stone riprap by machine to full course thickness in one operation upward from bottom of slope. Prevent displacement of underlying materials. Dumping of stone riprap or rolling stones down the slope is prohibited.

D. Fill spaces between larger stones to produce nearly even surface with minimum of voids. Manually supplement machine placement of stone to choke in voids.

E. Rearrange individual stones as necessary to ensure that finished configuration conforms to lines, grades and thickness shown.

F. Place geotextile filter fabric as specified in Section 02700, “Storm Sewer Systems”, if required.

G. Surface Grouting:
   1. After completion of the riprap, rock fill, or rock blanket, the surface shall be grouted, when required, at the rate of a 1 sack batch of grout to 2 square yards of surface covered except that if the finer aggregate is used, a 1 sack batch shall cover approximately 1-1/2 square yards. The
surface shall be swept clean of surplus grout with a stiff broom, using the major portion of the grout to fill the voids between the stones. The grout shall be cured by any of the methods specified for concrete pavement, except that transparent membrane shall be used in lieu of pigmented membrane.

2. During cold weather, the limitations and protection requirements of Section 03305, "Portland Cement Concrete", and ACI 306.1 shall apply to the grouting.

3. During hot weather the limitations and protection requirements of Section 03305, "Portland Cement Concrete" and ACI 305 shall apply to the grouting.

3.3 GABIONS

A. Prepare ground surface to be smooth and even where gabions will be installed.

B. Place geotextile filter fabric as specified in Section 02700, "Storm Sewer Systems" on prepared surface.

C. Assemble gabions and tie together in accordance with manufacturer's instructions.

D. Fill gabions in lifts of 12 inches maximum. Install tie devices in all units with exposed faces, spaced in accordance with requirements of jurisdictional agency.

E. Ensure stone fill is placed without voids larger than approximately smaller stones. Hand-place stones in exposed faces.

3.4 CAST-IN-PLACE CONCRETE

A. Use wood or steel forms. Place in accordance with ACI 347

B. Concurrent with setting of forms either wet the prepared subbase with water or cover the prepared subbase with a layer of polyethylene or other approved impervious material, in accordance with the ASTM C171.

1. Overlap polyethylene sheeting a minimum of 12 inches and tape.

2. Maintain cover intact until concrete is placed.

C. Place reinforcing steel or wire mesh as shown.

D. Provide and install dowel bars where shown in accordance with Section 02550, "Concrete Pavement."

E. Locate expansion and contraction joints where shown in accordance with Section 02550, "Concrete Pavement."

F. Unless otherwise shown, give surface wood float finish.

G. Protect, cure, and test concrete in accordance with Section 03300, "Cast-In-Place Concrete."

3.5 CONCRETE MASONRY UNITS

A. Place 2-inch layer of sand cushion on previously prepared slope at plus or minus 2 percent optimum moisture content.

B. Set units firmly by hand in sand cushion with long dimension parallel to base of slope so as to produce even surface.

C. Lay blocks with open 3/8-inch joints and with joints staggered as shown on plans.

D. Completely fill joints with mortar.

E. Protect and cure newly laid blocks for 7 days using wet cotton mats or wet burlap.

F. Lay blocks when the temperature is 40 degrees F or above.

3.6 PAVING BRICK

A. On the previously prepared slope compacted at plus or minus 2 percent optimum moisture content, place concrete base of thickness shown.

B. Give concrete base smooth screed finish.

C. Clean base, dampen, and lay 1-inch thick mortar bed.

D. Lay bricks with long dimension parallel to base of slope, with open 3/8-inch joints and with joints staggered.

E. Bed bricks firmly in mortar bed so as to produce even surface free from depressions or high spots.

F. Fill joints completely with mortar.

G. Protect and cure newly laid brick for a period of 7 days using wet cotton mats or wet burlap.

3.7 SODDING

A. Place sod as specified in Section 02931, "Seeding and Sodding- Non-Irrigated Areas."

3.8 FIELD QUALITY CONTROL

A. Maximum Surface Variation Tolerances:

1. Concrete Masonry Unit: Plus or minus 1/2 inch from grade, specified or shown, in 25 feet.
PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work of this section will not be measured but will be paid for at the lump sum prices for the respective slope protection work.

B. Stone riprap slope protection will be paid for at the lump sum price for "Stone Riprap".

C. Surface grouting placed in conjunction with stone riprap will be paid for at the lump sum price for “Surface Grouting.”

D. Gabions will be paid for at the lump sum price for “Gabion Structures”.

E. Cast-in-place concrete slope paving will be paid for at the lump sum price for “Slope Protection - CIP Concrete” for each thickness indicated.

F. Concrete masonry unit slope paving will be paid for at the lump sum price for “Slope Protection - Concrete Masonry Units” for each type of unit indicated.

G. Paving brick slope paving will be paid for at the lump sum price for “Slope Protection - Paving Brick” for each type of paver indicated.

H. Sodding used as ditch lining will be paid for in accordance with Section 02931, “Seeding and Sodding - Non-Irrigated Areas”.

I. Grading and compaction of slopes and excavation associated with ditch lining and slope protection will be paid for as specified in Section 02220, “Grading, Excavating, and Backfilling”.

J. Prices paid for ditch lining and slope protection will include sand cushion, aggregate filter, filter fabric, grout, mortar, and reinforcement.

END OF SECTION 02271
SECTION 02275
GEOGRID WALL REINFORCEMENT

PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies geogrid reinforcement and appurtenant materials for construction of the geogrid reinforced soil retaining wall in landscaped areas. This system is not to be used to retain fills subject to automobile or rail traffic surcharge loading. The design and installation of geogrid reinforcement is the sole responsibility of the Contractor.

B. Geogrid specified here is installed as part of modular retaining wall system specified in Section 02870, "Modular Retaining Wall Units".

1.2 REFERENCED STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   2. ASTM D698 - Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/ft3 (600 kN-m/m3))
   3. ASTM D4253 - Standard Test Methods for Maximum Index Density and Unit Weight of Soils Using a Vibratory Table
   4. ASTM D4254 - Standard Test Methods for Minimum Index Density and Unit Weight of Soils and Calculation of Relative Density

B. Geosynthetic Research Institute (GRI):
   4. GRI GG4 - Determination of the Long-Term Strength of Stiff Geogrids.

1.3 DEFINITIONS

A. Geogrid is an open mesh grid structure specifically fabricated for use as soil reinforcement.

B. Unit fill is a free draining granular material, used within the concrete units. See Section 02870, "Modular Retaining Wall Units".

C. Reinforced fill is the soil which is used as fill for the reinforced soil mass.

1.4 DESIGN REQUIREMENTS

A. Design of geogrid reinforced modular retaining wall shall be performed by and working drawings and computations shall be signed and sealed by the Contractor's engineer who shall be a Professional Engineer registered in the State of Texas.

B. Working Drawings shall include all details, dimensions, and cross sections necessary to construct the wall.

C. Working Drawings shall include plan and elevations of each wall. Plan and elevations shall be developed in accordance with the lines and grades shown in the Contract Drawings.

D. Elevation view of the wall shall indicate the following information:
   1. Elevation at the top of the wall, at all horizontal and vertical break points, and at least every 25 feet along the wall;
   2. Elevations at the top of leveling pads and footings;
   3. Distance along the face of the wall to all steps in the footings and leveling pads;
   4. Designation as to the type of panel or module;
   5. Length, size, and number of mesh or strips and the distance along the face of the wall to where changes in length of the mesh or strips occur; and
   6. Location of the original and final ground line.

E. Plan view of the wall shall indicate the following information:
   1. Offset from the construction centerline to the face of the wall at all changes in horizontal alignment;
   2. Limit of the widest module; and
   3. Mesh or strip and the centerline of any drainage structure or drainage pipe which is behind or passes under or through the wall.

F. Working Drawings shall also include the following notes, data, and details, as applicable:
   1. General notes required for design and construction of the wall.
   2. Horizontal and vertical curve data affecting wall construction.
3. A listing of the summary of quantities provided on the elevation sheet of each wall for all items including incidental items.

4. Cross sections showing limits of construction and in fill sections, limits, and extent of select granular backfill material placed above original ground.

5. Limits and extent of reinforced soil volume.

6. Details including any reinforcing bar bending details. Bar bending details shall be in accordance with Contract Documents.

7. Details for foundations and leveling pads, including details for steps in the footings or leveling pads, as well as, allowable and actual maximum bearing pressures.

8. Details of modules and facing elements. The details shall show all dimensions necessary to construct the element, all reinforcing in the element, and the location of reinforcement element attachment devices embedded in the facing.

9. Details for construction of the wall around drainage facilities, overhead sign footings, and abutment piles.

10. Details of elastomeric expansion joints.

12. Details of underdrains showing location, size, and connections to manholes and storm sewers.

G. Design computations: The method of analysis shall be a tie back wedge method as described in AASHTO Task Force 27 "Guidelines for the Design of Mechanically Stabilized Earth Walls". Submit computations on 8-1/2 inch by 11 inch pages.

1.6 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Geogrid shall be stored above 20 deg. F.

B. Prevent mud, wet cement, epoxy, and like materials which may affix themselves to the gridwork from coming in contact with the geogrid material.

PART 2 - PRODUCTS

2.1 GEOGRID

A. Geogrid shall be a dimensionally oriented and stable structure. The geogrid shall have an ultraviolet resistant finish which is inert to biological degradation. Also, it shall be resistant to naturally encountered chemicals, alkalies, and acids. Geogrid design properties and values shall be determined by the test methods in the following table.

2.2 REINFORCED FILL

A. The reinforced fill material shall be free of debris and consist of the following inorganic soil type. The maximum particle size shall be 4 inches. There shall be less than 20 percent by weight of particles greater than 1-1/2 inch.

B. Soils consist of fine grained (greater than 30 percent by weight passing U.S. standard sieve No. 200) silts and clays, with a liquid limit less than 50, and an plasticity index less than 25 in accordance with Section 03305, "Portland Cement Concrete".

2.3 FOOTING MATERIAL

A. Footing material shall be Mix S-7, unreinforced concrete, as per Section 03305, "Portland Cement Concrete".

PART 3 - EXECUTION

3.1 FOUNDATION SOIL PREPARATION FOR REINFORCED SOIL AND RETAINING WALL ZONE

A. Excavate foundation soil as required for installation of the retaining wall assembly shown on the approved working drawings. Take precautions to minimize excavations. Excavations shall be performed in accordance with Section 02220, "Grading, Excavating, and Backfilling".
3.2 RETAINING WALL ERECTION

A. Erect wall as specified in Section 02870, "Modular Retaining Wall Units".

B. Obtain Contracting Officer’s examination of foundation soil to ensure that the actual foundation soil strength meets or exceeds assumed design bearing strength. Remove soils not meeting required strength and replace with soil meeting the assumed design bearing strength. Foundation soil shall be tested in accordance with Section 02220, "Grading, Excavating, and Backfilling".

C. Fill over-excavated areas compacted backfill material and proof-roll foundation soil prior to fill and geogrid placement. The compacted backfill shall meet the requirements of Section 02220, "Grading, Excavating, and Backfilling".

D. Place footing as shown in the approved working drawings with a minimum thickness of 6 inches.

E. Install footing materials, as specified herein, upon prepared foundation soil.

F. Footing shall be level to ensure complete contact of retaining wall unit and shall be grouted with structural non-shrink grout in accordance with Section 03305, “Portland Cement Concrete”. Gaps shall not be allowed.

3.3 GEOGRID INSTALLATION FOR RETAINING WALLS

A. Install geogrid at the wall height and horizontal location shown on the approved working drawings in accordance with the procedure specified herein.

B. Lay geogrid horizontally on compacted backfill and pin to the concrete wall units.

C. Lay geogrid at the proper elevation and orientation as shown in the wall details and approved working drawings.

D. Roll out geogrid perpendicular to the wall. Verify orientation (direction) of the geogrid prior to proceeding with installation.

E. Hook geogrid over pins, pull taut, and anchor before pushing toward unit placed above the geogrid.

F. Remove slack in the geogrid at the wall unit connection using a method approved by the Contracting Officer.

G. Place unit fill in accordance with Section 02870, "Modular Retaining Wall Units".

H. Pull geogrid taut and free of wrinkles prior to placement of backfill. Secure geogrid in place with staples, pins, sandbags, or backfill as required by fill properties, fill placement procedures, and weather conditions.

I. Overlaps:
   1. Do not overlap geogrid in the strength direction. The strength direction is that length of geogrid perpendicular to the wall face and shall be one continuous piece of material without defects.
   2. Adjacent sections of geogrid shall be placed side to side.

3.4 FILL PLACEMENT

A. Place reinforced wall fill material in 8-inch lifts and compact to a minimum 95 percent of Standard Proctor Density.

B. Soil with a well-defined moisture-density relationship shall be compacted to at least 95 percent of the standard Proctor maximum dry density (ASTM D698 with oversize corrections where warranted) between – minus 3 and plus 2 percentage points of the optimum moisture content.

C. Fine aggregate free-draining soils that do not have a well-defined moisture-density curve shall be compacted to a relative density of at least 70 percent as determined by test methods ASTM D4253 and D4254. Granular backfill shall be compacted at a moisture content that will allow the desired density to be achieved.

D. Where the backfill material consists of more than 30 percent retained on the 0.75 inch sieve and sand cone or nuclear density measurements can not be made, a method specification shall be used to control compaction. The method specification shall be based on a test compaction section to establish the number of passes required to where there is no visible change in the test lift thickness caused by the steel drum roller. The method specification shall define the lift thickness and fill moisture content requirements for the approved steel drum roller. The number of passes required for compaction shall not be less than four.

E. Pretension geogrid by hand to remove wrinkles. Place, spread, and compact backfill in such a manner that eliminates the development of wrinkles and movement of the geogrid.

F. Utilize only hand operated compaction equipment within 3 feet of the wall face.

G. Place backfill from the wall outward to ensure that the geogrid remains taut.

H. Prevent damage to geogrid from tracked and rubber-tired equipment.

1. Operate no tracked construction equipment directly on the geogrid. Establish a minimum backfill thickness of 9 inches over geogrid prior to operation of tracked vehicles over the geogrid. Minimize turning of tracked vehicle to prevent tracks from displacing the fill and damaging the geogrid.
2. Move rubber-tired equipment at slow speeds (less than 10 mph) when passing over the geogrid reinforcement. Avoid sudden breaking and sharp turning.

I. Provide surface drainage during and after construction of the wall to minimize water infiltration of the reinforced soil zone.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work specified in this section will not be measured or paid separately, but all costs in connection therewith will be considered incidental to the work specified under Section 02870, "Modular Retaining Wall Units".

END OF SECTION 02275
PART 1 - GENERAL

1.1 DESCRIPTION

A. The work specified in this section consists of furnishing, installing, monitoring, reading, and interpreting data, maintaining, and removing geotechnical instrumentation. Geotechnical instrumentation specified herein shall be provided during open-cut, cut-and-cover, and tunnel excavation operations; underpinning installation and related excavation; and other elements of the work as required in the Contract Documents.

1.2 REFERENCED STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A36/A36M - Standard Specification for Carbon Structural Steel
   3. ASTM A53/A53M - Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless
   4. ASTM B221 - Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes

1.3 SYSTEM DESCRIPTION

A. For purposes of this section, geotechnical instrumentation shall consist of movement detection instruments, internal bracing and anchor load instrumentation, and ground water monitoring devices.

B. Select appropriate instruments to detect the movement of ground and structures during construction.

C. Develop an instrument monitoring system intended to provide early information to permit timely implementation of proper remedial measures, when and as required, to prevent damage to structures, facilities, and utilities.

D. Locate instruments and design and implement monitoring program to document the ground movement, if any, that takes place during excavation.

E. Locate settlement reference points on and about any structure which may be affected by excavation performed as part of the Contract. Design and implement monitoring program to document any horizontal or vertical movement of structure.

F. Determine exact location of the instruments including settlement reference points to be installed in the field with approval of the Contracting Officer.

G. Be responsible for interpretation of instrumentation data as input to evaluating excavation performance and controlling settlements to prevent damage to structures, facilities, and utilities.

H. Implement remedial measures, including modification of construction procedures, as necessary.

I. Settlement reference points shall be located as indicated in the Contract Documents.

J. The Contracting Officer will also interpret the instrument monitoring data and will make the interpretation available to the Contractor.

1.4 SUBMITTALS

A. Working Drawings: Submit Working drawings of instrumentation location layout and details at least 21 days before installation. Show proposed locations if they differ from those indicated and describe instrumentation components. Indicate methods of installation and maintenance for instrumentation systems.

B. Documentation:
   1. Submit manufacturer's catalogs and printed installation instructions for instruments furnished.
   2. Submit, within 24 hours of completion of equipment installation, 3 copies of installation notes, initial readings, and monitoring data taken immediately after installation.

C. Certification:
   1. Submit certification of calibration for equipment used.

D. Monitoring Documentation:
   1. Unless otherwise provided by the Contracting Officer, submit proposed forms to be used for recording observations, monitoring and reporting of data. Submit a sample showing proposed format for recording of readings, calculations and plots.
2. Submit the following within 12 hours after monitoring any instrument:
   a. A copy of the data sheet containing a cumulative history of all readings, including weather conditions at time of each reading.
   b. A copy of the plot of measured value versus time, which also includes a time history of construction activity likely to influence such readings. (e.g., depth of excavation, presence of heavy equipment on or near decking.)

3. Submit weekly a brief narrative of instrumentation activity for the preceding week, in a format approved by the Contracting Officer.

4. Submit samples as specified.

E. Mix Designs: Submit proposed inclinometer casing grout mix designs.

F. Closure Report: Upon removal of instrumentation, submit report certifying that removal of the upper casings, plugging of holes, and restoration of surfaces has been accomplished as specified.

1.5 QUALITY ASSURANCE

A. Qualifications:

1. Manufacturer: Select a firm regularly engaged in the manufacture of monitoring instrumentation of the type specified herein.

2. Equipment: Incorporate into the Work geotechnical instrumentation systems which essentially duplicate geotechnical instrumentation systems in satisfactory use for a period of 5 years prior to the bid opening of this Project.

3. Personnel:
   a. Employ a Professional Engineer, licensed in the State of Texas, specialized in geotechnical engineering, and experienced in installation of instruments of the type specified in this Section, to supervise and direct instrument installation technicians and to be responsible for instrument installation monitoring, reduction, and interpretation of instrumentation monitoring data.
   b. Employ qualified installation technicians who have previous experience in installation of instruments of the type specified herein.

C. Employ qualified technicians working under the direction of the Professional Engineer who have previous experience in supervision and monitoring instruments of the type specified in this Section.

d. Qualified personnel, whose qualifications are specified herein, shall be available on Site at all times during work that would affect geotechnical instrumentation.

1.6 JOB CONDITIONS

A. Disclosure of Instrumental Data: Do not disclose instrumentation monitoring data to third parties and do not publish instrument monitoring data without the prior approval of the Contracting Officer.

B. Location of Underground Facilities and Structures:

1. Mark boring locations for cased instruments on the ground surface before actual drilling, and verify location of existing utilities. Change location of borings, as required, to avoid damage to utilities. If proposed boring location is within 24 inches of marked utility, expose that facility by hand excavation between drilling.

2. Contractor shall verify locations of underground facilities and structures. Locations shown for utility facilities are taken from the various utility records and are approximate.

3. Verify locations of existing utilities in accordance with Section 02760, “Maintenance, Support and Restoration of Existing Utility Facilities”.

PART 2 - PRODUCTS

2.1 INCLINOMETER CASINGS

A. Provide casing with wall thickness sufficient to withstand external ground pressure and sufficiently flexible to accurately reflect horizontal ground movement. Provide inclinometer casings in earth of either:

1. Semi-rigid acrylonitrile-butadiene-styrene (ABS) plastic; 3.34 inches nominal outside diameter; provide in minimum lengths of 5 feet.

2. ASTM B221, 6063 T6, extruded aluminum alloy, epoxy-resin coated, 3.38 inches nominal outside diameter; provide in minimum lengths of 5 feet.

B. Provide casing with 4 internal longitudinal grooves, equi-spaced. Provide alignment of the grooves equal to or better than 1 degree in 10 feet.
C. Provide casing with upper casing couplings of the telescoping type with a 6-inch gap designed to close if settlement occurs. Provide casing with a bottom coupling of the rigid non-telescoping type. Provide casing couplings capable of supporting the weight of 125 feet of inclinometer casing freely suspended inside a drill hole.

D. Unless otherwise approved, do not use uncoated aluminum casings.

### 2.2 INCLINOMETER CASING GROUT

A. Provide grout of low-shear-strength (10 to 20 psi) lean concrete bentonite mixture.

### 2.3 INCLINOMETER CASING GROUND SURFACE PROTECTION

A. For inclinometer casings within unpaved work areas provide an 8 inch inside diameter, 5-1/2 feet long, ASTM A53 black steel pipe, threaded at one end, with a black malleable iron threaded, removable, locking type cap at the surface.

B. For inclinometer casings within paved areas, provide a minimum 6 inch inside diameter, 23 inches long, ASTM A48, Class 30 cast iron valve box with locking type cover, as indicated. Provide 2 wrenches for covers.

### 2.4 INCLINOMETER PROBES

A. Provide inclinometer probes with 24 inch wheel base and at least 150 feet of waterproof cable externally marked in 1 foot intervals.

B. Furnish inclinometer probes and read-out indicators in numbers sufficient to ensure the constant availability of functioning units on the site in case of loss or failure of prime units.

### 2.5 DEEP BENCHMARKS

A. Provide outer casings of ASTM A53, extra strong steel pipe: Nominal diameter of 4 inches.

B. Provide inner casings of ASTM A53, extra strong steel pipe: Nominal diameter of 2 inches.

C. Provide steel spiders to center the inner pipe.

D. Provide heavy grease at spiders.

E. Provide benchmark tops of necessary components as indicated.

F. In accordance with Section 03305, "Portland Cement Concrete", provide sand-cement grout. Proportion the grout mix containing 3 parts sand to 1 part of cement by weight; with a water cement ratio not to exceed 1.5.

G. Provide traffic covers in accordance with jurisdictional authority’s requirements and as approved by the Contracting Officer.

### 2.6 HEAVE MARKERS

A. Provide heave markers, as approved by the Contracting Officer.

### 2.7 SETTLEMENT REFERENCE POINTS

A. Structural Surfaces:

1. Provide settlement reference points that are either decals, graduated tape strips, scribe marks, concrete nails, PK nails, pins, optical targets, or combinations thereof.

2. Provide 3-piece expansion anchors consisting of an outer lead alloy sleeve, an inner lead alloy wedge nut and a stainless steel cap head bolt. Adjust for horizontal or vertical installation as field conditions require and as approved by the Contracting Officer. Provide graduated strips on columns.

B. Ground Surfaces:

1. In areas that are not paved but which may be subject to light traffic, provide metal plugs and capped pipe embedded in 6 inches by 6 inches by 8 inches concrete.

2. In areas protected from traffic (including construction traffic) where no pavement or structure exists, provide 2 inches by 2 inches hardwood stake with PK nail as a reference point.

3. Provide reference points that are chisel marks, concrete nails, round-headed bolts for precision, or combination thereof as field conditions require on street curbs, basement slabs, and pavements.

C. Provide protective housing of 4-inch inside-diameter pipe and flush lid for heavy traffic areas where reference points are at least 1 inch below surface.

### 2.8 DEEP SUBSURFACE SETTLEMENT INDICATORS

A. Provide deep subsurface settlement indicators consisting of steel pipe casing of 3 inch outside diameter; 1 inch inside diameter black steel pipe conforming to the requirement of ASTM A53, welded extra strong; stainless steel pipe cap for read point; 1/8 inch steel plate for spiders; 1/2 inch thick by 6 inch diameter steel plate for cover; grease and oakum packing for annular space; and assembled in accordance with the approved Working Drawings.
B. Provide protective ASTM A48, Class 30, cast iron curb boxes with locking type cover as indicated. Furnish 2 wrenches for covers.

2.9 LEVEL MONITORING DEVICES

A. Provide liquid settlement system to measure elevation changes between 2 points. One on a building column or wall and the other a fixed point outside the building. The points shall be connected by a flexible liquid column tubing with T-fitting at each column and the branch tube clamped or attached to the column with a scale marking the liquid level. Use clear plastic and brass fittings.

2.10 TILTMETERS

A. Provide tiltmeter sensors, read out indicators, and tiltmeter base plates.

B. Provide grout or epoxy resin, as approved by the Contracting Officer.

C. Furnish tiltmeter sensors and read-out indicators in numbers sufficient to ensure the constant availability of functioning units on the Site in case of loss or failure of the prime units.

2.11 TAPE EXTENSOMETER

A. Provide tape extensometer and anchor points for measurement of change in tunnel diameters.

B. Provide eyebolt for attachment to the tunnel lining that is compatible with the tape extensometer. Use a method of attachment suitable for the type of lining installed and which provides a firm installation that is protected from damage and can sustain a blow struck by a 16 ounce hammer without 0.005 inch change in the tape extensometer measurement.

C. Provide a tape extensometer standard having nominal length of 24 inches and constructed of a wide-flange section not less than 4 inches in depth and conforming to ASTM A36 structural steel. The tape shall have minimum length equal to diameter of the tunnel.

2.12 BOREHOLE EXTENSOMETERS

A. General:

1. Provide mechanical rod-type extensometers as follows:
   a. With multiple anchor positions;
   b. A fixed reference head;
   c. A protective cover;
   d. A removable readout;

   e. Corrosion resisting;
   f. Insensitive to blasting and traffic vibrations;
   g. Able to operate in water;
   h. Designed to resist freezing of rods, guides, and reference head caused by intrusion of grout, dirt, and mineral precipitates; and
   i. Able to operate correctly regardless of installation orientation either from the ground surface or from within the excavation.

2. Furnish read-out devices in numbers sufficient to ensure the constant availability of functioning units on the site in case of loss or failure of prime units.

3. Furnish with mechanical or electrical read out systems, as indicated.

B. Characteristics:

1. Range of each anchor: Within plus or minus 2 to 6 inches and extensible by resetting.

2. Sensitivity: Able to measure movements of anchors relative to reference head to a sensitivity of 0.001 inch over a range of 2 inches.

3. Repeatability: 0.005 inch maximum variation from the mean of repeated successions of readings.

C. Reference heads:

1. Provide reference heads which permit easy cleaning of the measuring surfaces.

2. Provide a removable cover to protect the reference head from damage during construction operations.

D. Drill hole: Anchors and reference head to fit entirely within a drill hole sized in accordance with the instrument manufacturer’s recommendations.

E. Anchors:

1. Rear anchors, center anchors, and reference head anchors to be of mechanical rock bolt or expansion shell type, able to grip the sides of the hole securely without detrimental effects from vibrations.

2. Rear anchors shall be adjustable at the time of installation for locations from 8 feet to 30 feet from the hole collar. Center anchors shall be adjustable at the time of installation for locations from 2 feet to 8 feet from the
hole collar. Adjustment of rear and center anchors made by using extension rods and couplings.

3. Subsurface anchor points and the entire subsurface assembly to be grouted with a weak sand-cement grout.

F. Rods:

1. Exposed ends of extension rods to have stainless steel tips.

2. Measurement rods to be encapsulated in oil or grease filled, flexible tubing.

G. Telltale:

1. To extend from the bottom anchor position of the extensometer to a point 5 feet inside the line of the opening.

2. Telltale set so that the position of the bottom anchor, relative to the opening, can be determined after the opening is excavated.

H. Readouts:

1. Capable of reading by either mechanical depth micrometer or remote reading electronic readout head.

2. Stainless steel reference points.

3. Protect remote readout lead wires from damage. Terminate lead wires in enclosure sealed against the intrusion of dirt, grout, and water.

2.13 STRAIN GAUGES

A. Provide strain gauges that are weather-resistant, suitable for either permanent encasement in concrete, or installation on bracing, or installation on tunneling steel ribs. Furnish latest model developed specifically for applications anticipated within this Contract.

B. Characteristics:

1. Insensitive to traffic and anticipated construction activity vibrations and able to function under water.

2. Capable of attaining a minimum service life of 4 years.

3. Complete with mounting brackets, waterproof cable, cable connectors, terminal boxes, protective steel channel covers, and steel flex conduit for full length protection of cables.

C. Provide terminal boxes recommended by the manufacturer of the strain gages containing switching arrangement which will enable each gauge contained in a load instrumentation zone to be recorded without changing connecting electrical leads.

D. Provide connector wires as recommended by strain gauge manufacturer.

E. Provide vibrating wire indicators in quantities sufficient to ensure the constant availability of functioning units on the site in case of loss or failure of prime units.

2.14 LOAD CELLS

A. Provide load cells of bonded strain gauge transducer type, moisture-resistant model developed specifically for load measurements and conditions anticipated within this Contract. Provide load cells having a working capacity equal to at least yield load of structural member and having an accuracy to within 1 percent of the load range.

B. Provide terminal boxes containing switching arrangement which enables each load cell contained in a load instrumentation zone to be recorded without changing connecting electrical leads.

C. Provide connector wires as recommended by load cell manufacturer.

D. Furnish read-out boxes in numbers sufficient to ensure constant availability of functioning units on the site in case of loss or failure of the prime units.

2.15 PRESSURE CELLS

A. Provide pressure cells, as approved by the Contracting Officer.

2.16 PIEZOMETERS

A. Provide piezometers as specified in Section 02140, "Dewatering".

PART 3 - EXECUTION

3.1 MOVEMENT DETECTION INSTRUMENTS, GENERAL

A. Notify the Contracting Officer not less than 24 hours before installing any instrumentation.

B. Calibrate instruments as per manufacturer's requirements.

C. Replace or repair damaged or nonfunctional instruments within 48 hours or as directed by the Contracting Officer.
D. Take corrective measures and modify construction procedures as required by the Contracting Officer to prevent any damage to structures, facilities, and utilities, if the geotechnical instrumentation measurements of deformation or ground water levels exceed acceptable limits indicated on the Contract Drawings.

E. Tunnel Instrument Installation: Take special care during installation of instruments in ground immediately adjacent to the proposed tunneling to ensure that adequate clearance between the instrument and the tunnel is maintained.

3.2 TOLERANCES

A. Establish the elevation of cased deep benchmarks to 0.001 feet.

B. Establish the initial coordinates of each instrument installation to 0.1 foot, or less.

C. Establish the initial elevation of settlement reference points and subsurface settlement indicators to 0.005 feet.

D. Record the subsequent elevations of settlement reference points and subsurface settlement indicators to 0.005 feet. Achieve level circuit closure with an error of closure of 0.01 foot, or less.

E. Establish survey turning points so that backsight and foresight are kept approximately equal.

3.3 BOREHOLE EXTENSOMETERS INSTALLATION:

A. Drill boreholes of size and at locations indicated, to required depth and to receive borehole extensometer.

B. Prepare logs of soil and rock encountered using qualified personnel to witness and log samples during drilling.

1. In soil obtain samples with standard 2 inch O.D. split spoon or equivalent;

2. Sample at minimum 5 foot intervals and at each change in stratification;

3. In rock, log continuous NX or AX cores as applicable to the specified installation.

C. Submit the logs and samples to the Contracting Officer.

D. Verify hole is drilled such that manufacturers installation requirements will be met.

E. Install multiple-anchor rod-type extensometers at locations indicated. Individual anchor positions will be subject to approval by the Contracting Officer.

3.4 INCLINOMETER CASINGS INSTALLATION

A. Open-Cut and Cut-and-Cover Excavation: Install inclinometer casings where shown on approved working drawings at least 7 days prior to start of adjacent excavation.

B. Tunnel Excavation: Install inclinometer casings a minimum of 14 calendar days prior to either the left or right tunnel advance approaching within 100 linear feet of the proposed instrumentation location.

C. Drill minimum 6 inch diameter and maximum 8 inch diameter holes, at locations indicated, to required depths to receive inclinometer casing.

1. Prepare logs of soil and rock encountered using qualified personnel to witness and log samples during drilling.

a. In soil obtain samples with standard 2 inch O.D. split spoon or equivalent;

b. Sample at minimum 5 foot intervals and at each change in stratification;

c. In rock, log continuous NX or AX cores as applicable to the specified installation.

2. Submit the logs and samples to the Contracting Officer.

D. Cap bottom of casings and fill annular space between casings and sides of holes with inclinometer casing grout pumped through a pipe or small tube to bottom of hole.

E. Cap bottom of casings and fill annular space between casings and sides of holes with inclinometer casing grout pumped through a pipe or small tube to bottom of hole.

F. Ground Surface Protection:

1. If inclinometer casings will be within unpaved work areas, project top of inclinometer casings a minimum of 16 inches above the ground. Protect inclinometer casings with 8-inch diameter steel casings. Locate tops of inclinometer casings not further than 2 inches below tops of steel casings. Embed steel casings 4 feet into ground, project 18 inches above ground elevation, and provide with removable caps. Mark steel casings with yellow paint.

2. If inclinometer casings will be in paved areas, excavate a hole 2 feet deep by not
larger than 12 inches in diameter, through paving, and install the valve box. Make the box flush with the paved surface and fill annular space between the box and the 2 foot hole with concrete. Project inclinometer casings within 3 inches of surface and not closer than 2 inches above bottom of hole or as required to read instrument. Close hole through pavement with a removable cover.

G. Maintain inclinometer casings in operating condition from time of installation until completion of work requiring inclinometer casings. Keep inclinometer casings locked when not being read or serviced. Establish and maintain convenient access.

3.5 DEEP BENCHMARK INSTALLATION

A. Establish a system of benchmarks as indicated before starting excavation and before other instruments are installed.

B. Drill 4-1/2 inch diameter holes, to 18 feet in soil or 3 feet in rock below bottom of future excavation or the tunnel construction invert. Install the outer casings to the bottom of the hole. Install steel spiders, to center the 2 inch diameter inner casings, at a maximum spacing of 20 feet.

1. In soil, split the inner casings for 12 inches at tips (as indicated) and drive the inner casings 2 feet into undisturbed soil below bottom of outer casings.

2. In rock, drill the inner casings 2 feet into rock below bottom of outer casings and grout bottom 12 inches of inner casings in place.

3. Pump heavy non-toxic (USDA Classification H-1) into annular space between the 2 inch diameter and the 4 inch diameter steel pipes until the space is completely filled.

C. Bore Logs: Prepare logs of soil and rock encountered using qualified personnel to witness and log samples during drilling. Submit the logs and samples to the Contracting Officer.

1. In soil obtain samples with standard 2 inch O.D. split spoon or equivalent;

2. Sample at minimum 5 foot intervals and at each change in stratification;

3. In rock, log continuous NX or AX cores as applicable to the specified installation.

D. Weld stainless steel read point to top end of benchmark pipe.

3.6 HEAVE MARKER INSTALLATION

A. Install heave markers as indicated before starting excavation and dewatering.

3.7 SHALLOW SUBSURFACE SETTLEMENT REFERENCE POINT INSTALLATION

A. Establish a system of settlement reference points on or about buildings and structures as indicated before starting excavating and dewatering. Correlate system with benchmarks established as reference points.

B. Locate and construct reference points in a manner which will not create a hazard to pedestrians and vehicles. Maintain access to settlement reference points.

C. Drive pipe to required depth utilizing a coupling and nipple as a striking surface.

D. Adjust depth to site conditions to embed pipe in soil below pavement.

E. Remove coupling and nipple and install pipe cap with read point.

F. Excavate around pipe and place curb lock box. Backfill outside of box. Leave box with the cover locked.

3.8 DEEP SUBSURFACE SETTLEMENT INDICATOR INSTALLATION

A. Install each deep subsurface settlement indicator as indicated.

B. Drill holes for the outer casings to a point 2 feet above the elevations shown. Do not damage the casing or disturb the soil below the casing where the inner pipe will be anchored.

C. Install outer casing and grout in-place.

D. Install protective cast iron curb boxes and grout in-place.

E. Install inner pipe split 12 inches at tips by driving to required elevation. Where inner pipe is to rest on a subsurface structure, take care not to damage or penetrate more than necessary for attachment to the subsurface structure. Pump heavy non-toxic (USDA Classification H1) into annular space between outer casing and inner pipe until space is completely filled.

F. Set pipe cap reference surface.

G. Install cover and lock.

3.9 GROUND SURFACE SETTLEMENT POINT INSTALLATION

A. Establish reference points on and about building and structures as indicated. Locate and construct reference points in a manner which will not create a hazard to pedestrians and vehicles. Maintain access to reference points.
B. For buildings or structures within zone of influence of the proposed excavation boundaries, install reference points on the outside of the building at a convenient height above grade, on all corners and at each column, or on walls, at spacings not to exceed 20 feet. Insofar as practicable, install all points on each side of the building at the same elevation. Install before installation of the excavation support system and underpinning and before beginning of dewatering operation.

3.10 BUILDING SETTLEMENT REFERENCE POINT INSTALLATION

A. Install building settlement reference point where shown on approved working drawings.
B. Drill correct diameter and depth hole into receiving surface.
C. Blow out drilling debris from the hole.
D. Assemble expansion anchor and insert into hole.
E. Tap outer sleeve on to wedge nut to effect initial sleeve contact with wall of hole.
F. Expand outer sleeve into tight contact with wall of hole by turning bolt until anchor is rigid with the hole. Do not strip wedge nut threads by excessive turning of the bolt.

3.11 LEVEL DEVICE INSTALLATION

A. Install level device where shown on approved working drawings.
B. Install plastic tubing filled with liquid around the lower level of the structure with a T-fitting at each column and the branch tube clamped to the column with a scale marking the liquid level.
C. Change in the liquid level on the scale will be indicative of the column settlement.
D. Record change in liquid level reading at each column.
E. Protect tubes from operations and people stepping on the tubes.

3.12 TILTMETER INSTALLATION

A. Install tiltmeter where shown on approved working drawings.
B. Bond tiltplates on buildings and structures with grout or epoxy resin and as specified before starting excavating and dewatering.
C. Maintain access to tiltplates.
D. Remove and dispose of the tiltplates upon completion of the Contract. Restore disturbed or damaged surfaces to the conditions existing prior to installation of tiltplates.

3.13 TAPE EXTENSOMETER INSTALLATION

A. Install Tape Extensometer anchor points on excavation walls or tunnel rings as soon as the plan locations of anchor points indicated are exposed.
1. If tunnel equipment prevents the taking of measurements the installation of anchor points or the taking of readings use alternate methods as approved by the Contracting Officer.
2. Install tape extensometer standard on tunnel sidewall in an area free from disturbance by equipment and freely accessible for use.
B. Maintain anchor points in functional condition and remove obstructions from lines of measurement as necessary for monitoring.

3.14 INTERNAL BRACING AND ANCHOR LOAD INSTRUMENTATION SYSTEMS INSTALLATION

A. Definition: A load instrumentation zone is defined as containing:
1. Strain gauges, switch boxes, connection wires, and other auxiliary hardware installed on or for cross bracing struts, at all strut levels, in 3 consecutive strut lines at the zone locations in plan, as indicated.
2. Load cells, switch boxes, connecting wire, and other auxiliary hardware installed on or for tiebacks on both sides of the excavation within the plan limits as shown.
B. Strain Gauges:
1. Install strain gauges in pairs, on opposite sides of bracing member's cross section. The strain gauges shall be installed at the end opposite the one being jacked, at least 3 strut depths away from the strut end. Exact locations will be determined by the approved design of the system. Install strain gauges before preloading bracing members, in conformance with the strain gauge manufacturer's installation instructions. Install the first strain gauges under the supervision of a qualified representative of the strain manufacturer.
2. For each zone of strain gauges on stressed bracing members, install 1 additional temperature compensation strain gauge on an unstressed segment of strut affixed to the support wall in a position to be subject to the same temperature fluctuations as the stressed member. Install the temperature compensation gauges in the same manner as those installed on stressed members.
3. Connect strain gauges to terminal boxes in conformance with the strain gauge manufacturer’s instructions. Route wiring to prevent mechanical damage and encase in conduit. Connect and operate under the supervision of a qualified field representative of the strain gauge manufacturer for the first load instrumentation zone.

4. Install terminal boxes for each load instrumentation zone, at street level within 10 feet of the excavation, in a protected location, and with convenient access for the Contracting Officer.

5. Assign alphanumeric designations to the strain gages that are consistent with the Contractor’s chosen designations for the support ribs. Clearly label electrical leads.

C. Load Cells:

1. Install load cells between walers and earth anchor plates or soldier piles. Exact locations will be determined in accordance with the approved design. Install load cells in conformance with the load cell manufacturer’s instructions.

2. Connect load cells to terminal boxes in conformance with the load cell manufacturer’s instructions. Encase connections in waterproof conduit. Connect and operate under the supervision of a qualified field representative of load cell manufacturer for the first load instrumentation zone.

3. Install terminal boxes on both sides of each load instrumentation zone, at street level within 10 feet of excavation, in a protected location, and with convenient access for the Contracting Officer.

4. Assign alphanumeric designations to the load cells that are consistent with the Contractor’s chosen designations for the support ribs. Clearly label electrical leads.

D. Pressure Cells: Install pressure cells as shown and subject to approval by the Contracting Officer.

3.15 PIEZOMETER INSTALLATION

A. As specified in Section 02140, “Dewatering”.

3.16 MONITORING SCHEDULE

A. General:

1. At a minimum, perform monitoring of geotechnical instrumentation, and follow the minimum schedule as specified below.

2. When instrumentation detects sudden changing movement or changing ground water levels take additional readings, in number and frequency as directed by the Contracting Officer.

B. Open-Cut and Cut-and-Cover Excavation Monitoring:

1. Movement detection instruments, except heave markers, within 20 feet of the excavation: Monitor an average of once per day during excavation, and once per week thereafter, until backfilled.

2. Movement detection instruments 20 feet or more outside of the excavation: Monitor an average of once every other day during excavation, and once every other week thereafter, until backfilled.

3. Heave markers: Monitor once following installation of the markers and once upon completion of excavation.

4. Internal bracing and anchor load instrumentation: Monitor an average of once per day while excavating 50 feet on either side of strut location, and once every week thereafter.

C. Tunnel Excavation Monitoring:

1. For the purposes of monitoring, instruments considered to be affected during construction of each individual tunnel are within a zone bounded by planes at a slope of 1 horizontal to 1 vertical at right angles to the tunnel alignment and tangent to the tunnel periphery.

2. Provide the instrumentation and take 3 readings of each instrument to establish an initial value. Take each of the 3 initial readings at an interval of at least 24 hours. Take the third and the last initial reading at least 2 weeks prior to the tunnel face approaching within 100 feet of the instrument. If the initial readings show a large variance, take additional readings to establish an initial reading.

3. Except for tape extensometer, read movement detection instruments once per shift while within the affected tunneling within 100 feet either way of the tunnel face, as follows:

   a. Once per shift or once per day, whichever is more frequent while tunneling within the 100 feet distance.

   b. At least once per day for 1 week after the tunnel excavation has
passed the 100 feet limit and once every week for 1 month thereafter.

4. Read movement detection instruments installed outside the affected zone once before the start of tunnel excavation, and at least once per day during tunneling when the tunnel is within 100 feet either way of the instrumentation stationing and once per week for 1 month thereafter.

5. Read level monitoring devices installed inside buildings near the proposed tunnel route for monitoring settlements on a schedule that is coordinated with compaction grouting and as follows:
   a. At least once per day during tunneling when the tunnel is within 100 feet of the building. Unless otherwise noted, the position of the tunnel refers to the face of excavation at the leading edge of the tunnel.
   b. At the end of each shift while tunneling under or near each affected building column and once per day for 1 week thereafter.

D. Observation Well Monitoring: As specified in Section 02140, "Dewatering."

E. Monitor instrumentation more frequently, if instrumentation detects significant, anomalous, or suddenly changing deformations, loads, or hydrostatic pressures.

3.17 INSTRUMENT PROTECTION, MAINTENANCE, AND REPLACEMENT

A. Protect and maintain instruments. Drain water or flush debris from under protective covers. Keep protective covers locked.

B. Provide suitable substantial protective barriers around instruments in construction areas.

C. Repair or replace damaged or missing instrument components or entire instruments as required within 48 hours at no extra cost to the Authority.

3.18 REMOVAL OF INSTRUMENTS

A. Upon completion of the Contract, leave cased deep benchmarks in place. Set cased deep benchmark protective covers flush with pavement or finished grade.

B. Prior to final acceptance of the work and subject to approval of the Contracting Officer, remove and dispose of the settlement reference points and heave markers, together with the protective boxes and covers. Fill holes drilled in masonry or concrete surfaces for settlement reference points with Portland cement mortar.

C. Upon completion of Contract, demolish inclinometer casings, unless otherwise directed, to a depth of 2 feet minimum below ground surface. Plug remaining open portions of inclinometer casings with Portland cement concrete. Backfill casing excavations with suitable material. Construct new pavement patches in paved areas of the same material and to the same thickness as existing adjacent pavement. Restore disturbed or damaged surfaces to the conditions existing prior to installation of instruments.

D. Terminate monitoring of observation wells when directed by the Contracting Officer. Leave observation well covers in place at the same elevation as of surrounding ground or pavement.

E. Remove painted instrument identification numbers from building and other surfaces. Remove wooden markers and protective barriers.

F. Restore and replace insulation, protective wrappings, and covers on utilities.

G. Backfill excavations made over and around utilities.

3.19 CONTRACTING OFFICER’S MONITORING

A. Access to Instruments: Provide and facilitate safe access to each instrument for the Contracting Officer at all times. Access includes, ladders, working platforms, and other necessary facilities, and the removal thereof.

B. The Contracting Officer may perform supplemental monitoring of instruments at any time. Cooperate with such instrumentation monitoring activities as follows:
   1. Make probes, sensors, and read-out devices available as required.
   2. Coordinate activities to minimize interference.
   3. Remove obstruction from lines of sight when requested by the Contracting Officer.
   4. Regulate traffic during instrument surveying operations.
   5. Temporarily cease activities which create hazards to instrument monitoring or surveying personnel.
PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

A. The work of this section, geotechnical instrumentation, including design of geotechnical instrumentation program and its implementation, interpretation, and maintenance (including removal of instruments and casings when specified) will be measured and paid for under the unit prices specified below.

B. Inclinometers will be measured by and paid for at the unit price for “Inclinometers” per linear foot based on the total number of linear feet of casing per installation to the nearest whole foot.

C. Deep benchmarks will be measured by and paid for at the unit price for “Deep Benchmarks” per linear foot based on the total number of linear feet of outer casing per installation to the nearest whole foot.

D. Heave markers will be measured by and paid for at the unit price for “Heave Markers” per each.

E. Settlement Reference Points: Settlement reference points shall be considered incidental to construction. No separate payment for settlement reference points will be made.

F. Deep subsurface settlement indicators will be measured by and paid for at the unit price for “Deep Subsurface Settlement Indicators” per linear foot based on the total number of linear feet of drilling to the nearest whole foot.

G. Level monitoring devices will be measured by and paid for at the unit price for “Level Monitoring Devices” per each.

H. Tiltmeters will be measured by and paid for at the unit price for “Tiltmeters” per each based on the total number of tiltmeters installed.

I. Tape extensometer will be measured by and paid for at the unit price for “Tape Extensometers” per each.

J. Borehole extensometer will be measured by and paid for at the unit price for “Borehole Extensometer” per linear foot based on the total number of linear feet of drilling to the nearest whole foot.

K. Strain gauges will be measured by and paid for at the unit price for “Strain Gauges” per each.

L. Load cells will be measured by and paid for at the unit price for “Load Cells” per each.

M. Pressure cells will be measured by and paid for at the unit price for “Pressure Cells” per each.

N. Piezometers, for the work related to this section only, will be measured by and paid for at the unit price for “Piezometers” per linear foot based on the total number of linear feet of drilling to the nearest whole foot.

END OF SECTION 02316
SECTION 02360
DRIVEN PILES

PART 1 - GENERAL

1.1 DESCRIPTION

A. This section includes specifications for designing, furnishing, and driving steel H-piles, prestressed concrete piles, and steel sheet piles as indicated, and performing any required pile load tests.

B. Pile Types:
   1. Type A: Steel H-piles, driven.
   2. Type B: Prestressed concrete piles, driven.

1.2 REFERENCE STANDARDS

A. American Association of State Highway and Transportation Officials (AASHTO):
   1. AASHTO/AWS D1.5M/D1.5 - Bridge Welding Code

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A252 - Standard Specification for Welded and Seamless Steel Pipe Piles
   2. ASTM D1143 - Standard Test Method for Piles under Static Axial Compressive Load
   3. ASTM D4945 - Standard Test Method for High-Strain Dynamic Testing of Piles

C. Texas Department of Transportation (TxDOT): Standard Specifications for Construction of Highways, Streets and Bridges.

1.3 DEFINITIONS

A. Geotechnical Engineer: For the purpose of this specification section, a Professional Engineer licensed in the State of Texas, whose qualifications include 5 years of documented experience in geotechnical testing, construction and inspection of piling foundations.

B. Structural Engineer: For the purpose of this specification section, a Professional Engineer licensed in the State of Texas, whose qualifications include 5 years of documented experience in the design of structures and structural foundations.

1.4 SUBMITTALS

A. Shop Drawings:
   1. Where load tests are shown or specified, show load test arrangements.
   2. For precast concrete piles, show procedures for fabrication including arrangement of reinforcing, as well as pick up and handling methods.
   3. For prestressed piles, show prestressing methods, tendon arrangement, working stresses, concrete mix design to be used, curing procedures, and methods for pick-up and handling, and minimum required strength prior to handling.

B. Documentation:
   1. Provide mill certificates for Type A piles and steel sheet piles.
   2. Provide certified concrete test reports in conformance with requirements of Section 03305, "Portland Cement Concrete".
   3. Pile order list:
      a. List of piles to be installed in the work showing size, type, number, location, and length needed to ensure penetration necessary to attain design capacity.
      b. Submit list prior to ordering piles.
   4. Submit details of the proposed pile driving job progress schedule, pile driving plan and termination blows per foot.
   5. Prior to commencement of pile installation operation, Contractor shall submit to the Contracting Officer for approval, details of all equipment for installation of piles. This shall include details of the pile hammer, power plant, leads, cushion material and helmet.
   6. Pile driving record: Maintain record throughout pile driving operations and submit upon completion of such operations. Include the following:
      a. Pile location.
      b. Ultimate pile load.
DRIVEN PILES

c. Date and time of beginning and ending of pile driving.
d. Sequence in which piles are driven.
e. Pile type, length, and diameter.
f. Equipment: Type and rating.
g. Blow counts throughout driving in blows per foot.
h. Splice locations.
i. Number of blows per inch of penetration for last 12 inches.
j. Vertical pile plumbness and batter.
k. Unusual conditions encountered during driving operations.
l. Final tip and cut-off elevations.

7. Submit evidence of experience of installer with names of projects, type of project, total linear feet of pile installed.

1.5 QUALITY ASSURANCE

A. Codes and regulations of the jurisdictional authorities.

B. The installer shall be a company specializing in performing the work of this section and have a minimum of 10 years experience in the installation of driven pile foundations.

C. The Contractor shall employ Geotechnical Engineer, or alternately retain a geotechnical consultant firm acceptable to the Contracting Officer to supervise the installation and driving of piling. The Geotechnical Engineer shall be required to certify the pile driving reports as described herein.

D. Pile Splices:

1. Welded splices shall conform to the design in the Drawings, or as approved by the Geotechnical Engineer and that are in conformance with AASHTO/AWS D1.5M/D1.5, latest revisions.

2. Submit qualifications of welding and testing personnel in accordance with Section 05120, “Structural Steel - Bridges”.

3. Remanufactured splices are not acceptable.

4. Splices shall provide at least equal stress strain behavior in bending, tension, compression and torsion as unspliced segment of pile.

1.6 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. When handling and delivering precast concrete piles, provide equipment to avoid undue bending stresses and breaking or chipping edges of pile. Do not use chain slings.

B. Support all piles, both steel and concrete, above ground and properly supported to prevent deflection and undue stress.

C. Storing and handling of steel piles shall be in ways that protect them from damage. The Contracting Officer will reject bent or kinked piles that the Contracting Officer believes cannot be straightened without damaging the metal.

D. The Contractor shall be responsible for all damage to the piles until they are incorporated into the structure and the structure is accepted, except specified otherwise in these specifications.

1.7 JOB CONDITIONS

A. Locate and protect underground facilities and structures as specified in Section 02220, “Grading, Excavating and Backfilling”.

PART 2 - PRODUCTS

2.1 CONCRETE PILES

A. Construct precast concrete piles, either conventionally reinforced or prestressed in accordance with Sections 03100, 03200, 03300, 03430, and 03365, as applicable, and the following:

1. For precast piling, concrete shall be Mix S-3.

2. For prestressed piling, concrete shall be of class shown on the plans.

3. All corners of square piling shall have a chamfer or radius.

4. The maximum sweep (curvature along axis of pile) not to exceed 1/8 inch per 10 feet of length.

2.2 STEEL H-PILE AND MISCELLANEOUS STEEL ACCESSORIES

A. In accordance with Section 05120, “Structural Steel - Bridges”; sizes as shown on the plans and AASHTO/AWS D1.5M/D1.5.
2.3 MISCELLANEOUS DRIVING ACCESSORIES

A. Driving heads, collars, bands, shoes, mandrels, and other driving devices in accordance with manufacturer's recommendations.

PART 3 - EXECUTION

3.1 DRIVING EQUIPMENT

A. Impact Hammer:

1. Adequacy of driving equipment, accessories, and methods is the general responsibility of the Contractor.

2. Foundation steel H-piles shall be driven with diesel, steam or air hammers.

3. The pile hammer used shall have a delivered energy suitable for the total weight of the pile, the character of the subsurface material to be encountered and the pile capacity to be developed as specified on the Drawings. If, in the opinion of the Contracting Officer, the driving equipment is inadequate or deficient, the Contracting Officer will direct it be removed from the job site. All costs for remobilizing, removing or replacing such equipment shall be at the Contractor's expense.

4. Driving criteria for piles shall be established by a Wave Equation Analysis of Pile Driving (WEAP). The Contractor shall furnish the manufacturer's specifications and catalog for the proposed hammer at least seven days in advance of pile driving in order to complete the WEAP.

5. Piles shall be driven to the ultimate pile capacity and to a driving resistance as determined by WEAP and as modified by test pile results, load test results, and pile driving analyzer (PDA) analysis.

6. If a diesel hammer is selected, the Saximeter, developed by Pile Dynamics, Inc., or equivalent, shall be used to provide an estimate of the driving energy of the hammer. If the driving energy of the hammer is different to the driving energy used to establish the pile driving criteria, the analysis to determine the pile driving criteria shall be reperformed using the measured hammer driving energy.

7. Driving equipment shall conform with the general criteria as specified in the Item 404 of the TxDOT Standard Specifications.

8. Should the driving equipment, accessories, or methods used or employed by the Contractor prove to be damaging to the piles or inadequate in attaining or maintaining the job progress schedule, the Contracting Officer may require the Contractor to replace some or all of the driving equipment, utilize different types of accessories, or use additional equipment.

9. Unless the use of gravity hammers are permitted by the Contracting Officer, all pile driving shall be done by impact hammer.

10. If the plans specify that test piles are required, the test piling shall be driven with the same size hammer as used for production piles.

B. Use a vibrohammer only with permission of the Contracting Officer.

C. Leads:

1. Piles shall be driven with fixed-lead drivers. The Contractor shall not use hanging or swinging leads unless they can be fixed in position during driving.

2. Provide leads of sufficient length to accommodate the combined length of pile and hammer.

3.2 DRIVING

A. General:

1. Drive piles only after completion of excavation or construction of an embankment, unless otherwise approved.

2. For piles installed in embankments, predrill through fill or embankment to natural ground or bottom of embankment, unless otherwise approved.

3. Pile jetting is not allowed without prior approval of Contracting Officer.

4. Drive each pile in a continuous operation until required penetration and bearing value have been obtained. If driving is stopped before required blow count is reached, drive 1 foot upon resumption of driving before resuming blow count.

5. Redrive each pile which is lifted by ground heave during driving of adjacent piles to at least original tip elevation or as directed.
6. Contractor shall ensure that ground conditions at the pile locations are adequate to support pile driving operations. Make provision for access and support of piling equipment during performance of work.

7. Piles shall not be driven until the excavation in the area which the piles are to occupy has been complete.

8. A driving helmet or cap shall be used between the top of the pile and the ram to prevent impact damage to the pile. The driving helmet or cap shall be capable of protecting the head of the pile, minimizing energy absorption and dissipation and cap shall have appropriate tapered grooves to fit the pile head and to prevent its distortion.

9. Use a driving helmet to protect the pile head.

10. Do not use any loose inserts in the helmet. The Contracting Officer is sole judge of the acceptability of the helmet.

11. Hold pile securely and accurately in position while driving.

12. Deliver hammer impacts concentrically and in direct alignment with pile taking care to avoid forcing pile laterally or bending pile. If in the Contracting Officer’s opinion, lateral or bending forces unduly affect the pile, the Contractor shall stop and rectify the situation at his own expense and to the satisfaction of the Contracting Officer.

13. Piling shall be driven to within five feet of plan length and to such greater depths necessary to obtain the required bearing resistance shown on the plans unless other penetration requirements or bearing evaluation methods as stated herein governed.

14. Restrike piles which have settled or heaved during driving of adjacent piles. No additional compensation will be made for pile restructured due to such settlement or heave.

15. Restrike piles as required by the Contracting Officer.

16. Remove loose and displaced material from around the piles after completion of driving, and leave clean, solid surfaces to receive foundation concrete.

B. Steel and Concrete Piles:

1. Hold pile heads in position with steel driving block or anvil.

2. Protect heads of concrete piles from direct impact of hammer by cushion driving block. Maintain cushion in good condition during entire driving operation. Arrange cushion driving block so that reinforcing bars projecting above piles will not be displaced or damaged in driving.

3. Use steel combination driving heads and pilots when driving steel H-beam piles. Closely fit driving heads to top of steel pile or shell and extend down sides of pile at least 4 inches.

4. Do not drive precast or prestressed concrete piles until 14 calendar days after casting.

3.3 SPlicing

A. Make splicing to produce a straight pile.

B. Prior to installing the splice, square the ends of the two sections of the pile to produce a straight splice with uniform bearing. In no case shall the ends of the pile sections be out of square by more than 1/16 inch.

C. Perform all splicing in the presence of the Contracting Officer.

D. In the event that a pile splice becomes damaged so as to impair the pile from its intended use, replace the pile. All costs associated with replacement, including any necessary changes to the pile cap, shall be borne by the Contractor.

3.4 Welding and Nondestructive Testing

A. Perform welding in accordance with AASHTO/AWS D1.5M/D1.5.

B. Welded splices shall be full penetration butt joints using qualified welding procedures and welders as indicated herein.

C. Provide a full-time, onsite Certified Welding Inspector (CWI) whenever any welding is being done.

D. Ultrasonically examine 10 percent of all pile splices. Contractor and Contracting Officer shall agree on splices to be examined.

E. Acceptance criteria for welding examination shall be AASHTO/AWS D1.5M/D1.5.
3.5 **PREDRILLED HOLES**

A. Where shown, drill holes to diameter not exceeding greatest cross sectional dimension of pile.

B. Set pile in predrilled hole and drive to necessary penetration and bearing value but in all cases to a minimum depth of 5 feet below bottom of predrilled hole.

C. Fill voids in hole with clean dry sand or lean concrete as approved.

D. Dispose of material resulting from drilling holes in accordance with the requirements of Section 02220, "Grading, Excavating, and Backfilling".

3.6 **DETERMINATION OF PILE LENGTH**

A. Furnish bearing piles of length necessary to develop a specified bearing value or to obtain a specific or a minimum penetration as specified in the plans.

B. If specified in the plans, furnish and install test piles to establish bearing resistance and subsequent pile lengths.

C. The Contractor may install additional test piles, make borings, or make such other investigations as he deems necessary at no additional cost to the Authority.

D. Cut-off piles neatly and squarely at the elevations shown on the Drawings. All cut-off lengths of piling shall remain the property of the Contractor and shall be properly disposed of.

3.7 **INSTALLATION OF TEST PILES**

A. Provide test piles, where shown, to determine lengths of piles to be furnished. Locate piles so that they can be cut off and become a part of the completed structure provided they conform to specified requirements for piling.

B. Based on result, adjust required penetration of permanent piling.

C. Install test piles with same type of equipment to be used to install foundation piles. Perform work in the presence of the Contracting Officer.

D. Dynamic tests shall be performed on all test piles during driving in accordance with ASTM D4945.

E. Remove piles which are not incorporated into completed structure or which do not satisfy test requirements to at least three feet below finished grade and backfill resulting hole as directed.

3.8 **PENETRATION RESISTANCE AND VERIFICATION**

A. All H-piles shall be driven to the bearing capacity shown on the Drawings as verified by the Dynamic Test (ASTM D4945) of one H-pile per substructure (pier or abutment).

B. Attain bearing value of not less than design loading shown or specified. Penetrate at least 12 feet into natural ground and, when pile tip elevation is specified, penetrate at least to specified tip elevation, unless otherwise approved.

C. Installation of each pile will be subject to approval of the Contracting Officer, who will be the sole judge of acceptability of pile with respect to penetration resistance at end-of-initial-driving as well as at restriking, to depth of penetration, or to other penetration criteria. Contracting Officer to approve final penetration resistance of piles prior to removal of pile driving equipment from the site.

3.9 **BEARING EVALUATION**

A. The ultimate pile capacity shall be determined by the Geotechnical Engineer based upon wave equation analysis (WEAP).

B. The WEAP shall be based upon the results of dynamic measurements during driving of piles designated as dynamic test piles.

C. Dynamic testing shall be performed in accordance with ASTM D4945.

D. Dynamic testing shall be performed on a minimum of one pile per bridge bent. The number of dynamic tests required may be reduced by the Contracting Officer.

E. The Geotechnical Engineer shall confirm adequate bearing or load capacity of driven piles to ensure the load capacities are in compliance with the project drawings. Evaluation shall be included in the pile driving record.

3.10 **LOAD TESTS**

A. Perform load test when required by the plans.

B. Load test equipment and testing procedures: In accordance with ASTM D1143.

C. Provide equipment with capacity equal to 200 percent of design working load and having means of determining applied load within plus or minus five percent and measuring settlement to nearest 0.001 inch.
D. Install test piles for load test at location shown in the presence of Contracting Officer after approval of test arrangement has been received. Assist the Contracting Officer in recording measurements necessary for determination of performance of piles.

E. Pile driving records shall be maintained for each pile type.

F. Dynamic tests shall be performed on all load test piles in accordance with ASTM D4945.

G. Commence loading test piles not sooner than 72 hours after installation. Unless failure occurs first, load pile in increments of 25 percent of individual pile or group design load as follows:

1. Individual piles: To 200 percent of pile design load.
2. Pile groups: To 150 percent of group design load.

H. Maintain each load increment until rate of settlement is not greater than 0.01 inch per hour, but not to exceed two hours.

I. Unless pile or pile group fails and if settlement is not greater than 0.01 inch per hour for one-hour period, remove total test load.

J. If settlement for one-hour period exceeds 0.01 inch, allow total load to remain for 24 hours, after which remove test load in decrements of 25 percent of total test load, allowing one hour between decrements.

K. Cut off test pile at elevation shown, if it is to be incorporated into structure.

L. Pile heads, at cut-off elevation, shall be within 3 inches of locations shown on the Contract Drawings as measured immediately after termination of initial driving, and 6 inches as measured after piles have been driven.

M. If tested to failure or not incorporated into structure, pull test pile or cut off so that top of pile is a minimum of 3 feet below finished grade or not less than 3 feet below bottom of structures.

N. Safe allowable load of test pile: Fifty percent of test load producing net settlement measured at top of pile equal to 0.0025 inch per ton of applied test load or 50 percent of test load which produces maximum net settlement of 1/4 inch after continuous application for 48 hours.

3.11 DEFECTIVE PILES

A. Contracting Officer will reject any pile found to be damaged or defective.

B. Contractor shall remove and replace rejected piles as directed by the Contracting Officer.

C. No extra compensation shall be made for removing and replacing or other work made necessary through rejection of a defective pile.

D. Replace piles which do not conform to specified tolerances or are split, broken or otherwise damaged to such a degree as to compromise design load. Perform repairs on such piles if approved. Have a Professional Engineer, licensed in the State of Texas, prepare a new design for pile cap or replacement piles or approved out-of-tolerance piles and submit the new design for approval. Do not begin remedial work without approval.

E. Fill rejected predrilled holes with lean concrete and redrill at approved location.

3.12 CUT OFF AND EXTENSION

A. Concrete Piles:

1. Cut off concrete piles at such elevation that they will extend into cap or footing as shown and in such manner as to avoid spalling or damaging pile below cut off.

2. Piles may be cast full length of reinforcing bars extending into the cap or footing, provided that after piles have been driven concrete is removed to expose steel as shown.

3. When reinforcing steel dowels are shown, dowels may be anchored in cast or drilled holes in concrete pile. If holes are drilled, drill by methods that will not damage concrete, reinforcing steel or prestressing steel. Drill minimum diameter consistent with placing approved epoxy adhesive and dowel. Leave holes free of dust, moisture, and other deleterious material. Place sufficient epoxy in holes before inserting dowels leaving no voids afterwards. Leave dowels undisturbed until epoxy has developed 100 percent of its strength capacity.

4. When concrete piles are driven or cut off below elevation of bottom of cap, extend pile section to elevation of bottom of cap by means of reinforced concrete extension.
constructed in accordance with approved details.

5. Replace or repair piles damaged when cut off.

B. Steel Piles:

1. Cut off steel piles at designated elevations and install anchor bars as shown.

2. Splice steel piles by use of approved prefabricated pile splices.

3. Welding shall be in accordance with AASHTO/AWS D1.5M/D1.5.

C. Only one splice per steel or concrete pile will be permitted.

D. Remove and dispose of cut off lengths of piling.

3.13 FIELD QUALITY CONTROL

A. Allowable Tolerances: Install piles at location shown in the plans to required vertical or batter alignment, within the following tolerances:

1. Axis of pile within 3 inches of design location at cut off elevation.

2. Axis of pile not out of plumb or batter by more than one percent of its driven length.

B. Pull and replace piles as directed by the Contracting Officer if out of alignment, or if approved by the Contracting Officer, redesign foundation.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work under this Section will not be measured for payment, and shall be considered incidental to other work specified, unless a quantity is provided in the Bid Schedule. If a quantity is provided, measurement will be per linear foot, from the tip to the head of the pile remaining in place in the completed structure.

B. If a Bid Item is provided, the unit price per linear foot shall include furnishing piles, driving piles, splices, obtaining safe bearing capacity, tip elevation performing Wave Equation Analysis and disposing of pile cut-offs, for each type and size or diameter.

END OF SECTION 02360
SECTION 02375
DRILLED SHAFT FOUNDATIONS

PART 1 - GENERAL

1.1 DESCRIPTION

A. This section covers the construction of drilled shaft foundations in accordance with this specification and in conformance with the details shown on the plans.

1.2 REFERENCED STANDARDS

A. American Concrete Institute (ACI):
   1. ACI 301 - Standard Specifications for Structural Concrete
   2. ACI 336.1 - Specification for the Construction of Drilled Piers

B. American Welding Society (AWS):
   1. AWS D1.1/D1.1M - Structural Welding Code Steel
   2. AWS D1.4 - Structural Welding Code - Reinforcing Steel

C. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM C31/C31M - Standard Practice for Making and Curing Concrete Test Specimens in the Field
   2. ASTM C39/C39M - Standard Test Method for Compressive Strength of Cylindrical Concrete Specimens
   3. ASTM C143/C143M - Standard Test Method for Slump of Hydraulic Cement Concrete
   4. ASTM A615/A615M - Standard Specification for Deformed and Plain Carbon Steel Bars for Concrete Reinforcement
   5. ASTM C1064/C1064M - Standard Test Method for Temperature of Freshly Mixed Portland Cement Concrete

1.3 DEFINITIONS

A. Drilled Shaft Foundation: A machine or hand excavated shaft cast-in-place and designed and constructed for structural support. It is an open excavation, circular in cross section with or without an enlarged or belled end bearing area.

B. Dry Construction Method: A method of shaft installation that allows the sides and bottom of the bearing stratum to be visually inspected prior to concrete placement. Temporary casing may be required to support caving soils and to control groundwater to allow dry construction in the bearing stratum.

C. Bearing Stratum: Bearing stratum is the soil or rock layer that carries the load transferred to it from the drilled shaft as designated on the plans.

D. Geotechnical Engineer: For the purpose of this section, Contractor-hired Professional Engineer licensed in the State of Texas, whose qualifications include 5 years of documented experience in geotechnical testing, design, construction and inspection of drilled shaft foundations. Geotechnical Engineer shall be present during the first day of drilled shaft installation or for the installation of the first 2 drilled shafts, whichever is greater. An experienced technician under the supervision of the Geotechnical Engineer shall be present during the drilled shaft installation.

1.4 MINIMUM DRILLED SHAFT INSTALLER QUALIFICATIONS

A. Three years experience in constructing shaft foundations.

B. Two years experience of on-site supervisors and 1 year of experience of drilling equipment operators.

C. Successful completion of 3 projects in the past 5 years with the installation of drilled shafts of similar diameters, lengths, and subsurface conditions as shown in the Contract Documents.

1.5 SUBMITTALS

A. Installer Qualifications: Submit 1 month prior to shaft construction written documentation of the installer’s qualifications in compliance with Article 1.4 herein. Supporting documentation shall include brief description of at least 3 projects on which the installer had been previously engaged in shaft construction with satisfactory results including project, names and current telephone numbers of owner’s representatives who can verify participation of cited projects.

B. Submit 1 month prior to construction of the work of this section the following items:
   1. Shop drawings showing placement of reinforcing steel.
   2. Concrete mix designs in accordance with the requirements of Section 03305, “Portland Cement Concrete”: Submit trial batches if Contracting Officer rejects the proposed mix proportions evidence.
   3. Submit certified mill test reports for reinforcing steel, including bar markings.
D. Concrete batch-plant tickets containing the information required by Section 03305, “Portland Cement Concrete”.

E. Submit Final Shaft Report prepared and sealed by the Geotechnical Engineer: Include at a minimum:

1. Top of rock elevation.
2. Penetration into bearing stratum.
3. Final axis of shaft and its variation from the design location.
4. Shaft diameter.
5. Variation of shaft from plumb and variations in shaft diameter.
6. Water inflow rate and method of control, if any, at time of concrete placement.
7. Reinforcement. Include elevation and length of any splices required by the plans or by additional length of shaft as required under Article 3.4. Record the total length of reinforcing cage installed and total length of reinforcing placed in pier.
8. Elevations, both top and bottom of any casing left in place.
9. Elevations of top and bottom of pier.
11. Other documentation as may be dictated by construction conditions.
12. Specific identification of drilled shaft installations that do not conform to the Contract Documents.

1.6 QUALITY ASSURANCE

A. Codes and regulations of the jurisdictional authorities shall be followed.

B. Contractor shall employ a Geotechnical Engineer as defined in Paragraph 1.3.D, acceptable to the Contracting Officer, to verify that the excavation, steel placement, and concrete placement for drilled shaft foundations conform to Contract Documents.

PART 2 - PRODUCTS

2.1 TEMPORARY CASING

A. When required by site conditions or directed in order to prevent caving or as necessary to exclude ground water, furnish a temporary casing with the following properties:

1. For size of casing and of the shaft below casing, see Article 3.6, herein.
2. Fabricated of sufficient strength to withstand handling stresses, concrete pressure, and surrounding earth or fluid pressures. Weld casing in accordance with AWS D1.1/D1.1M.
3. Smooth, watertight, clean, and free of accumulations of rust, grease, and hardened concrete. Corrugated casing is not allowed.

2.2 CONCRETE

A. As specified in Section 03300, “Cast-In-Place Concrete”, and Section 03305, “Portland Cement Concrete”.

B. Concrete mix design shall be S-1 or S-2 as specified in Section 03305, “Portland Cement Concrete”, and shall conform to the additional requirements specified herein.

C. Concrete shall be flowable, non-segregating concrete.

D. Concrete shall maintain a slump workability of nominal 6 inches. Minimum slump requirement shall be maintained until concrete placement is complete.

E. Concrete mix designs shall take into account the following additional requirements:

1. One additional sack of cement per cubic yard shall be added to design mix if concrete is to be placed in water.
2. Retarder or water reducing agent shall be included in concrete when casing is used or when drilled shafts are placed underwater.

2.3 REINFORCEMENT

A. ASTM A615/A615M, as shown and in accordance with Section 03200, “Concrete Reinforcement”.

B. Splice bars in conformance with Contract Documents. Submit any splice requirements for acceptance by Contracting Officer.

C. Protect reinforcing steel from contamination and corrosion that will preclude concrete bonding to reinforcing steel.

PART 3 - EXECUTION

3.1 GENERAL

A. Control operations to prevent damage to existing structures and utilities. Preventative measures shall include selecting construction methods and procedures that will prevent caving of shaft excavations and monitoring and controlling
DRILLED SHAFT FOUNDATIONS

vibrations from casing installation and removal and shaft drilling.

B. Comply with the requirements of Section 02220, “Grading, Excavating and Backfilling”.

C. Notify the Contracting Officer in time to permit inspection of the completed excavation prior to placement of reinforcing steel and prior to placement of concrete.

D. Construction Sequence: Comply with the following sequencing requirements unless otherwise shown in the Contract Documents or approved by the Contracting Officer:

1. Complete excavation to drilled shaft cap or footing elevation before shaft construction begins. Repair any disturbance to cap or footing area caused by drilled shaft installation prior to the cap or footing pour.

2. When drilled shafts are installed in conjunction with embankment placement, construct the drilled shafts after the placement of the fills. In areas where MSE retaining wall reinforced zone will cover drilled shafts, the drilled shafts shall be installed prior to wall construction.

3. Drilled shafts, constructed prior to the completion of embankment fills, shall not be capped until the fills have been placed as near to final grade as possible, leaving only the necessary workroom for construction of the caps.

E. Install drilled shafts in reasonable dry excavation, less than 2 inches of standing water, where the sides and bottom of the bearing stratum can be visually inspected prior to placing concrete unless shown otherwise in the Contract Documents or approved by the Contracting Officer.

F. Use temporary casing where caving soils are present and to control groundwater unless shown otherwise in the Contract Documents or approved by the Contracting Officer.

G. Complete drilled shafts within 8 hours of penetrating the bearing stratum. If delays prevent concrete placement within 8 hours of exposing the bearing stratum, increase the drilled shaft length or diameter as approved by the Contracting Officer to compensate for the deterioration of the bearing surfaces.

H. Remove subsurface obstructions at drilled shaft locations. Such obstructions may include hard rock layers, hard concretions, or boulders. Employ special procedures and tools if the hole cannot be advanced using augers, drilling buckets and underreaming tools that are appropriate to penetrate the formation above and below the hard rock obstructions. Such special procedures/tools may include chisels, boulder breakers, core barrels, air tools, and hand excavation. Blasting is prohibited.

I. Drilling tools that are lost in the excavation shall not be considered obstructions and shall be promptly removed by the Contractor.

J. Provide suitable access to Contracting Officer and lighting for inspection of the completed excavation, alignment of shafts, and placement of reinforcing bar cages.

K. Provide electric lighting, if necessary. Operate any mechanical equipment within excavation by air or electricity. Gasoline driven equipment within excavation is prohibited.

L. For all Traction Power Substation (TPSS) buildings, Communications and Signal House foundations, the top surface of drilled shaft piers shall be finished level and smooth, and have a minimum of 12 inches above grade or 2 inches above surrounding crushed stone as shown on Drawings. Pier foundations top elevation shall be to the same level for each building, within the tolerances given in Paragraph 3.6.J.

3.2 SOIL AND ROCK BEARING DETERMINATIONS

A. Excavate drilled shafts to the dimension and depths shown. Maintain sidewall integrity and stability throughout the excavation process.

B. Bearing stratum shall be confirmed in the field by the Geotechnical Engineer to ensure that the drilled shaft penetration depths are in compliance with the Contract Drawings.

C. Where requested by Geotechnical Engineer, the bearing stratum beneath the bottom of the drilled shaft excavation shall be continuously sampled where soil is present and cored where rock is present to a minimum depth equal to 2.5 diameters below the planned bearing depth. Soil samples shall be obtained with thin walled tube samplers and rock with a rock core sampler. The samples can be taken before the excavation is made or when the excavation reaches the planned tip penetration into the bearing stratum.

D. If the stratum is not capable of providing the required service load bearing resistance, stop work and notify the Contracting Officer.

E. Upon confirmation that the bearing stratum has been reached, complete the drilled shafts as shown on the Contract Drawings.

F. Excavate the bottom of drilled shaft foundations to a level plane. In the event that the shaft is founded in rock with an apparent surface slope of 2 (horizontal) to 1 (vertical) or steeper, the excavation shall be evaluated by the Geotechnical Engineer, for compliance with the geotechnical recommendations for design prior to concrete placement.
G. Remove loose material from the bottom of the drilled shafts and dewater as required to complete concrete placement in a dry excavation. Shaft cleanliness shall be determined by the Geotechnical Engineer or approved qualified staff by visual inspection and measurements and shall meet the following criteria:

1. Less than 40 percent of the shaft base may have loose material up to 0.5 inch thick at the time of placement of concrete.

2. Maximum thickness of any single piece of loose material shall not exceed 1.5 inches.

3. The maximum depth of standing water at the base of the drilled shaft shall not exceed 2 inches when concrete is poured.

H. Remove all waste material in accordance with Section 02220, “Grading, Excavating, and Backfilling”.

I. For TPSS buildings, Communication and Signal House foundations, the required soil bearing resistance shall not be less than 5000 psf.

3.3 TEMPORARY CASING

A. When required by site conditions, install temporary casing sufficient to withstand handling stresses, concrete pressure, and surrounding earth and water pressures.

B. Seat temporary casing into the top of the rock to obtain a seal to prevent fines and water from entering the excavation. Measure the tip elevation of the surface casing and the elevation of the top of the rock to confirm that the casing is seated into the rock.

C. If water is flowing into the shaft excavation at the bottom of the casing, advance the casing further into the rock to attempt to cut off the water. The rock may be excavated up to several feet to allow the casing to be set further into rock. However, the shaft excavation shall not be advanced to the design elevation until the casing is sealed in the rock.

D. Measure the penetration into the rock to confirm that the shaft has the specified embedment into the bearing strata.

E. Underwater concrete placement may be used, if after the casing is advanced into sound unweathered rock 12 inches or more, a seal cannot be obtained or if a fracture in the bearing strata is present that discharges water into the shaft excavation. Underwater concrete placement, by tremie or by pumping shall be in accordance with ACI 336.1.

F. Do not place concrete into the drilled shaft excavation with standing water until the condition of the bottom of excavation is evaluated by the following 3 criteria:

1. Clean out bucket should only discharge rock chips or fragments. If clay balls, sand, or mud are present, the clean out operations shall be continued until only rock chips or gravel are discharged from the clean out bucket. The continued removal of clay balls, gravels, and sands may indicate that the casing is not properly seated. If these conditions are present, steps shall be taken to seal the casing to prevent clay, sand, and gravel from entering the excavation.

2. Excavation shall be "vacuumed" with a pump capable of removing particles up to 0.5 inch rock chips. The materials discharged by the pump should only consist of rock chips in a clear to gray colored water. If clay balls, sands, gravels, or mud are discharged, bottom clean up operations shall be continued.

3. Sand content in water at bottom of the shaft shall not exceed 1 percent by volume.

4. If a seal cannot be created which prevents the entry of sand, gravel or mud into the drilled shaft; notify the Contracting Officer and obtain approval before placement of drilled shaft concrete.

G. Once it is established that underwater placement will be necessary, the construction operations shall be executed in a manner to allow the shaft to be concreted within 8 hours after the design penetration is reached.

H. If vibratory or impact type methods are approved for use by the Contracting Officer for use to install or remove the temporary casing, the following limitation applies. No casing may be installed or removed after any concrete is placed within a horizontal distance of 50 feet until all such concrete has set at least 24 hours.

I. Temporary casing shall be removed only while the concrete remains workable with a slump of 4 inches or greater. Casing extraction shall be at a slow, uniform rate with the pull in line with the shaft axis. As casing is withdrawn, a 5 foot minimum head of fresh concrete in the casing shall be maintained so that all the fluid trapped behind the casing is displaced upward without contaminating the shaft concrete. The required minimum concrete head shall be increased as needed to counteract the groundwater head outside of the casing.

J. Do not withdraw casing after concrete has attained initial set as determined by the Contracting Officer.

K. Do not vibrate concrete prior to removing casing.

L. Leave temporary casing in place only as specifically approved by the Contracting Officer.
M. Where the Contract Drawings indicate that the length of the shaft includes skin friction in the design, the shaft length shall be adjusted to provide the required embedment below the bottom of the installed casing.

3.4 REINFORCEMENT

A. Place reinforcement as shown on the Contract Drawings, in accordance with Section 03200, “Concrete Reinforcement”.

B. Completely assemble the reinforcing steel cage, consisting of longitudinal bars, spiral reinforcement, and lateral ties and place as a unit immediately prior to placement of concrete, unless otherwise specified.

C. Tie spiral reinforcement to the longitudinal bars at a spacing not to exceed 12 inches.

D. Reinforcing cage shall be designed as a structural element and braced to retain its configuration throughout the placing of concrete and removal of casing from the shaft. The reinforcing cage bracing shall not interfere with the placement of concrete.

E. Conform to following if shaft length is increased as determined by Contracting Officer:

   1. Provide a minimum of 1/2 number of longitudinal bars as required in the shaft, and place on the bottom extension.
   2. Provide lateral bars.
   3. Lap splice extension bars a minimum of 30 bar diameters.

F. Support and hold down the cage by positive method to ensure against vertical displacement during placing concrete and extracting temporary casing. Permissible reinforcing steel vertical movement during casing withdrawal shall not exceed upward movements of 6 inches and downward movement of 6 inches per 20 feet of shaft length.

G. Maintain minimum lengths for reinforcing bar laps shown on the plans. Only every third vertical reinforcing bar shall be lap-spliced at the same elevation.

H. In uncased shafts, use concrete spacer blocks, or steel chairs at sufficient intervals to ensure concentric spacing for the entire length of the cage. In cased shafts, use steel chairs. Plastic centralizers and boot chairs (roller type) can be used in lieu of concrete spacer blocks or steel chairs. Use “Shaft Spacer Systems” from Low-Tech Corp. in Georgia or approved equal.

I. Use concrete spacer blocks at the bottom of the cage to prevent contact of the reinforcing steel with the bottom of the excavation. Approved plastic spacer blocks may be used in lieu of concrete spacer blocks. Use “Shaft Spacer Systems” from Low-Tech Corp. in Georgia or approved equal.

3.5 CONCRETE

A. Place concrete in accordance with Section 03300, “Cast-In-Place Concrete”.

B. Place concrete continuously for entire length of shaft. The elapsed time from beginning to end of concrete placement shall not exceed 4 hours. The Installer can request a longer placement time provided the submitted concrete mix design will maintain a slump of at least 4 inches for the extended placement time. The concrete mix design shall be based on trial mixes and slump loss tests using concrete and ambient temperatures appropriate for site conditions.

C. For free fall of concrete, maximum of 25 feet will be allowed provided Installer can demonstrate that concrete can be directed such that it does not strike reinforcing cage or sides or holes during placement and no more than 2 inches of standing water is present. Otherwise place concrete through suitable tube or tremie to prevent segregation of materials. Tube or tremie may be made in sections to provide proper discharge and permit raising it as placement progresses. The tremie shall have a minimum diameter of 8 inches and a pump tube shall have a minimum diameter of 4 inches and watertight joints. Nonjointed pipe may be used if concrete is not allowed to discharge from side openings.

D. Do not begin placing concrete until shaft has been inspected and accepted by the Contracting Officer and reinforcing cage is in place and secured.

E. Make provisions to dewater shafts with pumps or other approved method. Place concrete in water, by tremie or pumping method, only if approved by the Contracting Officer.

F. Protect tops of drilled shafts against damage and cure and protect to prevent moisture loss and temperature extremes in accordance with ACI 301.

3.6 ALLOWABLE TOLERANCES

A. Axis of the shaft at the cut-off elevation within 3 inches of the design location.

B. Axis of the shaft shall not be out of plumb more than 1 percent of its excavated depth.

C. Center of the drilled shaft shall be within 3 inches of the plan position in the horizontal plane at the plan elevation for the top of the shaft.

D. After concrete is placed, the top of the reinforcing steel cage shall be no more than 6 inches above and no more than 3 inches below plan position.
E. Top elevation of the shaft shall have a tolerance within plus or minus 1 inch to 3 inches from the plan top-of-shaft elevation.

F. Final bottom elevation: As shown and determined by the Geotechnical Engineer and approved by the Contracting Officer. Cutting edges of excavation equipment shall be normal to the vertical axis of the equipment within a tolerance of 3/8 inch per foot of diameter.

G. Bells shall be excavated to the plan bearing area as a minimum. The actual diameter of the bells shall not exceed 3 times the specified shaft diameter.

H. When casing is required, inside diameter of casing shall not be less than specified diameter of the shaft. That portion of the shaft below the casing may not be smaller than the specified diameter of the shaft.

I. Drilled shafts located in the area of the station platforms may have stricter requirements than those stipulated in Paragraph 3.6.A and 3.6.B, herein. Refer to Contract Drawings for additional or more stringent requirements.

J. The following requirements only applied only to the TPSS buildings, Communication and Signal House foundations:
   1. Center of the drilled shaft pier foundations shall be within 1/2 inch of the design position as shown on the Drawings.
   2. Top elevation of drilled shaft pier foundations for each building shall be level to a tolerance of plus or minus 1/8 inch.

3.7 FIELD QUALITY CONTROL

A. One set of 3 cylinders per 100 cubic yards or fraction thereof. Make concrete cylinders in accordance with ASTM C31/C31M and test in accordance with ASTM C39/39M.

B. Measure concrete slump in accordance with ASTM C143 for each set of compressive strength test specimens.

C. Measure concrete temperature in accordance with ASTM C1064 for each set of compressive strength test specimens.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

A. Accepted drilled shaft foundations will be measured for payment by the linear foot for each respective diameter. Measurement will be from existing ground elevation at center of shaft, unless footing elevations shown on the Contract Drawings determine exact top of shaft elevation.

B. The quantities to be paid for removal of hard rock layer, concretion, and boulder obstructions shall be measured on the basis of the number of hours of work, or fraction thereof, after designation as an obstruction by the Contracting Officer, required to remove the obstruction and resume excavation.

4.2 PAYMENT

A. Drilled shafts will be paid for at the unit price per linear foot of each respective diameter of shaft complete-in-place. The unit price shall be full compensation for excavating, drilling test holes, pumping as required; temporary casings, concrete, reinforcing steel, disposal of excavated materials, and all other work of this section.

B. No payment will be made for extra reinforcement or shaft length if, due to Contractor’s fault, final bottom shaft elevation is placed below plan elevation in soil, or required penetration depth in rock.

C. No payment will be made for casings left in place, as they are incidental to the work described in this section.

D. No extra compensation will be made for additional concrete used in filling oversize casing or excavation.

E. No extra compensation will be made for lost tool removal including costs associated with the repair of hole degradation due to removal operations or an excessive time that the hole remains open.

F. Payment for the removal of hard rock layers, concretion, or boulder obstructions shall be paid at the unit price per hour for obstruction removal.

END OF SECTION 02375
PART 1 - GENERAL

1.1 DESCRIPTION

A. The work specified in this section consists of furnishing and construction of Overhead Catenary System (OCS) pole foundations and guy anchor piers including embedded items as shown on the Catenary Pole and Guy Anchor Pier Foundation Details and OCS Foundation Schedule Drawings.

1.2 REFERENCES

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A36/A36M - Standard Specification for Carbon Structural Steel
   2. ASTM A153/A153M - Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware
   3. ASTM D1751 - Standard Specification for Preformed Expansion Joint Filler for Concrete Paving and Structural Construction (Nonextruding and Resilient Bituminous Types)
   5. ASTM A194/A194M – Standard Specification for Carbon and Alloy Steel Nuts for Bolts for High Pressure and High Temperature Service, or Both
   7. ASTM F436 – Standard Specifications for Hardened Steel Washers

1.3 SUBMITTALS

A. Shop Drawings: Submit shop drawings showing anchor bolts, reinforcing steel, guy anchor rods, and grounding rods.
B. Materials List: Submit a written description of materials and sources of materials to be furnished for piers.
C. Installation Methods: Submit methods for securing the anchor bolts, anchor rods and ground rod in place and how the anchor bolts will be prevented from moving during concrete placement.

D. Certifications: Submit material certifications.

PART 2 - PRODUCTS

2.1 CONCRETE

A. Concrete: Mix S-1 or S-2, as specified in Section 03305, "Portland Cement Concrete".

2.2 REINFORCEMENT

A. Reinforcing: As specified in Section 03200, "Concrete Reinforcement".

2.3 ANCHOR BOLTS AND ANCHOR RODS

A. Anchor bolts and rods shall conform to ASTM F1554, Grade 55 and anchor bolt nuts shall conform to ASTM A194 or A563, Grade A, heavy hex. Washers shall be hardened steel, conforming to ASTM F436.
B. Galvanizing of anchor bolts, nuts, and washers shall conform to ASTM A153/A153M.
C. Guy anchor rods shall be galvanized according to ASTM A153/A153M and as indicated.
D. Guy anchor rods shall be attached to pier reinforcement with tie wire.

2.4 CONCRETE FORMWORK

A. Refer to Section 03100, "Concrete Formwork" and as specified below.
B. Forms used in constructing the pier above grade shall be of sufficient strength to withstand the pressure of the concrete and shall provide a concrete finish subject to the approval of the Contracting Officer.

2.5 EXPANSION JOINTS

A. Preformed expansion joint filler strips, conforming to ASTM D1751, shall be provided at common joint surfaces between drilled piers and other concrete work.

2.6 STEEL CASINGS

A. Steel Casings, where required, shall be sized within 2 inches of the diameter of the pier and shall be of sufficient strength to withstand surrounding soil and water pressure, and twist and handling from the machinery.
PART 3 - EXECUTION

3.1 GENERAL

A. Refer to Section 03100, "Concrete Formwork", Section 03200, "Concrete Reinforcement", and Section 03300, "Cast-In-Place Concrete", for general concrete related requirements.

3.2 EARTHWORK AND DRILLING

A. After the Contractor has established the locations of the pier foundations and guy anchors, prior to starting excavation, conduct a walkout inspection with representatives of the Contracting Officer, Contractor, and any other parties affected by the foundation locations, to resolve any problems resulting from the pole locations, soils conditions or alignment.

B. Drill the pier holes at the locations and to the diameters and depth indicated on the Catenary Pole and Guy Anchor Pier Foundation Details and OCS Foundation Schedule drawings, and within specified tolerances. If gray limestone is encountered during drilling of foundations, the hole need only penetrate the gray limestone the depth of two pier diameters or be bored the indicated depth, which ever is shallower.

C. Excavated materials satisfying the requirements of Section 02220, “Grading, Excavating and Backfilling” may be used for fill. Remove excavated materials that are surplus or unsatisfactory for fill from the work site and dispose of in a legal manner.

D. Use steel casing where approved by the Contracting Officer.

E. Remove boulders, concrete, debris, or other obstructions that will effect the drilling of the pier.

F. Remove loose dirt and water from the pier hole for proper inspection by the Contracting Officer.

G. No open pier holes shall be left overnight. Complete piers the same day as the excavation.

H. Bring utility lines or piping which block the pier drilling to the attention of the Contracting Officer and document them in writing.

I. Notify the Contracting Officer after the completion of each pier hole that it is ready for inspection.

J. Concrete placement in the pier hole shall not proceed until the hole has been approved by the Contracting Officer.

K. If it is determined by the Contracting Officer that an unfavorable soil condition exists, the shaft shall be rebored to a larger diameter or drilled deeper to satisfy structural requirements.

3.3 CONSTRUCTION

A. Concrete: smooth with float finish, per Section 03300, “Cast-In-Place Concrete” and Section 03350, “Concrete Finishing”. Foundation tops shall be sloped or level, as shown on the Catenary Pole and Guy Anchor Pier Foundation Detail Drawings.

B. Install reinforcing steel, rods, and anchor bolts embedded in the foundations as follows:

1. Place the reinforcement and install the anchor bolts in the pier shafts. The guy anchoring rods shall be located and oriented as indicated and within the tolerances specified in this section.

2. Electrical grounding, of the foundation, shall be provided as shown on the Contract Drawings.

3. Place reinforcing cages symmetrical about the axis of the foundations, and securely fasten to maintain the concrete cover as indicated.

4. Locate and orient anchor bolt assemblies as indicated, within the tolerances specified in this section.

5. Use prefabricated metal templates to hold the projecting lengths of the anchor bolts in their proper position.

C. Notify the Contracting Officer, after installation of the reinforcement, anchoring rods, or anchor bolts that the installation is ready for inspection. Adjust the reinforcement and anchor bolts or rods as required by the Contracting Officer.

D. Verify that the grounding rod is in place.

E. Immediately after inspection and approval by the Contracting Officer, begin placement of the concrete. Placement of concrete, in each pier, shall be one continuous pour.

F. Remove water and debris from the pier hole prior to and during concrete placement. In the event of contamination with earth or water, the Contractor shall remove the contamination from the shaft.

G. Protect anchor bolts, rods, grounding rod and reinforcement from movement during placement of concrete.
H. Whenever steel casings are used, they shall be withdrawn as the concrete is placed. Maintain an adequate head of concrete above the bottom of the casing to resist the soil and water pressures.

I. Vibration of the top five feet of concrete in the pier shall not be done until after the casing has been withdrawn.

J. The vibrator shall not make contact with the rebars or anchor bolts and shall not be used to position the concrete.

K. The anchor bolt template may be removed and reused elsewhere two days after the concrete has been placed. After removal of the template, clean the projecting anchor bolts and protect them from damage by moving vehicles and equipment.

L. Adjust the spacing of the ties to avoid interference with other embedded items. A two inch clearance between ties and other material is required for the passing of concrete.

M. Measure, record, and report the resistance developed by the ground rod in accordance with Section 16450, "Grounding and Bonding". Correct as required by the Contracting Officer.

3.4 TOLERANCES

A. Piers:

1. Locate each pier within 2 inches of its offset dimension as indicated on the OCS Foundation Schedule or as approved by the Contracting Officer.

2. To avoid local obstructions, the piers may be moved up to five feet parallel with the track. Adjacent to special track work, the along track positions of the foundation may only be modified by up to two feet six inches. Obtain approval in writing from the Contracting Officer prior to making such modifications.

3. Drill each pier within 5 degrees of the true vertical.

4. Drill pier not less than the diameter and length as indicated on the OCS Foundation Schedule or as required by the Contracting Officer.

5. The top of each pier shall be within 1/4 inch of the designated elevation, as indicated on the OCS Foundation Schedule.

B. Anchor Bolts and Guy Anchor Rods:

1. Locate each anchor bolt within 1/8 inch of its correct horizontal and vertical position in its anchor bolt assembly, as indicated on the OCS Foundation Schedule Drawings, and within 1/2 degree of its true vertical.

2. Locate each anchor bolt assembly within 1-1/2 inches of its correct offset and vertical position, as indicated on the OCS Foundation Schedule Drawings. Determine anchor bolt positions by the set out dimensions from the vertical and horizontal reference lines.

3. Locate each guy anchor rod within two inches of its correct horizontal and vertical set out dimension, within the pier.

4. Each anchor bolt assembly shall be within two degrees of its designated orientation, as indicated on the OCS Foundation Schedule Drawings.

5. Foundation anchor bolts or rods, which are bent or damaged after installation and prior to acceptance by the Contracting Officer, shall be repaired by an approved method at no additional cost to the Authority. If two or more anchor bolts in a foundation are bent greater than 20 degrees or are broken, the foundation shall be completely removed and replaced at the Contractor's expense.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Accepted quantities of work described in this section will be paid for at the unit price per each for the type of drilled pier foundations and guy anchors listed, including both the portion above grade and the portion below grade for each type.

B. The unit prices shall be full compensation for excavating, drilling test holes, pumping as required; temporary casings, concrete, reinforcing steel, disposal of excavated materials, and all other work of this section.

C. No payment will be made for casings left in place, as they are incidental to the work described in this section.

D. No extra compensation will be made for additional concrete used in filling oversize casing or excavation.

E. No extra compensation will be made for the removal of hard rock layers, concretion, or boulder obstructions.
END OF SECTION 02376
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies general track construction which consists of the mainline and yard trackwork indicated on the plans including installing direct fixation track, ballasted track, embedded/paved track, special trackwork, and track appurtenances.

1.2 REFERENCE STANDARDS

A. American Railway Engineering and Maintenance-of-Way-Association (AREMA):
   1. AREMA - "Manual for Railway Engineering" (AREMA Manual)
   2. AREMA - "Portfolio of Trackwork Plans"

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM D3786 - Standard Test Method for Hydraulic Bursting Strength of Textile Fabrics-Diaphragm Bursting Strength Tester Method
   3. ASTM D4491 - Standard Test Methods for Water Permeability of Geotextiles by Permittivity
   4. ASTM D4533- - Standard Test Method for Trapezoid Tearing Strength of Geotextiles
   5. ASTM D4632 - Standard Test Method for Grab Breaking Load and Elongation of Geotextiles

C. American Public Transportation Association (APTA):
   1. APTA - "Guidelines For Design of Rapid Transit Facilities" (APTA Guidelines

1.3 DEFINITIONS

A. Approach Slab: A reinforced concrete slab located at the interface of ballasted track with direct fixation track or paved track to provide a transition between ballasted track construction and the types of track with significantly higher track modulus.

B. Ballast: An integral part of the track structure, generally composed of crushed stone in which ties are embedded. Track ballast includes ballast compacted beneath the ties, in the cribs between the ties, and in the ballast shoulders at the ends of the ties.

C. Bumping Post: A device placed at the end of stub-end tracks to prevent a moving rail vehicle from inadvertently rolling off the end of the track.

D. Closure Rails: The rails between the parts of any special trackwork layout, such as the rails between the switch and the frog in a turnout; also the rails connecting the frogs of a crossing or of adjacent crossings, but not forming parts thereof.

E. Continuous Welded Rail (CWR): A number of rails welded together into a single length.

F. Crossing, Road: The intersection of one or more tracks and a street, road, or highway, at grade.

G. Crossing, Railroad: The intersection of two tracks, at grade, consisting of four frogs, also known as a "diamond".

H. Crosslevel: The difference in elevation of the tops of heads of opposite rails measured at right angles to the track alignment.

I. Crossover, Single: Two turnouts with the track between the frogs arranged to form a continuous passage between two nearby and generally parallel tracks.

J. Crossover, Double: Two crossovers which intersect between the connected tracks.

K. Crossover, Universal: Two single crossovers, one being right hand and the other left hand, joining two nearby parallel tracks. The two single crossovers are located in close proximity to one another and typically are operated by the same signal interlocking.
L. Dutchman: A short piece of running rail temporarily placed between the ends of two rails. A Dutchman is placed at the zero thermal stress length before the two rail ends are welded into CWR, to reduce the damage which would occur to the rail ends as a result of rail mounted track equipment passing over those ends.

M. Frog: A device used at the intersection of two running rails to provide support for wheel treads and passageways for their flanges, thus permitting wheels traversing either rail to cross the other.

N. Frog Number: The number used to designate the size of a frog, and being equal to one-half the cotangent of one-half the frog angle.

O. Grade Line: The line on the profile representing the top of the roadbed ready to receive the sub-ballast at the intersection of the roadbed with a vertical plane through the track center line.

P. Guard Rail: A rail or other device laid parallel with the running rails of a track to prevent wheels from being derailed; or to hold wheels in correct alignment to prevent their flanges from striking the points of frogs. A rail or other device laid parallel with the running rails of a track to keep derailed wheels adjacent to running rails.

Q. Inside Rail: On curved track, the rail closest to the curve center, the rail with the shorter radius. Sometimes referred to as the "low rail".

R. Joint Bar: A steel member, embodying beam-strength and stiffness in its structural shape and material; commonly used in pairs for the purpose of joining rail ends together, and holding them accurately, evenly, and firmly in position with reference to surface and gauge-side alignment.

S. Outside Rail: On curved track, the rail farthest from the curve center; the rail with the longer radius. Sometimes referred to as the "high rail".

T. Pocket Track: A track located between the two mainline tracks on which an out-of-service train may lay over or reverse direction.

U. Profile Grade Line (PGL): The datum line which defines the vertical alignment of the track, applied at the top of the low rail.

V. Rail Fastening - Ballasted Track: A resilient device used to secure the running rail to the concrete tie at the proper track gauge to provide proper vertical, lateral, and longitudinal restraint of the rail. Also known as direct fixation fasteners or DF fasteners.

X. Rail Joints: A fastening designed to unite the abutting ends of contiguous rails.

Y. Rail Joint, Insulated: A rail joint designed to arrest the flow of electric current from rail to rail by means of insulation so placed as to separate the rail ends and other metal parts connecting them. Commonly called insulated joints or "IJ's".

Z. Restraining Rail: A guard rail installed parallel to, concentric with, and on the gauge side of the inside running rail of curved track with a flangeway of approximately 2-1/8 inches. It extends into the tangent track on each end of the curve, bears against the back side of the wheels, and steers the inside wheels of each truck around the curve, thereby reducing the degree of contact of the leading outside wheel flange with the outside rail. It also reduces gauge wear on the outside running rail.

AA. Roadbed: The foundation (prepared subgrade) on which the track structure consisting typically of sub-ballast and ballast is placed.

BB. Special Trackwork: A generic term referring to turnouts, single and double crossovers, track crossings, and other such items.

CC. Standard Rail: A synonymous term to 115 RE rail.

DD. Stock Rail: A running rail against which a switch rail bears in a turnout.

EE. Stub-up: A conduit temporarily terminated in the roadbed for later use by signal, communication, or traction power installers.

FF. Sub-Ballast: A material which provides a semi-impervious layer between the finished subgrade of the roadbed and the ballast, to provide better drainage, prevent upheaval by frost, and better distribute the load over the roadbed.

GG. Subgrade: The finished surface of the roadbed below the level of sub-ballast or track slab.

HH. Superelevation: The vertical distance of the outer rail of a curve above the inner rail. It is provided to overcome or partially overcome the effects of curvature and speed.

II. Switch, Point of: The tip of the tapered end of a switch rail; the end of a switch rail farthest from the frog or heel block.
JJ. Switch Point, Undercut: A switch point planed to mate with a stock rail having a planed undercut, in order to provide an effective point width of zero.

KK. Switch Rail (Switch Point): A planed, tapered, movable rail which mates with a stock rail to enable movement of a train from one track to another.

LL. Switch, Split: The common type of track switch consisting essentially of two planed, movable switch rails.

MM. Top of Rail (T/R): The top surface of the head of the running rail.

NN. Track, Ballasted: Track constructed of rails, cross ties, and ballast. It is the predominant form of track constructed at-grade, but it is also used on short bridges.

OO. Track, Direct Fixation: Track constructed of rail and rail fasteners attached by means of anchor bolts to concrete, located in tunnels, cut and cover structures, aerial structures, and slab track.

PP. Track, Embedded (Paved): Track constructed on a track slab and, except for the flangeways, embedded in asphalt, concrete, paving blocks, rubber epoxy, or other such material to the elevation of the top of rail.

QQ. Track, Gauge: The distance between the inside faces of running rails at right angles measured at a point 5/8 inch below the top of rail. Standard gauge: 4 feet 8-1/2 inches.

RR. Track, Mainline: A track designated by route name and direction, and which is for the purpose of carrying revenue passengers.

SS. Track, Secondary and Yard: Track constructed for the purpose of switching, storing, or maintaining rail vehicles or connecting such tracks to mainline tracks.

TT. Trackway: The foundation on which the track is constructed. It usually consists of an earthen roadbed, but it may also be one of the following: a concrete roadbed for support of direct fixation track or paved track; a ballasted bridge deck (designed to receive ballast); or an aerial structure.

UU. Turnout: An arrangement of a switch and a frog with stock rails and closure rails, enabling rail vehicles to be diverted from one track to another.

VV. Turnout Number: The number corresponding to the number of the frog used in the turnout.

WW. Zero Thermal Stress: The state of uniform stress in CWR, while the rail is unrestrained and free to move longitudinally.

XX. For additional definitions, refer to AREMA Manual and Portfolio of Trackwork Plans.

1.4 SUBMITTALS

A. Shop Drawings, include the following:

1. Complete details for distributing CWR, including a rail schedule showing:
   a. Designation of line and profile rails.
   b. Layout of CWR strings by lengths.
   c. Location of proposed field cuts and field welds in CWR on the rail schedule. Include locations of factory insulated joint plugs and any insulated joints fabricated in the field.

2. Complete details of the proposed methods, including equipment, of laying and fastening CWR. Include method and equipment proposed for achieving zero thermal stress.

3. Description of temperature adjustment and final anchoring procedures for CWR, including charts, tables, and field instructions on heating, cooling and stretching.

4. Charts shall be provided that indicate gaps for varying lengths of rail and varying rail temperatures.

B. Procedures: Provide complete details of the end-hardening procedures, including identification of personnel to perform the procedure, the equipment, and the test results required no less than 30 days prior to initiating any end-hardening.

C. Equipment to be used on Roadbed: Submit weights and dimensions of equipment proposed for use on roadbed prior to employing it on roadbed.

D. Rail Mounted or Hi-Rail Construction Equipment: Submit a complete list of equipment for use during trackwork construction, within 30 days after receipt of the Notice to Proceed. Include rail-mounted geometry inspection vehicle.

1. Equipment to be utilized shall not exceed design clearance envelope and loading criteria for the Light Rail System.
2. Submit a complete description of all proposed modified equipment, including calculations verifying that loading criteria for the light rail system will not be exceeded.

3. Certify that the equipment modifications will clear all structures and other facilities at the areas where the equipment will be used.

4. Certify rail wheels are in good condition, without excessive wear. Damage to frogs, crossing panels, etc. shall be repaired or replaced as determined by the Contracting Officer.

E. Product Data: Submit manufacturer’s data for Contractor-furnished material including non-woven filter fabric and adhesive for bonding tags to concrete. Submit installation information and sufficient description to verify that materials comply with the specifications. Include specification data and manufacturer’s installation instructions for non-woven filter fabric.

F. Samples: Submit sample for non-woven filter fabric.

G. Test Reports: Submit summaries of test results each week for field weld tests, Brinnell Hardness Tests, insulated joint continuity tests, track geometry vehicle measurements, and any other periodic testing required by Contract. If there was no activity during the week, submit each summary noting no activity.

H. Rail Laying Record: Submit records in accordance with Article 3.10D. herein.

1.5 QUALITY ASSURANCE

A. Comply with:

1. Codes and regulations of the jurisdictional authority.

2. APTA Guidelines.

1.6 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Contractor-Furnished Material: Supply track construction material indicated in the Contract Documents.

B. Authority-Furnished Material:

1. In accordance with Section 01640, “Authority-Furnished Materials and Equipment”.

2. Load, store, and distribute continuous welded rail, crossties, and other Authority-furnished track material in a manner and with equipment which will prevent bumping and striking of the rail. Notify the Contracting Officer immediately, and in writing, of any damage discovered at the time of loading. Damage discovered after the materials are transported to the work site shall be repaired by the Contractor at no cost to the Authority.

3. Authority-furnished material shall not be used for temporary fixtures, jigs, templates or any other purpose other than their intended application in the final trackwork product.

1.7 MONUMENTATION AND SURVEYING

A. Monuments will be provided by the Authority to establish the centerlines of tracks as specified in Section 01722, “Field Engineering - Surveying”.

B. The Contractor shall set monuments at all points as shown on the Contract Drawings.

C. The Contracting Officer will furnish the Contractor with identifications and elevations to 1/1000 of a foot for all existing baseline monuments in accordance with Section 01722, “Field Engineering - Surveying”.

D. Do not use controls for surveys other than the monumentation described above unless otherwise approved by the Contracting Officer.

E. Perform surveying required herein in accordance with Section 01722, “Field Engineering - Surveying”. Assume full responsibility for all dimensions and elevations taken and the setting of lines and grades relating thereto.

1.8 CONSTRUCTION EQUIPMENT

A. No excess load is permissible for ballast cars, tie cars, or the rail train, and all equipment loads shall conform to the loading requirements as specified in the “DART Design Criteria Manual, Volume I, Facilities Design” on Figure 9.2.

B. Oversize Equipment: Operate equipment only on parts of the system where clearances have been checked for the equipment, with the following restrictions:

1. Past station platforms: Stop clear of platforms, check clearances, then proceed at 10 mph or less prepared to stop.
2. Under overpasses: Stop clear of structure, check clearance, then proceed at 10 mph or less prepared to stop.

3. Tangents: Speed restricted to avoid excessive rocking.

4. Curves:
   a. Track not at final alignment and superelevation: Proceed at speed of 10 mph or less prepared to stop.
   b. Track at final alignment and superelevation: Speed controlled to avoid excessive lean or rocking.

C. Equipment Condition:
   1. Operate only equipment on the roadbed which is in good state of repair and with all safety appliances and protective devices in place and functioning.
   2. Brakes shall be capable of stopping and holding equipment on 6 percent grades. The Contracting Officer may require braking demonstrations at any time, in any weather condition, and with any allowable load, to verify the safe operation of the equipment.
   3. Rail-mounted equipment shall be provided with brakes, including trailers and push carts. Semi-permanently coupled units may be treated as a single braking system.
   4. Rail-mounted equipment shall be provided with mechanical devices to permit the equipment to be securely anchored to the rails while unattended.
   5. Rail wheels with flat spots whose length exceeds 8 percent of the wheel diameter are prohibited. Equipment with a wheel having a flat spot exceeding 5 percent of the wheel diameter is restricted to a maximum speed of 10 mph on aerial structures and ballasted deck bridges. Remove equipment with a wheel which develops a flat spot whose length exceeds 8 percent of the wheel diameter.

1.9 STRUCTURAL WEIGHT LIMITS AND CLEARANCES

A. For the purposes of this Article, structure shall be understood to mean any constructed element within the completed roadbed which may interfere with or obstruct the track construction, including bridges or aerial structures, station platforms or foundations, road crossing headers, manholes, foundations, and conduit terminations (stub-ups).

B. Roadbed Structural Capacity:
   1. Aerial structures, ballasted deck bridges, culverts, and other structures under the roadbed are designed to support train loads applied through the track structure only, unless otherwise shown.
   2. If any construction vehicles are to be moved across bridge structures, the Contractor shall submit calculations signed and sealed by a registered Professional Engineer in the State of Texas to indicate the developed stresses do not exceed those of the equivalent train load.

PART 2 - PRODUCTS

2.1 METAL TAGS

   A. Provide aluminum or brass identification tags stamped in 1/4 inch increments from zero superelevation to maximum superelevation to mark the superelevation on curved track. These tags shall be 1-1/4 inches wide by 2 inches long by 0.050 inch thick, and stamped with numerals 1/2 inch high.

   B. Adhesive for Bonding Tags to Concrete: As proposed by the Contractor and approved by the Contracting Officer.

2.2 RAIL

   A. Tee-rail: 115 RE section either standard or premium rail in accordance with the requirements of AREMA "Specifications for Steel Rails" and as specified.

2.3 TIES

   A. Main line, special trackwork, yard track and pocket track construction shall consist of concrete crossties, unless otherwise shown on plans or in the Special Provisions.

   B. Concrete crossties: 8 feet 3 inches in length unless specified elsewhere conforming to AREMA “Specifications for Concrete Ties”. Concrete ties shall be prestressed monoblock concrete. Type to be used shall be shown on the Contract Drawings.

   C. Concrete switch ties of varying lengths conforming to AREMA “Specifications for Concrete”. Concrete ties shall be prestressed monoblock concrete. Type used shall be as shown on Contract Drawings.

   D. Concrete ties for at-grade road crossings shall be 10 feet in length conforming to AREMA “Specifications for Concrete".
2.4 NON-WOVEN FILTER FABRIC (GEOTEXTILE)

A. Shall adhere to the following requirements:

3.3 ALIGNMENT

A. Alignment consists of a series of straight lengths of track referred to as tangents, connected by simple, compound or reverse curves, with or without spirals.

B. The track shall be constructed to the alignment and profile indicated on the plans, within the tolerances specified in Table 02450-1.

C. Use outer rails of curves as the line rail. Either rail may be used as the line rail in tangent; however, use that same rail for the full length of that tangential segment of track.

D. The ends of the chord to be at points on the gauge side of the line rail 5/8 inch below the top of the rail head.

E. In addition to the requirements specified:

1. Place the track in good alignment before the finishing lift is made.

2. Follow immediately behind the finishing lift with a mechanical means of lining the track and line to accurate alignment. Typically line and surface in the same operation, but the finishing lift may include adjustments to “accurate alignment”.

PART 3 - EXECUTION

3.1 NON-WOVEN FILTER FABRIC

A. Use non-woven material for subgrade stabilization at locations indicted on the Contract Drawings.

B. Install fabric in accordance with manufacturer’s installation instructions.

3.2 GAUGE

A. Measure the track gauge between points 5/8 inch below the top, perpendicular to and from inside face to inside face of the running rails.

B. Tangent and curved track gauge: 4 feet 8-1/2 inches.

C. Special trackwork track gauge: 4 feet 8-1/2 inches.

D. Allowable gauge variation:

1. Ballasted mainline track: plus or minus 1/8 inch.

2. Direct fixation mainline track: plus or minus 1/8 inch.

3. Paved mainline track: plus or minus 1/8 inch.

3.3 ALIGNMENT

A. Alignment consists of a series of straight lengths of track referred to as tangents, connected by simple, compound or reverse curves, with or without spirals.

B. The track shall be constructed to the alignment and profile indicated on the plans, within the tolerances specified in Table 02450-1.

C. Use outer rails of curves as the line rail. Either rail may be used as the line rail in tangent; however, use that same rail for the full length of that tangential segment of track.

D. The ends of the chord to be at points on the gauge side of the line rail 5/8 inch below the top of the rail head.

E. In addition to the requirements specified:

1. Place the track in good alignment before the finishing lift is made.

2. Follow immediately behind the finishing lift with a mechanical means of lining the track and line to accurate alignment. Typically line and surface in the same operation, but the finishing lift may include adjustments to “accurate alignment”.

3.4 SURVEYING REQUIREMENTS

A. Refer to Section 01722, “Field Engineering - Surveying”.

B. Verify layout information shown in relation to the existing Authority-provided monuments and existing structures before proceeding with layout of the actual work. As the work proceeds, check every major element of work for line. Bring discrepancies in location of structures to the attention of the Contracting Officer before starting trackwork. Maintain an accurate surveyor’s field book of such checks; make available for the Contracting Officer’s reference. Record deviations which are accepted by the Contracting Officer on the Record Drawings.

C. Verify the actual grade line and the profile of the top of the sub-ballast. Variations from the design grade line and profile of less than plus or minus 1 inch shall be compensated for by the quantity of ballast or the thickness of concrete slab. Variations more than plus or minus 1 inch shall be reported to the Contracting Officer for direction. If no variations greater than plus or minus 1 inch are discovered, report the acceptance of the grade to the Contracting Officer, in writing.
D. Furnish and place markers for the control points and reference points of the track centerlines, as indicated. Stake centerlines at station platforms, grade crossings, and bridge structures for inspection by the Contracting Officer.

E. As required under Section 01722, furnish the Contracting Officer with a plan sheet showing the horizontal distance, azimuth, and angle from the control points indicated to the references indicated.

F. Maintain control points and reference points for the duration of the project.

3.5 SUPERELEVATION, SPIRALS, AND CURVATURE

A. Superelevation:

1. Superelevate mainline track curves as indicated.

2. Maintain superelevation uniformly over the length of curve or as otherwise shown.

3. Superelevate the outer rail above the inner rail; install the inner rail at the required profile indicated.

B. Spirals: Establish the superelevation at the point of tangency at zero and increase the superelevation uniformly through the length of the spiral to full elevation of the outer rail at the spiral-to-curve point. Install the spiral at the ends of simple curves and segments of compound curves as indicated.

C. Curvature: Curve information shall be as shown. Shop fabricated rail shall be marked by the manufacturer for installation.

3.6 TRACK SURFACE

A. Track surface is the relationship of opposite rails to each other in profile and crosstree:

1. Track profile is the running surface along the top of the grade rail.

2. The ideal surface is a uniform profile consisting of straight gradients connected by vertical curves, with zero crosstree on tangents, and predetermined crosstree on curves.

3. Do not raise the profile of track being surfaced above established grades.

4. When surfacing or raising track, select one rail, usually the lower rail on curves and the line rail on tangents, as the grade rail. Bring the other rail to surface by adjusting the crosstree as needed.

3.7 RAIL

A. Follow track charts in determining exact location and lengths of premium and standard rail.

3.8 CUTTING AND DRILLING RAIL

A. Use only the following tools for cutting rail:

1. Rail saw.

2. Abrasive cutting wheels.

B. Drill holes:

1. When necessary, drill new holes; do not punch, slot, or burn with a torch.

2. Drill holes 1-1/8 inch in diameter; locate as indicated.

3. Drill with the joint bars removed or before their application. Mark the location of the center of the hole, or drill through an approved template. Do not drill bolt holes using the joint bars as a template.

4. When bolt holes are drilled with a power track drill, maintain a uniform feeding pressure. Reduce pressure as the bit point breaks through the opposite side of the web. Do not force the drill.

5. Remove all rough edges from drilled rail holes.

6. Do not leave bolt holes in the ends of rail to be welded.

7. Reaming or enlarging incorrectly drilled holes to allow joint bar bolts to be installed will not be permitted. Rejected holes shall be sawcut from the rail.

8. Torch cuts or blown holes will not be acceptable.

9. Rail strings have handling holes. These holes shall be cropped before welding.

3.9 RAIL JOINTS

A. Either weld or bond rail joints as indicated.

B. Field weld rails in accordance with Section 02458, "Field Rail Welding".
C. Install bonded joints where indicated in accordance with the requirements of this section and Section 02457, "Bonded Joints".

D. Install joints in track that is in final horizontal and vertical alignment with ballast tamping completed.

3.10 LAYING CONTINUOUS WELDED RAIL

A. Unload and lay CWR in a place and in a manner that prevents damage to the ties, rails, and structures.

B. Lay opposite CWR strings in a manner which results in a 10 foot minimum stagger of welds.

C. Make every effort to minimize or eliminate field cuts and field welds in CWR. Designate location in finished track by route name, stations of ends of rail string, and right or left rail as determined by facing in the direction of increasing stationing. Place all rail numbers on the same side of the CWR string.

D. Record the following information at the time of laying the rails on the crossties or DF plinth and again at the time of anchoring CWR. Furnish copies of this documentation to the Contracting Officer.

1. Location by station, track designation, and rail.
2. Date and time.
3. Rail weight and section, mill brand, year rolled, and the heat number of the end rails in each CWR string.
4. Length of CWR string in feet.
5. The following temperatures, at the beginning of the activity and again at the end of the activity:
   a. Ambient temperature.
   b. Rail temperature.
6. Approximate weather conditions.
7. Adjustment applied (type and rail end movement).

E. Between the time of laying the rail (placement on the ties) and anchoring the rail, the Contractor shall monitor rail temperatures and adjust each Dutchman as required to avoid rail buckling or rail end batter

3.11 RAIL TEMPERATURE

1. Place rail thermometers on the shaded side of the rail base next to the web and leave in place until no change in its reading is detected, but not less than five minutes.
2. Take rail temperature at the time of adjusting the gap between rail ends.

3.12 RAIL GAP

A. During rail laying below the indicated zero thermal stress temperature, determine the required gap between CWR strings and between CWR and bolted rail by using the equation:

$$ G = (t - T) L K + Q $$

Where:

G = Required rail gap (inches).

[t] = Specified anchoring temperature in degrees F for type of track construction.

T = Actual rail temperature at time of laying in degrees F.

L = Length of rail in feet (one-half of the sum of lengths of the CWR string being laid and the preceding CWR string).

K = Coefficient of thermal expansion for rail steel (0.000078 inch per foot per deg. F).

Q = Rail gap as required by manufacturers of field weld kit in inches. For bolted standard joints, Q equals 0.125 inch, and for bonded insulated joints, Q equals the end post thickness.

3.13 DUTCHMAN

A. Insert a Dutchman after the rail has been laid, equal in length to G minus 1/2 inch where G is determined by the formula above, to prevent damage to the rail ends during rail laying, ballasting, and other operations requiring passage of on-track equipment over the rail joints.

B. Do not insert a Dutchman if the calculated rail gap G is less than 1-1/2 inches.

C. Remove the Dutchman prior to anchoring or when an increase of temperature results in a calculated closure of the rail gap.
D. Rail end batter in excess of 1/16" shall be removed by cutting out at least 19 feet of rail at the joint, replacing the joint with a plug rail, and field welding both ends. End batter repair by welding is not acceptable.

3.14 TEMPORARY FASTENING

A. Temporarily fasten track for use of on-track equipment.

B. Prior to equipment being placed on newly laid rail, secure the rail in a manner that will prevent damage to the CWR, rail fasteners, and other track materials.

C. Move equipment over newly laid rail in such a manner as to prevent damage to trackwork materials.

D. Temporarily fasten newly laid rail on ballasted track at not less than:
   1. Every third tie on tangents and on curves having a radius greater than 1,900 feet.
   2. Every other tie on curves having a radius of 1,900 feet or less.

E. Do not field weld or bond between contiguous CWR strings and between CWR strings and special trackwork units before the rail has been brought to final vertical and horizontal alignment, before the rail has been adjusted to the indicated zero thermal stress range, and before the rail has been fully fastened.

3.15 PERMANENT RAIL FASTENING

A. Adjust the CWR string lengths for the specified zero thermal stress temperature:
   1. Adjust rail on DF bridges before adjusting ballasted track approaches. Anchor 300 track feet on each side at the temperature specified for DF track. When adjusting the approaches, unclip the 300 ballasted track feet up to the structure and adjust the ballasted track string to the appropriate temperature for ballasted track.
   2. When closing on a fully anchored string, remove 300 feet of existing rail clips, readjust the existing string for temperature and refasten before executing the field weld.
   3. Fasten the CWR strings in a manner which ensures that there is no unfastened portion of rail greater than 100 feet in length between fastened portions of the same string.

B. Vibrate the rail to relieve internal rail stresses and fully fasten the string. Record movement at quarter points and submit to the Contracting Officer daily.
   1. Use vibrators, approved by the Contracting Officer, to relieve internal rail stresses.
   2. Do not strike CWR with objects which might damage the rail surface.

C. Temperature of a rail, when being fastened opposite a previously fastened rail, shall be within 5 degrees F of the previously fastened rail's temperature at the time of its fastening.

D. Once the rail has been adjusted to achieve zero thermal stress at the specified temperature, maintain the correct rail gap until the rail is fully fastened.

3.16 ZERO THERMAL STRESS

A. Zero thermal stress at the specified temperature in CWR may be achieved by heating, cooling, or pulling the rails, or a combination thereof. When zero thermal stress at the specified temperature is obtained, begin fastening immediately.

B. Maintain the stress within the rail to achieve the specified zero thermal stress range during installation of joints.

3.17 FIELD WELDING

A. Perform field welds in accordance with the requirements of Section 02458, "Field Rail Welding".

B. Join CWR strings in the field by the field welding process unless otherwise indicated to be joined in the field by bonded standard joints. The location of bonded standard joints is shown on the Contract Drawings.
C. Do not locate a field weld within the following locations:

1. Within 10 feet of any weld in the opposite rail.
2. Within 19 feet of a field weld in the same rail.
3. Within 19 feet from the center of a bonded standard joint.
4. Within 8 feet of a shop weld in the same rail.
5. Within 6 inches of a tie.
6. Within 8 feet of each end of a road crossing.

D. Weld Gap:

1. At the time of field welding, providing the proper rail temperature as indicated is present, establish the rail gap recommended by the manufacturer of the weld kit.
2. Should the rail gap on fastened CWR be larger than the weld manufacturer's recommended gap after the CWR strings have been readjusted for zero thermal stress, saw a length of rail from one end of one of the fastened CWR and insert a rail not less than 19 feet long to provide the recommended gaps for field welding.
3. At a location where the rail gap is smaller than the manufacturer's recommended gap, obtain the recommended gap by sawing a piece from one rail.

E. Repair of field welds will not be permitted. Excessive grinding, dipped or peaked welds, and shear tears shall be cut out and replaced with a plug rail not less than 19 feet long. The replacement of the rail and the two additional field welds shall be at no expense to the Authority.

3.18 RAIL END-HARDENING

A. End-harden standard rail ends in the field at all bonded joints. Remove joint bars from rail ends during the end-hardening process.

3.19 END-HARDENING TESTS

A. Personnel to perform end-hardening shall prepare two sample rails in accordance with the AREMA Manual.

1. Test the two samples through an independent laboratory approved by the Authority and submit the test results to the Contracting Officer.
2. Acceptance of the end-hardening procedure and personnel will depend on the samples passing the tests specified below.

B. Two samples of end-hardened rail shall be tested for Brinell hardness in accordance with ASTM E10 in a grid pattern of 1/4-inch increments for a distance of 6 inches from the end of the rail.

C. Record the Brinell hardness numbers and locations.

D. After the hardness test has been performed, section one sample longitudinally for 1 foot along the centerline of rail. The other sample shall be sectioned transversely 1/2 inch from the end of the rail. Etch both cross sections to facilitate the observation of the hardness pattern.

E. Attain a Brinell hardness number not less than 341 nor more than 401 when measured at a point on the centerline of rail 1/2" from the rail end. The decrease in hardness shall occur uniformly over a distance not less than two inches. The hardness pattern shall be uniform across the top surface of the rail head. Examine the etched cross sections of the rail to ensure that a uniformly distributed hardness pattern is evident. End hardening shall be performed only by personnel and with procedures which have been accepted in accordance with the above procedure.

3.20 RAIL BEVEL

A. Bevel rail ends at bonded joints in accordance with AREMA Standard Plan Basic Number 1005.

3.21 RAIL GRINDING

A. Upon completion of the track by the Contractor to the specified tolerances and after acceptance, rail grinding will be done by the Authority.

3.22 FINAL ALIGNMENT AND TRACK INSPECTION

A. Survey the track in accordance with Section 01722, "Field Engineering - Surveying", to determine if the horizontal and vertical alignment, gauge, crosslevel, and superelevation are within the tolerances specified for each type of track construction.

B. Make a complete inspection of the track using a rail-mounted geometry inspection vehicle approved by the Authority. Geometry test shall meet FRA Class 4 Standards.

C. Correct track deviations which exceed tolerances.
D. The track geometry vehicle shall record the following measurements in a single pass.
   1. Track gauge.
   2. Right rail surface (profile).
   3. Left rail surface (profile).
   4. Right rail alignment.
   5. Left rail alignment.

E. Track Geometry Vehicle Measured Results.
   1. All measurements shall be displayed on the same chart, in a linear format, for a length of track, 5000 feet to 6000 feet per page. Charts shall be calibrated to read in construction survey stationing.
   2. Each measure shall be shown on a separate line with graduations at 0.25 in/div for all measurements except gauge, which shall be shown at 0.12 in/div.

3.23 ELECTRICAL TESTS

A. Track-to-earth resistance tests will be performed by the Authority’s corrosion engineer.

   1. Testing will be conducted by the Authority’s corrosion engineer as track construction progresses to ensure proper rail isolation is being achieved during construction.

   2. The Contractor shall notify the Contracting Officer when corrosion testing can be conducted in order to avoid construction conflicts. A minimum of three days notice is required. Testing time required is to be estimated at one day per 1000 feet of track.

   3. Testing will also be required after trackwork installation is completed (final acceptance for trackwork construction prior to signal and traction power rail connections) and after all signaling and traction power components/wiring are installed (final acceptance for signaling and traction power installations).

B. Contractor shall correct Contractor installations that fail the track-to-earth resistance tests, during construction testing or final acceptance testing. Following completion of these corrective measures, Contractor shall notify the Contracting Officer as specified herein for testing and the installations will be re-tested. All corrective measures shall be completed at the expense of the Contractor.

C. Final acceptance testing of track to earth resistance will be performed by DART Corrosion Engineer.

D. Acceptance criteria: Track-to-earth resistance shall not be less than:
   2. Grade Crossings: 300 ohms per 1000 linear feet after installation of panels.
   3. Embedded track: 150 ohms per 1000 linear feet.

E. Typical track construction will normally yield resistance values from 10 to 100 times greater than the acceptance criteria. Ballast dust, sandblasting residue, welding debris, grinding particles, and other debris may significantly reduce the resistance.

3.24 PRECURVED RAIL

A. Install fabricated precurved rail as shown and in accordance with the approved manufacturer’s fabrication drawings.

B. Mark precurved radius and installation location.

3.25 RESTRAINING RAIL

A. Install fabricated restraining rail as shown and in accordance with the approved manufacturer’s fabrication drawings.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work specified in this section will not be measured separately for payment, but all costs in connection therewith will be considered incidental to track construction measured elsewhere.

4.2 PAYMENT

A. The work specified in this section will not be measured or paid for directly, but the cost shall be allowed for in the cost of track construction and other related items of the Work.

**Notes:**

1. Total deviation is measured between the theoretical and actual alignment centerline at any point in the track.
2. Total horizontal and vertical deviation in road crossings ± 1/4".
3. In the Station Platform areas: Total Horizontal deviation shall be 0° towards Platform and 1/8" away from platform; Total Vertical deviation shall be 0° above Platform and 1/8" below platform.

END OF SECTION 02450
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies furnishing, placing, and compacting sub-ballast on prepared subgrade ("roadbed"). Work to be performed in accordance with Texas DOT Standard Specifications for Construction and Maintenance of Highways, Streets and Bridges, Item 247 unless otherwise noted.

1.2 REFERENCED STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM C88 - Standard Test Method for Soundness of Aggregates by Use of Sodium Sulfate or Magnesium Sulfate

3. ASTM C127 - Standard Test Method for Density, Relative Density (Specific Gravity), and Absorption of Coarse Aggregate

B. Texas Department of Transportation (TxDOT):

1. TxDOT Standard Specifications for Construction and Maintenance of Highways, Streets and Bridges (TxDOT Standard Specifications)
   a. Item 247 – Flexible Base

2. TxDOT Manual of Testing Procedures (TEX)
   a. TEX-113-E - Laboratory Compaction Characteristics and Moisture-Density Relationship of Base Materials
   b. TEX-115-E - Field Method of Determining In-Place Density of Soils and Base Materials

c. TEX-140-E - Measuring Thickness of Pavement Layer

1.3 SUBMITTALS

A. Qualification: Submit source of supply sufficiently in advance to obtain approval not less than 30 days prior to anticipated date of commencing installation.

B. Certification:

1. Prior to installation, provide the Contracting Officer with certified test results of sub-ballast quality and grading as conducted by an approved testing laboratory.

2. Provide additional certified test results if, during ballast installation, and with approval, the supplier changes the source of sub-ballast.

3. In any case the test results shall not be older than 6 months from the certification date.

1.4 QUALITY ASSURANCE

A. Source of Materials:

1. Obtain approval of sub-ballast and the source of supply and production prior to commencing installation.

2. Do not change material or source of supply without approval.

B. Inspection:

1. Visually inspect material delivered to the worksite. Stop delivery of material which does not appear to meet the specification pending sampling and testing.

2. If material loaded, being loaded, or installed, does not conform to specified requirements, the Contractor shall reject the material and no further delivery shall be accepted until the deficiency is corrected.

3. The Contracting Officer may reject material at the Worksite based on visual inspection. Rejected materials will be stockpiled and not used in the work pending sampling and testing.
PART 2 - PRODUCTS

2.1 SUB-BALLAST

A. Provide crushed stone, with the following requirements:

1. Gradation: ASTM C136 and C117 or in accordance with TxDOT Standard Specifications, Item 247, Type A, Grade 1 with the following additional requirements and exceptions:

   a. Sieve Size Retained By Weight
      1-3/4 inches 0
      7/8 inch 10 to 35
      3/8 inch 30 to 50
      No. 4 45 to 65
      No. 40 70 to 85

   b. Maximum liquid limit: 35.

2. Clay lumps and friable particles: ASTM C142, 0.5 percent maximum.

3. Wear: ASTM C131, 40 percent maximum.

4. Absorption: ASTM C127, 0.5 percent maximum.

5. Soundness: ASTM C88, weighted average loss 15 percent maximum after five cycles of sodium sulfate tests.

6. Use of limestone, slag or crushed concrete is not allowed.

PART 3 - EXECUTION

3.1 PLACING MATERIAL

A. Do not place material on subgrade that is muddy, rutted, or frozen or has standing water.

B. Prior to placing materials, prepare subgrade in accordance with Section 02220, "Grading, Excavating, and Backfilling".

C. Place material to provide uniformity of grading throughout work.

D. If subgrade is dusty, sprinkle with water prior to placing sub-ballast.

E. Install, shape, and compact sub-ballast to the depth shown.

1. Where compacted thickness is 6 inches or less, place sub-ballast in one layer.

2. Where compacted thickness is more than 6 inches, place material in two or more layers of equal thickness of not more than 6 inches each.

3.2 COMPACTION

A. During placing and compacting, maintain moisture content within specified tolerance, in this section.

B. Compact material for its full depth to 97 percent of maximum dry density within two percent of optimum moisture content, per TEX-115-E and TEX-113-E.

3.3 FIELD QUALITY CONTROL

A. Allowable Tolerances:

   1. Construct sub-ballast to the following tolerances:

      a. Vertical: Within plus or minus 1/2 inch of elevation shown. Deviation not to exceed 1/4 inch in 16 feet.

      b. Horizontal: Within plus 3 inch minus 1 inch of the limits shown.

      c. Thickness: Minus 1/2 inch (TEX-140-E).

   2. During compaction, maintain moisture content within two percent of optimum moisture content.

B. Test Methods:

   1. Determine optimum moisture content and maximum dry density in accordance with TEX-113-E.

   2. Perform a minimum of one density test for every 200 linear feet of route on the sub-ballast in accordance with TEX-115-E, Part 2.

   3. Perform depth check for every 4,000 SY of the sub-ballast in accordance with TxDOT Item 247.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will be not be measured, but will be paid for at the lump price for "sub-ballast", complete-in-place.

END OF SECTION 02451
SECTION 02453
TRACK BALLAST

PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies furnishing ballast to be installed under the work of other sections.

1.2 REFERENCE STANDARDS
A. American Railway Engineering and Maintenance-of-Way-Association (AREMA):
   1. AREMA - "Manual for Railway Engineering" (AREMA Manual)

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM C88 - Standard Test Method for Soundness of Aggregates by Use of Sodium Sulfate or Magnesium Sulfate
   3. ASTM C127 - Standard Test Method for Density, Relative Density (Specific Gravity), and Absorption of Coarse Aggregate

1.3 SUBMITTALS
A. Qualification: Submit source of supply sufficiently in advance to obtain approval not less than 30 calendar days prior to anticipated date of commencing installation.

B. Certification:
   1. Prior to installation, provide the Contracting Officer with certified test results of ballast quality and grading as conducted by an approved testing laboratory.

   2. Provide additional certified test results if, during ballast installation, and with approval, the supplier changes the source of ballast.

   C. Gradation Results: Provide certified copies of gradation belt samples results taken each day the ballast is produced. Submit a tabulation of gradation results each month, including the average percent passing for each gradation for the period.

1.4 QUALITY ASSURANCE
A. Comply with:
   1. Codes and regulations of the jurisdictional authority.
   2. AREMA Manual.

B. Source of Materials:
   1. Obtain approval of ballast prior to commencing installation.
   2. Do not change material or source of supply without approval.
   3. Take samples at the locations designated by the Contracting Officer.

PART 2 - PRODUCTS

2.1 BALLAST
A. Furnish crushed stone composed of hard, strong, durable particles free from injurious amounts of deleterious substance and with the following additional requirements:
   1. Use of limestone, slag, or any material containing metallic ore or metallic residues is prohibited.

   2. Gradation: ASTM C136 and C117 with the following additional requirements:
      a. Mainline track: AREMA Size 4A.
      c. Gradation shall comply with the following:

      Percent Passing by Weight
### Sieve Size

### PART 3 - EXECUTION

#### 3.1 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Handle ballast during all stages of manufacture and supply in a manner that ensures a uniform product.

B. Handle and transport ballast at all times in a manner and with equipment that prevents segregation and contamination by mud or any other deleterious material.

C. Do not allow ballast to fall from a height in a manner that the larger particles are thrown beyond the smaller particles. When placing ballast in a bin, drop the material vertically over the center of the bin.

#### 3.2 STOCKPILING

A. Stockpile ballast on level, well-drained sites free of all foreign materials and of adequate bearing capacity to support the weight of the materials to be placed thereon.

B. Except where stockpiled on concrete or asphaltic concrete foundations or on otherwise acceptably stabilized areas, provide a stockpile base approved by the Authority.

C. Build stockpiles in layers not to exceed three feet in depth, for each layer, completing each layer over the entire area of the stockpile before beginning the next layer. Uniformly spot-dump aggregates delivered to the stockpile in trucks. Coning of the piles or spilling of material over the edges of the pile is prohibited.

#### 3.3 DEFECTIVE MATERIALS

A. Unless otherwise permitted by the Contracting Officer, remove rejected materials from the Worksite within 48 hours of rejection.

#### 3.4 FIELD QUALITY CONTROL

A. Inspection:

1. The Contracting Officer has the right to stop delivery of material to the Worksite based upon visual inspection pending sampling and testing, in accordance with the General Provisions, "SUSPENSION OF WORK".

2. The Contractor shall reject any ballast which arrives at the Worksite for unloading that does not conform to the specified requirements.
3. Take two samples of the delivered ballast product from each 4000 tons of delivered ballast. Each sample shall be representative and weigh not less than 100 pounds. Test for conformance with the specifications.

4. If material delivered does not conform to specified requirements, the Contracting Officer may reject the material and no further delivery will be accepted until the deficiency is corrected. Non-conforming material will be removed and replaced.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work specified in this section will not be measured or paid for separately, but costs in connection therewith will be considered incidental to Section 02459, “Special Trackwork” and Section 02460, “Ballasted Track Construction” and related items of work.

END OF SECTION 02453
SECTION 02455
TRACK APPURTENANCES

PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies furnishing, fabricating, and installing track appurtenances as shown on Contract Drawings.

1.2 REFERENCE STANDARDS

A. American Railway Engineering and Maintenance-of-Way-Association (AREMA):
   1. AREMA - "Manual for Railway Engineering" (AREMA Manual)

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A36/A36M - Standard Specification for Carbon Structural Steel
   2. ASTM A490 - Standard Specification for Heat-Treated Steel Structural Bolts, 150 ksi Minimum Tensile Strength
   3. ASTM D257 - Standard Test Methods for DC Resistance or Conductance of Insulating Materials

C. National Electric Manufacturing Association (NEMA):
   1. NEMA LI1 - Industrial Laminating Thermosetting Products

1.3 SUBMITTALS

A. Shop Drawings.
B. Product Data: Ballast mats.
C. Installation Procedures.
D. Certification:
   1. Tests certified by an approved testing laboratory.
   2. Manufacturer's certification.

1.4 QUALITY ASSURANCE

A. Comply with:
   1. Codes and regulations of the jurisdictional authority.
   2. AREMA Manual.

PART 2 - PRODUCTS

2.1 AUTHORITY-FURNISHED MATERIALS

A. In accordance with Exhibit D, "SPECIAL PROVISIONS".

B. In accordance with Section 01640, "Authority-Furnished Materials and Equipment".

C. Restraining rails furnished by the Authority under this Contract will include the following materials.
   1. Fabricated wear bar holder assembly.
   2. Wear bar.
   3. Elastomeric pad 1/4 inch by 7-1/2 inch by 13-1/2 inch with identical hole location as holder assembly.

2.2 CONTRACTOR FURNISHED MATERIALS

A. Furnish insulated joints and rail plugs meeting the following requirements:
   2. Each insulated joint shall bond together two lengths of new fully heat treated or head hardened rail in accordance with Section 02450, "General Track Construction". Overall length of the insulated joint plug shall be 39 feet minimum with joint located 16 feet from one end.
   3. The insulated joint assembly shall be suitable for installation in CWR without altering the structural integrity or mechanical performance of the rail.
   4. The rails forming the insulated joint shall have a Brinell Hardness of 341 to 388, in accordance with AREMA, "Specification for Steel Rails".
   5. Electrical resistance of the insulated joint in service shall be not less than 100 megohms.
   6. Insulated joints shall be of a type that have been successfully installed (twenty or more units) in at least three North American transit systems similar to the Authority's light rail transit system. Further, these installations shall have been in service for at least the last five continuous years.
7. Furnish insulated joint with six pin bolts consisting of one inch diameter structural steel, collars, and hardened steel washer in accordance with ASTM A490.

B. Insulating sleeves and washers (bushing): Grade G-10 phenolic in accordance with NEMA LI 1 with a minimum resistivity of $10^{14}$ ohm-centimeters measured in accordance with ASTM D257. Furnish test results to Contracting Officer for review and approval.

1. Insulating bushing shall incorporate a steel flat washer integral with the top surface. The washer shall be pre-coated with 100 percent dry powder epoxy resin, 3M Corporation Scotch Kote No. 213, or approved equal.

2. Insulating bushing shall be used with a silicone-based caulk/sealant, General Electric RTV-12, or an approved equal.

3. Insulating bushing shall be fabricated using a suitable adhesive to secure sleeve and washer. Cut edges and surfaces shall be sealed with the resin used in the sleeve manufacture.

C. Bonded Standard and Insulated Joints: As specified in Section 02457, "Bonded Joints". Bonded standard joints required in special trackwork will be furnished by the Authority.

D. Special Clips and Insulators:

1. Special insulators ("shaved") to provide clearance for insulated joints.

2. Special insulators for use with the grade crossing panels provided by the Contractor to accommodate the rubber boot.

3. Special right-hand clips for use around insulated joints furnished by the Contractor.

4. Special left-hand clips for use around insulated joints furnished by the Contractor.

E. Timber Spacers:

1. New sawed mixed hardwoods, except white oak.

2. 12 feet long by 6 inches wide by 5 inches deep. Sawn to 5 inches x 6 inches or nominal.

3. Pressure Treat Timbers:

   a. In accordance with requirements of AREMA, "Specifications for Ties and Wood Preservation".

   b. With seven pounds of creosote-petroleum solution retained per cubic foot or to refusal.

F. Standard Bumping Posts:

1. General Requirements:

   a. The standard bumping post shall be as shown on the Contract Drawings, and shall consist of a steel bumping post equipped with shock-absorbent head of multiple-spring and shock bed design.

   b. Bumping posts shall be designed to be bolted to the running rails and not to require anchoring to crossties or concrete track bed. No part of the bumping post assembly shall extend more than 1-3/4 inches below the rail base.

2. Material: Tension bars and compression beams to be ASTM A36 steel.

G. Ballast Mats:

1. Provide ballast mats at specific locations indicated on Track Charts. The ballast mats, type and size shall be as shown on the Contract Drawings.

2. Material:

   a. Made of polyurethane or natural rubber base or blend of one of these materials.

   b. Minimum 1 inch thickness.

   c. Static stiffness in the range of 0.01 to 0.02 N/mm$^3$ (Newtons per cubic millimeter).

   d. Maximum dynamic to static stiffness ratio of 1.75.

   e. Trade name of material: Sylomer, Sylodyn, Escoa/Phoenix, Clouth or approved equal.
PART 3 - EXECUTION

3.1 RESTRAINING RAIL
   A. Install an Authority-furnished restraining rail assembly with an adjustable and replaceable wear bar where shown and as specified.
   B. Install restraining rail to guard the running rail as follows: Mainline ballasted and direct fixation track with a centerline radius less than or equal to 500 feet.
   C. Install restraining rail to an elevation one inch above the top of the low rail.
   D. Electrically isolate restraining rails from the running rail and track concrete.
   E. Electrical resistance of the restraining rail assembly in service shall not be less than 400 ohms/1000 linear feet of restraining rail.

3.2 TIMBER SPACERS
   A. Install timber spacers as shown on the Contract Drawings the entire length of the station platform.
   B. Timber spacer shall be attached to the concrete platform as shown on the Contract Drawings.
   C. The Contractor will drill the appropriate holes in the concrete platform at the specified locations and install female bolt inserts accordingly.
   D. The timber spacer holes shall be field drilled in accordance to the Contract Drawings and actual female insert locations.

3.3 STANDARD BUMPING POSTS
   A. Install bumping post in accordance with Contract Drawings and the approved manufacturer's instructions.
   B. Rail insulated joints shall be installed prior to the bumping post to electrically isolate the post from the remainder of the rail system. Location of the insulated joints shall allow sufficient distance to ensure that the wheels of a parked vehicle do not crossover the insulated joints.

3.4 BALLASTMAT
   A. Install ballast mats in accordance with manufacturer's recommendations.
   B. Install ballast mats on top of concrete slab surface that is clean and free of sharp projections or recesses.

C. Joints between ballast mat sections shall be overlapped such that there are no gaps between sections.

D. Ballast mats shall extend minimum of 5 feet 6 inches on both sides of track centerline.

E. Remove foreign material from ballast mat surface before proceeding with placement of ballast.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL
   A. With the exception of restraining rail, insulated joints and rail plugs, bumping posts, and ballast mats, the work specified in this section will not be measured or paid for separately, but costs in connection therewith will be considered incidental to the trackwork (measured elsewhere) to which these track appurtenances belong.
   B. Installation of Authority Furnished restraining rail will be measured and paid for at the unit price per lineal foot complete-in-place, including restraining rail, transition rails, brackets, hold down assemblies, elastomeric pads and restraining rail joints.
   C. "Insulated joints and rail plug" will be measured and paid for at the unit price per each for insulated joints complete-in-place, which price shall include fabricating the bonded insulated joint; field welding the complete assembly into the running rail; and fastening the rail to the track at the correct alignment and profile.
   D. Standard bumping post will be measured and paid for at the unit price per each for bumping post complete-in-place.
   E. Ballast mat will be measured and paid for at the unit price per square yard for each type of ballast mat.

END OF SECTION 02455
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes specifications for furnishing, fabricating, delivering, and installing bonded joints.

1.2 REFERENCED STANDARDS

A. American Railway Engineering and Maintenance-of-Way-Association (AREMA):
   1. AREMA - "Manual for Railway Engineering" (AREMA Manual)

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A194 - Standard Specification for Carbon and Alloy Steel Nuts for Bolts for High-Pressure or High-Temperature Service, or Both
   2. ASTM A490 - Standard Specification for Structural Bolts, Alloy Steel, Heat Treated, 150 ksi Minimum Tensile Strength
   3. ASTM F436 - Standard Specification for Hardened Steel Washers

1.3 SUBMITTALS

A. Submit shop drawings.

B. Submit proposed procedures, including the following:
   1. Installation procedures.
   2. Recommended bolt tensioning.
   3. Proposed procedure for maintaining the specified gap in the CWR during installation of bonded joints.
   4. Proposed procedure for installing joints at direct fixation fasteners.
   5. Proposed alternate methods of dynamically testing bonded joints, if applicable.

C. Test Reports: Submit test results of bonded joints certified by an approved testing laboratory.

D. Adhesive Manufacturer's Quality Control Program: Submit detailed description of the manufacturer's proposed quality control program for the manufacture of the bonding adhesive used in the bonded standard joints, including how it is regulated, maintained, and monitored.

PART 2 - PRODUCTS

2.1 BONDED STANDARD JOINTS

A. Joint Bars:
   1. Furnish smooth, straight bars providing full face contact, conforming to the configuration of 115 RE rail and the girder rail, and fabricated from quenched carbon-steel as specified in AREMA Manual, “Specifications for Quenched Carbon Steel Joint Bars”. Joint bars shall be 36 inches in length.

   2. Provide joint bars with the following tolerances:
      a. Fishing height: Plus or minus 1/64 inch of the dimension shown on the approved shop drawings.
      b. Length: Within plus or minus 1/8 inch of the dimensions shown on the approved shop drawings.
      c. Straightness: That portion of the bar adjacent to the rail: within plus or minus 1/32 inch, when using a 36 inch straight edge.

   B. Pin Bolts: Furnish 6 pin bolts consisting of 1 inch diameter structural steel, collars, and hardened steel washer in accordance with ASTM A490.

   C. Joint components: Furnish bonded standard joints complete with bars, washers, bolts, nuts, and manufacturer recommended adhesives.

   D. Provide materials necessary for testing as specified herein.

   E. Bonded Standard Joints shall be manufactured by Allegheny Rail Products, Inc. of Pittsburgh, PA or approved equal.

2.2 BONDED INSULATED JOINTS

A. Furnish bonded insulated joints that meet the following requirements:

   2. Insulated joint assembly shall be suitable for installation in CWR without altering the structural integrity or mechanical performance of the rail.

   3. Electrical resistance of the insulated joint in service shall be not less than 100 megohms.
4. Insulated joints shall be of a type that have been successfully installed (twenty or more units) in at least 3 North American transit systems similar to the Authority LRT system. Further, these installations shall have been in service for at least the last 5 continuous years.

5. Furnish insulated joint with 6 pin bolts per bonded joint.
   a. Provide pin bolts of 1 inch diameter structural steel, A325 or Grade 8.
   b. Provide collar for 1 inch pin bolt.
   c. Provide flat circular hardened steel washers in accordance with ASTM F436.
   d. Locate the bolt holes as specified in the AREMA Manual.
   e. Bolt hole size in accordance with the manufacturer's recommendation.

6. Joint components: Furnish bonded insulated joints complete with bars, washers, bolts and collars.

B. Bonded insulated joints for paved track shall meet the same requirements as specified in Paragraph 2.2.A, except the insulated joint assembly shall be suitable for installation in continuously welded girder rail.

2.3 BONDED TWO RAIL STANDARD JOINTS

A. Joint Bars: As specified for Bonded Standard Joints.

B. Flangeway Filler: Rolled steel; for 1-7/8 inch wide flangeway, 36 inches long, with tolerances as specified in Article 2.1 herein.

C. Bolts: Same as in Article 2.1, herein, except 11 inches long.

2.4 ADHESIVES

A. Furnish adhesive with a minimum shelf life of 1 calendar year from the time of purchase when stored in accordance with the manufacturer's recommendations where the room temperature may vary from 40 degrees F to 90 degrees F.

2.5 FABRICATION TESTING

A. Test a minimum of 3 bonded joints for standard rail and a minimum of 3 bonded joints for girder rail, testing at least 2 joints of each type rail for longitudinal compression and one for stroke rolling load, as specified herein. Do not commence testing until shop drawings and installation procedures have been approved. Complete the tests as specified.

B. Longitudinal Compression Test:

1. Assemble 2 bonded joints on 2 pieces of standard rail, each 2 feet long and in accordance with the manufacturer's requirements. Saw the assembly in half where the rails are butted together. Execute sawing in a manner which will prevent overheating and damage to the epoxy bond. Make sawcuts perpendicular to the centerline of the top of the rail with a tolerance of plus or minus 1 degree. Fabricate a device so that the reaction of the sawed end occurs only at the face of the joint bars when a load is applied at the centroid of the rail at the opposite end.

2. Apply loads longitudinally in increments of 25,000 pounds. Maintain the load increment constant until the longitudinal deflection of the rail ceases before increasing the load to the next increment. Increase the load incrementally until a successful load of 650,000 pounds is achieved, or failure occurs. At each increment of loading, record the load and differential movement of the rail and the joint bars, measured to the nearest 0.001 inch.

3. Acceptable Tolerances:
   a. Slippage: No slippage before a compressive load of 650,000 pounds is applied to the joint.
   b. Differential Movement: Magnitude for the differential movement not to exceed 1/8 inch in any direction.
   c. At the completion of the test, after the load on the rail has been released, the relative position of the rail joint bar shall be within 1/32 inch of its original value.

C. Stroke Rolling Load Test:

1. Mount the joint on a 33-inch stroke rolling load test machine. Support the joint on 36-inch centers and center the joint. Apply the 44,400-pound rolling load on the rail for 2,000,000 cycles. Measure and record to the nearest 0.001 inch, for every 500,000 cycles, the deflection of the rail at the centerline of the rail joint when the wheel load is over both point A and point B.

2. Acceptable Tolerances, after 2,000,000 cycles:
   a. Show no evidence of joint failure by bending.
b. Do not exceed 0.065 inch of joint deflection during the test.

3. Alternate: Submit for approval other methods of testing the bonded joint for review, if desired. Submit manufacturer’s certification of tests of a similar joint.

D. Repeat Tests: After the Stroke Rolling Load Test, repeat the Longitudinal Compression Test.

E. The Contracting Officer may reject joints which fail to meet these requirements.

F. Fabrication testing of bonded joints may be waived by the Contracting Officer if the Contractor’s bonded joint crews have been qualified by either a Class 1 railroad or other Transit Agency with similar testing requirements. Qualifications of bonded joint crews may be submitted for review by the Contracting Officer provided the qualification testing was conducted within 12 months of the first bonded joints being placed on the project.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Bonded Standard and Two Rail Joints:

1. Install at non-insulated joint locations, as shown.

2. Install bonded standard joints, in accordance with the manufacturer’s written instructions except as modified by these specifications.

B. Bonded Insulated Joints: Install per manufacturer’s written instructions, except as modified by these specifications.

C. Bonded Insulated Joints for Paved/Embedded Track: Install per manufacturer’s written instructions, except as modified by these specifications.

D. End Hardening in the Field: End harden rail ends at joints that are not fully heat treated, as specified in Section 02450, “General Track Construction”.

3.2 FIELD QUALITY CONTROL

A. Crew and Foreman Qualifications: Prior to installation of bonded standard joints have each crew and its respective foreman prepare 2 sample bonded standard joints.

1. Prepare each sample joint in accordance with the approved procedures and the requirements of this section.

2. Perform thorough grinding to remove the rail brands from the rail for the entire length of the joint.

3. Test each sample for compliance with the Longitudinal Compression Test as specified.

a. Should a sample joint fail to meet the specified requirements of this test, the qualification of the foreman involved will be deemed unacceptable.

b. If the foreman of a joint bonding crew is changed at any time during the Contract, the new foreman shall be qualified as specified, unless he has already been accepted as qualified.

4. Test insulated joints for electrical resistance. Joint shall have 100 megohms or greater resistance.

B. Bolts: Prior to installing bolts in bonded joints, calibrate the installation tool that is to be used for tightening the bolts by testing at least 3 typical bolts in a device capable of indicating actual bolt tension. Use a torque multiplier for the bolts which is capable of producing the minimum installed fastener tension recommended by the joint manufacturer.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this Section will not be measured separately for payment, and costs in connection therewith, including qualifying the procedure and crews, and the removal, reinstallation, and retesting of rejected joints, will be considered as included in the Contract lump sum price or the Contract unit prices per linear foot of track of the different types as specified in applicable trackwork sections.

END OF SECTION 02457
PART 1 - GENERAL

1.1 DESCRIPTION

A. The Work specified in this Section shall include providing materials, equipment, laboratory and quality control testing of rail welds, and labor necessary to weld together the abutting ends of rail, and qualification of welding and welders. Rail welds shall be one of the two types indicated below:

1. Pressure (Electric Flash-Butt) Welds: Tee rail for ballasted mainline track, embedded/paved tracks, direct fixation (DF) tracks, and yard body tracks outside the limits of special trackwork shall be welded into continuous strings using the electric flash-butt pressure welding process.

2. Thermite Welds: Thermite welds shall be used only where it is impractical to perform Pressure Welds. Thermite welds shall be used in rail for use in embedded (paved) yard track and within the limits of grade crossings. Shop pre-curved rail shall be welded in place in the track.

B. Pressure welding shall be performed using mobile electric flash-butt welding machine designed for rail welding.

C. Contractor shall make his own assessment as to the number of rails to be welded under this Contract, and the number of welds to be made by any one welding process, based on the information contained in these Specifications and the Contract Drawings.

1.2 REFERENCED STANDARDS

A. Association of American Railroads (AAR):

B. American Railway Engineering and Maintenance-of-Way-Association (AREMA):

1. AREMA Manual for Railway Engineering (AREMA Manual)

C. American Welding Society (AWS):

1. AWS D1.1/D1.1M - Structural Welding Code Steel

D. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM E10 - Standard Test Method for Brinell Hardness of Metallic Materials

2. ASTM E94 - Standard Guide for Radiographic Examination

3. ASTM E164 - Standard Practice for Ultrasonic Contact Examination of Weldments

4. ASTM E709 - Standard Guide for Magnetic Particle Examination

1.3 SUBMITTALS

A. Certification: Submit manufacturer’s certification for foreman and crew.

B. Pressure (Electric Flash-Butt) Welds: Submit the following:

1. A written description of the welding procedure, including facilities, personnel and list of similar completed projects.

2. A list of equipment and calibration methods, method of rail end alignment, method of rail straightening.

3. Welding Machines Performance: Submit pressure welding machine performance standards as provided by the manufacturer. During welding production, a recorder shall be attached to each welding machine to record platen movement and current impulses on the form "Record Of Field Welds". A record of machine performance for each weld shall be submitted to the Contracting Officer. If the record indicates performance which is not in conformance with the approved standards, the weld will be considered defective and shall be rejected.

4. Shop Drawings: Submit Shop Drawings for the pressure welding machine and Shop Drawings of the proposed method and equipment for handling and laying CWR. This submittal shall include reference data relating to where the proposed equipment and laying method were previously successfully used.

5. Details of the equipment and procedure proposed for straightening welds if required. The submittal shall include reference data relating to where the proposed straightening equipment and method were previously successfully used.

6. The manufacturer’s recommended procedure for welding high strength rail if different from requirements for standard rail.
7. Pressure Weld Samples: Prior to beginning of production welding, 6 test welds shall be made using the welding machine and the procedures proposed in the Manufacturer’s instructions. Two of the welds shall be standard rail to standard rail; two shall be high strength rail to high strength rail; two welds shall be standard treated rail to high strength rail. The welds shall be tested by the testing service. Certified test reports shall be submitted to the Contracting Officer.

8. Proposed location for flash-butt welding plant including methods of transporting materials and equipment to the site, types and locations of environmental controls and duration of welding operations.

C. Thermite Welds: Submit the following:

1. Prepare a detailed description covering the step-by-step procedures to be employed in making the welds. Include a complete description of each of the following applicable items as well as any other characteristics essential to the welding procedures.
   a. Manufacturer’s trade name for the welding process.
   b. Method used for cutting and cleaning of the rail ends. Flame cutting of rail ends will not be allowed.
   c. Minimum and maximum spacing between rail ends.
   d. Method used for maintaining the rails in alignment during welding.
   e. Method used for preheating, including time and temperature.
   f. Tapping procedure, including the minimum time required to cool the weld under the mold insulation.
   g. Method used, including a description of special tools and equipment, for removing the upset metal and finishing the weld to the final contour.
   h. Manufacturers recommended procedure for welding high strength rail if different from requirements for standard rail.
   i. Method for controlling smoke and fumes from field welding within indicated requirements.
   j. Quality control procedures.

2. Documentation: Prepare, maintain, and make available to the Contracting Officer a complete welding record indicating kit manufacturer, welding foreman, rail temperature, weather conditions, and station location.

D. Calibrations: Submit description of calibration equipment and calibration methods.

E. Testing Programs for Field Quality Control: Submit testing programs prepared by the radiographic, ultrasonic, and magnetic particle weld testing services for approval by the Contracting Officer. Each program shall include a description of the proposed procedures, materials, equipment, safety requirements, and report.

1.4 QUALITY ASSURANCE

A. Welding Supervision:

1. Perform welding under the direct supervision of an experienced rail welding supervisor or foreman.

2. Qualify each field welding foreman and crew through a representative of the field rail welding process manufacturer.

3. Have each welding crew perform 3 sample welds to be subjected to rolling load, bending, and hardness tests.

4. Have the field rail welding process manufacturer witness the first satisfactory 5 welds made by each crew. Field welding crews which produce more than 10 percent defective welds will be barred from further work until re-qualified by the manufacturer.

B. Fabrication of Sample Pressure Welds and Thermite Welds.

1. Produce 3 sample welds of each combination of metallurgy standard to standard, standard to high strength, high strength to high strength to be pressure or thermite welded for testing.

2. Prepare samples by the welding crews in accordance with the Contractor’s submitted, reviewed, and accepted methods and procedures for rail welding. The supervisor of each welding crew shall be trained and certified by the manufacturer supplying the weld kits and/or pressure welder to perform rail welding. Each welding crew shall perform at least one of each type of the sample welds. Prior to performing welds in the specified work, the welds and each welding crew shall be qualified as specified below.

3. When the weld machine is returned to production after a period of malfunctioning
FIELD RAIL WELDING

or major repair, or when the welding crew is replaced, additional sample welds, as stated above, will be required. Acceptance of the welding machine or the new crew will only be after acceptable welds as above have been produced.

4. Sample pressure and thermite welds shall be tested by an independent laboratory and the certified test results shall be submitted to the Contracting Officer. Approval of the pressure welder, weld kit, weld specification, and welding crews will be dependent upon the sample welds satisfying the test requirements in this specification. Qualification testing of sample welds shall be as stated herein.

5. Fabrication and testing of sample welds may be waived by the Contracting Officer if the Contractor’s welding crews have been qualified by either a Class 1 railroad or other Transit Agency with similar testing requirements. Qualifications for welding crews may be submitted for review by the Contracting Officer provided the tests have been conducted within 12 months of the first welds taking place on the project.

PART 2 - PRODUCTS

2.1 RAIL WELDING

A. Perform field rail welds utilizing one of the following brands of rail welding or an approved equal. All field welds shall only be preheated type.

1. Field Flash Butt Welding: Process by Holland or approved equal.

B. Unless otherwise shown or specified, conform to the rail welding kit manufacturer’s recommended standards when welding high strength rail.

2.2 RAIL

A. Rail for welding shall be as specified in Section 02450, "General Track Construction".

PART 3 - EXECUTION

3.1 RAIL END PREPARATION

A. Clean the rails to be free of grease, oil, dirt, loose scale, and moisture to a minimum of 6 inches back from the rail ends, including the rail end surfaces, by use of a wire brush.

B. Align the faces of the rail ends.

C. Clean for 2 inches on each side of the weld, to remove scale and rust, using a power actuated grinder with abrasive wheel.

D. Rail ends shall show no steel defects, dents, or porosity before welding.

E. If rail is required to be cut to length for any reason, cut it square and clean by means of rail saws or abrasive cutting wheels in accordance with AREMA Manual Chapter 4, Section 2.1.

3.2 RAIL

A. Straighten rail not meeting the requirements of AREMA Manual Chapter 4, Section 3.11, to within the specified tolerance.

B. If any rail cannot be straightened, cut it back a sufficient distance to achieve the required alignment.

C. Perform all straightening or cutting prior to welding.

3.3 RAIL GAP

A. Align and properly gap the ends of the rails to be welded to produce a weld which conforms to the alignment tolerances specified.

B. Hold the rail gap and alignment during field welding without change during the complete welding cycle.

1. Align rail on the head of the rail:

   a. Vertical alignment: To provide for a flat running surface. Any difference of height of the rails shall be in the base.

   b. Horizontal alignment: In such a manner that any difference in the width of heads of rails occurs on the field side.

2. Horizontal offsets: Not to exceed 0.040 inch in the head and 0.125 inch in the base.

3. Surface misalignment tolerance:

   a. Combined vertical offset and crown camber: Not to exceed 0.040 inch per foot.

   b. Combined vertical offset and dip camber: Not to exceed 0.010 inch per foot.

4. Gauge misalignment tolerance: Combined horizontal offset and horizontal kink camber not to exceed 0.040 inch per foot.
3.4 BOLT HOLES
A. One handling hole may be made in each end of a CWR string. Cut off rail ends containing such holes prior to welding.

3.5 SAMPLE WELDS
A. In accordance with the approved methods and procedures, prepare at least 3 sample welds on standard rail, and 3 sample welds on high strength rail or alloy rail.
B. In addition, each welding crew to prepare a minimum of one sample weld.
C. Each sample weld shall join two pieces of rail each a minimum of 30 inch in length.
D. All sample welds shall be tested by the testing laboratory (approved by the Authority) as follows:
   1. Radiographically inspect each weld in accordance with ASTM E94.
   2. Use radiographic tests to establish the acceptable procedures for performing field inspection of welds.
   3. For each type of rail, and after passing the radiographic test, subject at least one sample weld to each of the following tests:
      a. Slow Bend Test for Sample Welds: Sample weld shall be subjected to the Slow Bend Test described in the Proceedings of the AREMA, Volume 68, pages 384 and 385. Test acceptance criteria minimum of 1 inch deflection and 100,000 pounds per square inch modulus of rupture.
      b. Hardness test: In accordance with ASTM E10 longitudinally section the rail for a distance of 12 inches on each side of the weld and test for Brinell Hardness. Test the rail head portion for hardness on the sectioned face at points on a grid pattern of 3/8 inch increments for 1 inch on each side of the centerline of the weld and on a grid pattern of 1/2 inch increments beyond the weld until the hardness is that of the parent metal. The Brinell Hardness throughout to be as follows:
         1) For standard rail: Minimum 285 and maximum of 331.
         2) For high strength rail: Minimum 341 and maximum of 401.
E. Submit the test results for the sample welds to the Contracting Officer for approval of the welding process and the crew. Should any sample weld fail to meet the specified requirements, the welding process, the welding crew, or both may be disapproved.
F. Should the supervisor of an approved crew be replaced, the entire welding crew shall be re-qualified under the direction of the new supervisor.
G. Welding crews that have been qualified by either a Class 1 railroad or other Transit Agency with similar testing requirements may be submitted for review by the Contracting Officer provided the tests have been conducted within 12 months of the first welds taking place on the project.

3.6 FIELD WELD POSTHEATING
A. Leave the molds in place after tapping for the time required to permit complete solidification of the molten metal and proper slow cooling to prevent cracking and provide a complete weld with proper hardness and ductility.

3.7 PRESSURE (ELECTRIC FLASH-BUTT) WELDING
A. Pressure welding shall be in accordance with the AREMA Manual Chapter 4, Section 3.11, except as modified hereinafter.
B. Mismatched or jagged rail ends shall be either sawed or cut with an abrasive rail cutter. Mating rail ends by flashing shall not be accepted.
C. Rails shall have the scale removed down to bright metal in areas where the welding current-carrying electrodes contact the rail. Grind down raised rail brands in electrode areas. Grind down raised rail brands in electrode areas. The weld and adjacent rail for a distance clearing the electrodes shall be rejected if in the areas of electrode contact there is not more than 95 percent of the mill scale removed. Electrode contact areas shall be examined for evidence of electrode burn. Where metal is displaced or where the oxidized areas exhibit checks or small cracks the weld shall be rejected and the rail cut back clear of the electrode burn.
D. Welds shall be forged to point of refusal to further plastic deformation and shall have a minimum upset of 1/2 inch, with 5/8 inch as standard.
E. If flashing on electric pressure (flash butt) welds is interrupted, because of malfunction or external reason, with less than 1/2 inch of flashing distance remaining before upsetting, rails shall be reclamped in the machine and flashing initiated again.
F. Whenever possible, grinding shall be accomplished immediately following welding at an elevated temperature. When grinding must be done at ambient temperature, avoid grinding burns and metallurgical damage.
G. Alignment of rail in the welding machine shall be at the head of the rail.

1. Vertical alignment shall provide for a flat running surface. Any difference of height of the rail shall be in the base.

2. Horizontal alignment shall be accomplished in such a manner that any difference in the width of heads of rails shall be divided equally on both sides of the head. Where the difference, when divided, exceeds 0.040 inches, 0.020 inches of the difference shall be placed on the gauge side and the remaining differences in the width of heads shall be on the field side.

3. In any case horizontal offsets shall not exceed 0.040 inch at the head and/or 0.125 inch at the base.

H. Surface and Gauge Misalignment Tolerances: Shall meet the alignment tolerances given in the AREMA Manual, Chapter 4, Part 2, “Tolerances for Inspection of Welded Rail New and Mainline Relay Rail”.

I. If, at any time, 7 or more of a series of 12 consecutive welds made on one machine exceed 75 percent of the stated surface misalignment tolerances that machine shall be shut down and adjusted before work continues.

J. Re-welds shall be cut out beyond the heat affected zone of the previous weld.

3.8 WELD FINISHING AND TOLERANCES

A. Bring rails and joints in the finished track to a true surface and alignment by means of an approved grinding machine.

B. Finish the completed weld by grinding to conform with the following requirements:

1. Finishing deviation shall not be more than plus 0.010 inch to minus 0.0 inch of the parent section of the rail head surface.

2. Finish the sides of the rail head to plus or minus 0.010 inch of the parent section.

3. Finish the bottom and sides of the rail base to a finishing deviation of not more than plus 0.010 inch of the parent section.

4. Finish the web zone to within 1/8 inch of the parent contour but not deeper than the parent section. Finishing shall eliminate all cracks.

5. Alignment tolerances to be as specified in AREMA Manual, Chapter 4, Section 3.11.

6. Notches created by minor offset conditions, twisted or misshaped rails shall be eliminated by minimum grinding to blend the variations.

7. Fins on the weld due to grinding or shear drag shall be removed prior to final inspection.

3.9 WELD QUALITY

A. Inspect each test weld using the dry powder magnetic particle method in accordance with ASTM E709.

B. Inspect each weld using a 3 foot straightedge along the centerline of the rail and 0.625 inch below top of rail on the gauge side of the rail head. Center the straightedge over the weld. The gap between the straightedge and the rail shall comply with the requirements of AREMA, Chapter 4.

C. Ensure that each completed weld has full penetration and complete fusion and is entirely free of cracks or fissures.

D. Porosity and slag-type defects will be acceptable provided that testing indicates that the largest defect does not exceed more than 3/16 inch in its largest dimension; the total area of the defect does not exceed 0.010 square inches, and the sum of the greatest dimension of defects in a line does not exceed 1/2 inch.

E. Weld Hardness: As specified for the sample welds herein.

3.10 WELD NUMBERING

A. Mark a sequential weld number on the rail immediately adjacent to the weld using a quality lead paint marker at the time the weld is made.

B. Number welds sequentially in the order in which they are made.

C. The Contracting Officer will provide the Contractor with the initial weld number.

D. When defective welds are replaced assign a new sequential number to the new weld by adding a letter to the defective weld number.

3.11 FIELD QUALITY CONTROL

A. General:

1. Test all welds at the time of welding and ultrasonically test both the welds and the rail once the rails have been laid in final position

2. Use equipment which has a distance amplitude correction feature.
FIELD RAIL WELDING

3. Calibrate the equipment daily using an 11W calibration block, also made of rail steel.

4. Inspection Personnel: Qualify all inspection personnel in accordance with AWS D1.1/D1.1M.

5. Cut out and re-weld all welds giving fault indication in ultrasonic inspection using a minimum 19 foot piece of rail.

B. Radiographic Weld Testing:

1. Contracting Officer will select welds to be radiographically tested in accordance with ASTM E94. Radiographic film shall be Type 1 or Type 2 and the exposed film density shall be within the range of 1.5 to 3.8. At least 4 exposures are required, one through the head, one through the web, and one each through the two base flanges.

2. Testing Procedures: In accordance with the approved submittal.

3. Testing Rate: Radiographic tests shall be performed on:
   a. 100 percent of the first 10 mainline welds.
   b. 20 percent of the next 50 mainline welds.
   c. 10 percent of the remaining mainline welds.
   d. 4 yard welds shall be radiographically tested.

4. Defective Welds: Upon detection of a defective weld, the test rate shall be increased to ensure that all defective welding is disclosed. The Contracting Officer will select additional welds to be radiographed.

5. Penatrameters shall be shimmed to compensate for excess weld metal on the web and base.

6. Acceptance Criteria: The weld quality shall meet the requirements of Paragraph 3.8.

C. Ultrasonic Weld Testing:

1. Mainline and yard field welds not subject to radiographic testing shall be ultrasonically tested (UT) over the entire cross section of head, web, and base. The UT equipment shall meet the requirements of AWS D1.1/D1.1M, Paragraph 6.17. The procedure shall meet the requirements of ASTM E164. Prior to performing production UT of welds, UT technicians shall demonstrate to the satisfaction of the Contracting Officer that they can discern and identify indication produced by slag, porosity, lack of fusion, and cracks.

   a. Use ultrasonic test equipment capable of detecting a 3/64 inch discontinuity, 6-1/2 inches below the top of rail. At a minimum, scan the weld from the top and both sides of the rail head and the base. Scan the weld from both sides on the face for longitudinal and transverse discontinuities using the applicable scanning pattern or patterns.

2. Testing Procedures: In accordance with the approved submittal.

3. Acceptance criteria shall be as follows:
   a. Welds showing a response at any level that is identified as a crack or lack of fusion will not be acceptable.
   b. Welds showing a response that is less than 50 percent of the primary reference level will be acceptable.
   c. Welds showing a response greater than 50 percent but that do not exceed the primary reference level are acceptable, providing that all of the following apply:
      1) Defects are evaluated as slag or porosity.
      2) Largest defect does not exceed 0.180 inch in its largest dimension.
      3) Total area of the defects do not exceed 0.09 square inch.
      4) Sum of the greatest dimension of defects in a line does not exceed 3/8 inch.
   d. Welds showing a response that exceeds the primary reference level will not be acceptable.

D. Magnetic Particle Testing:

1. Main line and yard field test welds shall be magnetic particle tested (MT). The procedures used shall meet the requirements of ASTM E709. Welds surfaces shall be tested except the underside of the rail base. The magnetizing equipment shall be an electro-magnetic yoke meeting the following requirements:
FIELD RAIL WELDING

a. DC lift capacity of 40 pounds, and/or
b. AC lift capacity of 10 pounds at the maximum pole spacing.

2. Testing Procedures: In accordance with the approved submittal.

3. Acceptance Criteria: The weld quality shall meet the requirements of Paragraph 3.8.

3.12 DEFICIENT WELDS

A. Replacement of Defective Welds:

1. When the Contracting Officer determines a weld is unacceptable, cut out the weld and replace it with a 19 foot (minimum) rail plug.
   a. Make saw cuts at least 6 inches from the centerline of the faulty weld.
   b. Renumber replacement welds as indicated.
   c. Ultrasonically test replacement welds made in rail as specified herein.

2. If one or both of the rails may be moved, cut out the weld, pull rails together to the indicated rail gap and reweld.

3. If neither rail may be moved, cut the weld out of the rail and replace with a section of new rail and with 2 new welds. Use a 19 foot minimum length of the new rail.

3.13 PROTECTION OF RAIL INSULATORS

A. Rail insulators (pads, clips, insulators, and bushings) shall be covered/protected by a non-flammable material to prevent hot grinding fines from fusing into the rail insulating components.

3.14 WELD SLAG

A. Welding fines and slag shall be removed from around the rails, insulating components, and the entire track area.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work specified in this section will not be measured separately for payment, but all costs in connection therewith will be considered incidental to track construction measured elsewhere.

END OF SECTION 02458
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies furnishing and installing special trackwork comprising of turnouts, crossovers, crossings, and similar work as shown on the Contract Drawings.

1.2 REFERENCED STANDARDS

A. American Railway Engineering and Maintenance-of-Way-Association (AREMA):
   1. AREMA - "Portfolio of Trackwork Plans"

1.3 SUBMITTALS

A. Installation Procedures: Prepare and obtain approval of a description of the procedures to be employed in the execution of the special trackwork installation at least 30 calendar days before beginning the work. Place particular emphasis upon alignment, clearances, and methods of checking both.

B. Product Data: Submit manufacturer's description of the proposed lubricants for use on the riser plates.

C. Submit qualifications of welders qualified as specified in Section 02458, "Field Rail Welding".

1.4 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Contractor shall arrange, at the expense of the Contractor, for the delivery of materials to the Worksite.

B. Handle special trackwork materials in a manner which will prevent damage during loading, unloading, storing, transporting, and installing.

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIALS

A. Materials required for special trackwork, in accordance with the Standard and Directive Drawings and AREMA Trackwork Plans.

   1. The Authority will be providing 80 foot rail sections.

2.2 CONTRACTOR FURNISHED MATERIALS

A. Provide materials, including ballast necessary for ballasted special trackwork installation.

B. Provide concrete materials, bonding agent, insert anchor grout, and shims required for Direct Fixation special trackwork construction as specified in Section 02462, "Direct Fixation Track Construction".

C. Insulated joints and rail plugs within special trackwork will be furnished by the Authority. Refer to track charts for Contractor furnished insulated joints and rail plugs.

D. Turnouts, crossovers, and track crossings as indicated, including rails, switches, frogs, special plates, resilient clips, hand throw switch stands, spring connecting rod, and guard rail assemblies as shown on the drawings.

E. Concrete switch ties and crossties for ballasted special trackwork.

F. Direct fixation (DF) fastener assemblies required for DF special trackwork.

2.3 LUBRICANTS

A. Provide Glidex as manufactured by Midwest Industrial Supply or approved equal for application to the riser plates. The lubricant shall have low electrical conducting properties.

2.4 RELATED MATERIAL NOT IN CONTRACT

A. Switch machines, operating rods, and switch machine mountings furnished and installed by others.

PART 3 - EXECUTION

3.1 BALLASTED SPECIAL TRACKWORK INSTALLATION

A. Install ballasted special trackwork as specified herein and in accordance with Section 02460, "Ballasted Track Construction". If work involves operating tracks, track outages shall be arranged through the Contractor.

B. On the initial layer of ballast, space and align ties within the limits of special trackwork, as indicated. Place switch ties within a tolerance of plus or minus 1/2 inch of the location shown, except that ties adjacent to switch rods are to be placed within plus or minus 1/4 inch of the location shown.

C. Special care is required for railroad crossings, since similar frogs may not be identical. Review shop drawings and locations of insulated joints.

D. Clean ties and rail pads prior to installing rails to ensure full bearing of the pads on the ties.

E. Frog Gauge Plate Stops: Field welded to gauge plates.
F. Surfacing and Aligning:

1. Surface, tamp, and align special trackwork as specified herein and in Section 02460, “Ballasted Track Construction”.

2. Uniformly tamp ballast under both sides of each tie directly under each running rail for a distance of 15 inches on both sides of the rail.

3. In general, bring the top of the ballast section to within 1 inch below the base of the rail throughout the special trackwork units. Ballast shall not be in contact with any rail or metallic rail appurtenances.

4. Provide 4 inch clearance below the rail base at operating and switch rods.

5. Conform the width and slope of the shoulders to the sections indicated.

G. Final Alignment:

1. The final surface and alignment of the special trackwork to be within the tolerances specified for ballasted mainline track in Section 02450, “General Track Construction”.

2. After final surfacing and aligning, dress the ballast to conform to the ballast sections indicated.

3. In the event that sub-ballast outside the toe of the slope is fouled or disturbed as a result of the Contractor’s operations, re-slope those portions of the sub-ballast and ballast.

3.2 DIRECT FIXATION SPECIAL TRACKWORK INSTALLATION

A. Install direct fixation special trackwork as specified herein and in accordance with Section 02462, “Direct Fixation Track Construction”. If work involves any live tracks, track outages shall be arranged through Contracting Officer.

B. Follow manufacturer’s instructions in the installation of special trackwork components.

C. Install direct fixation fastener assemblies and conduct insert pullout tests as specified under Section 02462, “Direct Fixation Track Construction”.

3.3 JOINTS

A. Locate special trackwork joints as indicated.

B. Install joints as specified in Section 02457, “Bonded Joints”.

3.4 LUBRICATION

A. Lubricate sliding surfaces on special trackwork assemblies.

B. Clean surfaces free of foreign material before applying the lubricant in accordance with the manufacturer’s recommendations.

3.5 FIELD MAINTENANCE

A. Adjust rods for 4-3/4 inches throw at the number one rod.

B. Adjust switch rods, clips, and bearings to permit free movement of the switch points. Install shims and shim keeper plates and lubricate bearings as required for free movement.

C. Maintain and protect special trackwork materials installed prior to final acceptance.

D. Do not operate Contractor work trains or other rail-mounted equipment over special trackwork until fasteners and rails have been fully fastened and switch points have been secured.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Materials furnished by the Authority will not be measured for payment.

B. Special trackwork will be measured and paid by the Contract unit price per each, complete-in-place. Such unit price shall be considered as full compensation for work described in this section and related other sections including the materials furnished by the Contractor; transportation, storage and handling of the Authority's furnished material; and installation.

C. The “unit” length of turn outs and the “overall” length of crossovers as defined in the Contract Documents, will not be measured or paid for under the pay items for ballasted track or direct fixation track but will be paid for as part of in the Contract unit prices for special trackwork.

END OF SECTION 02459
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies constructing ballasted track on constructed trackbed to lines and grades shown. Ballasted track construction includes the following: placing ballast; distributing and lining ties; installing and field welding running rail; raising and lining track; and other incidentals as specified herein. Track on approach slabs and ballasted deck bridges is included.

B. Unless otherwise shown or specified, trackwork within the limits of ballasted special trackwork units is included in this section.

C. Timber spacers installed in stations along platform walls shall be considered incidental to ballasted track construction.

1.2 REFERENCED STANDARDS

A. American Railway Engineering and Maintenance-of-Way-Association (AREMA):

1. AREMA - “Manual for Railway Engineering” (AREMA Manual)

1.3 SUBMITTALS

A. Submit descriptions of the proposed dynamic track stabilizers, liners, and other track laying equipment. Subject the track laying equipment to inspection and acceptance by the Contracting Officer prior to and during its use.

1.4 QUALITY ASSURANCE

A. Comply with:

1. Codes and regulations of the jurisdictional authority.

2. AREMA Manual.

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIALS

A. In accordance with Exhibit D, “SPECIAL PROVISIONS”.

B. In accordance with Section 01640, “Authority-Furnished Materials and Equipment”.

2.2 CONTRACTOR FURNISHED MATERIALS

A. Furnish ballast and filter fabric.

B. Furnish all other materials and equipment required for ballasted track construction.

2.3 BALLAST

A. Provide ballast in accordance with Section 02453, “Track Ballast”.

2.4 RAIL FASTENINGS

A. Provide Pandrol Fastclip rail fasteners or approved equal for concrete ties for ballasted track and install per manufacturer’s installation instructions. Fastclip rail fasteners shall include toe insulators, 4 side post insulators, 2 rail seat pads, and 4 cast-in-place shoulders.

2.5 BONDED JOINTS

A. Provide bonded rail joints as specified in Section 02450, “General Track Construction” and Section 02457, “Bonded Joints”.

PART 3 - EXECUTION

3.1 INITIAL LAYER OF TRACK BALLAST

A. Uniformly distribute and compact an initial layer of track ballast over the finished sub-ballast before tie distribution.

B. Uniformly spread and compact each lift of ballast within the initial layer with not less than four passes of either a self-propelled, pneumatic-tired roller or vibratory compactor capable of applying a dynamic load of not less than 18,000 pounds.

C. Do not distribute track ballast over sub-ballast which has not yet been approved by the Contracting Officer.

D. Place ballast to the cross-section shown.

E. Haul and place ballast material in such a way that damage to the adjacent track areas is avoided.

F. Ballast Depth:

1. Place ballast in lifts not to exceed 4 inches in depth.

2. Bring the initial layer of compacted ballast to an elevation that will establish the track surface no higher than 4 inches below final grade.

3. Minimum depth of ballast from the bottom of tie to the top of sub-ballast: 12 inches for mainline track and 8 inches for yard track and bridges.
3.2 TIE DISTRIBUTION

A. Distribute all ties as shown on drawings.
B. Avoid unnecessary handling, reloading, and redistribution of the ties.
C. To the extent practical, unload ties in the proper position for use without further handling. Do not drop ties. Move ties using only equipment or tools suitable for moving ties.
D. Inspect ties for damage after unloading and remove ties with excessive cracking. Crack widths greater than 0.06 inches will be cause for rejection. Exposed rebar will be cause for rejection.
E. Install ties at right angles to the centerline of the track at the following spacings, center to center, plus or minus 1/4 inch:
   1. Mainline track: Concrete ties at 30 inches on center.
   2. In Highway Grade Crossing: 10 foot concrete ties at 24 inches on center.
   3. Ballast-Deck Bridges: Concrete ties at 24 inches on center.

3.3 LAYING RAIL

A. Lay, fasten, and field weld rail as specified in Section 02450, "General Track Construction".

3.4 ZERO THERMAL STRESS TEMPERATURE

A. Determine rail temperature as specified in Section 02450, "General Track Construction".
B. Fasten rail to achieve zero thermal stress at a temperature of 105 degrees F plus or minus 5 degrees F.
C. The temperature of opposite rails to be within 5 degrees F of each other.
D. The Authority will test the zero thermal stress temperature at ½ mile intervals, unless otherwise required by the Authority, using the Vortek “Verse” machine, a non-destructive test method, accurate within plus or minus 2.5 degrees F. The Authority may also employ destructive methods of testing for the actual zero stress temperature. Ballasted track outside the specified limits and the accuracy of the Verse machine (97.5 degrees F to 112.5 degrees F) shall be adjusted to conform to the specifications at no cost to the Authority. Contractor shall provide the necessary support (including labor) to perform the test.

3.5 RAIL FASTENING

A. Prior to laying rail, clean the fastener assembly contact surface to allow full bearing of the rail on the assembly.
B. Mainline Tracks:
   1. In each rail clip application, drive in a direction perpendicular to the length of the rail.
   2. Drive the two clips per fastening assembly toward each other.

3.6 FINAL BALLAST

A. Following assembly of the track, unload the ballast in the tie cribs and on the shoulders of the track structure.
B. Unload sufficient ballast to restrain the movement or buckling of track due to temperature changes.
C. Unload sufficient ballast to continue to hold the track after the surfacing raise.

3.7 TRACK SURFACING

A. Following placement of final ballast, perform track surfacing as follows:
   1. Do not perform track surfacing unless the cribs are filled with ballast.
   2. Do not perform track surfacing when the rail temperature exceeds 115 degrees F, unless otherwise approved by the Contracting Officer.
B. Perform track surfacing by an approved method which prevents undue bending of the rail or straining of the joints.
C. Perform a minimum of two surfacing lifts of the track, each lift a minimum of 1 inch and a maximum of 2-1/2 inches.
D. Restore to full bearing any ties pulled loose during surfacing operations.

3.8 BALLAST TAMPING

A. Tamping shall be done with a squeeze-vibratory type power tamper approved by the Contracting Officer. Control of the power tamper's tamping cycle shall ensure the maximum uniform compaction of ballast along the track.
B. Thoroughly tamp ballast on both sides of the tie from a point 15 inches inside the rails to the ends of the tie.
C. Do not tamp at the center of the ties outside the limits described above.

D. Tamp inside and outside both rails on each tie simultaneously.

E. Grade crossings may be temporarily tamped with lighter tampers, but shall be retamped with the production tamper after adjacent track connections are completed. The final tamping shall be performed by mechanical means before the grade crossing panels are placed.

F. Ties damaged by Contractor in any fashion by tamping of ballast shall be replaced at no cost to the Authority. The Authority will deduct the cost of the Authority-furnished tie for replacement.

3.9 FINAL SURFACING AND ALIGNMENT

A. Complete final surfacing and alignment of the track to the specified tolerances.

B. Perform rail alignment in accordance with Section 02450, “General Track Construction”.

C. Upon completion of the raising and aligning operations, fill cribs and shoulders with ballast to one inch below the base of rail. Remove any ballast touching metallic portions of the track.

D. Unless otherwise shown, extend shoulder ballast 12 inches beyond the end of ties parallel to the plane formed by the top of rails. In at-grade sections, slope shoulder ballast at 2:1 to the sub-ballast, as indicated.

3.10 BALLAST COMPACTION

A. Compact ballast with approved equipment specifically designed to dynamically stabilize the track structure.

B. Track Stabilization Equipment: Dynamic track stabilizer capable of applying stabilizing forces into the track structure at a continuous speed of 1/2 mph. The equipment shall have a proportional measuring system to accurately measure and control stabilization.

3.11 FIELD QUALITY CONTROL

A. Refer to Section 02453, “Track Ballast”, for inspection of delivered material. If material installed does not conform to specified requirements, the Contracting Officer may reject the material and no further delivery will be accepted until the deficiency is corrected.

B. Allowable Tolerances:

1. Construct surface of initial layer ballast to the following tolerances:

   a. Vertical: Within plus or minus one inch of elevation shown, with deviation not more than 1/4 inch within five feet either side of the track centerline nor more than 1/2 inch from a 16 foot straight edge, not cumulative.

   b. Horizontal: Deviation throughout the limits of the work: plus three inches, minus one inch.

2. Remove a maximum of one percent of the ties, selected at random by the Contracting Officer, in order to inspect the ballast compaction beneath the ties. Use the information to determine the variables of each piece of tamping and compaction equipment. Restore ties and ballast to the original configuration.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Materials furnished by the Authority will not be measured for payment.

B. Ballasted track construction will be measured and paid for at the Contract unit price per linear track foot for each type, complete in place. Such unit price shall be considered as full compensation for track construction described in this section and other related sections including the materials furnished by the Contractor; transportation; storage and handling of materials furnished by the Authority; and installation of all materials.

C. In areas of ballasted special trackwork, the “unit” length of the turnouts and the “overall” length of crossovers as defined in the Contract Documents, will not be measured or paid for under the pay item for ballasted track construction, but will be paid for as part of the Contract unit prices for special trackwork as specified in Section 02459. “Special Trackwork”.

END OF SECTION 02460
SECTION 02462
DIRECT FIXATION TRACK CONSTRUCTION

PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section specifies the construction of direct fixation (DF) track to the lines and grades shown. The work is comprised of the installation of track concrete (second placement as shown), direct fixation rail fasteners, rail, field welding, and other incidentals, as specified.

B. Direct fixation track construction applies to grade separation structures and other construction, as indicated.

1.2 REFERENCED STANDARDS

A. American Association of State Highway and Transportation Officials (AASHTO):
   1. AASHTO M148 - Standard Specification for Liquid Membrane-Forming Compounds for Curing Concrete

B. American Railway Engineering and Maintenance-of-Way-Association (AREMA):
   1. AREMA - "Manual for Railway Engineering" (AREMA Manual)

C. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   2. ASTM D570 - Standard Test Method for Water Absorption of Plastics

D. The Society for Protective Coatings (Formerly known as Steel Structures Painting Council) (SSPC):
   1. SSPC-SP 1 - Solvent Cleaning

1.3 SUBMITTALS

A. Installation Procedures: Prepare and submit a description of the procedures and methods to be employed in the execution of the installation of direct fixation trackwork. At a minimum, include the following:
   1. Method of laying out the work including track concrete pads, inserts, and fasteners, to result in finished track meeting the alignment requirements within the specified tolerances.

   2. Method of preparing concrete invert surfaces to obtain the specified bond to reinforced track concrete plinth.

   3. In accordance with the requirements of Sections 03100. "Concrete Formwork", 03200, "Concrete Reinforcement", and 03300, "Cast-In-Place Concrete", submit the track concrete construction procedures, including:
      a. Plinth sizes, and procedures for forming, mixing, placing, and curing of concrete.
      b. Proposed concrete materials; include packing, storing, handling, proportioning, additives, mixing, and placing details.
      c. Proposed method for measuring and controlling substrate temperature during concrete setting and curing.

   5. Details for securing the fastener inserts in the track concrete, including the following:
      a. Brand or manufacturer of each component.
      b. Proposed temperature range of the substrate for setting inserts and curing anchor material; supported by test data.
      c. Proposed wetness range for placing and curing anchor material.
      d. Proposed packing, storing, handling, proportioning, mixing, and placing details.
      e. Proposed insert cleaning and degreasing details.
      f. Proposed method for measuring and controlling substrate temperature during setting and curing of anchoring materials.

   6. Equipment and procedures for completing the insert pull-out tests as specified.

   7. Quality control procedures to ensure proper installation.

   8. Procedure for handling, installing, and field welding continuous welded rail on direct fixation track.
B. Product Data: Submit product data for bonding agent, insert anchor grout, and concrete bonding agent.

C. Mix Design: Submit concrete mix design as specified in Section 03305, "Portland Cement Concrete".

D. Certification: Certification of concrete mix design, reinforcement, and bonding agents.

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIALS

A. In accordance with Exhibit D, "SPECIAL PROVISIONS".

B. In accordance with Section 01640, "Authority-Furnished Materials and Equipment".

2.2 CONTRACTOR FURNISHED MATERIALS

A. Concrete Materials:
   1. Provide concrete formwork as specified in Section 03100, "Concrete Formwork".
   2. Provide concrete reinforcement as specified in Section 03200, "Concrete Reinforcement".
   3. Provide concrete: Mix S-3, as specified in Section 03305, "Portland Cement Concrete".

B. Bonding Agent: Provide a bonding agent free of polysulfides; resistant to acids and petroleum products; with a water absorption rate of less than one percent when tested in accordance with ASTM D570; and with a minimum tensile strength of 4000 psi when tested in accordance with ASTM D638.

C. Insert Anchor Grout: The following grouts are acceptable for use in the installation of the direct fixation insert anchorage systems. Provide one of these insert anchorage grouts, or an approved equal.
   2. FX-830 polyester resin grout: As manufactured by Fox Industries, Incorporated, Baltimore, MD 21211.
   3. Five Star ET epoxy grout or Five Star REG epoxy grout: As manufactured by U.S. Grout Corporation, Fairfield, CT 06430.

D. Shims:
   1. ASTM, A167, UNS S30400; and 1/16, 1/8, and 1/4 inch.

E. Concrete bonding agent: As proposed by Contractor and approved by Contracting Officer.

PART 3 - EXECUTION

3.1 DRAINAGE SYSTEM PROTECTION

A. Prior to the start of direct fixation track construction, proof test with a mandrel all under track drainage systems.

B. Protect track drainage systems at all times during construction. Ensure that the track drainage system is kept free of the intrusion of concrete, aggregates, grouts, oils, or other materials.

C. At the completion of direct fixation track construction, proof test all track drainage systems to demonstrate that the Contractor's operations have not plugged the drains. Clean the drainage system of all foreign materials found as a result of the post construction operations mandrel proofing.

3.2 CONCRETE FORMWORK AND REINFORCEMENT

A. Prepare concrete formwork in accordance with Section 03100, "Concrete Formwork".

B. Provide concrete reinforcement in accordance with Section 03200, "Concrete Reinforcement".

3.3 ANCHOR ASSEMBLY AND TEMPLATES

A. Install the direct fixation anchorage assembly using an approved template. Ensure that the template allows the spacing shown and that the anchorage assembly is located properly with respect to rail location, elevation, and orientation.

B. Ensure that the top of the female anchorage assembly insert is flush with, or embedded no lower than 1/32 inch below the surface of the track concrete plinth. Set the insert normal, plus or minus 1 degree, to the plane of the fastener assembly.

C. Remove oil, grease, and other foreign matter from the outside of the anchorage using a solvent, caustic degreaser, or steam cleaning in accordance with SSPC SP1.

D. Keep the anchorage clean and free of dirt, debris, and loose concrete during installation.

E. Prior to concrete placement, coat the anchorages with a bonding agent.
F. Welding or mechanically affixing anything to the anchorage or the anchorage insert is prohibited.

3.4 ALTERNATE ANCHORAGE INSTALLATION

A. Submit alternate anchorage assembly installation procedures and methods to the Contracting Officer for approval. Impact installation of anchorage assemblies on aerial structures is prohibited.

3.5 CONCRETE PLACEMENT

A. Prior to concrete placement, clean existing surfaces in accordance with the requirements of Section 03300, "Cast-In-Place Concrete".

B. Coat the surface of the existing concrete slab with concrete bonding agent in accordance with the manufacturer's recommendations.

C. Place the track plinth concrete in accordance with the requirements of Sections 03100, "Concrete Formwork", 03200, "Concrete Reinforcement", and 03300, "Cast-In-Place Concrete".

D. Utilize a stubby, 4 inch long “Shallow Slab” vibrator in placing plinths, unless otherwise approved by Contracting Officer.

3.6 CONCRETE FINISH

A. Steel trowel finish the top surface of the track plinth as described in Section 03350, "Concrete Finishing".

B. Provide form finish for other surfaces of track plinths as described in Section 03350, "Concrete Finishing".

3.7 CONCRETE TOLERANCES

A. Do not cast the plinth across any construction, expansion, or contraction joints.

B. Track Plinth (Second pour concrete) Dimensional Tolerances:
   1. Segment casting length: 54 inch long, maximum, unless approved otherwise by Contracting Officer.
   2. Spacing: 6 inches between segments, minimum.
   3. The plinth shall extend a minimum of 6 inches beyond the edge of the fasteners except where lesser space is required to provide clearance for switch rods, detector rods, and other switch machine connecting rods.
   4. Top of track plinth surface: Parallel to a plane passing through the top of both rails, and even with adjacent fastener bearing surface.

5. Cross slope variation: Not to exceed plus or minus 1/2 degrees.

6. Difference in elevation at the rail centerline at two adjacent fastener locations: Not to exceed 1/16 inch.

3.8 INSERT ASSEMBLY GROUT PLACEMENT

A. Prepare non-shrink grout in accordance with the approved manufacturer’s recommendations.

1. Clean all grout mixing equipment prior to preparing grout mix.

2. Mix only that quantity of grout which can be placed prior to initial set as determined by the manufacturer’s recommendations and existing conditions.

3. Mix grout when components achieve a temperature between 70 degrees F and 80 degrees F.

B. Grout placement temperature requirements:

1. Place grout when the surface temperature at insert assembly location is at least 50 degrees F and rising.

2. Do not place grout when the surface temperature at the insert assembly location is expected to fall below 50 degrees F within 48 hours of placement.

3. Do not place grout when insert assembly surface temperatures exceed 90 degrees F. Shade or cool insert assemblies to achieve a surface temperature at or below 90 degrees F.

C. Thoroughly clean and dry the insert assembly and the insert assembly locations using approved methods.

3.9 INSERT PULL-OUT TESTS

A. After the curing of the track concrete plinth, subject at least one anchorage assembly in every 200 installed to a restrained and an unrestrained pull-out test, as described. An indicator marker shall be installed in the field at all locations where the actual plinth pull-out tests were completed.

B. Restrained Pull-out Test:

1. Place a 6 inch by 6 inch by 1/2 inch steel plate with a 1.75 inch diameter hole in the center over the anchor bolt in an installed anchorage assembly.
2. Apply an upward vertical load of 1000 lbs. per second, against the plate, until a load of 20,000 pounds occurs; after achieving 20,000 pounds, release the load.

C. Unrestrained Pull-out Test:
1. Remove the steel plate described above.
2. Apply the upward vertical load of 1000 lbs. per second as described until a load of 10,000 pounds is achieved and release the load.
3. The test assembly shall be as described in the AREMA Fastening Uplift Test. Vol.1, Chapter 30 “Ties”, Section 2.6 Fastener

D. Record all tests, identifying each bolt location, the loads applied and the results and submit copies of the documentation to the Contracting Officer.

E. Acceptance Criteria: Restrained pull-out test: No evidence of failure by either slippage or cracking of the concrete to anchorage assembly bond before the load of 10,000 pounds is achieved.

3.10 DIRECT FIXATION FASTENER ASSEMBLY INSTALLATION

A. Ensure that the surface of the track plinth to receive the direct fixation fastener assembly is free of dirt and debris or concrete which might affect the proper setting of the assemblies.

B. Set the direct fixation fastener assemblies over the anchorage assembly insert and temporarily secure them to the track plinth.

C. Install fastener assemblies in pairs, within a tolerance of one inch, except at skewed structural joints.

D. Install fasteners at right angles to the centerline of the track, one fastener under each running rail.

E. Direct fixation fasteners shall be installed so as to permit plus or minus 1/4 inch gauge adjustment of rail at each fastener to accommodate future rail wear.

F. Install fastener assemblies spaced every 30 inches, unless otherwise shown or specified. Every 25 feet of length as measured along the rail must contain 10 fasteners.

3.11 SHIMS

A. Install shims between the direct fixation fastener assembly and the track concrete in accordance with the manufacturer’s recommendations in order to ensure proper rail line and grade.

B. Unless otherwise approved, do not chip concrete to adjust the direct fixation assembly fasteners line and grade.

3.12 LAYING CONTINUOUS WELDED RAIL (CWR)

A. Lay, fasten and field weld CWR as specified in Section 02450, "General Track Construction", and Section 02458, "Field Rail Welding".

3.13 ZERO THERMAL STRESS TEMPERATURE

A. Determine rail temperature as specified in Section 02450, "General Track Construction".

B. At-Grade and Aerial Direct Fixation Rail:
1. Install, fasten, and field weld rail in at-grade and aerial structures direct fixation track to produce zero thermal stress in rail at 85 degrees F plus 10 degrees F and minus 5 degrees F.
2. U-Wall sections are considered to be at-grade for zero thermal stress temperature if the walls are less than 30 feet high above top of rail.

C. The temperature of opposite rails to be within 5 degrees F of each other.

D. The Authority will test the zero thermal stress temperature at 1/2 mile intervals, unless otherwise required by the Authority, using the Vortek "Verse" machine, a non-destructive test method, accurate within plus or minus 2.5 degrees F. The Authority may also employ destructive methods of testing for the actual zero stress temperature. Ballasted track outside the specified limits and the accuracy of the Verse machine (97.5 degrees F to 112.5 degrees F) shall be adjusted to conform to the specifications at no cost to the Authority. Contractor shall provide the necessary support (including labor) to perform the test.

3.14 ADJUSTING RAIL

A. Bring the rail to final line with the rail bearing against the field side shoulder of the fastener.

B. Tension the anchor bolts in accordance with the approved installation procedures.

1. If power wrenches are used for tensioning, adjust them to stall or cut out at the required tension.

2. If manual torque wrenches are used, torque the bolts until the calibrated tension is achieved. Ensure that the anchor bolt is in the tightening position when the torque is measured.
3.15 FASTENING DIRECT FIXATION TRACK

A. Fully tension anchor bolts on the direct fixation fasteners prior to fastening any string of continuous welded rail.

B. Anchor CWR by applying the direct fixation rail clips in accordance with the manufacturer's recommendations and the approved installation procedures.

3.16 AERIAL DIRECT FIXATION TRACK

A. Complete the following sequence when fastening direct fixation aerial track to aerial structures:
   1. Prior to installing direct fixation track to an aerial structure, prepare for installation a minimum of 500 feet of approach track beyond each end of the aerial structure track.
   2. Install all direct fixation fasteners on the aerial structure.
   3. Place the CWR strings throughout the limits of the structure. Fasten rail on approach tracks in accordance with this section or Section 02460, "Ballasted Track Construction". Secure the resilient rail clips on every fifth fastener of the aerial structure, except on curves having radii less than 1,900 feet. Secure every third fastener on curves having radii less than 1,900 feet.
   4. Bring the track throughout the structure, including ballasted track, to the final line and surface shown or specified in accordance with the requirements of Section 02460, "Ballasted Track Construction", and as specified herein for direct fixation track.
   5. Install the remaining resilient rail clips.

3.17 FIELD WELDING IN DIRECT FIXATION TRACK

A. Perform field welding of direct fixation track in accordance with the requirements of Section 02458, "Field Rail Welding".

3.18 SPECIAL TRACKWORK

A. Install direct fixation track within the limits of special trackwork as specified in Section 02459, "Special Trackwork".

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Materials furnished by the Authority will not be measured for payment.
THIS PAGE INTENTIONALLY LEFT BLANK
SECTION 02464
CONCRETE APPROACH SLAB AND TRACK SLAB

PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies providing reinforced Portland cement concrete approach slab and track slabs.
B. Refer to Division 3, Concrete, for concrete provisions applicable to the work of this Section.

PART 2 - PRODUCTS

2.1 CONCRETE
A. Reinforcement and Corrosion Control Bonding Materials: In accordance with Section 03200, "Concrete Reinforcement".
B. Concrete Mix Design: Mix S-3, as specified in Section 03305 "Portland Cement Concrete".

PART 3 - EXECUTION

3.1 CORROSION CONTROL BONDING
A. Provide corrosion control bonding as shown and specified in Section 03200, "Concrete Reinforcement".

3.2 PROTECTION OF CONCRETE PAVEMENT
A. Obtain approval prior to permitting use of completed pavement by construction or other traffic.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL
A. Concrete in transition slab and track slab will be measured and paid for as specified in Section 03300, "Cast-In-Place Concrete".

END OF SECTION 02464
SECTION 02469
TRACK DEMOLITION AND SIGNAL EQUIPMENT REMOVAL

PART 1 - GENERAL

1.1 DESCRIPTION

A. The work covered by this section includes the dismantling, salvaging, and removal from site of certain sections of existing track, associated materials, and signal equipment, the limits of which are as indicated on the Contract Drawings.

B. Material removed and not designated to be re-used in the work or salvaged shall be disposed of by the Contractor.

C. The work shall include transportation of the signal equipment and other items designated for salvage to storage facilities designated by the Contracting Officer.

D. Refer to Section 02050, “Demolition”, for general requirements for demolition.

E. Salvage: Refer to Article entitled “Definitions” in Section 02072, “Removal and Restoration of Miscellaneous Existing Facilities”.

1.2 REFERENCE STANDARDS

A. American Railway Engineering and Maintenance-of-Way-Association (AREMA):
   1. AREMA - “Manual for Railway Engineering"
   2. AREMA - “Portfolio of Trackwork Plans"

1.3 SUBMITTALS

A. Submit the following for approval:
   1. Work plan indicating sequence of operation for dismantling, removal from site, and storage of rail, tie plates, and signal equipment.
   2. Work plan indicating sequence of operation for dismantling, removal from site, and disposal of other track materials.

1.4 QUALITY ASSURANCE

A. Comply with:
   1. Codes and regulations of the jurisdictional authority.
   2. AREMA Manual.

PART 2 - PRODUCTS

2.1 BALLAST

A. Ballast removed from line shall be disposed of in accordance with Section 02220, “Grading, Excavating, and Backfilling” except for that portion required for new ballasted freight track, as applicable.

B. Under no circumstances shall ballast removed from line be used in new light rail transit (LRT) trackwork. Ballast for new LRT trackwork shall be in accordance with Section 02453, “Track Ballast”.

PART 3 - EXECUTION

3.1 CONTRACTOR’S STORAGE YARD

A. For material and equipment removed and to be re-used in the work of the Contract, the following provisions apply in addition to those specified in Section 01500, “Temporary Facilities and Controls”, under Contractor’s Facility.

B. Provide aisle ways within the material storage yard to allow access to track material.

C. Prepare and maintain an inventory of stored material.

3.2 DISMANTLING OF TRACKWORK

A. Inspection: Coordinate removal of rail with Contracting Officer to ensure that rail lengths have been properly identified as to final disposition.

B. Dismantle trackwork on site and sort out rails and tie plates. Dismantle special trackwork only to the extent necessary for its transportation and removal from the site. Remove special trackwork completely, including throw rod, front rod, lock rod, point of detection rod, wire and cable, conduit, junction box, and mounting and fastening material. Remove bolts by hand or mechanical means unless frozen and unable to be broken loose. If frozen, bolts may be flame cut.

C. Transport designated rail and tie plates to the storage yard and place in segregated areas.

D. Stack rails on firm, level ground not more than five high. Place a minimum of four hardwood spacers, or as many as necessary to prevent bending, underneath the bottom rails and between subsequent layers of rail.

E. Carefully handle material during removal, transportation, stacking, and storage using
equipment and methods approved by the Contracting Officer. Lift rails only using antislip rail tongs which meet AREMA standards. Take precautions to prevent any damage to the rail.

3.3 DISMANTLING OF SIGNAL EQUIPMENT

A. Remove the signals completely, including supporting brackets or posts, pedestal bases, ladders, conduits, cable, and wire.

B. Remove cases completely, including mounting and fastening material, conduit, trunking, wire, and cable. At locations where track cases are to be removed, the Contractor shall remove the rail connections and track leads along with conduit. Where cases are mounted on a concrete pad by means of expansion bolts, the bolts shall be removed.

C. Remove existing messenger wire, including supporting brackets, dead-ends, insulators, brackets, hooks, clamps, bolts, and other appurtenances.

D. Remove existing junction boxes from the Worksite. The Contractor shall remove these boxes completely, including mounting and fastening materials, conduits, trunking, wire, and cable.

E. Transport signal equipment and associated materials to the storage facility designated by the Contracting Officer and place in segregated areas.

3.4 SITE CLEAN-UP

A. Remove from site and legally dispose of debris and other material resulting from the track demolition and signal equipment removal operations. Burning of any materials on site will not be permitted.

3.5 OWNERSHIP OF MATERIALS

A. Rails, standard tie plates, and material required for freight track modifications designated for salvage or re-use shall remain the property of the Authority.

B. Other rails, joint bars, spikes, bolts, associated hardware, special trackwork, grade crossing panels, other track materials, crossties, switch ties, and miscellaneous debris shall become the property of the Contractor who will be responsible for their removal from site and legal disposition.

C. Ownership of signal equipment shall be as designated on the Contract Drawings.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work of this section will not be measured but will be paid for under the Contract lump sum price for “Track Demolition and Signal Equipment Removal”.

END OF SECTION 02469
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies the installation of highway grade crossings to the lines and grades on the Contract Drawings.

B. Concrete headers for highway grade crossings are to be constructed under another contract, unless otherwise noted.

1.2 REFERENCED STANDARDS

A. American Railway Engineering and Maintenance-of-Way-Association (AREMA):
   1. AREMA - "Manual for Railway Engineering" (AREMA Manual)

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM D226 - Standard Specification for Asphalt-Saturated Organic Felt Used in Roofing and Waterproofing

C. North Central Texas Council of Governments (NCTCOG)
   1. Standard Specifications for Public Works Construction

1.3 SUBMITTALS

A. Work Plan: Submit a workplan for each grade crossing for the Contracting Officer’s approval prior to starting work. The plan shall define the Contractor’s schedule, method and sequence of construction. The workplan shall include maintenance of road traffic including detour and traffic control during construction. The workplan shall include a sketch for each grade crossing locating crossing panels with respect to the concrete headers. Workplan shall be consistent with Contract milestones and Vehicular and Pedestrian Traffic Control Plan.

B. Product Data: Joint filling, preformed joint filler, rail boot, and wood shims. Include data on proposed preservative treatment, grade, and species of wood shims. Include rail boot manufacturer’s installation instructions.

1.4 QUALITY ASSURANCE

A. Comply with codes and regulations of the jurisdictional authorities including the following:

PART 2 - PRODUCTS

2.1 GRADE CROSSINGS, GENERAL

A. Materials necessary for this completion of the work described in this Section shall comply with applicable local codes and requirements of the local jurisdictional authorities.

B. Provide hardware required for installation.

C. Track Gauge: 4 feet 8-1/2 inches, measured at right angle between the inside faces of the running rail at a point 5/8 inch below the plane defined by the top of the two rails.

D. Flangeway:
   1. Flangeway width: Absolute minimum 2-1/4 inches wide, absolute maximum 2-1/2 inches wide (including tolerance).

E. Rail Boot: To ensure that the crossing system has no rail to ground connection or rail to rail connection that will cause grounding of the rail or shunting of the track signal circuit or stray currents from the traction power supply, provide a Rail Boot as shown on the Contract Drawings.

F. Ensure that the crossing system creates no electromagnetic interferences with the Authority’s train-to-wayside signal and train control system, the vehicle propulsion and control system, or the interaction between these systems.

2.2 AUTHORITY FURNISHED MATERIALS

Not Used.

2.3 CONTRACTOR FURNISHED MATERIALS

A. Provide the following items and materials:

B. Joint Filler and Preformed Joint Filler: As shown on the Contract Drawings. Where wood shims do not occur under joint sealant, provide preformed joint filler compatible with joint sealant and approved by the Contracting Officer.

C. Bond Breaker: Asphalt Felt Type II (No. 30) in accordance with ASTM D226.

D. Geotextile Fabrics (Non-Woven Filter Fabric): Provide geotextile fabric as specified in Section 02450, "General Track Construction".

E. Bituminous Pavement Materials: Where shown, furnish bituminous concrete base pavement materials for crossings in accordance with Section 02511, "Bituminous Pavement".
F. Rail Boot System:

1. Provide a rail boot system that provides encapsulation of the running rails in grade crossings so as to isolate the rail electrically and mechanically from the surrounding pavement. Rail boot at each rail shall be continuous along length of crossing, unless otherwise approved. Rail boot size and configuration shall be compatible with Authority-furnished crossing panels.

2. Provide Pip-Fast Rail Boot System as provided by the following manufacturer or approved equal:
   a. Iron Horse Engineering Co.
      4724 Schooner Blvd.
      P.O. Box 5398
      Suffolk, VA 23435

3. The rail boot system shall consist of the following component material:
   a. A rubber “rail boot” extruded profile that fits the shape of the rail section very closely, made from a medium durometer (73), high-dielectric, thermoplastic elastomer with internal shape factor to provide vibration damping, coupled with a minimum volume resistivity of 1x10^{12} ohm-centimeter when tested by soaking 7 days in a saturated NaCl solution. The elastomer shall be impervious to salts, fuels and weather extremes.
   b. Rubber “joining cuffs” shaped to fit the outside profile of the rail boot, used to make water and electrically-tight joints in the boot, usually located at field welds or where boot lengths end.
   c. Butyl sealant, as required by the rail boot manufacturer, to bond and seal the overlap joints between the boots and joining cuffs.
   d. Crumb-rubber/polyurethane resilient grout as required by the rail boot manufacturer for use to fill the void area between the ends of the rail boots, inside the joining cuffs, to prevent any intrusion of water and to prevent sharp weld projections from cutting the cuffs.
   e. Special, non-conductive “duct” tape to hold and seal the rail boot and joining cuffs to the ball of the rail, holding the rubber items tight to the rail profile and preventing the ingress during construction or use a reusable, resilient plastic profile which fits over the boot, holding and sealing it without duct tape.

G. Grade Crossing Panels: Provide grade crossing panels as specified in Section 02476, “Grade Crossing Panels”.

PART 3 - EXECUTION

3.1 GENERAL

A. In addition to the requirements specified herein, installation shall comply with the applicable local codes and requirements of the local jurisdictional authorities.

3.2 INSTALLATION

A. Construct grade crossings to the lines and grades indicated and in accordance with the requirements of AREMA Manual, Chapter 5, “Track”, Part 8 Section 8, Highway/Railway Grade Crossings, except as modified herein.

B. Install ballasted track in accordance with Section 02460, “Ballasted Track Construction”, and approved for alignment and profile by the Contracting Officer. No mechanical hand tampers will be permitted for compaction of ballast in grade crossings.

C. Install 10 foot long crossties at correct position and spacing to satisfy the requirements of the headers, grade crossing panels, and fasteners.

D. Install rail boot in conjunction with rail installation in accordance with rail boot manufacturer’s instructions.

E. Install geotextile fabric where indicated on the Contract Drawings extending to the indicated limits in accordance with the manufacturer’s instructions. Protect geotextile fabrics from puncture throughout construction.

F. Install the crossing panels in accordance with the manufacturer’s instructions and the approved installation procedure.
   1. Respace or replace ties, as necessary, to provide ties at the locations and spacing required by the crossing manufacturer.

G. Phased Construction: During phased construction of a grade crossing, construct temporary roadway consisting of 6 inch thick temporary pavement in accordance with Section 02511, “Bituminous Pavement”. Base course shall consist of compacted ballast in accordance with Section 02453, “Ballast”. Place bituminous pavement on top of two layers of bond breaker placed on top of compacted ballast. Protect concrete.

H. At the time of track installation, remove bituminous pavement and bond breaker (either temporary roadway specified herein or bituminous pavement
installed by others under previous contract). Remove and stockpile for later use sufficient ballast to install ties, rail, and fasteners 2 inches below the finished road surface. Surface and tamp to finished grade prior to installing panels.

3.3 FIELD QUALITY CONTROL
   A. Concrete Crossing Panel Installation: Arrange through the Contracting Officer for the presence of a manufacturer’s representative during installation of the crossings installed under this contract, to supervise and assist in the installation process.

3.4 SUB-BALLAST
   A. On each end of pre-ballasted cross section, check previously placed sub-ballast for grade and crown with templates and straightedges for compliance with tolerances specified Section 02451, “Sub-Ballast”.
   B. Correct deficiencies in grade, contour, and compaction.
   C. Sub-ballast may not be left high.
   D. Prior to subsequent operations, roll sub-ballast with suitable power roller.
   E. Obtain approval of sub-ballast prior to placing ballast.

3.5 PROTECTION
   A. Obtain approval prior to permitting use of completed highway grade crossing by construction or other traffic.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL
   A. Highway grade crossing will be measured and paid for at the Contract unit price for each location per track foot, complete-in-place.
   B. No separate measurement or payment will be made for joint filler, rail boot, transportation, and storage, and other work specified in this section.
   C. Removal, and disposal of temporary roadway is incidental to highway grade crossing construction and no separate measurement or payment will be made.

END OF SECTION 02470
SECTION 02471
HIGHWAY GRADE CROSSINGS - CIVIL WORK

PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies the installation of highway grade crossings to the lines and grades shown on the Contract Drawings. This section does not include installation of trackwork and crossing panels.

B. Highway grade crossing specified herein includes concrete headers, associated concrete pavement, sub-ballast, and ballast. Includes bituminous pavement roadway to accommodate use of highway crossing by public or construction traffic prior to installation of trackwork and crossing panels.

1.2 REFERENCE STANDARDS

A. American Association of State Highway and Transportation Officials (AASHTO):
   1. AASHTO M81 - Standard Specification for Cut-Back Asphalt (Rapid-Curing Type)
   2. AASHTO M194 - Standard Specification for Chemical Admixtures for Concrete

B. American Railway Engineering and Maintenance-of-Way-Association (AREMA):
   1. AREMA - "Manual for Railway Engineering" (AREMA Manual)

C. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM C78 - Standard Test Method for Flexural Strength of Concrete (Using Simple Beam with Third-Point Loading)
   2. ASTM D226 - Standard Specification for Asphalt-Saturated Organic Felt Used in Roofing and Waterproofing

D. Standard Specifications for Public Works Construction, North Central Texas Council of Governments, as revised

1.3 SUBMITTALS

A. Work Plan: Submit a work plan for each grade crossing for the Contracting Officer’s approval prior to starting work. The plan shall define the Contractor’s schedule, method and sequence of construction, including coordination of the installation of other elements within the crossing area, i.e., utilities, conduits, signal foundations, Workplan shall include maintenance of road traffic including detour and traffic control during construction. Workplan shall be consistent with Contract milestones and as specified in Section 01570, “Maintenance and Control of Traffic”.

B. Shop Drawings: Submit shop drawings showing layout of contraction, and expansion joints.

C. Product Data: Submit product data on joint filler and accessories.

D. Make submittals in accordance with the requirements specified in Section 03305, “Portland Cement Concrete”, including design mixes.

1.4 QUALITY ASSURANCE

A. Concrete: Conform to quality assurance requirements as specified in Section 03305, “Portland Cement Concrete”, and this section.

B. Testing: Subject concrete for slab and header to test procedures specified in Section 03305, “Portland Cement Concrete”.

C. Comply with codes and regulations of the jurisdictional authorities including the following:

PART 2 - PRODUCTS

2.1 GRADE CROSSINGS, GENERAL

A. Materials necessary for this completion of the work described in this Section shall comply with the applicable local codes and requirements of the local jurisdictional authorities.

2.2 MATERIALS

A. Concrete: Provide concrete Mix S-7 in accordance with Section 03305, “Portland Cement Concrete”.

B. Reinforcement: In accordance with Section 03200, “Concrete Reinforcement”.

C. Bituminous Paint: In accordance with AASHTO M81, Grade RC-250.

E. Underdrain Pipe: In accordance with Section 02700, "Storm Sewer Systems".

F. Bond Breaker: Asphalt Felt Type II (No. 30) in accordance with ASTM D226.

G. Base for Pavement: Where shown, furnish base material in accordance with Section 02230, "Base for Pavements".

H. Bituminous Pavement Materials: Where shown, furnish bituminous concrete base pavement materials for crossings in accordance with Section 02511, "Bituminous Pavement".

I. Sub-ballast: In accordance with Section 02451, "Sub-Ballast".

J. Ballast: In accordance with Section 02453, "Track Ballast".

K. Lime: In accordance with Section 02243, "Soil Stabilization: Lime Treatment".

L. Geotextile Fabric: In accordance with Section 02700, "Storm Sewer Systems". Application Type: Erosion Protection.

PART 3 - EXECUTION

3.1 GENERAL

A. In addition to the requirements specified herein, comply with the applicable local codes and requirements of the local jurisdictional authorities shall be used.

3.2 INSTALLATION

A. Construct grade crossings to the lines and grades indicated and in accordance with the requirements of AREMA Manual, Chapter 5, Section 8, "Highway - Railway Crossings", except as modified herein.

B. Compact subgrade and subgrade fill material as shown on Contract Drawings and in accordance with Section 02220, "Grading, Excavating, and Backfilling". Stake centerline of each track for 500 feet in each direction. Set offsets from the centerlines for the track sides of the concrete headers. Set grade stakes for each edge of pavement at each header location. Notify the Contracting Officer seven days in advance so that verification of line and grade can be confirmed before concrete is placed.

C. Perform soil stabilization where indicated on Contract Drawings.

D. Construct concrete headers and concrete slabs which form a part of highway grade crossing as shown on Contract Drawings. Apply one coat of bituminous paint to concrete contact areas of abutting structures and previously placed slabs.

E. Install sub-ballast in accordance with Section 02451, "Sub-Ballast".

F. Install underdrain to the lines and grades shown on the Contract Drawings and in accordance with Section 02700, "Storm Sewer Systems".

G. Install geotextile fabric extending to the indicated limits in accordance with manufacturer's instructions, prior to installation of ballast. Protect geotextile fabric from puncture throughout construction.

H. Install base course of compacted ballast in accordance with Section 02460, "Ballasted Track Construction". Construct 6 inch thick pavement in accordance with Section 02511, "Bituminous Pavement", on top of two layers of bond breaker material.

3.3 JOINTS

A. Joints: Construct in compliance with NCTCOG Standard Specifications for Concrete Pavements.

3.4 REINFORCEMENT

A. Place reinforcement as shown and in accordance with Section 03200, "Concrete Reinforcement".

B. Provide corrosion control bonding as shown and specified in Section 03200, "Concrete Reinforcement".

3.5 CONCRETE

A. Place, finish, and cure Portland cement concrete as specified in Section 03300, "Cast-In-Place Concrete".

3.6 FIELD QUALITY CONTROL

A. Concrete:

1. Straightedges and Templates: In accordance with Article 3.1 of this section.

2. Allowable Tolerances:

   a. Horizontal: plus or minus 1/8 inch.

   b. Vertical: plus or minus 1/8 inch.
3. Perform the following testing in addition to the testing required under Section 03305, “Portland Cement Concrete”. Test Cores:
   a. Provide test cores, four inches in diameter for testing from locations as directed.
   b. Number of cores: One core minimum per 1,000 square yards or fraction thereof of concrete surface with a minimum of two cores per discontinuous segment. Where deficient surface is discovered, take additional cores as directed.
   c. Repair core holes with specified concrete.

3.7 PROTECTION OF CONCRETE PAVEMENT

   A. Obtain approval prior to permitting use of completed pavement by construction or other traffic.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

   A. Highway grade crossing will be measured and paid for at the Contract unit price for each location by track foot, complete-in-place.

   B. No separate measurement or payment will be made for excavation, lime stabilization, subgrade compaction, concrete header, concrete slab, furnishing and installing base, sub-ballast, geotextile fabric, and ballast, transportation, storage, and handling of Authority furnished materials and other work specified in this section, but will be considered included in the Contract unit price for highway grade crossing.

   C. Installation of temporary roadway is incidental to highway grade crossing and no separate measurement will be made.

   D. Underdrain, including its geotextile fabric and filter material, will be measured and paid for in accordance with Section 02700, “Storm Sewer Systems”.

END OF SECTION 02471
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies the furnishing and installation of concrete pedestrian crossings in stations, to the lines and grades shown on the Contract drawings.

B. The Contractor shall furnish labor, tools, materials, equipment, facilities, incidentals, and transportation to manufacture, ship, deliver, unload, and install.

C. Concrete pedestrian crossing panels shall consist of new, precast full depth modular, gauge and field panels, and associated anchoring and other hardware necessary for a complete installation without field modifications.

1.2 REFERENCE STANDARDS

A. American Concrete Institute (ACI):
   1. ACI SP-66 - ACI Detailing Manual
   2. ACI 308 - Standard Practice for Curing Concrete
   3. ACI 318 - Building Code Requirements for Structural Concrete

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM C39/C39M - Standard Test Method for Compressive Strength of Cylindrical Concrete Specimens
   2. ASTM D257 - Standard Test Methods for DC Resistance or Conductance of Insulating Materials

C. American Railway Engineering and Maintenance-of-Way-Association (AREMA):
   1. AREMA - "Manual for Railway Engineering" (AREMA Manual)
   2. AREMA - "General Specifications for Highway Grade Crossings Over Railroad Tracks"

D. Concrete Reinforcing Steel Institute (CRSI):
   1. CRSI DA4 - Manual of Standard Practice

E. Precast/Prestressed Concrete Institute (PCI):
   1. PCI/CONCRT MNL-117 - Manual for Quality Control for Plants and Production of Architectural Precast Concrete Products
   2. PCI/CONCRT MNL-119 - Drafting Handbook - Precast and Prestressed Concrete

1.3 QUALITY ASSURANCE

A. Precast Unit Design: The precast units shall be proportioned to resist in-place service loading conditions. Analyze the units for stresses resulting from traffic, fabrication, handling, shipping, storage, erection, connection to the supporting structure, vibrations from the light rail transit (LRT) vehicle during operation, and temperature changes. Select the concrete strength, reinforcement, and lifting devices and procedures necessary to provide precast units conforming to requirements shown and specified.

B. Concrete Sampling and Testing: Fresh concrete used in the work shall be sampled and tested by the testing laboratory using technicians certified by the American Concrete Institute to determine its acceptability as required by ACI 318 and to demonstrate general conformance with specified properties as follows:
   1. Compressive Strength Test: ASTM C39; one specimen tested 7 days, two at 28 days, and one retained in reserve for later testing if required. When frequency of testing will provide less than five strength tests for a given class of concrete, testing shall be conducted from at least five randomly selected batches or from each batch if fewer than five are used.

   2. Notify the Contracting Officer prior to casting and testing cylinders. Contracting Officer's representative shall be present at the time of casting test cylinders and also shall be present during testing of the cylinders.

1.4 SUBMITTALS

A. Shop Drawings: Submit shop drawings and calculations to the Contracting Officer for approval. Include detailed information concerning installation and layout details for each crossing. Design calculations shall be certified by a registered Professional Engineer.

B. Prepare drawings in accordance with PCI/CONCRT MNL-119, ACI SP66, and CRSI DA4.
Include details of form fabrication, profiles, joints, reinforcing steel, clips, anchors, inserts, reglets, lifting devices, openings, connection to other work and placement, and erection sequence.

C. Product Data: Submit product data on elastomeric material, flangeway filler material, rail boot system, and wood. Include data on proposed preservative treatment, grade, and species.

D. Certification: Provide certification of compliance with requirements as specified herein.

E. Schedule: Submit a manufacturing, curing, testing, delivery, storage, and installation schedule for crossing panels. Arrange for the in-plant inspection of sampling, testing, and other quality control activities. Advise the Contracting Officer of any changes in the schedule as the work progresses.

F. Sample: Submit a color panel sample.

PART 2 - PRODUCTS

2.1 GENERAL

A. Furnish concrete pedestrian crossing panels with associated installation hardware, including rail boot and any specialized hardware, such as rail clips or insulators, and specialized materials, such as dielectric tape, boot cuffs, sealants, cements.

B. Joint Sealant: Furnish joint sealant as shown on the Contract Drawings and in accordance with Section 07900, "Seals and Sealants".

2.2 PEDESTRIAN CROSSING PANELS

A. Provide crossing panels, elastomeric material, rail boot, and associated hardware required for installation on concrete crossties, spaced on 30 inch centers as shown on Contract Drawing. Crossing panels shall conform to the concrete tie configuration of the Authority and provide an adequate envelope for the fastening system.

B. Provide panels in 10 foot lengths. Crossing panels shall be fully clad with galvanized steel angles on the perimeter of the top surface. Angles shall be sized and anchored to the panel to prevent breakage or cracking during installation and removal of the panels, and related track.

C. Provide crossing panels which fit without field modifications and which are supported on concrete ties without modifications to the ties.

D. Provide crossing panels having been manufactured by a company who has been in production of the panels for similar use for at least two years.

E. Provide crossing panels, which will accommodate a track gauge of 4 feet 8-1/2 inches, measured horizontally between the inside faces of the running rail at a point 5/8 inch below the plane defined by the top of the two rails.

F. Provide crossing panels which will accommodate:

1. A flangeway width of 2-1/4 inches wide absolute minimum; 2-1/2 inches wide absolute maximum (including tolerance).

2. A flangeway depth of 1-3/4 inches.

G. Ensure that the crossing panels have no rail to ground connection or rail to rail connection that will cause grounding of the rail or shunting of the track signal circuit or stray currents from the traction power supply.

H. Crossing Panel Configuration:

1. Crossing panels shall be new, prefabricated modular panels without modifications to design shown on the Standard Drawings, except those approved as necessary to accommodate the Rail Boot. Fastening systems for installation of crossing panels that require either anchor bolts cast in concrete ties or u-bolts that require removal of ballast under concrete tie are not permitted.

2. The running surface of each panel, when installed, shall be 1/8 inch below the top of rail.

3. Crossing panels shall fit without field modifications.

4. Crossing panels shall be designed to allow for quick and easy removal and reinstallation without causing damage to the crossing system itself and without requiring any equipment other than hand tools.

I. Crossing Panel Components: Crossing panels shall be furnished with associated hardware necessary for complete installation including

1. The crossing panels and fasteners necessary for attaching the panels to concrete ties in accordance with manufacturer’s specifications and recommendations.

2. End plates with metal tapered ends or other approved means to close off each end of
the crossing to prevent dragging equipment from damaging the crossing material.

3. Manufactured hardware to attach end plates to the crossing system.

4. Plugs to cover each installation hook hole engineered for a tight, flush fit with the panel's exposed surface.

J. Elastomeric Material:

1. Elastomer used for pedestrian crossing panels shall have a maximum water absorption of 1 percent by weight after twenty-four hours immersion in water as measured in accordance with ASTM D570.

2. Elastomer used for pedestrian crossing panels shall have a minimum volume resistivity of $1 \times 10^{12}$ ohm-centimeters after twenty-four hours immersion in potable water measured in accordance with ASTM D257.

K. Flangeway Filler Material. The material shall have a minimum volume resistivity of $1 \times 10^2$ ohm-centimeters and water absorption of not more than 1 percent along with suitable wearing characteristics.

L. Rail Boot System:

1. Provide a rail boot system that provides encapsulation of the running rails in grade crossings so as to isolate the rail electrically and mechanically from the surrounding pavement. Rail boot at each rail shall be continuous along length of pedestrian crossing, unless otherwise approved.

2. Provide Pip-Fast Rail Boot System as provided by the following manufacturer or approved equal:
   a. Iron Horse Engineering Co.
      4724 Schooner Blvd.
      P.O. Box 5398
      Suffolk, VA 23435
   b. Rubber "joining cuffs" shaped to fit the outside profile of the rail boot, used to make water and electrically-tight joints in the boot, usually located at field welds or where boot lengths end.
   c. Butyl sealant, as required by the rail boot manufacturer, to bond and seal the overlap joints between the boots and joining cuffs.
   d. Crumb-rubber/polyurethane resilient grout as required by the rail boot manufacturer for use to fill the void area between the ends of the rail boots, inside the joining cuffs, to prevent any intrusion of water and to prevent sharp weld projections from cutting the cuffs.
   e. Special, non-conductive "duct" tape to hold and seal the rail boot and joining cuffs to the ball of the rail, holding the rubber items tight to the rail profile and preventing the ingress during construction or use of a reusable, resilient plastic profile which fits over the boot, holding and sealing it without duct tape.

2.3 TIMBER SPACER

A. Pressure preservative treated wood, treat after fabrication.

B. Preservative treatment for cut ends and drilled holes: As specified in Section 06100, "Rough Carpentry".

2.4 MANUFACTURE

A. Fabrication:

1. Formwork: Accurately construct forms, mortar-tight, and of sufficient strength to withstand pressures resulting from concrete placing operations and temperature changes. Maintain formwork to provide completed precast concrete units of shapes, lines, and dimensions indicated in Contract plans.

3. Surface Finishes: Provide exposed surface finishes for precast units as specified herein.
   a. Surface Finish: Finish shall be light sandblast as described in Section 03350 “Concrete Finishing”. Provide surfaces free of pockets, streaks, and honeycomb, with uniform color and texture to match approved control sample. Penetrating type surface sealer shall be applied to surface finish.
   b. Unexposed surfaces shall have a formed or float finish.

4. Curing: Liquid membrane curing compound shall not be applied to surfaces which will be sealed or painted. Follow recommendations in ACI 308 and PCI/CONCRTMNL-117.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Do not install pedestrian crossing panels until the track has been accepted by the Contracting Officer for line and surface. Verify proper horizontal and vertical dimensions between tracks and station platforms before installation. Assure that the vertical offset between crossing panels and station platform warning strips at end crossings does not exceed 1/4 inch and that the offset at the center crossing is 8 inches, plus or minus 1/4 inch.

B. Construct pedestrian crossings to the lines and grades indicated and in accordance with the requirements of AREMA, “General Specifications for Highway Grade Crossings Over Railroad Tracks”, except as modified herein.

C. Verify that ballasted track has been installed in accordance with the Specifications and approved for alignment and profile by the Contracting Officer.

D. Verify that crossties are of correct length, position, and spacing to satisfy the requirements of the pedestrian crossing panels and fasteners. Correct any deficiencies prior to proceeding with pedestrian crossing installation.

E. Install the concrete crossing panels in accordance with the approved installation procedure.

1. Install Rail Boots in accordance with the manufacturer’s instructions and the approved installation procedure.

2. Install expansion joints and flangeway filler material.

3. Install joint sealant between crossing panels and the station platforms as required and in accordance with Section 07900, “Seals and Sealants”.

4. Use fasteners and abrasion pads.

F. Install joint sealant between adjacent crossing panels as required to maintain a watertight surface.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Pedestrian crossings in stations will not be measured, but will be paid for at the Contract lump price, complete-in-place.

B. No separate measurement will be made for concrete pedestrian crossing panels, elastomeric material, joint sealant, and all other related work specified in this section and shown on the plans.

END OF SECTION 02473
PART 1 - GENERAL

1.1 DESCRIPTION

A. Contractor shall furnish all labor, tools, materials, equipment, facilities, incidentals and transportation, to manufacture, test, ship, deliver and place into storage.

B. Grade crossing panels shall be precast concrete panels.

C. Grade crossing panels shall consist of new, full depth modular gauge and field panels and all associated hardware and fastenings necessary for a complete installation without field modifications or additional materials.

1.2 REFERENCED STANDARDS

A. American Railway Engineering and Maintenance-of-Way-Association (AREMA):

1. AREMA - "Manual for Railway Engineering" (AREMA Manual)

B. American Association of State Highway and Transportation Officials (AASHTO)

C. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

2. ASTM A615 - Standard Specification for Deformed and Plain Billet-Steel Bars for Concrete Reinforcement.
10. ASTM D2000 - Classification System for Rubber Products in Automotive Applications.
12. ASTM E329 - Standard Recommended Practice for Inspection and Testing Agencies for Concrete, Steel, and Bituminous Materials as Used in Construction.

D. American Concrete Institute (ACI):

1. ACI SP-66 - ACI Detailing Manual
2. ACI 308.1 - Standard Specification for Curing Concrete
3. ACI 318/318R - Building Code Requirements for Structural Concrete (ACI 318) and Commentary (ACI 318R)

E. Precast/Prestressed Concrete Institute (PCI):

1. PCI/CONCRT MNL-116 - Manual for Quality Control for Plants and Production of Structural Precast Concrete Products
2. PCI/CONCRT MNL-119 - Drafting Handbook - Precast and Prestressed Concrete

F. Concrete Reinforcing Steel Institute (CRSI):

1. CRSI DA4 - Manual of Standard Practice

1.3 SUBMITTALS

A. Shop Drawings: Submit 1 reproducible and 2 legible copies of shop drawings and calculations to the Contracting Officer for approval. Include detailed information concerning installation and layout details for each crossing.

B. Certification: Provide certification of compliance with requirements as specified herein.

C. For concrete Grade Crossing Panels: Prepare shop drawings in accordance with PCI/CONCRT MNL-119, ACI SP66, and CRSI DA4. Include details of form fabrication, profiles, joints, reinforcing steel, clips, anchors, inserts, ringlets, lifting devices, openings, connection to other work and placement, and erection sequence.

D. Calculations: The precast units have been proportioned to resist in-place service loading conditions only. Using the services of a registered Professional Structural Engineer experienced in...
precast concrete design, analyze the units for stresses resulting from all grade crossing traffic, fabrication, handling, shipping, storage, erection, connection to the supporting structure, vibrations from the Authority's selected Light Rail Transit vehicle during operation, and temperature changes. Select the concrete strength, reinforcement, and lifting devices and procedures necessary to provide precast units conforming to requirements shown and specified. Maintain general design concept shown without increasing or decreasing sizes of members or altering profiles or alignment. Provide complete design calculations and drawings prepared and sealed by a Professional Structural Engineer.

E. The manufacturer of the grade crossing panels shall provide detailed installation procedures and recommendations for the contractor's use.

F. Submit Quality Assurance Program Manual as described in Article 1.4, below. The manual shall fully describe the Quality Assurance Program and provide the means for its implementation.

1.4. QUALITY ASSURANCE

A. Manufacturer's Qualifications for concrete Grade Crossing Panels: Successful experience in the fabrication of precast concrete grade crossing systems manufactured for similar applications and have been successfully used in the United States for the last 2 years by a class one railroad or transit agency in a highway or city street environment.

B. Quality Control shall be in conformance with the requirements of PCI MNL-116, current edition. The supplier shall establish, implement and maintain a Quality Assurance program according to the requirements of this standard.

C. Concrete Sampling and Testing: Fresh concrete used in the work shall be sampled and tested by the testing laboratory using technicians certified by the American Concrete Institute to determine its acceptability as required by ACI 318 and to demonstrate general conformance with specified properties as follows:

1. Compressive Strength Test: ASTM C39/C39M; one specimen tested at 7 days, two at 28 days, and one retained in reserve for later testing if required. When frequency of testing will provide less than 5 strength tests for a given class of concrete, testing shall be conducted from at least 5 selected batches or from each batch if fewer than 5 are used.

2. Contracting Officer's representative may be present at the time of casting all test cylinders and also may be present during testing of the cylinders.

D. Calculations: Design calculations shall be certified by a registered Professional Engineer.

E. Guarantees, Warranties, and Bonds: Furnish one executed original and three copies.

1.5 SHOP INSPECTION

A. Provide the Contracting Officer free entry at all times to the manufacturer's shop to inspect the processing and manufacture of the grade crossing panels and accessories while work under this Contract is being performed. Have the manufacturer, at no additional cost to the Authority, provide the Contracting Officer with all labor, machinery, material, tools, and equipment necessary to prepare test specimens to satisfy the Contracting Officer that the fabrication of the grade crossing panels is being performed and accessories are being furnished in accordance with these specifications.

B. In-Shop Inspection: Schedule in-shop inspections at a time agreeable to the Contracting Officer. Provide the inspection schedule to the Contracting Officer at least 30 days in advance of the initial in-shop inspection and 10 days in advance of subsequent in-shop inspections.

1.6 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Deliver grade crossing panels to the Worksite in such quantities and at such time to assure continuity of installation.

B. Store and handle units at the Worksite in such a manner to prevent cracking, chipping, distorting, warping, or other physical damage. Lift and support units only at designated lifting or supporting points as shown on approved shop drawings.

PART 2 - PRODUCTS

2.1 GRADE CROSSING PANELS, GENERAL

A. Provide grade crossing panel material and associated hardware required for installation on 10 feet 0 inch concrete crossties spaced on 24 inch centers unless otherwise shown on the contract drawings. Concrete grade crossing panels shall be manufactured for special trackwork areas to ensure ends of panels are positioned over the centerline of concrete ties as shown on the contract documents. Grade crossing panels shall conform to and provide an envelope for the fastening system.

B. Provide grade crossing panels that facilitate easy removal and reinstallation without causing damage to the system. Maximum grade crossing panel lengths shall be 12 feet and minimum grade
crossing panel length shall be 8 feet unless otherwise specified on the Contract Drawings.

C. Track Gauge: 4 feet 8-1/2 inches, measured horizontally between the inside faces of the running rail at a point 5/8 inch below the plane defined by the top of the two rails. Restraining Rail Gauge: 4 feet 3-3/4 inches, measured horizontally between the inside face of the running rail and restraining rail at a point 5/8 inch below the plane defined by the top of the two rails.

D. Field grade crossing panels shall conform to the spacing of the concrete headers as shown on the drawings, providing a stabilized, movement free installation. Where concrete headers are not shown on drawings, provide gauge and field panel lengths as shown on the Grade Crossing Summary drawing.

E. Flangeway:
   1. Flangeway Width: Minimum 2-1/4 inches wide; maximum 2-1/2 inches wide.

F. Grade crossing panels are to be designed to withstand the following service conditions as per ACI, AASHTO and AREMA requirements:
   1. Light rail train speeds to 65 mph.
   2. Truck and auto speeds to 55 mph.
   3. Truck loading HS-20.
   4. Service life of 25 years.
   5. Portions of individual crossings will be used for pedestrian traffic and must have a safe walking surface.
   6. Design detailing shall be similar to illustration on attached BNSF/UP Common Standard Drawing No. 200302.

G. To ensure that the grade crossing panels have no rail to ground connection or rail to rail connection that will cause grounding of the rail or shunting of the track signal circuit or stray currents from the traction power supply, a Rail Boot shall be used. Grade crossing panels shall be designed to accommodate the installation of the Rail Boots.

H. Panels shall have minimum frame cladding as shown on the Contract Drawings.

I. End cladding angles for gauge panels shall have a 3 inch gap minimum to improve shunt resistance. Non-conductive spacer is to be attached to the gauge frame.

J. Contractor shall coordinate manufacture of all grade crossing panels within special trackwork areas to conform to tie layout and special trackwork components, i.e., frogs, guardrails and restraining rails as shown on the Contract Documents.

K. Contractor shall manufacture all materials necessary for special trackwork areas to provide complete coverage of the track structure within the grade crossing limits while conforming to specifications described herein.

2.2 PRE-CAST CONCRETE GRADE CROSSING PANELS

A. Furnish grade crossing panels fabricated of a precast, full depth concrete design capable of withstand: temperatures of 20 degrees F to plus 150 degrees F; degradation from oxidation, water, alkali, petroleum products, synthetic lubricants, and sunlight without having detrimental effect on the performance of the crossing. Grade crossing panel design shall be able to withstand the rigors of installation and re-installation including the application of fasteners and accessories without breaking, cracking, or any other detrimental effect on the performance of the grade crossing panels.

B. Design of Precast Concrete Grade Crossing Panels:
   1. Concrete Materials:
      a. Portland Cement:
         1) ASTM C150, Type II or Type III, low alkali (having not more than 0.60 percent alkali content per Table 1A, “Optional Chemical Requirements).
         2) Use only one brand, type, and source of supply of cement, unless noted otherwise.
      b. Aggregates:
         1) Coarse aggregate for mixes is to conform with ASTM C33; hard, durable, selected, and graded; free of material that causes staining or reacting with cement.
         2) Fine aggregate for mixes is to conform with ASTM C33; manufactured sand of same material as coarse aggregates, unless
GRADE CROSSING PANELS

approved otherwise by the Contracting Officer.

c. Water: Potable, free from foreign materials in amounts harmful to concrete and embedded steel.

C. Proportioning and Design of Concrete Mixes:

1. Design mixes are to be certified by an independent testing facility or by qualified precast manufacturing plant personnel, at precast fabricator's option.

2. Proportion mixes by either laboratory trial batch or field experience methods, using materials to be utilized on the project for each type of concrete required, complying with ACI 318.

3. Compressive strength: 6000 psi at 28 days minimum, 2500 psi minimum before removing from forms and 4000 psi minimum before shipment.

4. Total air content: Not less than 5 percent or more than 7 percent.

5. Slump of concrete shall not exceed 3 inches unless approved by the Contracting Officer.

6. Maximum water-cement ratio shall not exceed 0.45 (by weight).

7. Minimum cement content shall be 650 pounds per cubic yard.

8. Adjustment to concrete mixes: Mix design adjustments may be requested when characteristics of materials, job conditions, weather, test results, or other circumstances warrant. Laboratory test data for revised mix designs and strength results shall be submitted to and approved by the Contracting Officer before using in the work.

9. Use air-entraining admixtures in strict compliance with manufacturer's instructions. Admixtures to increase cement dispersion or provide increased workability for low-slump concrete may be used subject to the approval of the Contracting Officer.

10. Use admixtures in conformance with manufacturer's recommendations for climatic conditions prevailing at time of placing. Adjust quantities of admixtures as required to maintain quality control.

D. Reinforcement:

1. Structural steel shall conform to ASTM A36/A36M specifications.

2. Reinforcing steel shall conform to ASTM A615 specifications and shall meet Grade 60 requirements.

3. High Strength Prestressing wire, standard in some panel systems, is acceptable.

E. Grade Crossing Panel Configuration:

1. Grade crossing panels shall be new, prefabricated modular panels without modifications to standard design, except those approved as necessary to accommodate the rail fasteners, the Rail Boots and special trackwork components. Fastening systems for installation of grade crossing panels, that require either anchor bolts cast in concrete ties or u-bolts that require removal of ballast under concrete ties are not permitted.

2. The running surface of each panel, when installed, shall be 1/8 inch below the top of rail.

3. Grade crossing panels shall fit without field modifications.

4. Grade crossing panels shall be designed to allow for quick and easy removal and re-installation without causing damage to the crossing system itself.

5. Neither removal or re-installation of the grade crossing panels shall require additional materials, other than required sealers or fillers.

6. Panels shall be field welded with a minimum 2 inch weld in accordance with Section 02458, “Field Rail Welding”, to prevent movement.

F. Grade Crossing Panel Components: Grade crossing panels shall be furnished with all associated hardware, as required, necessary for complete installation including:

1. The grade crossing panels in accordance with manufacturer's specifications and recommendations.

2. End plates with tapered ends or other approved means to close off each end of the crossing to prevent dragging equipment along the track from damaging the crossing material.
3. Manufactured hardware to attach end plates to the crossing system, as required, depending on the system provided.

4. Elastomeric shims to support grade crossing panels over concrete ties shall be provided.

5. Continuous one piece rubber boot with internal shape factor, high dielectric strength extending a minimum of 8 inches past each end of grade crossing panels.

2.4 MANUFACTURE

A. Fabrication: Grade crossing panels shall be manufactured to match the centerline track radius as required for crossings which are in spirals and curves.

B. Fabrication of Concrete Grade Crossing Panels:

1. Formwork: Accurately construct forms, mortar-tight, and of sufficient strength to withstand pressures resulting from concrete placing operations and temperature changes. Maintain formwork to provide completed precast concrete units of shapes, lines, and dimensions indicated in plans attached herewith within specified fabrication tolerances.

2. Consolidating:

a. Concrete shall be thoroughly consolidated by vibration during placement, and shall be thoroughly worked around the prestressing tendons, embedded inserts, and into corners of the forms. Consolidate concrete to the requirements of ACI 309R.

b. External form vibration, internal concrete vibration, or a combination of both shall be used to obtain uniform mix, and shall be sufficient to yield concrete with a density of not less than 143 pounds per cubic foot.

c. Forms shall not be damaged during consolidation.

3. Surface Finishes: Provide exposed surface finishes for precast units as specified herein.

a. Textured Surface Finish: Finish shall be skid resistant with broom finish perpendicular to the main traffic route. Provide surfaces free of pockets, streaks, and honeycomb, with uniform texture to match approved control sample.

b. Unexposed surfaces shall have a formed or float finish.

4. Curing: Liquid membrane curing compound shall not be applied to surfaces which will
C. Branding and Stamping: Grade crossing panels shall be marked to match approved shop drawings, with clearly identifiable markings, for ease of installation and compliance with installation requirements.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Grade crossing panels shall be installed as per Section 02470, “Highway Grade Crossing - Trackwork”.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Grade crossing panels will be measured and paid for by the track foot of the gauge panels and will include gauge and field grade crossing panels, rail boot, end plates, transportation, site preparation, storage, and all other related work specified in this section and shown on the plans.

PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies providing asphaltic surface and base courses on prepared lime treated soil subgrades or constructed flexible base course in conformance with section, lines, and grades shown.

B. For work done in the right-of-way of other jurisdictional agencies, the minimum requirements of the jurisdictional agency shall apply, unless otherwise directed on the plans.

1.2 REFERENCED STANDARDS

A. American Association of State Highway and Transportation Officials (AASHTO):
   1. AASHTO M140 - Standard Specification for Emulsified Asphalt
   3. AASHTO M208 - Standard Specification for Cationic Emulsified Asphalt
   4. AASHTO T30 - Standard Method of Test for Mechanical Analysis of Extracted Aggregate
   5. AASHTO T164 - Standard Method of Test for Quantitative Extraction of Bitumen from Bituminous Paving Mixtures
   6. AASHTO T165 - Standard Method of Test for Effect of Water on Cohesion of Compacted Bituminous Mixtures
   7. AASHTO T168 - Standard Method of Test for Sampling Bituminous Paving Mixtures
   8. AASHTO T230 - Standard Method of Test for Determining Degree of Pavement Compaction of Bituminous Aggregate Mixtures

B. Asphalt Institute (AI):
   1. AI MS-2 - Mix Design Methods for Asphalt Concrete and Other Hot-Mix Types.

C. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM D2950 - Standard Test Method for Density of Bituminous Concrete in Place by Nuclear Methods

D. Texas Department of Transportation (TxDOT)
   2. TxDOT Manual of Testing Procedures (TEX):
      a. TEX-106-E, Calculating the Plasticity Index of Soils
      b. TEX-200-F, Sieve Analysis of Fine and Coarse Aggregates
      c. TEX-217-F, Determining Deleterious Material and Decantation Test for Coarse Aggregates
      d. TEX-410-A, Abrasion of Coarse Aggregate Using the Los Angeles Machine

1.3 SUBMITTALS

A. Mix Design: In addition to the requirements of the AI MS-2, with bulk specific gravity determined in accordance with AASHTO T165; submit the following:
   1. For each mix to be supplied submit mix design based on expected production averages.
   2. In mix design establish:
      a. Weight percent of total aggregate and of aggregate finer than each required sieve size.
      b. Weight percent of total mix of asphalt cement.
      c. Temperature of mix when batched.
   3. Maintain mix design once approved.

B. Certification: For each delivery of asphaltic material, submit certificate stating type and amount of asphalt and results of specified tests. Material certifications and test results shall not be older than 6 months from proposed use dates.

C. Documentation: Weight ticket: For each load of bituminous mixture delivered to the site, submit weight ticket showing the following:
   1. Mix type.
   2. Mix temperature.
3. Identification of the truck.
4. Tare weight of truck.
5. Loaded weight of truck.
7. Time of leaving mix plant.
8. Signature of the plant representative and date.

D. Source of Supply: Submit under Section 01450, “Quality Control”.
E. Compaction Equipment: Submit data on proposed equipment.

1.4 QUALITY ASSURANCE
A. Sources of Supply:
1. Once approved, do not change source of supply, unless approved by the Contracting Officer.
2. Do not construe approval as approval of entire location but as approved only insofar as material continues to meet specified requirements.
3. Maintain quality of material. Material may be sampled and tested by the Contracting Officer as often as deemed necessary.
4. The Contracting Officer has the right to reject material at the Worksite by visual inspection pending sampling and testing.

B. Bituminous products and solvents shall be compliant with the latest regulations of the Texas Commission on Environmental Quality (TCEQ) and other jurisdictional authorities regarding regulations governing permissible content of volatile organic compounds (VOCs).

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING
A. Delivery Trucks:
1. For transporting bituminous mixtures use trucks which show no leakage of oil or grease, have solid metal dump-type beds which are clean and smooth with tight fitting rear gate to prevent loss of materials in transit.
2. Prior to loading, spray inside surface of truck beds with minimum amount of approved thin oil or mixture of lime and water proportioned 50 gallons of water to 100 pounds of lime necessary to prevent adhesion of the mixture. Do not use kerosene, gasoline or excessive amount of oil.
3. Equip trucks with coverings to protect loads from weather and with suitable insulation to prevent undue heat loss during transit at temperatures below 40 degrees F.

B. Weighing of Bituminous Mixtures:
1. Provide approved truck scales having both dial and automatic printer or use public scales.
2. Use scales complying with applicable laws, ordinances, and regulations governing use of scales.
3. Have scales tested and sealed by authorized public official as often as directed to ensure their accuracy.
4. At least once a week, check tare weight of each truck with full load of fuel and fitted with its equipment.

1.6 JOB CONDITIONS
A. Do not place bituminous pavement on wet surfaces.
B. Do not place bituminous pavement when the ambient temperature is 50 degrees F and falling or when the temperature of the base is less than 40 degrees F. Bituminous pavement may be placed when the ambient temperature is above 40 degrees F and rising. Take the ambient temperature in the shade and away from artificial heat.

PART 2 - PRODUCTS

2.1 ASPHALT CEMENT
A. AASHTO Viscosity Grade AC-20.

2.2 CUT-BACK ASPHALT
A. Cut-Back Asphalt for Prime Coat: Equivalent to AASHTO Viscosity Grade AC-20.
B. Liquid Asphalt for Prime Coat: SC-70 or SC-250 as applicable; Slow curing type.

2.3 EMULSIFIED ASPHALT
A. Emulsified Asphalt for Tack Coat: SS-1 or SS-1h, diluted 1 part water to 1 part emulsified asphalt. Prior to dilution, emulsified asphalt to comply with AASHTO M140 or M208. Apply at rate of 0.05 to 0.15 gallons per square yard.
2.4 AGGREGATE

A. Sand:

1. General: Sand material shall constitute a part of the final aggregates for hot mix asphalt concrete (HMAC).

2. Deleterious Substances: The sand used as fine aggregates shall be free from loam, clay balls or other injurious foreign matter.

3. Tests: The plasticity index of that portion of the fine aggregates sand passing the No. 40 (425 um) sieve shall not be more than 6 when tested in accordance with TEX-106-E.

4. Gradation: Fine aggregate sand shall be that portion of the sand in the total aggregate passing the No. 10 (2.0 mm) sieve. It shall be well graded and composed of sound, durable sand particles.

B. Stone Screenings:

1. General: Stone screenings may constitute part or all of the fine aggregates for HMAC. Screenings shall be of the same or similar material for coarse aggregates.

2. Deleterious Substances: The screenings shall be free from loam, clay balls or other injurious foreign matter.

3. Tests: The plasticity index of that portion of the fine aggregates passing the No. 40 (425 um) sieve shall not be more than 6 when tested in accordance with TEX-106-E. Fine aggregates from each source shall meet plasticity requirements.

4. Gradation: The stone screening shall meet the following grading requirements unless otherwise shown on the plans:

5. When authorized by the Contracting Officer, stone screenings containing particles larger than 3/8 inch may be used but only that portion of the material passing the 3/8 inch sieve shall be considered as fulfilling the requirements for screening when a minimum percent of screenings is specified for a particular mixture.

6. Additional Requirements: Where limestone rock asphalt screenings are specified for use, they shall be screenings resulting from crushing operation.

7. Rejection: Sand which fails to meet the requirements of these Specifications may be rejected by the Contracting Officer. Such rejections shall incur no cost to the Authority.

8. Sand sources, from which materials not meeting these Specifications are delivered, may be rejected as further supply sources to the project by the Contracting Officer. Such rejections shall incur no cost to the Authority.

C. Coarse Aggregates:

1. General: Coarse aggregates shall consist of clean, tough, durable fragments of crushed stone, crushed gravel, or gravel as specified herein, of uniform quality throughout.

2. Deleterious Substances: The coarse aggregates shall be free from clay, organic, or other injurious matter occurring either free or as a coating on the aggregates.

3. Tests: Material removed by decantation in accordance with TEX-217-F (Part II, Decantation) shall not be more than 2 percent. The stone or gravel from which the aggregates are made shall have an abrasion of not more than 40 for all courses except the non-skid surface course, which shall have an abrasion of not more than 35. These figures may be calculated in accordance TEX-410-A.

4. Gradation: The coarse aggregates shall be that portion of the total aggregates retained on the No. 10 sieve (2.0 mm). The crushed gravel shall be so crushed that not less than 85 percent of the particles shall have more than one crushed face. The use of uncrushed gravel shall be permitted only in the coarse binder course.

5. Additional Requirements: When it is specified that the coarse aggregates be sampled from the hot bins and tested in accordance with TEX-217-F (Part II, Decantation), the amount of material removed shall not exceed 1 percent.

6. Coarse aggregates sources from which materials with properties not meeting these specifications are delivered may be rejected as further suppliers to the project by the Contracting Officer. Such rejections shall incur no cost to the Authority.

D. Mineral Filler:

1. General: Mineral filler shall consist of a thoroughly dry stone dust, Portland cement, or other mineral dust approved by the Contracting Officer.
2. Deleterious Substances: The mineral filler shall be free from foreign and other injurious matter.

3. Gradation: When tested by the method outlined in TEX-200-F (Part I or Part 3 as applicable), it shall meet the following percentages by weight:

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>Percent by Weight or Volume</th>
</tr>
</thead>
<tbody>
<tr>
<td>Passing No. 30 sieve (600 um)</td>
<td>95 - 100</td>

<td>Not less than 75</td>
</tr>
<tr>
<td>Passing No. 200 sieve (75 um)</td>
<td>Not less than 55</td>
</tr>
</tbody>
</table>

4. Rejection: Mineral filler which fails to meet the requirements of these Specifications may be rejected by the Contracting Officer. Such rejections shall incur no cost to the Authority.

5. Mineral filler sources, from which materials with properties not meeting these Specifications are delivered, may be rejected as further suppliers to the project by the Contracting Officer. Such rejections shall incur no cost to the Authority.

E. Seal Coat: Fog seal coat or fine seal coat, as indicated.

2.5 MIXES

A. Design of mixes shall be provided by the Contractor, and shall be obtained from a qualified independent testing laboratory or agency, properly equipped to design bituminous concrete mixes. Costs of obtaining mix designs shall be at the Contractor’s expense.

B. Design of mixes including aggregate quality and degradation, shall conform with the quality requirements of TxDOT.

C. Proportion constituents of job mixes within limits specified in Table 02511-1.

PART 3 - EXECUTION

3.1 EQUIPMENT

A. Equipment for Preparing Bituminous Material: Use bituminous paving material prepared in mixing plant conforming to AASHTO M156.

B. Equipment for Spreading and Finishing Bituminous Material:

1. Use equipment capable of placing and screeding material at widths ranging up to 12 feet by increments of 1 foot and at varying thickness.

2. Use machines which spread bituminous mixture without tearing surface. Achieve finish that is smooth, true to cross section, uniform in density and texture and free from hollows, corrugations, and other irregularities.

C. Equipment for Compacting: Provide approved equipment capable of compacting materials to specified Marshall density.

3.2 BASE PREPARATION

A. Subgrade shall be prepared as shown on the Contract Drawings. Sand or other granular leveling material shall be specifically prohibited beneath pavement areas.

B. Obtain Contracting Officer’s approval of base prior to placement of surface course.

C. Aggregate and Soil Aggregate Bases:

1. Apply cut-back asphalt primer at rate of 0.2 to 0.5 gallon per square yard when base is damp but with no standing water.

2. Allow 24 hours for base to entirely absorb primer. Blot excess primer with just enough sand to prevent pickup under traffic. Sweep loose sand from base before placing asphalt base course.

D. Portland Cement Concrete, Bituminous, and Brick Pavement Bases:

1. Apply tack coat using equipment designed for purpose.

2. Apply tack coat uniformly to clean dry base at rate of 0.05 to 0.15 gallons per square yard.

3. Ensure that surface has cured and is satisfactorily tacky before placing mix.

E. Immediately prior to placing mix, apply thin coat of hot asphalt cement to contact surfaces of curbs, gutters, manholes, and similar structures.

3.3 PLACING MIX

A. Place base course mixture in one or more lifts with asphalt paver or spreader to provide nominal compacted thickness as shown. Place surface course mixture with asphalt paver to provide nominal compacted thickness as shown. Minimum lift thickness shall be at least 2 times maximum particle size. Maximum lift thickness to be that which can be demonstrated to be laid in a single lift and compacted to required uniform density and smoothness. Place material in continuous
operation. Correct irregularities before final compaction of mixture.

B. If equipment being used produces tracks, pulling, indented areas, or other permanent blemishes in material being spread, remove such equipment from Worksite and substitute other approved spreading and finishing equipment. Repair affected areas disturbed by equipment.

C. Do not permit direction of movement of paving equipment to be changed by turning on newly completed base, binder or surface courses.

D. Adjacent to headers, gutters, manholes, and similar structures, place surface course so that finished surface is 1/4 inch above edge of structure.

3.4 COMPACTION

A. Compact immediately after placing. Initial rolling shall be with steel-wheel tandem roller, steel three-wheel roller, vibratory roller, or pneumatic-tire roller following paver as closely as possible, oriented with drive wheel closest to paver. If intermediate rolling is needed, use pneumatic-tire roller immediately behind initial rolling. Final rolling shall be with steel tandem roller. Use vibrating plate compactor or hand tamper to achieve thorough compaction in areas too small for roller.

3.5 COLD JOINTS

A. Longitudinal: Apply tack coat to cold material before joining new work.

B. Transverse: Place bulkhead full depth of course or cut back minimum of 3 inches from sloping surface with masonry saw. Apply tack coat to cold material.

C. Cold material is any material whose temperature is below 250 degrees F.

3.6 BULKHEADS

A. Where placement of mix is to be discontinued for such period of time that material will fall below specified street temperature, place suitable bulkhead.

B. Construct cold joint as specified when work is resumed.

3.7 HANDWORK

A. When approved, perform bituminous paving work by hand.

B. Undertake handwork using equipment designed and approved for purpose.

C. Perform handwork so that resulting paving meets specified requirements.

3.8 FIELD QUALITY CONTROL

A. Allowable Tolerances:

1. Place bituminous pavement to within tolerance of plus or minus 1/8 inch of thickness shown.

2. Construct surfaces to the following tolerances:
   a. Base courses to within plus or minus 3/8 inch of elevation shown.
   b. Surface courses to within plus or minus 3/16 inch of elevation shown.
   c. Surfaces to deviate no more than 1/4 inch in the length of 10 foot steel straightedge, not cumulative.

3. For base courses, attain 94 percent of Marshall density.

4. For surface courses, attain 96 percent of Marshall density.

B. Testing:

1. Mixes: During course of the work, submit mixes as directed for testing of gradation and bitumen content in accordance with AASHTO T30 and T164 on random samples selected in accordance with AASHTO T168.

2. Determine density of base and surface courses by one of the following methods:
   a. Take samples of base and surface courses from locations designated by the Contracting Officer and test against the job mix formula in accordance with AASHTO T230.
   b. Test base and surface courses for density and thickness with a nuclear density meter in accordance with ASTM D2950.

   1) Number of cores/tests not exceeding 1 core/test per 500 square yards of bituminous pavements or 2 cores per shift, whichever is greater.

   2) Wherever deficient pavement is discovered take such additional cores/tests as directed.

   3) Repair core holes promptly using the same mix that was cored; where cores are taken through both base course and surface course
simultaneously, use surface course mix for repair work.

C. After completion of paving work, paving shall be flooded with water, and any resulting ‘ponds’ shall be ringed with chalk. Such hollows shall be corrected with addition of bituminous materials and rerolling until paving is completely level and free from hollows and high spots.

3.9 PROTECTION OF BITUMINOUS PAVEMENT

A. Obtain approval for use of pavement by public and construction traffic.

B. Do not permit traffic to cross uncompleted longitudinal joints.

3.10 DEFICIENT PAVEMENT

A. Where directed, replace new material or repair bituminous pavement that does not meet specified requirements at no cost to Authority.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Prime coat and tack coat will not be measured separately, but will be considered subsidiary to placing bituminous pavement of the type specified.

B. Bituminous pavement will be not be measured, but will be paid for at the lump sum price for “Hot Mix Asphaltic Concrete Pavement” for each type for each location.

C. Bituminous pavement, prime coats, and tack coats used as temporary pavement structure for the purpose of traffic maintenance and control will not be measured or paid for, but will be considered subsidiary to the work described in Section 01570, “Maintenance and Control of Traffic”.

The asphaltic material shall form from 4.0 to 8.0 percent of the mixture by weight.

END OF SECTION 02511
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies providing and installing unit pavers on prepared surfaces in conformance with the lines, grades, and sections as shown.

1. This Section includes the following:

   a. Brick pavers set in aggregate setting bed.

   b. Concrete pavers set in aggregate setting bed.

1.2 REFERENCE STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

   1. ASTM C33 - Standard Specification for Concrete Aggregates
   2. ASTM C902 - Standard Specification for Pedestrian and Light Traffic Paving Brick
   3. ASTM C936 - Standard Specification for Solid Concrete Interlocking Paving Units
   4. ASTM D1752 - Standard Specification for Preformed Sponge Rubber and Cork Expansion Joint Fillers for Concrete Paving and Structural Construction

1.3 SUBMITTALS

A. Product Data: For the following:

   1. Brick pavers.
   2. Concrete pavers.

B. Samples for Verification: Full-size units of each type of unit paver indicated; in sets for each color, texture, and pattern specified, showing the full range of variations expected in these characteristics.

   1. Include Samples of exposed edge restraints.

C. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.

1.4 QUALITY ASSURANCE

A. Installer Qualifications: An experienced installer who has completed unit paver installations similar in material, design, and extent to that indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.

B. Source Limitations: Obtain each type of unit paver, joint material, and setting material from one source with resources to provide materials and products of consistent quality in appearance and physical properties.

C. Mockups: Before installing unit pavers, build mockups for each form and pattern of unit pavers required to verify selections made under sample Submittals and to demonstrate aesthetic effects and qualities of materials and execution. Build mockups to comply with the following requirements, using materials indicated for the completed Work, including same base construction, special features for expansion joints, and contiguous work as indicated:

   1. Build mockups in the location and of the size indicated or, if not indicated, as directed by Contracting Officer.
   2. Notify Contracting Officer seven days in advance of dates and times when mockups will be constructed.
   3. Demonstrate the proposed range of aesthetic effects and workmanship.
   4. Obtain Contracting Officer's approval of mockups before starting unit paver installation.
   5. Maintain mockups during construction in an undisturbed condition as a standard for judging the completed Work.
   6. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Protect unit pavers and aggregate during storage and construction against soiling or contamination from earth and other materials.

   1. Cover pavers with plastic or use other packaging materials that will prevent rust marks from steel strapping.
UNIT PAVERS

1.6 PROJECT CONDITIONS
A. Cold-Weather Protection: Do not use frozen materials or materials mixed or coated with ice or frost. Do not build on frozen subgrade or setting beds. Remove and replace unit paver work damaged by frost or freezing.

PART 2 - PRODUCTS
2.1 UNIT PAVERS
A. Brick Pavers: Light-traffic paving brick; ASTM C902, Class SX, Type I, Application PX. Provide brick without frogs or cores in surfaces exposed to view in the completed Work.
B. Concrete Pavers: Solid, interlocking paving units, ASTM C936, made from normal-weight aggregates in sizes and shapes indicated.

2.2 SIZES, COLORS AND TEXTURES
A. Sizes, Colors and Textures: As scheduled on Drawings using manufacturer’s designations.

2.3 ACCESSORIES
A. Cork Joint Filler: Preformed strips complying with ASTM D1752, Type II.
B. Job-Built Concrete Edge Restraints: Comply with requirements of Section 03300, "Cast-In-Place Concrete" and use Concrete Mix S-7, as specified in Section 03305, “Portland Cement Concrete”.

2.4 AGGREGATE SETTING-BED MATERIALS
A. Sand for Leveling Course: Sound, sharp, washed, natural sand or crushed stone complying with gradation requirements of ASTM C33 for fine aggregate.
B. Sand for Joints: Fine, sharp, washed, natural sand or crushed stone with 100 percent passing No. 16 sieve and no more than 10 percent passing No. 200 sieve.

PART 3 - EXECUTION
3.1 EXAMINATION
A. Examine areas indicated to receive paving, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

1. Where pavers are to be installed over waterproofing, examine waterproofing installation, with waterproofing Installer present, for protection from paving operations. Examine areas where waterproofing system is turned up or flashed against vertical surfaces and horizontal waterproofing. Proceed with installation only after protection is in place.

3.2 PREPARATION
A. Vacuum clean concrete substrates to remove dirt, dust, debris, and loose particles.

3.3 INSTALLATION, GENERAL
A. Do not use unit pavers with chips, cracks, voids, discolorations, and other defects that might be visible or cause staining in finished work.
B. Mix pavers from several pallets or cubes, as they are placed, to produce uniform blend of colors and textures.
C. Cut unit pavers with motor-driven masonry saw equipment to provide clean, sharp, unchipped edges. Cut units to provide pattern indicated and to fit adjoining work neatly. Use full units without cutting where possible. Hammer cutting is not acceptable.

1. For concrete pavers, a block splitter may be used.

D. Joint Pattern: As indicated.

E. Pavers over Waterproofing: Exercise care in placing pavers and setting materials over waterproofing so protection materials are not displaced and waterproofing is not punctured or otherwise damaged. Carefully replace protection materials that become displaced and arrange for repair of damaged waterproofing before covering with paving.

1. Provide joint filler, where indicated, at waterproofing that is turned up on vertical surfaces; or, if not indicated, provide temporary filler or protection until paver installation is complete.

F. Tolerances: Do not exceed 1/16-inch unit-to-unit offset from flush (lippage) nor 1/8 inch in 24 inches and 1/4 inch in 10 feet from level, or indicated slope, for finished surface of paving.

G. Expansion and Control Joints: Provide joint filler at locations and of widths indicated. Install joint filler before setting pavers. Make top of joint filler flush with top of pavers.
H. Provide edge restraints as indicated. Install edge restraints before placing unit pavers.

1. Install job-built concrete edge restraints to comply with requirements in Section 03300, "Cast-In-Place Concrete."

3.4 AGGREGATE SETTING-BED PAVER APPLICATIONS

A. Place leveling course and screed to a thickness of 1 to 1-1/2 inches, taking care that moisture content remains constant and density is loose and constant until pavers are set and compacted.

B. Treat leveling base with soil sterilizer to inhibit growth of grass and weeds.

C. Set pavers with a minimum joint width of 1/16 inch and a maximum of 1/8 inch, being careful not to disturb leveling base. If pavers have spacer bars, place pavers hand tight against spacer bars. Use string lines to keep straight lines. Fill gaps between units that exceed 3/8 inch with pieces cut to fit from full-size unit pavers.

1. When installation is performed with mechanical equipment, use only unit pavers with spacer bars on sides of each unit.

D. Vibrate pavers into leveling course with a low-amplitude plate vibrator capable of a 3500- to 5000-lbf compaction force at 80 to 90 Hz. Perform at least three passes across paving with vibrator. Vibrate under the following conditions:

1. After edge pavers are installed and there is a completed surface or before surface is exposed to rain.

2. Before ending each day's work, fully compact installed concrete pavers to within 36 inches of the laying face. Cover open layers with nonstaining plastic sheets overlapped 48 inches on each side of the laying face to protect it from rain.

E. Spread dry sand and fill joints immediately after vibrating pavers into leveling course. Vibrate pavers and add sand until joints are completely filled, then remove excess sand. Leave a slight surplus of sand on the surface for joint filling.

F. Do not allow traffic on installed pavers until sand has been vibrated into joints.

G. Repeat joint-filling process 30 days later.

3.5 REPAIR, CLEANING, AND PROTECTION

A. Remove and replace unit pavers that are loose, chipped, broken, stained, or otherwise damaged or that do not match adjoining units as intended. Provide new units to match adjoining units and install in same manner as original units, with same joint treatment and with no evidence of replacement.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will be paid for on a lump sum basis for unit pavers per location indicated wherein no measurement will be made.

END OF SECTION 02515
PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Concrete Pavers:
   1. Setting: Thinset mortar.

B. Cast Iron Paving Plates:
   1. Setting: Cast-in-place concrete grout

1.2 RELATED SECTIONS

A. Section 02220 - Grading, Excavating and Backfilling.
B. Section 02515 - Unit Pavers.
C. Section 02525 - Combined Curb and Gutters, Curb Ramps, and Walks.
D. Section 03300 - Cast-In-Place Concrete.
E. Section 07900 - Seals and Sealants.

1.3 REFERENCED STANDARDS

A. American Society for Testing and Materials (ASTM):
   1. ASTM C 33 - Specification for Concrete Aggregates.
   4. ASTM C 140 - Specification for Concrete.

B. Tile Council of America (TCA):
   1. TCA F102 - Installation Method Cement Mortar Bonded.

C. American National Standards Institute (ANSI):
   1. ANSI A-118.4 - Latex Portland Cement Mortar.
   2. ANSI A-118.6 - Grout - Latex.

1.4 SUBMITTALS

A. Submit under provisions of Section 01330 - Submittals.
B. Product Data: Manufacturer's data sheets on each product to be used, including:
   1. Test Reports: 3 copies, showing compliance with specified ASTM requirements.
   2. Preparation instructions and recommendations.
   3. Storage and handling requirements and recommendations.
   4. Installation methods.
C. Shop Drawings:
   1. Layout drawings of each paved area showing the pattern of pavers, indicate pavers requiring cutting, indicate setting bed methods in each area, drainage patterns and drains. Include details of setting beds, noting all materials and their thickness, show details at curbs and vertical surfaces.
   2. Details of custom (nonstandard) curbs and stair tread/risers, include methods of installation.
D. Selection Samples: For each finish product specified, 2 complete sets of color chips representing manufacturer's full range of available colors and patterns.
E. Verification Samples: For each finish product specified, 3 sample pavers of each manufactured, type, size and color selected or specified.
1.5 QUALITY ASSURANCE

A. Manufacturer Qualifications:

1. Products shall be produced by a single manufacturer unless otherwise specified.

2. Manufacturer shall submit evidence of having not less than 15 years successful production of this product.

3. Paver manufacturer shall demonstrate, either by proven field performance or a laboratory freeze-thaw test, that the paving units have adequate durability if they are to be subjected to a freeze-thaw environment.
   a. Satisfactory field performance is indicated when units similar in composition and made with the same manufacturing process as those to be supplied to the purchaser, do not exhibit objectionable deterioration after at least 3 years.
   b. The units used as the basis for proven field performance shall have been exposed to the same general type of environment, temperature range and traffic volume as is contemplated for the units supplied to the purchaser.

B. Product Qualifications:

1. Products shall be fully shop cured and shall meet ultimate design compressive strength requirements prior to shipment to project site.

2. Manufacturer shall submit evidence that design compressive strength has been met.

C. Installer Qualifications:

1. Subcontractor shall submit evidence of skill and not less than 5 years specialized experience with this product.

D. Mock-Up: Provide a mock-up for evaluation of surface preparation techniques and application workmanship.

1. Finish areas designated by Architect.

2. Do not proceed with remaining work until workmanship, color, and sheen are approved by Architect.

3. Refinish mock-up area as required to produce acceptable work.

1.6 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Deliver and handle precast concrete pavers and cast-iron paving plates in such a manner as to prevent damage. Units shall be stored above ground on pallets. Pallets shall be clean and non-staining. All damaged or otherwise unsuitable material shall be immediately removed from the job site.

B. Store and dispose of solvent-based materials, and materials used with solvent-based materials, in accordance with requirements of local authorities having jurisdiction.

1.7 PROJECT CONDITIONS

A. Maintain environmental conditions (temperature, humidity, and ventilation) within limits recommended by manufacturer for optimum results. Do not install products under environmental conditions outside manufacturer's absolute limits.

1. Do not work during freezing weather or on wet or frozen sub-base.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Acceptable Manufacturer (Precast Concrete Pavers): Wausau Tile Co., which is located at: P. O. Box 1520 9001 Bus Hwy. 51; Wausau, WI 54402-1520; Toll Free Tel: 800-388-8728; Tel: 715-359-3121; Email: wtile@wausautile.com; Web: www.wausaupaving.com; or Approved Equal.

B. Acceptable Manufacturer (Cast Iron Paving Plates): Neenah Foundry Co. which is located at: 2121 Brooks Avenue, Neenah, WI 54956; Toll Free Tel: 800-558-5075; Tel: 920-725-7000; Email: conssales@nfco.com; Web: www.nfco.com; or Approved Equal.

C. Requests for substitutions will be considered in accordance with provisions of Section 01630 – Product Substitution Procedures.
2.2 PRECAST CONCRETE PAVERS

A. Concrete Pavers: Detectable Warning Pavers as manufactured by Wausau Tile Co. or Approved Equal.
   1. Thickness: Standard, 2 inches to 2-3/4 inches
   2. Nominal Size: 12 inches square.
   4. Color: As indicated on Drawings.
   5. Installation Patterns: As indicated on Drawings.

B. Concrete Pavers: Engraved Series Pavers as manufactured by Wausau Tile Co. or Approved Equal.
   1. Thickness: Standard, 2 inches to 2-3/4 inches
   2. Nominal Size: 12 inches square.
   3. Design: As indicated on Drawings.
   4. Color: As indicated on Drawings.
   5. Engraving: Epoxy filled.
   6. Installation Patterns: As indicated on Drawings.

C. Precast Material Requirements:
   2. Aggregates shall conform to ASTM specifications, except that grading requirements shall not necessarily apply, ASTM C33 for concrete aggregates, normal weight.
   3. Other Constituents: Coloring pigments, integral water repellents, etc., shall be previously established as suitable for use in concrete and either shall conform to ASTM Standards where applicable, or shall be shown by test or experience not to be detrimental to the durability of the concrete.

D. Paver Performance Requirements:
   1. Compressive Strength: At the time of delivery to the work site, the average compressive strength shall not be less than 8,000 psi with no individual unit less than 7,000 psi (48,000 kPa) per ASTM C140.
   2. Absorption: The average shall not be greater than 6 percent per ASTM C140.
   3. Flexural Strength: Not less than 800 psi (5500 kPa) per ASTM C293.
   4. Load carrying capacity: Paver units shall have a tested center load capacity of 1,850 lb (840 kg). WT CL96
   5. Freeze/thaw: Durability of the paver shall meet the freeze/thaw tests in accordance with Section 8 of ASTM C1260. Specimens, when tested, shall have no breakage and not greater than 1 percent loss in dry weight of any individual unit when subject to 50 cycles of freeze/thaw.
   6. Sizing: Permissible variations in dimensions shall not differ by more than 1/16 inch from width, height, length or thickness. Standard units are manufactured with a 3/16 inch bevel on all four sides of finished surface. Unit shall conform to a true plane and not differ by more than 1/16 inch in either concave and/or convex warpage.

2.3 CAST IRON PAVING PLATES

A. Cast Iron Plate with Directional Arrow: Detectable Paving Plates as manufactured by Neenah Foundry Co. or Approved Equal.
   1. Plate Thickness: Standard, 1/2 inch.
   2. Overall Thickness including support ribs: 1 ½ inches.
   3. Nominal Size: 10 inches wide by 36 inches long.
   6. Installation Patterns: As indicated on Drawings.
   7. Approximate Weight: 67 pounds

B. Cast Iron Accessible Staging Plate with ISA Symbol: Detectable Paving Plates as manufactured by Neenah Foundry Co. or Approved Equal.
   1. Plate Thickness: Standard, 1/2 inch.
DIRECTIONAL DETECTABLE PAVERS AND PLATES

2. Overall Thickness including support ribs: 1 ½ inches.
3. Nominal Size: 30 inches square.
4. ISA Symbol Size: 10 inch square, centered on plate
7. Installation Patterns: As indicated on Drawings.
8. Approximate Weight: 67 pounds

6. Cast Iron Material Requirements:

2.4 INSTALLATION MATERIALS
1. Portland Cement Mortar Mix: ASTM C150 Custom Bldg Products thick Bed Mortar Mix with Admix, or approved equal.
2. Reinforcement: 2 inches by 2 inches - 16/16 welded galvanized wire mesh used in thick mortar bed.
3. Water: Clean and free of deleterious acids, alkalis or organic materials.
4. Grout: Custom Bldg Products Grout with Admix, color as selected or approved equal.
5. Bond Slurry: Custom Bldg Products bond coat or approved equal.
8. Bond Breaker: As specified in Section 07900 – Seals and Sealants.

PART 3 - EXECUTION

3.1 EXAMINATION
A. Do not begin installation until substrates have been properly prepared.
B. If substrate preparation is the responsibility of another installer, notify Architect of unsatisfactory preparation before proceeding.
C. Concrete shall not exceed 1/8 inch in 10 feet from required plane.
D. Concrete to be steel troweled with fine broom finish. No curing or sealing compound used.

3.2 PREPARATION
A. Clean surfaces thoroughly prior to installation.
B. Prepare surfaces using the methods recommended by the manufacturer for achieving the best result for the substrate under the project conditions.

3.3 INSTALLATION
A. Install in accordance with manufacturer's instructions.
B. Placement Tolerance:
1. Maximum of 1/16 inch height variation between adjacent pavers.
2. Individual pavers shall not vary more than 1/16 inch from level across width of the paver.
3. Paved areas shall not vary more than 1/4 inch from level in a distance of 10 feet measured at any location and in any direction.
4. Joints between pavers to be 3/16 inch or 1/8 inch.
C. Thinset Mortar Method - Pedestrian Installation:
1. Locate and delineate area of existing concrete pavers to be removed. Sawcut existing pavers as necessary to achieve desired shape. Remove existing pavers to be removed.
2. Installation of Mortar bed as per TCA F102. Materials use shall follow instructions of manufacturer for use in mortar method.
3. Install precast concrete pavers.
4. Grouting of pavers in strict accordance with grout manufacturer's directions and instructions. Latex or acrylic additives of the same manufacturer as the grout.
5. Control and expansion joints shall be installed per TCA EJ 171. Joint materials used shall follow manufacturer’s directions and instructions.

6. Rework mixes from time to time to maintain proper consistency, as recommended by manufacturer but do not add ingredients. Discard mortar that has reached its initial set.

7. Field cut precast pavers in accordance with manufacturer’s recommendations for methods, equipment and precautions.

8. Cleaning: Remove mortar stains and all other types of soiling from exposed paver surfaces, wash and scrub clean.

D. Portland Cement Setting Bed Installation for concrete pavers:

1. Locate and delineate area of existing concrete pavers to be removed. Sawcut existing pavers as necessary to achieve desired shape. Remove existing pavers to be removed.

2. Installation of mortar bed as per TCA F101. All materials used follow instructions of manufacturer for use in mortar method.

3. Install precast concrete pavers.

4. Grouting of pavers in strict accordance with grout manufacturer’s directions and instructions. Latex or acrylic additives of the same manufacturer as the grout.

5. All control and expansion joints to be installed as per TCA EJ 171. All joint materials used shall follow manufacturer’s directions and instructions.

6. Field cut precast pavers in accordance with manufacturer’s recommendations for methods, equipment and precautions.

7. Cleaning: Remove mortar stains and all other types of soiling from exposed paver surfaces, wash and scrub clean.

E. Cast in Place Concrete Grout Setting Bed Installation for cast iron paving plates:

1. Locate and delineate area of existing concrete pavers to be removed. Sawcut existing pavers as necessary to achieve desired shape. Remove existing pavers to be removed. Remove sand bedding as required.

2. Installation of cast-in-place concrete grout in void created by removed pavers and bedding sand. Finish with trowel to within ½ inch of top of adjacent pavers.

3. Install cast iron paving plates by evenly pressing into prepared concrete grout bed. Ensure that top of plate is flush with surrounding pavers.

4. Ensure no air pockets exist between plate and grout bed.

5. Field cut cast iron plates as necessary prior to installation in accordance with manufacturer’s recommendations for methods, equipment and precautions.

6. Cleaning: Cast iron will oxidize and may stain surrounding area until iron patina has formed. Remove grout stains, rust stains and all other types of soiling from exposed plate and surrounding surfaces, wash and scrub clean.

F. Concrete Slab Installation:

1. Locate and delineate area of existing concrete pavers to be removed. Sawcut existing pavers as necessary to achieve desired shape. Remove existing pavers to be removed.

2. Install precast concrete pavers, slabs and curbs in locations, patterns and at elevations and with slopes for surface drainage as shown on the Drawings. Install precast concrete pavers, slabs and curbs in accordance with the manufacturer’s printed installation instructions and the final reviewed shop drawings.

3. Apply neoprene modified asphalt adhesive on the cured setting bed by squeegeeing or troweling. If troweled on, use a trowel with serrations not exceeding 1/16 inch depth. Place adhesive to not more than 1/16 inch thickness over the total surface of the setting bed. Do not begin installation of pavers, slabs and curbs until adhesive is dry to the touch.

4. Lay out pavement in 30 feet working area modules. Set precast concrete pavers, slabs and curbs by hand on
dry adhesive in patterns shown on the Drawings with hand tight joints 1/16 inch to 1/8 inch wide joints and uniform top surfaces.

5. Field cut precast concrete pavers in accordance with manufacturer's recommendations for methods, equipment and precautions.

6. Maintain accurate alignment and check for creep and shrinkage. Make adjustments to creep and shrinkage within the 30 feet module area.

7. Sweep fine dry sand over pavement surface to fill joints immediately after installing pavers, slabs and curbs on setting bed. Brush in sand until joints are completely filled, remove surplus sand. Do not allow traffic on installed pavers, slabs or curbing until the joints have been filled.

8. Protect newly laid pavers, slabs and curbs with plywood panels on which workers stand. Advance protective panels as work progresses but maintain protection in areas subject to continued movement of materials and equipment to avoid creating depressions or disrupting alignment of installed pavers, slabs and curbs.

9. Install the specified joint filler where precast concrete pavers, slabs and curbs abut curbs, other vertical surfaces and other construction.

10. Backfilling: After the precast concrete paving is completed, backfill the spaces along the edges of the walks, metal edging and pavements to be required elevations with material reviewed by the Testing Laboratory. The Material shall then be compacted until firm and the surface neatly graded, with allowance made for top soil.

G. Sand Setting Bed Installation:

1. Locate and delineate area of existing concrete pavers to be removed. Sawcut existing pavers as necessary to achieve desired shape. Remove existing pavers to be removed. Repair sand bedding as required.

2. Place solid steel 3/4 or 1 inch (19 mm or 25 mm) thick control bars directly on the base. Install shims under bars for minor adjustment of depth and finish paver elevations and slopes. Space bars approximately 11 feet (3.4 m) apart and parallel to each other to serve as guides for strike-off boards.

3. Place sand setting bed between control bars on the binder course to not less than thickness of the designated control bars. Spread material and strike off by pulling the material with a 12 feet long by 2 inches by 6 inches wood board several times to produce a smooth firm and even setting bed. Add fresh material in low areas after each pass of the strike off board. After each panel is complete remove and advance the first control bar to the next panel position in readiness for placing and striking adjacent panels. Fill in depressions left by the control bar and any shims.

3.4 PROTECTION

A. Protect installed products until completion of project.

B. Remove and replace pavers which are loose, chipped, broken, stained or otherwise damaged, or if units do not match adjoining units as intended. Provide new units to match adjoining units and install in same manner as original units, with same joint treatment to eliminate evidence of replacement.

C. Touch-up, repair or replace damaged products before Substantial Completion.

END OF SECTION 02521
PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies providing combined curb and gutters, curb ramps, and sidewalks to the sections, lines and grades shown on the Contract Drawings.
B. For work done in the right-of-way of other jurisdictional agencies, the minimum requirements of the jurisdictional agency shall apply, unless otherwise indicated in the Contract Documents.

1.2 REFERENCED STANDARDS
A. American Concrete Institute (ACI):
   1. ACI 318 - Building Code Requirements for Structural Concrete
B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A53/A53M - Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless
   2. ASTM A615/A615M - Standard Specification for Deformed and Plain Carbon Steel Bars for Concrete Reinforcement
   3. ASTM A663/A663M - Standard Specification for Steel Bars, Carbon, Merchant Quality, Mechanical Properties
   4. ASTM C309 - Standard Specification for Liquid Membrane-Forming Compounds for Curing Concrete
   5. ASTM C881 - Standard Specification for Epoxy-Resin-Base Bonding Systems for Concrete
C. North Central Texas Council of Governments (NCTCOG)
   1. Standard Specifications for Public Works Construction, as revised (NCTCOG Standard Specifications).

1.3 SUBMITTALS
A. Shop drawings for joint devices.
B. Certification: As specified in Section 03305, "Portland Cement Concrete", including design mixes.

PART 2 - PRODUCTS

2.1 GENERAL
A. Materials (including their delivery, storage, handling, and testing) necessary for the completion of the work described in this Section shall be in complete accordance with the NCTCOG Standard Specifications except as otherwise specified herein.

2.2 MATERIALS
A. Concrete: In accordance with Section 03305, "Portland Cement Concrete", Mix S-7.
B. Benches and Chairs: as per ACI 318
C. Tie Bars: ASTM A615, Grade 60, of type and size indicated.
D. Dowels: Plain round bars meeting requirements of ASTM A615, Grade 60, or ASTM A663, Grade 80, epoxy coated bars, furnished with approved snug-fitting ASTM A53 galvanized pipe sleeve. Provide sleeve with one end closed. Sleeves for dowel ends may be plastic.
E. Weep Holes: ASTM A53 galvanized pipe of size indicated.
F. Expansion-Joint Filler and Joint-Sealant Compound: as per Section 07900.
G. Concrete curing compound: ASTM C309, Type 1
H. Epoxy Adhesive: ASTM C881, Type V for load bearing concrete, Grade and Class as determined by project conditions and requirements.
I. Color Hardener: Lithochrome Color Hardener, as manufactured by L. M. Scofield Company, 4155 Scofield Road, Douglassville, GA 80134, (800) 800-9900, or approved equal. Color as designated by jurisdictional agency. If no color is designated, then color to match: L. M. Scofield Classic Gray - A-33.

PART 3 - EXECUTION

3.1 CONSTRUCTION
A. Concrete combined curb and gutters, curb ramps, and sidewalks shall be constructed in accordance with the NCTCOG Standard Specifications (including hot weather and cold weather concrete) except as otherwise indicated.
B. Provide cast-in-place concrete construction, plain or reinforced as indicated. Curbs and gutters shall be formed accurately to indicate section profile with template screed.
C. Extruded curbs and gutters, placed by an extrusion machine, may be provided where site conditions are suitable and the extrusion process is appropriate for the purpose.

D. Random Cracking: Through the Contract period and until the end of the Warranty period (refer to General Provisions, “WARRANTY OF CONSTRUCTION”) random drying shrinkage cracks or stress cracks of any nature in Portland cement concrete sidewalks constructed under the Contract will be unacceptable and are subject to being rejected at the discretion of the Authority. Rejected concrete shall be removed and replaced at no additional cost to the Authority. Routing, by any means, and sealing random cracks will not be permitted. Randomly cracked Portland cement concrete sidewalks will require removal and replacement of only the five feet long section or sections containing random cracks. This process is subject to review and should be conducted within reason. Cracks should be rejected if excessive and not superficial. The area of removal and replacement of slabs containing longitudinal random cracks will be determined by the Authority.

E. Curb Ramps:

1. Construct curb ramps in accordance with the applicable standards shown on Contract Drawings and applicable jurisdictional agencies.

2. Curb Ramp Surface: For purposes of warning, curb ramps shall have a light reflective value and texture that contrasts with that of pedestrian route.
   a. Texture shall consist of truncated domes extending the full width and depth of curb ramp as indicated on the Contract Drawings.
   b. Contrast: Apply color hardener to the full width and depth of curb ramps not including side slopes. Apply and cure in accordance with manufacturer’s instructions.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Curb ramps, reinforcing steel, dowels, texture, and color will not be measured or paid for separately, but will be considered subsidiary to the construction of curb, gutters, and sidewalks.

B. Curb and combined curb and gutter specified in this Section will not be measured, but will be paid for at the lump sum prices for “Curb” and “Combined Curb and Gutter”, complete-in-place, for the various types and colors.

C. Sidewalks specified in this Section will not be measured, but will be paid for at the lump sum prices for “Sidewalk”, complete-in-place, for the various thicknesses, colors, and types.
SECTION 02550
CONCRETE PAVEMENT

PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section specifies providing reinforced Portland cement concrete pavement in conformance with the sections, lines, and grades shown on the Contract Drawings.

B. For work done in the right-of-way of other jurisdictional agencies, the minimum requirements of the jurisdictional agency shall apply, unless otherwise indicated in the Contract Documents.

1.2 REFERENCED STANDARDS

A. Standard Specifications for Public Works Construction, North Central Texas Council of Governments, as revised (NCTCOG Standard Specifications).

1.3 SUBMITTALS

A. Shop Drawings for Joint. Submit pavement joint types and layout of expansion, contraction, and construction joints.

B. Product Data: Submit product data on joint filler and curing compound.

C. Concrete Submittals: As specified in Section 03305, "Portland Cement Concrete", including design mixes.

1.4 QUALITY ASSURANCE

A. Comply with codes and regulations of the jurisdictional authorities.

PART 2 - PRODUCTS

2.1 GENERAL

A. All materials (including their delivery, storage, and handling) necessary for the completion of the work described in this Section shall be in complete accordance with the NCTCOG Standard Specifications except as otherwise specified.

B. Concrete for roadway paving, integrally-placed curbs, driveways, street headers, and median noses: In accordance with Section 03305, "Portland Cement Concrete". Mix P-1, if machine placed, and P-2, if hand placed.

C. Concrete for median paving: In accordance with Section 03305, "Portland Cement Concrete". Mix S-7.

PART 3 - EXECUTION

3.1 CONSTRUCTION

A. Concrete pavement shall be constructed in accordance with the NCTCOG Standard Specifications (including hot weather and cold weather concrete) except as otherwise indicated.

B. Random Cracking: Through the Contract period and until the end of the Warranty period (refer to General Provisions, "WARRANTY OF CONSTRUCTION") random drying shrinkage cracks or stress cracks of any nature in Portland cement concrete pavement constructed under the Contract will be unacceptable and are subject to being rejected at the discretion of the Contracting Officer. Rejected concrete shall be removed and replaced at no additional cost to the Authority. Routing, by any means, and sealing random cracks will not be permitted. When Portland cement concrete pavement must be removed and replaced, the area of removal shall extend from the nearest contraction or dummy joint or construction joint a minimum distance of 10 feet, measured parallel to the longitudinal axis of the pavement, and include that portion of the concrete pavement containing the random crack. A sawed dummy joint will be required to be sawed across the opposing, non-damaged, slab in line with the saw cut made for the removal of the damaged slab. The area of removal and replacement of slabs containing longitudinal random cracks will be determined by the Contracting Officer.

C. Dowels at expansion joints shall be supported by dowel baskets as approved.

3.2 CONCRETE TESTING AND QUALITY CONTROL

A. As specified in Section 03305, "Portland Cement Concrete", with the exception of thickness testing which shall be in accordance with NCTCOG Standard Specifications for Concrete Pavement.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Concrete pavement specified in this section will not be measured, but will be paid for at the lump sum prices for "Reinforced Concrete Pavement, "Concrete Median Pavement," and "Reinforced Concrete Driveways," for the various thicknesses.

B. Monolithic median noses will not be measured, but will be paid for at the lump sum price for "Monolithic Median Nose".
C. Integral curb and reinforced concrete street headers shall be measured by and paid for at the lump sum prices for “Integral Curb” and “Reinforced Concrete Street Header” for the various types and dimensions.

D. Reinforcing steel will not be measured separately, but will be considered subsidiary to the construction of concrete pavement and other work specified in this section.
1.1 DESCRIPTION
A. This section specifies furnishing and installing pavement markings, object markers, and delineators.

B. For work done in the right-of-way of other jurisdictional agencies, the minimum requirements of the jurisdictional agency shall apply, unless otherwise indicated in the Contract Documents.

1.2 REFERENCED STANDARDS
A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM C321 - Standard Test Method for Bond Strength of Chemical-Resistant Mortars
   5. ASTM D792 - Standard Test Methods for Density and Specific Gravity (Relative Density) of Plastics by Displacement
   6. ASTM E28 - Standard Test Methods for Softening Point of Resins Derived from Naval Stores by Ring-and-Ball Apparatus

B. Federal Standards (FED STD):
   1. FED STD 141 - Paint, Varnish, Lacquer and Related Materials: Methods of Inspection, Sampling and Testing
   2. FED STD 595 - Colors Used in Government Procurement

D. Texas Department of Transportation (TxDOT): Standard Specifications for Construction of Highways, Streets, and Bridges (TxDOT Standard Specifications).

E. Texas Department of Transportation (TxDOT): Material Specifications:
   1. DMS-8200 – Traffic Paint.
   2. DMS-8290 – Glass Traffic Beads.

1.3 SUBMITTALS
A. Product Data: Submit manufacturer's product data including specifications for each of the following products:
   1. Paint: For each color.
   2. Spheres.
   3. Thermoplastic compound: For each color.
   4. Preformed plastic markings.
   5. ReflectORIZED Traffic Buttons: For each type and color
   6. Delineators.

B. Submit certification, manufacturer's recommendations, and test results for each product. Test results shall not be older than 6 months.

1.4 PRODUCT DELIVERY, STORAGE, AND HANDLING
A. Deliver materials in factory-sealed containers plainly marked as follows:
   1. Manufacturer's name and address.
   2. Location of plant.
   4. Color of material.
   5. Amount of contents.
   6. Date of manufacturer and lot number.
1.5 JOB CONDITIONS

A. Environmental Requirements:

1. Traffic zone paint:
   a. Apply only when ambient air temperature is above 40 degrees F and temperature of surface to be painted is above 45 degrees F.
   b. If pavement is wet, allow surface to dry for eight hours minimum after surface appears dry.
   c. Do not apply glass spheres in strong windy conditions.

2. Extruded thermoplastic compound:
   a. Apply by extrusion at 400 degrees F minimum when air temperature is more than 35 degrees F and pavement temperature is above 45 degrees F, or in accordance with manufacturer's recommendations.
   b. If pavement is wet, delay application until the pavement has been exposed to at least two hours of direct sunlight after surface appears dry.

3. Preformed plastic traffic markings:
   a. Apply on dry pavement when ambient temperature and temperature of pavement surface is above 60 degrees F.
   b. When temperature of pavement surface is less than 60 degrees F and when approved, apply surface heating to degree necessary for application of plastic marking.

B. Refer to Section 01570, "Maintenance and Control of Traffic," and to Section 01500, "Temporary Facilities and Services Required During Construction," for requirements traffic control, barricades, and protective devices.

2.2 GLASS BEADS

A. Retroreflective Glass Spheres: TxDOT DMS-8290, Type I.

2.3 EXTRUDED THERMOPLASTIC COMPOUND

A. Thermoplastic compound:

1. Mixture of thermoplastic resins and other substances compounded for use in traffic markings which, when extruded hot in place and cooled to ambient temperature, will produce stark white or yellow reflective marking stripe.

2. Pigmented binder well dispersed and free from skins, dirt, foreign objects, or ingredients that will cause bleeding, staining, or discoloration and consisting of mixture of non-drying synthetic resins at least one of which is solid at room temperature.

3. Total binder content of thermoplastic compound: 15 percent minimum, 35 percent maximum by weight.

4. Filler incorporated with resins or binder: White calcium carbonate with compressive strength of 5,000 psi.

5. Permanently white or yellow, without blemish or discoloration, with straight, clean cut, sharply defined, parallel edges, and of uniform cross section.

6. Shaped to minimize tire impact and adhere permanently to road.

7. Set to solid, non-tacky, non-slippery line of sufficient elasticity to resist cracking and chipping caused by weather and temperature changes, traffic action, as well as pavement crawl, and lift in freezing weather.

8. After curing, does not react with nor deteriorate in contact with snow removal chemicals, oil and other substances common to roadway surfaces.

9. Chemically stable and emitting no dangerous fumes.

10. Especially compounded for traffic markings, with no change in color and brightness characteristics after prolonged exposure to sunlight.
11. No breakdown or deterioration when held at plastic temperature for extended periods of time nor when repeatedly reheated to plastic temperature.

12. No change in temperature versus viscosity characteristics through repeated reheatings and from batch to batch.

B. Properties of Thermoplastic Compound:

1. Water absorption: 0.5 percent maximum by weight of retained water when tested in accordance with ASTM D570.

2. Softening point: 90 degrees C minimum when tested in accordance with ASTM E28.

3. Specific gravity: From 1.80 to 2.50 at 25 degrees C when tested in accordance with ASTM D792.

4. Low temperature stress resistance: No cracking or flaking, after 24 hours at 20 degrees C, when applied to asphalt surface.

5. Resistance to impact: Not less than 10 inches per pound at 77 degrees F using a 25 inch per pound scale, when tested in accordance with ASTM D256, Method A.

6. Bond strength: 150 psi minimum when tested in accordance with ASTM C321.

7. Drying time: Not exceeding straight line graphic established between two points representing two minutes at 50 degrees F and fifteen minutes at 90 degrees F respectively, when both ambient air temperatures are measured at maximum relative humidity of 70 percent.

8. Indentation Resistance Procedure:

3. The white compound pigment containing not less than six percent titanium dioxide (TiO2).

D. Yellow thermoplastic compound: After drying, yellow, FED STD 595, Color 33538, tested in accordance with FED STD 141, Method 4252.

E. Binder Sealer: Epoxy sealer, in accordance with manufacturer's recommendations.

2.4 PREFORMED PLASTIC TRAFFIC MARKINGS

A. Composed of preformed plastic, smooth on top surface, undersurfaces factory-coated with pressure-sensitive adhesive coating overlaid with protective paper, polyethylene or other suitable material which remains in place until plastic is ready for application to pavement.

B. Composition:

1. Nonreflectorized plastic material: Consisting of basic plastic and plasticizers, 50 percent minimum by weight.

2. Reflectorized plastic material: Consisting of 40 percent minimum by weight of basic plastic and plasticizer and 30 percent minimum by weight of clear, reflective glass spheres, thoroughly and uniformly dispersed throughout plastic.

C. Pigmentation:

1. White plastic markings: Pure white, free from tint, and containing not less than six percent titanium dioxide.

2. Yellow plastic markings: Yellow, FED STD 595, Color 33538, FED STD 141, Method 4252.

3. Uniform coloring throughout cross section of plastic.

D. Low temperature stress resistance: No indication of breaking, chipping or cracking when sample of specified thickness is abruptly bent to right angle.
after being immersed in water at 32 degrees F for 30 minutes.

E. Resistance to wear: Endure not less than 2,500 cycles of a Taber Abraser, using CS-17 wheels under a load of 1,000 grams when each 0.001 inch thickness of plastic is tested at 21 degrees C.

F. Tensile strength: Nonreflectorized markings not less than 1500 psi; reflectorized markings not less than 750 psi when tested in accordance with ASTM D638.

G. Bond strength: Withstand 50-pound static shear load for 15 seconds average at 21 degrees C before complete parting of bond when pair of 2 inch wide strips are overlapped 2 inches and adhesive faces placed together.

H. Preformed plastic traffic markings:
   1. Thickness: 0.095 inch, minus 0.005 inch or plus 0.010 inch.
   2. Width: Plus or minus 1/8 inch per 12 inch length.

2.5 REFLECTORIZED TRAFFIC BUTTONS

A. Permanent: In accordance with jurisdictional authorities and related standard construction details with all revisions thereto.

B. Temporary: Raised pavement markers shall conform to FP-85, Section 634. They shall be white (crystal), yellow, or red, or a combination thereof, as specified in the drawings.

2.6 Delineators

A. Delineators’ geometric shape, composition, and reflective characteristics shall be in accordance with requirements of the TMUTCD and the jurisdictional agency where the work is being performed.

2.7 CONCRETE FOR DELINEATORS

A. In accordance with Section 03305, "Portland Cement Concrete," Mix S-7.

2.8 HARDWARE FOR DELINEATORS

A. Brackets, straps, braces, bolts, and appurtenances as shown on the drawings, or if not shown, these items shall be of the size, shape, material, and workmanship necessary to make final product acceptable to jurisdictional agency where the work is being performed.

B. Approved commercial quality hardware is acceptable.

PART 3 - EXECUTION

3.1 GENERAL

A. The work of this section shall be executed in accordance with the NCTGOC Standard Specifications, and as specified herein.

B. Surface Preparation: Prior to application of pavement markings, clean asphalt and concrete pavements as specified herein to remove foreign matter, including direct, loose material, and other contaminants in accordance with TxDOT Standard Specifications, Item 678, “Pavement Surface Preparation for Markings.”
   1. Clean asphaltic pavement surface by brushing, washing, compressed air, high-pressure water, or any combination thereof to remove contamination and loose materials.
   2. Clean concrete pavement surfaces by blast cleaning sufficiently to remove loose and flaking materials and contaminants. Concrete pavement surfaces shall not be cleaned by grinding.

3.2 LAYOUT

A. Layout of Pavement Markings: Lay out pavement markings in accordance with regulations of jurisdictional authorities and as shown on the drawings.

B. Pavement Markings and Symbols:
   1. Unless otherwise shown or specified, install pavement markings of size and configuration as shown in jurisdictional authorities standard construction details, the TMUTCD, or as shown in the "Standard Alphabet for Highway Signs and Pavement Markings".
   2. Apply letters, directional arrows and other markings in color shown.

C. Length, width, and color of pavement markings, as shown on the drawings.

D. Delineators:
   1. Set markers and delineators at locations shown, secure to posts so that top of reflecting head is 4 feet above adjacent roadway.
2. Space delineators as shown.

3.3 APPLICATION - TRAFFIC ZONE PAINT

A. Equipment:
   1. Use equipment suitable for mechanical application of paint and glass spheres.
   2. Apply paint with atomizing spray machines designed for striping to apply stripes of uniform cross section, and thickness, at specified coverage with clear cut edges permitting easy and accurate adjustment of width and rate of application as well as immediate shut off.
   3. Use automatic mechanical equipment designed and constructed to distribute glass spheres in uniform pattern and at prescribed coverage regardless of variation in speed of travel. Equipment may be integral part of striping machines or self-contained unit designed for attachment to striping machines, so that glass spheres will be applied immediately following application of paint. Use equipment designed and constructed to permit adjustment of coverage rate.

B. Method of application:
   1. Schedule marking and striping operations to permit paint to set and harden before roadway is opened to traffic.
   2. Allow hot laid bituminous material to cool, prior to beginning striping operations.
   3. Prepare surfaces as specified in Article 3.1 herein.
   4. Apply paint and glass spheres, mix and thin paint in accordance with manufacturer's recommendations.
   5. Apply glass spheres uniformly, immediately following application of paint. Do not pre-mix paint and spheres.
   6. Apply pavement markings accurately with straight clean cut, sharply defined parallel edges and of uniform cross section.
   7. Clean striping machines as often as necessary to ensure application of markings of specified quality and physical requirements.

3.4 APPLICATION - EXTRUDED THERMOPLASTIC COMPOUND

A. Master kettle:
   1. Minimum capacity: 800 pounds of melted compound.
   2. Double oil jacket.
   3. Thermostatic controls.
   4. Approved heating device.
   5. Temperature gauges for oil and compound.
   6. Integrally mounted chopping device to chop and drop solid compound into kettle.

B. Liner:
   1. Use liners with self-contained heat source, such as propane heater, capable of maintaining compound at drawing temperature of not less than 400 degrees F as well as radiant heater installed over die for same purpose.
   2. For installation of crosswalk lines, stop lines and solid center lines, use liner with capacity of approximately 150 pounds and automatic sphere dispenser capable of distributing reflective spheres on surface of line while still plastic.
   3. For centerline and lane line installation, use mobile unit equipped to automatically install dashed lines in combinations of line and skip up to 40 feet and for application of reflective spheres as specified for smaller liner.
   4. Provide for varying die widths in liner to produce indicated line widths, including shaping die cutoff device to provide clean, square ends at beginnings and ends of lines.

C. Application of binder sealer:
   1. Before applying binder sealer, prepare roadway surface as described under job conditions as specified herein.
   2. Where thermoplastic stripe is to be installed spray surfaces with binder sealer immediately prior to installation of compound.
   3. Mix binder-sealer fresh each day. Do not pre-mix.
D. Application of thermoplastic compound:
   1. Apply compound in colors shown and at locations shown.
   2. Do not use pans and aprons to control width of lines.
   3. Use equipment including extrusion dies capable of maintaining compound at specified extrusion temperature and density and capable of producing stripe of specified width.
   4. Do not apply thermoplastic marking in gutters; stop marking approximately 12 inches from face of curb.

E. Application of glass spheres:
   1. Perform reflectorizing of thermoplastic compound by immediate application of glass spheres to specified density.
   2. Perform reflectorizing so that completed line registers not less than 55 on Hunter Nite Visibility Meter.

3.5 APPLICATION - PREFORMED PLASTIC TRAFFIC MARKINGS

A. Prepare roadway surface by removing dirt, dust, oily substances, and other foreign matter before installing plastic markings as specified in Article 3.1 herein.

B. Do not install plastic marking on wet or damp pavement.

C. Make installations in neat, workmanlike manner with ends and edges of successive strips of material even.

D. Position center and lane markings using chalk as guides.

E. Installation on new asphaltic concrete surfaces:
   1. When plastic markings are to be installed on new asphalt surfaces, install while asphalt is still hot and immediately before final rolling is performed.
   2. As part of final rolling operation, position and embed plastic marking into surface.

F. Installation on existing asphaltic concrete surfaces:
   1. Apply prime coat recommended by manufacturer of plastic markings to pavement surface prior to installation of markings.
   2. Accurately locate and press marking into place and obtain final bond by at least two longitudinal passes of ten-ton roller.

G. Installation on Portland cement concrete pavement:
   1. Prepare roadway surface by removing dirt, dust, oily substances, and other foreign matter before installing plastic markings as specified in Article 3.1 herein.
   2. Seal surface of concrete pavement with quick setting primer to reduce capillary action and improve bond between marking and pavement surface.
   3. Otherwise install as specified for asphaltic pavement.

3.6 PAINTING OF CURBING

A. Paint curbing and raised traffic bars with traffic zone paint.

B. Clean surfaces to be painted of dirt, dust, oil, and other foreign substances.

C. Allow 14 days minimum after installation of Portland cement concrete curbing before painting.

D. Paint top and front of curbing in locations shown with one coat of nonreflectorized traffic zone paint as specified.

E. Painting of curbing and wheel stops: Wet film thickness - 0.015 inches minimum.

3.7 PAINTING OF FIRE LANES

A. The Fire Lane pavement shall be painted lines of red traffic zone paint, 6 inches wide to show the exact boundary lines of the fire lane. The boundary lines shall be on the curbs when present or may be on the flat pavement where curbs are not provided. The lines shall be marked by 4 inch high lettering, using a 1 inch stroke of white paint on the contrasting red background stating: "NO PARKING - FIRE LANE". This marking shall be placed at 25-foot intervals along each boundary line. Text markings on the red stripe shall right reading from the center of the fire lane.

3.8 APPLICATION - TRAFFIC BUTTONS

A. Prepare roadway surfaces by removing dirt, dust, oily substances, and other foreign matter before installing buttons as specified in Article 3.1 herein.
B. Do not install on wet or damp pavement.

C. Make installations in neat, workmanlike manner.

D. Position center and lane marking buttons using chalk as guides.

E. Installation on new asphaltic concrete surfaces:
   1. Apply prime coat recommended by manufacturer of buttons to pavement surface prior to installation of markings.
   2. Accurately locate and press marking into place and obtain final bond.

F. Installation on existing asphaltic concrete surfaces:
   1. Apply prime coat recommended by manufacturer of buttons to pavement surface prior to installation of markings.
   2. Accurately locate and press marking into place and obtain final bond.

G. Installation on Portland cement concrete pavement:
   1. Seal surface of concrete pavement with quick setting primer to reduce capillary action and improve bond between marking and pavement surface.
   2. Otherwise install as specified for asphaltic pavement.

3.9 FIELD QUALITY CONTROL - ALLOWABLE TOLERANCES AND COVERAGE

A. Traffic-zone paint:
   1. Width of lines not to vary from indicated width by more than 1/8 inch in each linear foot.
   2. Lengths of skip or lane lines and unpainted surface between skip lines not to vary by more than 3 inches from indicated length.
   3. Coverage rate maximum: 100 square feet minimum and 110 square feet maximum of surface coverage per gallon of paint, yielding wet film thickness of 0.015 inch minimum.
   4. Coverage rate of glass spheres: 10 pounds per gallon of paint minimum.

B. Extruded thermoplastic compound:
   1. Thickness of stripe: 90 to 125 mils.

2. Rate of application of binder-sealer: Between 800 linear feet and 1,000 linear feet per gallon for 4-inch wide lines. For lines of other widths, apply in proportion based on such rate.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Traffic Zone Paint will be measured and paid for at the unit price per linear foot for “Traffic Zone Paint”, for each color and width, and type of line (solid or broken line).

B. Thermoplastic markings specified for placement in the form of lines, except at specified parking lots and the “RRXING” transverse lines, will be measured and paid for at the unit price per linear foot for “Thermoplastic Markings” for each color, width, and type of line (solid or broken).

C. Preformed plastic traffic markings will be measured and paid for at the unit price per each and per linear foot for “Preformed Plastic Traffic Markings” for each type, color, and shape of marking.

D. Glass beads will not be measured or paid for separately but will be considered subsidiary to the work of providing traffic zone paint and thermoplastic pavement markings.

E. “RRXING” markings at railroad crossings shall include the RXR symbol and the three 24 inch transverse lines needed for each approach lane to the crossing. The RXR symbol will not be measured, but will be paid for at the lump sum price for “RRXING Symbol and Lines” for each crossing.

F. Reflectorized traffic buttons will be measured and paid for at the unit price for “Reflectorized Traffic Buttons” for each type.

G. Delineators will be measured and paid by at the unit price for “Delineators” per each.

H. Temporary pavement markings, temporary raised traffic buttons and temporary delineators designated for use during construction operations will not be measured directly, but will be considered subsidiary to the pay item for “Maintenance and Control of Traffic” specified in Section 01570, "Maintenance and Control of Traffic".

I. Marking of pavement and curbs in parking lots and areas outside the designated right-of-way will not be measured directly, but shall be paid for at the lump sum price for “Miscellaneous Striping and Buttons” per each location.
J. Replacement of existing pavement markings and buttons beyond the limits designated on the permanent signage and marking plans, required as a result of removal for installation of temporary traffic control plans, will not be measured directly, but will be considered subsidiary to the pay item for “Maintenance and Control of Traffic” specified in Section 01570, “Maintenance and Control of Traffic”.

K. Surface preparation will not be measured by and paid for but will be considered subsidiary to the pertinent pay item for the various markings and the various raised markers, words, shapes, and symbols.

END OF SECTION 02580
PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies the fabrication and installation of traffic signals and the related components.

1.2 REFERENCED STANDARDS
A. American Institute of Steel Construction (AISC):
   1. AISC 303 - Code of Standard Practice for Steel Buildings and Bridges
   2. AISC 348 - Specification for Structural Joints Using ASTM A325 or A490 Bolts
B. Americans with Disabilities Act Accessibility Guidelines (ADAAG)
C. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A153/A153M - Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware
   2. ASTM A325 - Standard Specification for Structural Bolts, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength
   3. ASTM A490 - Standard Specification for Heat-Treated Steel Structural Bolts, 150 ksi Minimum Tensile Strength
   4. ASTM A563 - Standard Specification for Carbon and Alloy Steel Nuts
   5. ASTM F436 - Standard Specification for Hardened Steel Washers
   6. ASTM F1554 - Standard Specification for Anchor Bolts, Steel, 36, 55, and 105-ksi Yield Strength
D. Institute of Transportation Engineers (ITE)
   1. Equipment and Material Standards of the Institute of Transportation Engineers
      a. Chapter 2: Vehicle Traffic Control Signal Heads (VTCSH)
      b. Chapter 3: Pedestrian Traffic Control Signal Indications
E. National Electrical Manufacturers Association (NEMA):
   1. NEMA C80.1 - Rigid Steel Conduit - Zinc Coated (GRC)
   2. NEMA 70 - National Electric Code (herein after referred to as NEC)
   3. Standard Specifications for Public Works Construction, as revised (NCTCOG)
   4. Texas Manual on Uniform Traffic Control Devices (TMUTCD)
   5. UL 651 - UL Standard for Safety Schedule 40 and 80 Rigid PVC Conduit
    1. Certification: Certification of compliance for each product to be used in the Work.
    2. Requests for Deviations: If the Contractor desires to deviate from any of the stated procedures or to make substitutions for any materials or equipment, submit written request accompanied by samples, product data, and other information, as appropriate. Obtain written approval from the Contracting Officer prior to proceeding.
1.4 SEQUENCING AND SCHEDULING

A. Schedule work so as to cause the minimum interference with traffic and the operation of the existing signal system. Existing signals may be shut down for modification and/or equipment installation only with the approval of the Contracting Officer and the jurisdictional authority and in accordance with the approved Traffic Control Plan. Refer to Section 01570, “Maintenance and Control of Traffic”, for Traffic Control Plan requirements.

PART 2 - PRODUCTS

2.1 TRAFFIC SIGNALS, GENERAL

A. Materials necessary for this completion of the work described in this Section shall be in accordance with the NCTCOG Standard Specifications, the requirements of the jurisdictional authority, and as indicated in the Contract Documents.

B. Furnish materials necessary to complete each traffic signal installation, whether the item is specifically mentioned or not. Unspecified materials (i.e., electrical tape, bolts and nuts, etc.) shall meet the requirements of the National Electrical Code.

C. If more than one unit of a given item is required, ensure that units are the product of one manufacturer, unless otherwise approved by the Contracting Officer.

2.2 VEHICLE SIGNAL HEADS

A. Each signal head shall be a weather tight assembly of one or more signal faces of the expandable, adjustable, light emitting diode (LED) type, together with brackets and fittings necessary for proper mounting with the type of signal support designated on the Contract Drawings. Each signal face shall consist of one or more signal sections, rigidly and securely fastened together, capable of being positively positioned to control the movement of one direction of traffic. Each signal section shall consist of an optical unit, housing, housing door, and visor. Tie rods shall not be used to fasten signal sections together to form a signal face. Signal heads on this Contract shall be the product of one manufacturer.

B. The housing for each signal head section shall be made of durable polycarbonate. Each traffic signal head shall be BLACK in color. Each head shall be clean, smooth and free from flaws, cracks, blowholes, and other imperfections. It shall be designed as a self-contained unit capable of separate mounting or inclusion in a signal face containing two or more signal sections rigidly and securely fastened and perfectly aligned together. It shall be equipped with round openings in the top and bottom so that it may be rotated between water-proof supporting brackets and thus be capable of being directed at any angle in the horizontal plane. It shall be equipped with positive locking devices to maintain a specific angle of direction when in place. The doors shall match the head housing in color and be suitably hinged and held securely to the body of the housing by simple stainless steel locking devices. Other door parts, such as hinge pins, lens clips, and screws, shall also be of stainless steel material. Neoprene gasketing shall be used between the lenses and reflectors to exclude dust and moisture. The depth of each housing section shall not be greater than 7-1/8 inches for 12 inch signal heads. Each signal housing shall accept both plastic and aluminum backplates.

C. Visors shall be made of durable polycarbonate and shall be formed such that approximately 2 inches of the visor's depth from the face of the housing forms a full circle and the remainder of the depth forms a tunnel visor. Visors shall match the color of the head, not less than 0.05 inches in thickness. Each visor shall be designed to fit tightly against the housing door, by the means of four standard twist-on type lugs secured with four stainless steel bolts for easy mounting and rotation. Visors shall be at least 9-1/2 inches deep for 12 inch signal sections, and have flat black finish on the inside surface. Visors supporting louvers shall be constructed of aluminum and have the same physical appearance as the polycarbonate visors.

D. Refer to Article 2.9 entitled “Optical System for Vehicle and Pedestrian Signals”, herein, for signal lamp unit requirements.

2.3 VEHICLE SIGNAL HEAD BACKPLATES

A. Backplates for 2, 3, 4, and 5 section signal heads shall be constructed from black virgin ABS plastic. Backplates shall contain ultraviolet inhibitors and stabilizers for protection against ultraviolet degradation, shall maintain their flexibility under freezing temperatures, and shall withstand wind loads of 100 MPH after installation.

B. Backplates shall be one piece, vacuum formed with a non-reflective front surface.

C. Outside and inside edges shall be formed with a 3/4 inch flat and straight flange turned away from the front surface. Backplates shall have a 5 inch border width, shall have a minimum corner radius of 1.5 inches, and shall have a nominal thickness of 0.125 inch.

D. The finished backplate shall be pre-drilled to fit the signal for which it is designed or shall contain drill starts for field drilling. Backplates shall be provided with necessary bolts, nuts and washers for attaching to the signal head.

E. Provide backplates compatible with the signal head furnished. Backplates provided shall be identical and the product of one manufacturer.

F. The following brand of backplates will be considered acceptable: Pelco Products, Inc.
Other brands of backplates meeting the above requirements and those of the jurisdictional authority may be substituted upon approval.

2.4 PEDESTRIAN SIGNAL HEAD

A. Each pedestrian signal head shall meet the requirements listed herein.

B. Pedestrian signal head dimensions:

1. Maximum height: 19 inches
2. Maximum width: 19 inches
3. Maximum depth: 19 inches high

C. The casing of the signal head shall be a one piece polycarbonate or corrosion resistant aluminum alloy with four integrally cast hinges to provide for operation of a swing down door. The casing shall be yellow in color.

D. The entire signal head assembly shall form a dust and weather proof unit after installation.

E. Each signal head shall be compatible with the mounting hardware specified herein.

F. Refer to Article 2.9 entitled “Optical System for Vehicle and Pedestrian Signals”, herein, for pedestrian signal lamp unit requirements.

G. Each pedestrian head shall include a 1-1/2 inch deep polycarbonate eggcrate or “Z” pattern visor with impregnated flat black color, designed to eliminate the interference of sunlight and to allow clear visibility of the symbols.

H. Each pedestrian signal door shall be designed with adequate hinges and latch slots to provide swing down door operation and thumb screw locking devices.

I. Associated pins, screws, bolts, and nuts shall be made of stainless steel material.

J. Pedestrian signals shall be furnished with the specified mounting hardware installed and completely wired to the signal head, suitable for mounting on the specified side of the pole (pole on the right side or pole on the left side). The casing shall include top and bottom openings that are sealed with removable plugs and that are designed for use with 1-1/2 inch pipe bracket mounting hardware.

2.5 VEHICLE SIGNAL HEAD MOUNTING HARDWARE

A. Each mounting hardware assembly shall be a universally adjustable signal bracket, meeting the requirements specified herein.

B. The bracket shall allow for signal head rotation about the bracket axis, rotation about the supporting member axis, rotation on the vertical plane, and sliding of the support tube against the bracket connection point on the supporting member.

C. The bracket shall be attached to the supporting member with a stainless steel band capable of withstanding 100 ksi tensile stress.

D. The bracket attachment to the signal head shall assume rigid connection through the top and bottom of the signal head and fit the brand of signal head required on this project.

E. The bracket shall be of the type to accept the number of signal sections specified in the drawings for each signal head.

F. Both arms of the bracket shall be cast from aluminum alloy and be secured about their rotational axis by set screws. The arm on one side of the tube shall be internally threaded to accommodate the threaded support tube.

G. The entire assembly shall be capable of securely supporting a signal head under 100 mph wind loading conditions on the attached member.

H. Parts used in this assembly shall be made of corrosion resistant material or be coated with a corrosion resistant finish.

I. Wiring from the supporting member (signal arm or pole) to the signal head shall be completely concealed within the mounting assembly.

J. Each bracket shall be furnished complete with the necessary hardware for installation on the signal supporting member.

K. The nominal arm length shall be 9 inches. Longer arms shall be substituted by the Contractor when maneuverability or visibility of the signal head is restricted.

L. The following brand of vehicle signal mounting hardware will be considered acceptable: "Astro-Brac" by Pelco Products, Inc. Other brands of vehicle signal mounting hardware meeting the above requirements and those of the jurisdictional authority may be substituted upon approval.

2.6 PEDESTRIAN SIGNAL HEAD MOUNTING HARDWARE

A. Each pedestrian signal mounting hardware assembly shall be a “clamshell” mount and meet the following requirements:

1. Each unit shall consist of a two-piece, cast aluminum alloy assembly, painted yellow, and be joined in the final assembly by the use of factory-installed stainless pins. After
mating, the two pieces shall have the following dimensions:

a. Maximum height: 11-1/4 inches
b. Maximum width: 5-1/2 inches (including hinge ears)
c. Maximum depth: 3-3/4 inches

2. Pole connection surface shall be configured to accept connections to poles of 4 inches minimum diameter. The hardware shall allow pole mounting by means of a band strap.

3. The head half of the assembly shall be secured to the pedestrian signal with four 5/16 inch bolts.

4. A minimum of three sets of screw terminal pairs shall be located on a terminal block in either the head or pole half of the assembly.

5. The terminal block compartment shall be watertight to prevent moisture from reaching the terminals.

B. Electrical wiring shall be completely concealed within the mounting assembly.

C. Parts used in this assembly shall be made of corrosion resistant material or be coated with a corrosion resistant finish.

D. Each bracket shall be furnished complete with the necessary hardware for installation on the signal supporting member.

E. The following brand of pedestrian signal head mounting hardware will be considered acceptable. Pedestrian signal head mounting hardware produced by other manufacturers may be substituted providing they meet the jurisdictional authority's requirements and are approved.

1. Indicator Controls Corporation Part Number 4835
2. McCain Traffic Supply Part Number P9050

2.7 SIGNAL HEAD LOUVERS

A. Louvers shall be provided for those signal sections indicated in the Contract Drawings. Louvers shall be of such design as to provide visibility of the lens for the intended lane of traffic as indicated by the Contract Drawings and block visibility to other lanes.

B. The internal arrangement of each louver shall consist of 5 vanes with 5 degree cut-offs right of center. Louvers shall have a flat black finish on the external surfaces and a dull black finish on the inside surfaces. Each louver shall be of suitable weight and size to fit inside the tunnel visor furnished for the intended signal section.

C. A "chicken wire" screen with sufficient mesh size to prevent entry by birds shall be securely fastened to the front face of each louver.

D. When indicated on the Contract Drawings, a Pelco Model SP-1010-TX geometrically programmed louver with visor and clip shall be used to shield the signal displays. Other louvered signal displays shall be shielded with the louver specified above.

2.8 PEDESTRIAN PUSHBUTTON ASSEMBLIES

A. Each pedestrian pushbutton assembly shall be of one piece cast aluminum construction which includes a pushbutton switch, sign frame, and sign.

B. The housing of the pushbutton switch shall be completely dust and moisture resistant.

C. The sign frame for each assembly shall accept a 9 inch by 12 inch sign.

D. The sign shall have a white reflective background with black lettering and border meeting the graphical and textual requirements as specified on the Contract Drawings and the jurisdictional authority's requirements.

E. Curve back assemblies shall be provided for mounting on round poles of 4 to 15 inches in diameter.

F. The pushbutton housing and sign frame shall have a yellow, corrosion resistant finish.

G. The pushbutton shall have an easy to push 2-inch "ADA" style button that meets ADA requirements as published in the Federal Register.

2.9 OPTICAL SYSTEM FOR VEHICLE AND PEDESTRIAN SIGNALS

A. The optical system for each signal section shall meet the requirements specified herein.

B. Each LED signal lamp unit shall be a single, self-contained, watertight silicon sealed unit, consisting of a UV stabilized polymeric outer shell, multiple LED light sources and a regulated power supply. LED’s shall be mounted on a polycarbonate positioning plate or conformally coated PC board.

C. LED’s shall be manufactured using AlInGaP (Aluminum-Indium-Gallium-Phosphorous) technology or other technology with as low or lower susceptibility to temperature degradation than AlInGaP. AlGaAs (Aluminum-Gallium-Arsenic) LED’s will not be allowed.
D. Color and Design:

1. The color of the LED lamps shall be as specified herein and on the Contract Drawings.

2. Pedestrian signal lamp unit shall display a uniform, bright alternate symbol message of “HAND” in portland orange and “WALKING PERSON” in lunar white. The countdown part of the module must consist of 2 digits and must be located immediately adjacent to the associated “UPRAISED HAND” icon and integrated into the module. Each message shall be a minimum of 12 inches in height and 7 inches in width. A 30 second countdown timer shall be included with the pedestrian signal.

E. Each LED traffic signal lamp shall meet minimum laboratory light intensity values, color (chromaticity), and light output distribution as described in ITE Standards, Chapter 2.

F. Each LED pedestrian signal lamp shall meet minimum laboratory light intensity values for color (chromaticity) as described in the ITE Standards, Chapter 3.

G. The LED signal lamp unit shall operate on a 60 Hz AC line voltage ranging from 80 volts RMS to 135 volts RMS without flickering.

1. For traffic signal lamps: Two captive, color coded, 36 inches long, 600V, 18 AWG minimum jacketed wires shall be provided for an electrical connection to the signal head terminal block.

2. For pedestrian signal lamps: The conductors to the lamp unit shall be copper, 12 inches long, 221 degrees F insulation, and shall conform to the 1999 NEC Article 402, “Fixture Wires”.

H. LED’s shall be arranged in no less than 5 equally loaded circuits. For traffic signal lamps only: The module shall be designed to sense a loss of light output due to catastrophic LED failures of between 25 and 40 percent. Loss of light output due to LED failure shall not be detected for losses of less than 25 percent but shall be detected for any loss of light greater than 40 percent.

I. Acceptable brands of LED’s are listed on the TxDOT website’s Prequalified Products List. Other brands of LED’s meeting the above requirements and those of the jurisdictional authority may be substituted upon approval.

2.10 CONDUITS AND RELATED HARDWARE

A. Conduits shall be in compliance with Section 16111, “Conduits”, and as specified herein.

B. Metal Conduits: Conduit, including elbows and couplings shall be standard weight schedule 40 zinc-coated steel rigid threaded conduit (hot-dip galvanized), conforming to NEMA C80.1, and Underwriters’ Laboratories Specifications.

C. PVC Conduits: Polyvinyl chloride conduits, including elbows and couplings shall be schedule 40 PVC conduit, conforming to UL 651.

D. Weatherheads shall be made of aluminum and attached to conduit by means of a clamp-on strap.

E. Splice/terminal cans shall be no less than 6 inches deep, 6 inches wide, and 6 inches high. Terminal cans shall be made of a rust resistant, weatherproof material. Plastic terminal cans will not be acceptable.

2.11 GROUNDING CONDUCTORS AND RODS

A. Grounding and bonding shall be in compliance with Section 16450, “Grounding and Bonding”, and as specified herein.

B. The grounding conductor shall be a No. 6 AWG stranded copper wire.

C. Ground rod electrodes shall be copper-bonded steel being at least 5/8 inch in diameter and a minimum of six feet long.

2.12 MULTI-CONDUCTOR SIGNAL CABLE/WIRE

A. Conductor cable for intersection signalization and interconnect shall be multi-conductor capable of operating at 600 volts maximum, and suitable for use at conductor temperatures not exceeding 167 degrees F. Such cable shall meet the requirements of NEC. Interconnect cable size and type shall be as described in the Contract Drawings.

B. Signal conductor cable shall be No.14 AWG/THHN/multi-conductor, stranded copper, the number of conductors as specified on the Contract Drawings. The copper wire (before insulating) shall meet the requirements of the latest ASTM standards for uncoated wire.

C. Wire running from the pole base to the pedestrian signal head shall be No. 14 AWG stranded multi-conductor jacketed cable.

D. Refer to Paragraph entitled “Identification of Signal Wires and Cables” for additional product requirements.

E. Wire and cable shall be compliance with Section 16120, “Wire and Cable”.

2.13 A.C. POWER AND LUMINAIRE POWER WIRE

A. A.C. Power Wire shall be No. 4 AWG/XHHW, with the number of conductors being specified in the
Contract Drawings, and meeting the provisions of NEC.

B. Luminaire Wire shall be No. 8 AWG/XHHW, with the number of conductors being specified in the Contract Drawings, and meeting the provisions of NEC.

C. The cable shall be capable of operating at 600 volts maximum and suitable for use at conductor temperatures not exceeding 167 degrees F. Material and construction shall be in accordance with the applicable requirements of the "Insulated Power Cable Engineers Association" (I.P.C.E.A) Standards.

2.14 CABLE INSTALLATION LUBRICANT

A. Cable installation lubricants shall be commercially available wire pulling compounds suitable for PVC sheathed cables consisting of soap, talc, mica, or similar materials designed to have no deleterious effect on the cables being used. Lubricant shall not be the grease or oil type used on lead sheathed cables.

2.15 PULL BOXES

A. The pull box cover shall be constructed of galvanized steel and its top surface shall have a minimum co-efficient of friction of 0.5.

B. The words "DANGER HIGH VOLTAGE TRAFFIC SIGNAL" shall be imprinted as an integral part of pull box covers.

C. Pull box covers shall be furnished with a locking mechanism to prevent access to the pull box without the use of tools.

D. Pull boxes shall be of a stackable design so that they can be joined together to achieve an extra-height box.

E. Pull box enclosures shall be constructed of concrete, and when covered, shall meet AASHTO standard specifications for H20 loading (32,000 pound, single axle load over a 10 inch by 10 inch area). Enclosures and covers shall be rated for a minimum of 5,000 lbs over a 10 inch by 10 inch area.

F. Pull box components shall be designed and tested to withstand temperatures as low as minus 20 degrees F.

G. Pull boxes designated as Type C on the Contract Drawings shall be 15.25 inches in width by 28.25 inches in length by 10 inches in depth.

2.16 TRAFFIC SIGNAL STRUCTURES

A. General:

1. Furnish traffic signal structure components in compliance with the designs, dimension, strength, and material quality specified in the Contract Drawings to assure structural consistency of components in future improvements.

2. Components of Traffic Signal Structures listed in this subsection shall be hot dipped galvanized to resist corrosion.

B. Other hardware necessary for complete installation of traffic signal structures, i.e., simplex plates, pole caps, transformer bases, and anchor bolts, shall be hot dipped galvanized and conform to the design, dimension, and strength requirements of said items as indicated in the Contract Drawings.

2.17 TRAFFIC SIGNAL CONTROLLERS AND CABINETS

A. Refer to the Contract Drawings for specifications for a traffic signal controller, cabinet, and related equipment based on the requirements of the jurisdictional authority.

2.18 ANCHOR BOLTS (BOLTS, NUTS, AND WASHERS)

A. Anchor Bolts: ASTM F1554, Grade 55, unless noted otherwise on Contract Drawings. ASTM A563, Grade A for nuts. ASTM F436, Type 1 for washers.

B. Galvanized per ASTM A153/A153M

C. Bolts hooked, unless otherwise shown or recommended by manufacturer of pole or structure being anchored.

1. Two nuts and one washer for each anchor bolt for plumbing pole or leveling structure.

2.19 CONCRETE

A. In accordance with Section 03305, "Portland Cement Concrete", Mix S-2.

PART 3 - EXECUTION

3.1 GENERAL

A. Construction within shall be in accordance with the NCTCOG Standard Specifications as revised, the requirements of the jurisdictional authority, and as specified herein.

B. Install and activate completed signals and signal systems.
C. Installation work shall be in accordance with the applicable sections of the NEC, local ordinances and regulations, the Contract Drawings, these Specifications and relevant sections of the NCTCOG Standard Specifications. Finished work shall be neat and uncluttered in appearance.

D. Furnish and install signal equipment including: controller cabinets (unless noted otherwise), signal structures, conduits, pull boxes, signal head assemblies, detector units, AC service, conductors, concrete, reinforcing steel, forms for structure foundations, grouting materials, painting materials, miscellaneous nuts, bolts, and washers, and other miscellaneous equipment that is required to complete the Work.

E. Obtain and install a meter base for electrical power service for each signal installation on this contract. Obtain the meter base from the electrical utility company.

F. Maintain existing traffic signal operations during the installation of new signals. Where controllers, cabinets and/or, signal heads exist on foundations that are to be removed, maintain the signal in proper working order by use of an existing controller or temporary controller, and/or temporary head(s) and cables. Provide temporary materials, as required.

G. Removal and Salvage of Existing Equipment:
   1. Remove existing traffic signal equipment as designated in the Contract Drawings. If equipment/materials are to be salvaged, obtain from the jurisdictional authority through the Contracting Officer a list of salvage materials. Deliver the salvage materials to the jurisdictional authority’s designated storage location. Give the Contracting Officer 1 week notice prior to removing or dismantling any traffic signal cabinet or structure in order to receive any special instructions.
   2. Ship and handle salvage material (heads, poles, cabinets, cable, signs, amplifiers, etc.) in a manner so as to prevent damage to these items. Signal heads shall be removed from poles prior to shipping. Secure cables in controller cabinets to prevent damage during shipment and handling. Tighten screws into their respective slots to prevent loss during shipping. Remove the controller and supplemental control equipment (conflict monitors, detector amplifiers, load switches, etc.) from the cabinet prior to cabinet removal and give them to an authorized representative of the jurisdictional authority at the time of the signal turn-on.
   3. The representative of the jurisdictional authority will identify existing damage to salvageable material and mark damaged items in the field. The Contractor will not be held responsible for damage not caused by the Contractor or for existing damage. If damage to material is the fault of the Contractor, make repairs or supply equal items within three working days, at the Contractor’s expense. If the Contractor fails to repair or replace damaged items in said time, the Contractor will be charged for the assessed value.

H. Notify the jurisdictional authority a minimum of 2 days prior to delivering salvaged materials and schedule delivery at a time convenient to the jurisdictional authority. Deliver salvaged material to the storage area designated by the jurisdictional authority. Obtain receipt for Contractor’s records.

I. The initial acceptance of the work performed by the Contractor for each signalized intersection shall take effect at the time the intersection is put in operation. The warranty period required under General Provisions, “Warranty of Construction”, shall start at the date the signal is put in operation with complete permanent equipment.

J. The locations of traffic signal foundations, bases, conduit, detectors, and similar work shown on the Contract Drawings are approximate. Exact locations shall be determined by the Contractor at the time of construction.

K. Although the Contract Drawings are drawn approximately to scale, the positional relationship of some system components and equipment (e.g., cabinet and pole locations) have been distorted for purposes of clarity.

L. The locations and lengths of existing conduit and other utility facilities shown on these Contract Drawings are approximate, exact locations and lengths shall be determined by the Contractor. Refer to Section 02760, “Maintenance, Support, and Restoration of Existing Utility Facilities”, for requirements for locating and protecting existing utilities.

3.2 TRAFFIC SIGNAL COMPONENTS - INSTALLATION OF ELECTRICAL SERVICE

A. Furnish and install conduit and wire from service connections for AC Service as shown on the Contract Drawings and as required by the electrical utility company for traffic signal controllers and
3.3 TRAFFIC SIGNAL COMPONENTS - INSTALLATION OF CONDUIT

A. Comply with the requirements of the jurisdictional authority for street and sidewalk cutting, excavation, and repair and the applicable provisions of the specifications.

B. Conduit installation shall comply with Section 16111, “Conduits”.

C. Trench excavation, support, and backfilling shall comply with Section 02221, “Utility Excavation and Backfilling”.

D. Install underground cable facilities required to satisfy the requirements of the new signal system. Route cable through existing conduits and new conduits installed by the Contractor as shown in the Contract Drawings.

1. If any of the available cable routing paths utilize existing duct space of the local tele/communications provider, the Contractor shall be responsible for detailed coordination of proposed cable routing and actual installation, with local tele/communications provider before any work is started. Installation of conduit and cable in local tele/communications provider manholes shall be per local tele/communications provider Specifications, which includes adequate ventilation to prevent injury to personnel caused by toxic or harmful gases.

E. New Conduit:

1. Unless otherwise shown on the Contract Drawings, conductors shall be in conduit except when in metal poles. Conduit and fittings shall be of the sizes and types shown on the Contract Drawings. Exposed conduits and related parts shall be rigid metal. Each section of conduit shall bear evidence of approval by Underwriter's Laboratories.

2. Conduit terminating in posts or pedestal bases shall not extend vertically more than 3 inches above the concrete foundation. Field bends in rigid metal conduit shall have a minimum radius of 12 inch diameters times the nominal size of the conduit.

3. Each length of galvanized rigid metal conduit, where used, shall be reamed and threaded on each end and couplings shall be made tight. Joint PVC conduit by the solvent-weld method in accordance with the conduit manufacturer's recommendations. Use no reducer couplings unless specifically indicated on the Contract Drawings.

4. Conduit and fittings shall have burrs and rough places smoothed and shall be clean and free of obstructions before the cable is installed. Make field cuts with a hacksaw only. Make field cuts square and true so that the ends will butt or come together for the full diameter thereof. Use no cutting torch to cut or join conduit. Slip joints or running threads will not be permitted for coupling conduit unless approved by the Contracting Officer. When a standard coupling cannot be used, use an approved union coupling and provide a water-tight coupling between the conduit. Install couplings properly to bring their ends of connected conduit together to produce a good rigid connection throughout the entire length of the conduit run. Where the coating on a conduit run has been damaged in handling or installation, such damaged parts thoroughly painted with rust preventive paint. Cap or plug ends of conduits until installation of the wire is complete. When directed, draw a full-size metal wire brush, attached by swivel joint to a pull tape, through the metal conduit to ensure that the conduit is clean and free from obstructions. Place conduits in an open trench at a minimum 24 inches depth below the curb grade in the sidewalk areas, or 18 inches below the finished street grade in the street areas. Paint shall be in accordance with Section 09970, “Coatings for Steel”.

5. Secure and support conduit placed for concrete encasement in such a manner that the alignment will not be disturbed during placement of the concrete. Place no concrete until of the conduit ends have been capped and box openings closed. Place concrete in accordance with Section 03300, “Cast-In-Place Concrete”.

6. Jacking or Boring: Place PVC conduit, which is to be placed under existing pavement, sidewalks, and driveways, by first providing a void through which the PVC conduit shall be inserted. The void may be
made by either boring or jacking a mandrel. Place metal conduit, which is to be placed under existing pavement, sidewalks, and driveways, by jacking or boring.

a. If it is determined by the Contracting Officer that it is impractical to place the conduit by jacking or boring due to unforeseen obstructions, written permission will be granted for the Contractor to cut the existing pavement.

7. Pits for jacking or boring shall not be closer than 2 feet to the back of the curb or the outside edge of the shoulder unless otherwise directed. The jacking and boring method used shall not interfere with the operation of streets, highways, or other facilities, and shall not weaken or damage any embankment structure, or pavement. Use heavy jacks for jacking. Perform boring by mechanical means providing a maximum 1 inch overcut for the conduit to be placed. Use of water or other fluids in connection with the boring operation will be permitted only to lubricate cuttings. Water jetting will not be permitted.

8. Where conduit is to be placed under existing asphaltic pavement, use the jacking method unless written approval is given by the Contracting Officer for placement of conduit by boring.

9. Tamp backfill for excavations with mechanical tamps in 6 inch layers (compacted) to the density of the surrounding ground.

10. Provide adequately bent conduit and properly excavate so as to prevent damage to the conduit or conductor by a bend radius which is too short.

11. Where conduit is installed into an existing base, cut base as shown in the Contract Drawings and install conduit into the base without interfering with the operation of the signal.

12. Make conduit runs continuous and of the same material (metal only or PVC only). Where tying into existing conduit, continue with the same material (metal to metal or PVC to PVC).

F. Existing Conduit:

1. Prior to pulling cable in existing underground conduit, clean conduit with a mandrel or cylindrical wire brush and blow out with compressed air. If conduit appears to be blocked, make an attempt to clear the conduit by rodding. (The Contractor will not receive extra compensation for rodding.) Notify the Contracting Officer prior to disconnecting or removing existing interconnect cable.

2. Where existing conduit is found to be unusable (conduit has collapsed or the cable is unable to be pulled from the existing conduit), upon approval, install new rigid metal or PVC conduit.

3.4 TRAFFIC SIGNAL COMPONENTS - CABLE

A. General:

1. Wire and cables shall comply with Section 16120, “Wires and Cables”, and requirements specified herein.

2. Install cables in conduit unless indicated as an “overhead” cable run. Conduit shall be continuous, free of debris, reasonably dry, and without sharp projections, edges, or short bends. If required by the Contracting Officer, demonstrate that the conduit is dry and free of debris by pulling a swab and/or mandrel through the conduit. Install conductors in a manner so as to ensure against harmful stretching of the conductors or damage to the insulation. Installation methods shall conform to the recommendations of the cable manufacturer.

3. Pull cables in a given conduit run at the same time and assemble conductors to form one loop in such a manner that the pulling tension is equally distributed to the cables. For long, hard pulls use pulling eyes. For short runs, the cables may be gripped directly by the conductors by forming them into a loop to which the pull wire or rope can be attached. Select method that is appropriate for the anticipated maximum pulling tension in each case.

4. In many instances, existing conduits which contain signal cable shall be used for the installation of new cables. In locations where new cables are to replace existing cables, the existing cables may be used to pull in the new cables. At locations where new cables are to be added to existing cable runs, first pull out the existing cables, then replace, adding the new cables to the existing cables to form one cable pull. Installation and removal shall be done in such a way as to prevent damage to the existing and/or new cables. In the event of damage, the Contractor shall bear the responsibility of providing the material and labor for replacement of defective cables at no extra cost.

5. Measure conduit runs accurately for determining cable lengths to be installed. Insert a measuring device into the conduit,
and measure the length (to the nearest foot) from entry point to exit point. Make conduit run measurements in the presence of the Contracting Officer. Record cable measurements and include the distances on an as-built drawing. In locations where new cables are to replace existing cables, the Contractor may use the removed cables as a measuring device to determine the lengths of the new cables to be installed; however, this does not relieve the Contractor of his responsibility to record accurate measurements of cable lengths.

6. Do not exceed manufacturer's recommended maximum pulling tensions under any circumstances. If so required by the Contracting Officer, insert a dynamometer in the pull wire as the cables are being pulled into the conduit to demonstrate that the maximum tensions are not being exceeded. The cable shall be fed freely off the reel into the conduit without making a reverse curve. At the pulling end, draw the pull wire and cables from the conduit in direct line with the conduit. Use sheaves or other suitable devices as required to reduce any hazards to the cable during installation. Lubricate cables to reduce friction and further minimize possible damage.

7. Neatly train cables to their destinations in manholes, cabinets, pole bases, pullboxes, and other terminations. Adhere to the cable manufacturer's recommended values for the minimum bending radii to which cables may be bent for permanent training during installation. These limits do not apply to conduit bends, sheaves, or other curved surfaces around which these cables may be pulled under tension while being installed. Larger radius bends are required for such conditions.

8. Pack plumbers putty around cables at the end of each conduit run to seal the conduit openings and prevent moisture and debris from entering.

B. Controller Cabinet Wiring:

1. Wiring for the controller cabinet shall consist of connecting (1) signal wires, (2) power wires, (3) ground wires, and (4) pedestrian push-button wires, to their respective terminals in the cabinet. In the controller cabinet, stranded signal conductors from the field shall be stripped back and a solderless terminal connector shall be attached by means of a special crimping tool manufactured by AMP, Inc. of Harrisburg, Pennsylvania (Model #AB59250). These terminal connectors shall be inserted under the binder head screw and tightened securely. Other wiring for the controller cabinet shall be completed as shown on the wiring diagrams and in the instructions furnished with the controller cabinet by the manufacturer.

2. Neatly install field wiring in cabinets. Train incoming cables to their destination and neatly face together. Trim spare wires and neatly coil with the ends taped. Detector lead-in cables shall have their insulation jackets removed from their terminal strip connection to the bottom of the cabinet, and have their ground wires tied together in the bottom of the cabinet.

3. Pedestrian pushbuttons shall have a common ground wire that is completely isolated and independent from other ground wires. Connect this wire to the designated terminal in the controller cabinet.

C. Signal Head Wiring: Wire signal heads to tie each head into the signal cable for the system. Wiring for the signal head shall consist of connecting the terminal block in each signal section to the common terminal block in each signal face, and where applicable, connecting the common terminal block in each signal face to the terminal block in the signal-head terminal compartment. Wire feeding through the mast arm pole structure shall be wrapped once with plastic electrical tape and wrapped again with electrical friction tape extending 12 inches on each side of the pole opening for a total of 24 inches. For mast arm and pole mounted heads, conductors running from the pole's terminal compartment or transformer base to the signal head terminal shall be No.14 stranded wire. Span wire heads shall be wired with No.14 stranded wire.

D. Terminals: The ends of stranded wires which are to be attached to terminal posts shall be provided with solderless terminal connectors, specified herein.

E. Splices:

1. Make no splices inside conduit runs. Splice signal cables only at locations that are specified in the Contract Drawings. Splicing signal cable in pull boxes is prohibited.

2. Splicing methods shall be in accordance with good electrical practice and the cable manufacturer's recommendations. Materials used shall be of high quality and specifically intended for this purpose. Train cables to their final position and cut to proper lengths. Remove the cable's jacket and insulation as required. In doing this, use care to ensure against nicking the conductors. Install connection tightly and remove burrs, rough edges, and similar imperfections.

3. If wire nuts are used to secure the connection, then splice no more than three
wires together. If more than three wires are connected, then use a Kearney connector or mechanical clamp. Secure splices involving grounding conductors with Kearney connectors or mechanical clamps.

4. When directed that the connections shall be soldered, apply heat by use of a hot soldering iron. Heating the connection with a direct flame will not be permitted. Use care to protect the insulation when soldering. Clean entire surface; take special care in cleaning the outside jacket in order to remove the wax finish. Before the first layer of tape is wrapped, coat entire area with an electric grade rubber cement. After this solvent has dried, insulate the connection to the proper thickness with electrical grade rubber splicing compound tape. This tape requires a pressure and temperature in service to complete its vulcanizing process and shall be stretched to 2/3 its normal width when applied. Cover the completed splice with a half-lap layer of vinyl plastic electrical tape. This wrapping shall be smooth but the tape shall not be stretched more than necessary.

5. Splices in communication cables shall include the shield. Splices between cable pairs shall be made with "Scotchlock" solderless connectors designed for this purpose. The completed splice shall be insulated with a re-enterable plastic splice case. Splices at points other than those shown on the Contract Drawings may be made only with the written approval of the Contracting Officer.

F. Enclosed Wiring: Except for cables suspended by span wire and electrical wiring within steel signal poles, enclose cables and single conductor wire above the ground surface in metal conduit up to but no closer than 1 foot of the lowest power conductor source. Place power-tap lines carried down poles in metal conduit.

G. Identification of Signal Wires and Cables:

1. Follow color codes as shown in the Contract Documents. Make colors continuous from the point of origin to the point of termination. Splices will be permitted only if the same colors are spliced.

2. Designate each communication cable with permanent marking labels at each pull box and in the controller cabinet.

H. Installation of New Signal Cable: Installation of new signal cable in existing conduit will not be permitted until foundations subject to removal have been eliminated. The Contractor may deviate from this requirement in special cases only, after obtaining the approval of the Contracting Officer.

3.6 TRAFFIC SIGNAL COMPONENTS - CONCRETE FOUNDATIONS FOR SIGNAL STRUCTURES

A. Concrete foundations for signal structures shall be located so that the closest structure leg is a minimum of 4 feet from the face of the nearest vertical curb.

B. Excavate for foundations in accordance with lines and depths indicated on the Contract Drawings and as specified in Section 02220, "Grading, Excavating and Backfilling," and Section 02375, "Drilled Shaft Foundation Piers," as applicable. Loose material shall be removed from the excavation before concrete is placed. Water shall be removed by pumping or bailing. The use of explosives will not be permitted.

C. Concrete placement shall comply with Section 03300, "Cast-in-Place Concrete".

D. Construct foundations shall be constructed to the dimensions shown on the Contract Drawings or as
directed by the Contracting Officer. Form and make level the top of the finished foundation. Hold anchor bolts and conduits rigidly in place by a template until the concrete is set. Use a mechanical vibrator for compacting and working the concrete.

1. After the concrete has been placed and the top struck off, it shall be covered with wet cotton or burlap mats, for not less than 96 hours. Bracing and templates for anchor bolts shall remain in place for 96 hours after the concrete is poured. During that time, the anchor bolts and conduit shall not be subjected to any applied strain. Transformer bases shall not be installed on any foundations until approval has been obtained from the Contracting Officer.

E. Backfill shall be tamped with mechanical tamps in 6 inch layers to the density of the surrounding ground. Where excavation is made in the roadway shoulder, the shoulder shall be replaced with material equal to the original composition.

F. Excavated material, not required for backfill, shall be promptly removed and disposed of by the Contractor, as specified in Section 02220, “Grading, Excavating, and Backfilling”. The work site shall be kept clean and neat.

G. No concrete shall be placed when the atmospheric temperature drops below 40 degrees F (temperature reading taken in the shade away from artificial heat) unless permission to do so is given by the Contracting Officer.

3.7 TRAFFIC SIGNAL COMPONENTS - TRAFFIC SIGNAL STRUCTURES

A. Examine foundations, which are to receive traffic signal standards, to assure proper anchorage alignment. Report discrepancies to the Contracting Officer.

B. Level transformer bases, if used, and tightly secure to the foundation before the structure is placed on the base. If shims are required for leveling, total shim height shall not exceed 1/2 inch. Extend foundation anchor bolts a minimum of three threads through each nut in the base.

C. Except as modified herein, erect traffic signal structures in accordance with the applicable Specifications and Standards of the AISC Manual of Steel Construction. Erecting equipment shall be suitable for the work and shall be in first class condition. Where parts cannot be assembled or fitted properly as a result of errors in fabrication or deformation due to handling or transportation, report such condition immediately to the Contracting Officer for approval of the method of correction that shall be used. Straightening of plates and angles or other shapes shall be done by approved methods. Bent or damaged heat-treated parts will be rejected. Steel work shall be drained properly. Fill pockets in structures exposed to the weather with a waterproof material approved by the Contracting Officer. The Contractor shall correct shrinkage and distortion of butt welds. Moment connections in the field on beams and girders shall have a minimum of 3/16 inch root opening prior to welding for flange preparations. Correct loose joints by cutting with a hand guided torch, if necessary.

D. Erect and assemble in accordance with manufacturer’s detailed instructions.

E. Field welding shall be as specified for shop fabrication of welded construction. Any shop paint on surfaces adjacent to joints to be field welded shall be wire brushed to reduce the paint film to a minimum.

F. Grouting: Pack void between concrete base and pole base plate with nonshrink grout, as specified in Section 03305, “Portland Cement Concrete”, and install as specified in Section 05130, “Structural Steel - Buildings”. Install a waterproof silicone-based sealer between the controller cabinet and the controller foundation in accordance with Section 07900, “Seals and Sealants”.

3.8 TRAFFIC SIGNAL COMPONENTS - SIGNAL HEADS

A. Assemble signal head units as specified in the Contract Drawings or as directed. Mount signal heads level and plumb. Position and secure the signal heads so they are visible at a minimum of 200 feet back from the stop bar.

B. Cover signal heads or parts of heads not in operation with burlap until placed into operation. When the signal heads become operational, immediately remove existing heads no longer required.

C. Hardware in each signal head assembly shall be completely tight. Securely tighten signal and pedestrian heads immediately after the signal head assembly has been installed. If any signal head assembly is found to be loose or asymmetrical in any manner, remove and rebuild the signal head assembly to the satisfaction of the Contracting Officer.

3.9 TRAFFIC SIGNAL COMPONENTS - FIELD PAINTING

A. No painting will be required for the signal heads except those parts on which the paint has been scratched or marred, and such parts shall be given two coats of high-grade enamel or paint of the same color as the factory paint.

B. Surfaces where the shop coat of paint has been damaged shall be retouched using the same system as the original shop painting. Promptly after the acceptance of the weld, clean, pretreat,
and prime welds and the areas adjacent thereto as specified under the shop painting.

3.10 FIELD QUALITY CONTROL

A. Perform Contractor-conducted testing in the presence of the Contracting Officer.

B. Signal Cables:

1. Check cables for insulation resistance upon installation and prior to termination. Perform the tests with a test set operating at a minimum of 500 volts D.C. applied to the conductors.

2. Test each conductor in the multiconductor signal cables for insulation resistance relative to each other and to the outer covering of the cable. The minimum acceptance value for insulation resistance shall be 1 megohm.

C. Traffic Signal Cable Splices: The Contracting Officer will select at random at least five splices to be inspected. In the presence of the Contracting Officer, sectionize each selected splice to expose the various layers of materials and the connector. These splices will be thoroughly checked by the Contracting Officer for compliance to these specifications. If any splices fail to meet these requirements, then the Contracting Officer will select ten more splices at random for inspection. The Contractor shall then remake each splice.

3.11 TRAFFIC SIGNAL MAINTENANCE DURING CONSTRUCTION

A. Refer to General Provisions “Protection of Existing Site Conditions”. While performing work under this contract, the Contractor bears the sole risk of loss for damages to or destruction of any traffic signal equipment or appurtenances, on equipment that was not to be replaced or installed under this Contract, but which was damaged or destroyed through the fault or negligent act of the Contractor. The Contractor shall replace such damaged or destroyed equipment, etc., at no cost to the Authority or the jurisdictional authority, regardless of whether or not the damaged or destroyed equipment or other element, was a part of this Contract or any warranties under this Contract. The Contractor’s responsibility shall cease under this Article upon written acceptance of an intersection by the Contracting Officer.

B. The Contractor shall provide, at his expense, temporary signal cable systems and signals mounted on span wires, portable bases, or other locations as specified in the Contract Drawings and necessary during the project to ensure that signal head displays are always in operation. Temporary signal assemblies shall feature 12 inch lenses on signal faces. Such temporary signals shall be finished in appearance, meet the requirements of TMUTCD, shall conform to the jurisdictional authority’s standards for temporary box span traffic signals, and be approved by the Contracting Officer.

C. The Contractor’s responsibility for full operation and maintenance of traffic signal equipment shall begin when he starts any type of work which affects active intersection control at the first intersection and shall extend through the period of final project acceptance of each intersection. This maintenance responsibility includes existing controllers/masters, existing interconnect and cabling systems, existing signal indications, new controllers/masters, new signal hardware, new cabling systems, and other hardware elements which are considered part of either the existing or the new traffic signal system.

D. The Contractor shall utilize qualified personnel to respond to trouble calls and to repair any malfunctions. Provide a local telephone number (not subject to frequent changes) where trouble calls are to be received on a 24 hour basis by the Contractor. Respond to reported trouble calls within a reasonable travel time from a Dallas address, but not more than 2 hours maximum. Make appropriate repairs within 12 hours.

E. It is recognized that the jurisdictional authority may make a first response to any trouble call. Action on such response will, however, be limited to placing the intersection on flash, replacing load switches or detector amplifiers, erecting temporary control devices, requesting immediate traffic control by uniformed police officer, or other such action deemed necessary to provide a safe operation. Such action will in no way relieve the Contractor of his operation and maintenance responsibility or the cost of the jurisdictional authority to respond and take appropriate action to provide public safety.

F. Provide police traffic control assistance for planned controller change-outs or any other operational procedures in accordance with the requirements of the jurisdictional authority and as requested by the Contracting Officer. Arrange for police assistance directly, at least 24 hours in advance. If the Contracting Officer discovers that the Contractor has failed to provide adequate police assistance, the Contracting Officer may order additional assistance. Police traffic control assistance, for any purpose, shall be the financial responsibility of the Contractor, regardless of who obtains the assistance.

G. Temporary signalization will be coordinated with time base coordination. A representative of the jurisdictional authority will "punch in" traffic signal settings during construction, and Authority’s forces will prepare the initial traffic signal timing in a timing sheet format.

H. The Contractor may use existing signal heads and signal controllers for temporary control. Temporary signal controllers shall be Model 170 or as approved by the jurisdictional authority. With the approval of the Contracting Officer and the
jurisdictional authority, the permanent signal controller and cabinet may be used for temporary control in its permanent location; however, the Contractor shall be responsible for damage to permanent equipment.

I. Refer to Sections 01500, “Temporary Facilities and Services Required During Construction”, and Section 01570, “Maintenance and Control of Traffic”, for related provisions for temporary traffic signals and traffic controls.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work of this section, traffic signal construction, will be measured and be paid for at unit price for “Traffic Signalization” for each intersection as follows:

1. Traffic signal poles shall be measured and paid for each pole installed, including pole foundation, anchor bolts and all necessary hardware.

2. Traffic Pull Boxes shall be paid for each pull box installed, including frame and cover, all excavation, backfill and surface restoration.

3. Pedestrian Signal Heads and Vehicle Signal Heads shall be paid for each signal head installed, including all signal head mounting hardware, signal cable, louvers and signal head back plates.

4. Pedestrian pushbutton assemblies shall be paid as each pedestrian pushbutton assembly installed, payment will also include all pushbutton switches, sign frame, signs and related hardware and wiring.

5. Conduit shall be measured and paid per linear foot of conduit installed, including all excavation and backfill. Conduit installed under pavement shall include the cost of any necessary pavement restoration to restore the pavement to its original condition.

6. Traffic Signal Controller, cabinet and all vehicle detector equipment shall be furnished by the City of Dallas.

7. Concrete for the controller foundation shall be measured and paid in accordance with Section 03300, “Cast-In-Place Concrete.”

9. Pay for “Install Highway Traffic Signal" each, install equipment furnished by others. Removal of existing signal equipment to be subsidiary to this item.

B. Temporary signalization will not be measured but will be paid for at the lump sum price for “Temporary Traffic Signals”.

C. No separate measurement or payment will be made for the following work required for work of this section. Such work will be considered subsidiary to the various bid items:

1. Installation of materials furnished by the Authority or the jurisdictional authority.

2. Costs associated with obtaining meter bases.

3. Foundations for traffic signals and for other work of this section, including work caused by obstructions.

4. Concrete work, including reinforcing steel.

5. Excavating, backfilling, jacking, boring, and tunneling, including concrete encasement, bedding material, and disposal of surplus material.

6. Support of excavation for depths not exceeding 5 feet

7. Dewatering.

8. Removal or abandonment of existing conducts and associated items.

9. Removal and replacement of existing bases, pavements, sidewalks, curbs, and gutters.

10. Barricading and maintenance and control of traffic, including police traffic control assistance.

11. Maintenance and support of existing utility facilities, except as otherwise indicated in Section 02760, "Maintenance, Support, and Restoration of Existing Utility Facilities”.

D. Trench Support System for trenches exceeding a depth of 5 feet will be measured and paid for as specified under Section 02221, "Utility Excavation and Backfill".

END OF SECTION 02590
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section specifies the furnishing, installation, testing, and disinfection of water mains and appurtenances.

1.2 REFERENCED STANDARDS

A. North Central Texas Council of Governments (NCTCOG)

1.3 SUBMITTALS

A. Submit manufacturer’s data and shop drawings, as applicable, for fittings, valves, vaults, hydrants, meters, meter boxes, valve boxes, RCCP layouts, and appurtenances.

B. Certification. Submit certifications for water piping and casings.

C. Documentation:

1. Submit bill of materials for materials used on this Project for approval.

2. Tests shall conform to requirements of the authority in charge of water line.

1.4 QUALIFICATIONS

A. Fire Protection Specialist: A certified fire protection specialist shall be required to install components of fire protection lines, hydrants, valves, risers, and nozzle assemblies. This does not apply to fire hydrant laterals and normal appurtenances of water lines.

PART 2 - PRODUCTS

2.1 GENERAL

A. Materials (including their delivery, storage, handling, and testing) necessary for the completion of the work described in this section shall be in accordance with the NCTCOG Standard Specifications, requirements of the jurisdictional authority, and as indicated in the Contract Documents.

B. Obtain equipment and appurtenances designated to be furnished by jurisdictional agency and pay associated costs.

C. Commercial Service:

1. Meter with detector check device of size indicated on drawings. Items shall be furnished by the Contractor or by the jurisdictional authority as applicable.

2. Meter Vault shall be sized for meter and detector check device as shown on drawings or by the jurisdictional authority as applicable.

3. Meter Vault Lid: Furnished by the jurisdictional authority.

D. Irrigation Service: Furnish copper service, backflow preventer, meter box, and lid.

PART 3 - EXECUTION

3.1 GENERAL

A. Refer to Section 02220, “Grading, Excavation, and Backfilling,” for excavation and backfill. Refer to Section 02221, “Utility Excavation and Backfill”, for support of excavation.

B. Make arrangements with jurisdictional authority for tie-ins and for testing, inspections, installation, or other services to be performed by jurisdictional authority and pay associated costs.

C. Provide cathodic protection as shown on drawings as specified Section 13100, “Corrosion Control”.

D. Provide grounding and bonding as shown on drawings as specified in Section 16450, “Grounding and Bonding”.

E. Install water distribution system in accordance with NCTCOG Standard Specifications, the requirements of the jurisdictional authority, and the Contract Documents.

1. Fire Hydrants to be installed as follows:

a. Fire hydrants, in accordance with the local jurisdictional Authority, shall be provided within 300 feet of Traction Power Substation, Signal and Communication facilities. Clean agent extinguishing system may be used to increase this distance with approval from the local jurisdictional Authority.

F. Protect and maintain existing utility services in accordance with Section 02760, “Maintenance, Support, and Restoration of Existing Utility Facilities”.
3.2 WATER SERVICE CONNECTIONS
A. Make residential, commercial and irrigation water service connections at locations shown on the Contract Drawings in accordance with the requirements of the jurisdictional authority.
B. Residential Service: Transfer existing water services from the new water main to the meter. The size of each transferred service shall be the same as the existing service, unless otherwise indicated.
C. Commercial Service: Install water service and meter with detector check device in vault.
D. Irrigation Service: Tap existing main and install copper service, backflow preventer, and meter box and lid.

3.3 FIRE LINE CONNECTIONS
A. Make fire line connection. Install fire protection lines, hydrants, valves, risers, and nozzle assemblies

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL
A. Water mains will be measured by and paid for at the unit price for “Water Main” per linear foot for each type and size, including furnishing and installing the pipe with incidentals necessary to complete the water distribution system work except for the items listed for separate payment herein.
B. Connections to existing water mains will be measured by and paid for at the unit price for “Connect to Existing Main” per each for each type and size.
C. Fire hydrants will be measured by and paid for at the unit price for “Fire Hydrants” per each for each type and size. No separate measurement or payment will be made for thrust blocks, removing existing fire hydrants, or any other incidentals necessary to complete the work.
D. No separate measurement or payment will be made for the following work required for work of this section. Such work will be considered subsidiary to the various bid items:

1. Testing, purging and sterilization of water mains; new water and irrigation service connections to existing or new water mains; and new water service lines.
2. Water meters, vaults, boxes, lids, valves, tapping sleeves, flush points, and iron fittings; replacement of existing service connections to the new or existing water mains; cutting and plugging the existing service lines and water mains; tapping the water main for service connection; installing a new service line from the new meter box to the property line; removing and installing valve boxes; removing existing fire hydrants; transferring (connecting) the new service line to the meter; and other associated items.
3. Concrete work, including reinforcing steel.
4. Excavating, backfilling, jacking, boring, and tunneling, including bedding material.
5. Concrete encasement, carrier pipe, welding, enclosures, jacks, cushions and other accessories as required for utility crossings, whether constructed in open cut or by other than open cut.
6. Support of excavation for depths not exceeding 5 feet.
7. Dewatering.
8. Removal or abandonment of existing pipelines and associated items.
9. Removal and replacement of existing bases, pavements, sidewalks, curbs, and gutters.
10. Barricading and maintenance and control of traffic.
11. Maintenance and support of existing utility facilities, except as otherwise indicated in Section 02760, "Maintenance, Support, and Restoration of Existing Utility Facilities".
E. Trench Support System for trenches exceeding a depth of 5 feet will be measured and paid for as specified under Section 02221, "Utility Excavation And Backfill".
F. Cathodic protection will be measured and paid for under Section 13100, "Corrosion Control".

END OF SECTION 02660
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies installing storm sewers and underdrains.

1.2 REFERENCED STANDARDS

A. American Association of State Highway and Transportation Officials (AASHTO):
   1. AASHTO M33 - Standard Specification for Preformed Expansion Joint Filler for Concrete (Bituminous Type)
   2. AASHTO M36 - Standard Specification for Corrugated Steel Pipe, Metallic-Coated, for Sewers and Drains
   3. AASHTO M153 - Standard Specification for Preformed Sponge Rubber and Cork Expansion Joint Fillers for Concrete Paving and Structural Construction
   4. AASHTO M175 - Standard Specification for Perforated Concrete Pipe
   5. AASHTO M190 - Standard Specification for Bituminous Coated Corrugated Metal Culvert Pipe and Pipe Arches
   6. AASHTO M252 - Standard Specification for Corrugated Polyethylene Drainage Pipe
   8. AASHTO M294 - Standard Specification for Corrugated Polyethylene Pipe, 300- to 1200-mm Diameter

B. American Concrete Institute (ACI)
   1. ACI 318 - Building Code Requirements for Structural Concrete

C. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   4. ASTM A153/A153M - Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware
   7. ASTM C32 - Standard Specification for Sewer and Manhole Brick (Made From Clay or Shale).

24. ASTM F449 - Standard Practice for Subsurface Installation of Corrugated Polyethylene Pipe for Agricultural Drainage or Water Table Control.

D. Military Specification (MIL):

1. MIL-PRF-23236 - Paint Coating Systems, Fuel and Salt Water Ballast Tanks (Metric)

E. The Society for Protective Coatings (Formerly known as Steel Structures Painting Council) (SSPC):

1. SSPC-SP 6 - Commercial Blast Cleaning

F. Texas Department of Transportation, Standard Specifications for Construction of Highways, Streets, and Bridges (TxDOT Standard Specifications).

G. Standard Specifications for Public Works Construction, North Central Texas Council of Governments, as revised (NCTCOG Standard Specifications).

1.3 SUBMITTALS

A. Shop Drawings:

1. Drawings for each size and configuration of precast manhole with details of accessories and joints.

2. Diagrams showing dimensioned locations for openings in precast concrete manhole walls.

B. Documentation:

1. Submit calculations for modified or special designs to demonstrate compliance with required load-bearing capacity, certified by a Professional Engineer, licensed in the State of Texas.

2. Submit videotapes and run sheets of television inspections.

C. Certification:

1. Reinforced Concrete Pipe: Manufacturer's certification.

2. Casting: Manufacturer's certification.

4. Concrete: Certifications and test results for aggregates and cement no older than 6 months.

5. Geotextile Filter Fabric: Manufacturer's certification.

1.4 PRODUCT SHIPPING, HANDLING, AND STORAGE

A. Geotextile Filter Fabric: Labeling, shipment and storage: In accordance with ASTM D4873, including the following:

1. Each roll of filter fabric will include a product label clearly showing the name of the manufacturer or supplier, the product and style name, the roll number, and shall state that the geotextile is in accordance with the manufacturer's certification.

2. Each roll of filter fabric will be wrapped with a material to protect the geotextile from damage due to shipment, water, sunlight, and contaminants. The integrity of the protective wrapping shall be maintained during periods of shipment and storage.

3. During storage, rolls of filter fabric shall be elevated off the surface of the ground and
adequately covered to further protect them from site construction damage; precipitation; extended exposure to ultraviolet radiation; chemicals, including strong acids or bases; flames, including welding sparks; temperatures in excess of 160 degrees F.; and any other potentially damaging physical or environmental conditions.

PART 2 - PRODUCTS

2.1 CONCRETE WORK

A. Formwork: In accordance with Section 03100, "Concrete Formwork".

B. Reinforcing Steel: In accordance with Section 03200, "Concrete Reinforcement".

C. Portland Cement Concrete: In accordance with Section 03305, "Portland Cement Concrete," Mix S-2, and Section 03300, "Cast-in-Place Concrete".

2.2 AGGREGATES

A. Aggregate for Pipe Cradle:
   1. For plastic pipe: ASTM C33, sand or coarse aggregate No. 8.
   2. For other pipe: ASTM C33, coarse aggregate No. 67.

2.3 CONCRETE PIPE

A. Concrete Pipe, General:
   1. If proposed circular pipe is to have elliptical reinforcement, indicate the location of the minor axis either by applying 12 inch long by 3 inch wide waterproof stripes on the inside and the outside of the pipe, or by a lift hole or lift holes along the minor axis.
   2. If pipe is to have one lift hole, locate the lift hole at the balance point. If pipe is to have two lift holes, locate each hole equidistant from the balance point. Do not locate lift holes where the holes will expose or interfere with the reinforcement.
   3. Stamp each pipe length at the manufacturer's plant in a manner which will clearly and legibly show the following:
      a. Pipe strength or reinforcement class.
      b. Wall thickness designation.
      c. Manufacturing date.
      d. Manufacturer's Symbol.
      e. When required, municipality's acceptance.
      f. Use no pipe which has not been stamped in the Work.

B. 10-inch diameter and smaller:
   1. ASTM C14, Class 2, nonreinforced concrete pipe.
   2. Bell-and-spigot type, joints fabricated in accordance with ASTM C361. Physical characteristics for rubber gaskets in accordance with ASTM C443.

C. 12-inch diameter and larger:
   1. ASTM C76, reinforced, bell-and-spigot or tongue-and-groove, Class IV, unless otherwise shown.
   2. Radius (bevel) pipe, with drop between two pipe sections not exceeding the common wall thickness.
   3. Rubber gasket joints, when required, fabricated in accordance with ASTM C361. Physical characteristics for rubber gaskets in accordance with ASTM C443.
   4. Acceptance tests as specified in ASTM C76 form basis of acceptance for concrete pipe in accordance with the following:
      a. 72-inch diameter and smaller: Acceptance on the Basis of Plant Load Bearing Test, Material Tests and Inspection of Manufactured Pipe for Visual Defects and Imperfections.
      b. Larger than 72 inches in diameter: Acceptance on the Basis of Material Tests and Inspection of Manufactured Pipe for Defects and Imperfections.

D. Perforated nonreinforced concrete pipe: AASHTO M175, Type 1 or 2, bell-and-spigot or tongue-and-groove type as shown.

F. Concrete Box Culvert and Box Sewers: Box Culverts and Box Sewers shall be in accordance
with TxDOT Standard Specifications Item 462, unless otherwise shown.

2.4 JOINT MATERIAL

A. Rubber gaskets: ASTM C443.

B. Jointing mastic: Elastic, water-resistant, formulation of plastic bituminous materials, nonflammable solvent and inert fillers so combined that:
   1. When applied to a vertical metal surface and heated to 120 degrees F, jointing mastic will neither slump nor lose plasticity.
   2. When applied directly from container without further fixing, jointing mastic can be applied in even, adherent coat within temperature range of 20 degrees F to 100 degrees F.

2.5 PLASTIC PIPE AND FITTINGS

A. Poly (Vinyl Chloride) (PVC) Sewer Pipe and Fittings:
   1. For 4 Inch to 15 Inch Size: ASTM D3034, SDR-35.
   2. For 18 Inch to 27 Inch Size: ASTM F679, T-1 Wall Thickness.
   3. Roadway and Track Crossings:
      a. 12 Inches and Smaller: ASTM D3034, ADS N-12
      b. Larger Than 12 Inches: ASTM D2241, SDR-21 (200 psi).

B. Corrugated Polyethylene (PE) Tubing With Smooth Lining: Pipe and fittings shall be made of polyethylene (PE) compounds which conform to cell Class 324420-C as described in ASTM D3350 except that the carbon black content shall not exceed 5%.
   1. For 4 Inch to 10 Inch Size: AASHTO M252.
   2. For 12 Inch to 36 Inch Size: AASHTO M294.

C. Perforations:
   1. For PVC pipe sizes up to and including 8 inches, perforations shall be in accordance with Table 5 of ASTM F758 unless otherwise specified on the Contract Drawings. For pipe sizes greater than 8 inches, perforations shall be as specified on the Contract Drawings.

2.6 CORRUGATED METAL PIPE

A. Bituminous-Coated Corrugated Metal Pipe: AASHTO M190, Type A or C as shown, with connecting bands, AASHTO M36.

2.7 LUBRICANTS

A. Lubricant for Rubber Gasket Pipe Joints: Vegetable oil soap.

2.8 CAULKING AND JOINT FILLERS

A. Jute for Caulking: Good quality jute, free from tar, oil, or grease and dry when installed.

B. Preformed Expansion Joint Fillers: AASHTO M153, Type I, Type II or Type III.

2.9 BRICK

A. Brick: ASTM C32; solid brick; Grade SS; 2-1/4 inches by 3-3/4 inches by 8 inches.

2.10 PRECAST CONCRETE SEWER STRUCTURES

A. Cylindrical, eccentric and conical: ASTM C478.

B. Other configurations: ACI 318.

2.11 PIPE CASING MATERIAL

A. Steel, corrugated metal pipe, or concrete pipe, as shown.

2.12 MANHOLE STEPS

A. Rebar: No. 4 reinforcing bar with molded polypropylene or rubber encasement.

2.13 METAL CASTINGS

A. Manholes, Frames and Covers, Inlet Frames, and Grates: Section 05500, "Metal Fabrication".

2.14 WATER SEALS

A. Metal Water Seals for Basin Connections: Neenah Foundry Model No. R-3707 or approved equal.
2.15 **COAL-TAR EPOXY COATING**

A. Two-component; chemically cured, conforming to MS DOD-P-23236A, Type I, Class 2.

B. Thinner: As recommended by manufacturer of coating and as approved.

2.16 **STEEL**

A. Structural Steel Members: ASTM A36/A36M.

B. Steel Pipe: ASTM A53, black finish, extra strong wall class.

C. Stainless Steel Angle: ASTM A167, Type 03400.

D. Galvanizing: ASTM A123/A123M or ASTM A153/A153M.

E. Miscellaneous Metal: Section 05500, "Metal Fabrication".

2.17 **GEOTEXTILE FILTER FABRIC**

A. In accordance with AASHTO M 288, geotextile filter fabric shall comply with the requirements specified herein.

1. Fabric: Shall consist of long-chain synthetic polymers composed of at least 95 percent by weight of polyolefins or polyesters.

2. Filter fabric shall be formed into a stable network such that the filaments or yarns retain their dimensional stability relative to each other, including selvages.

3. Fabric edges shall be selvaged.

4. Physical properties: Property values listed below shall be minimum average roll values in the weakest principal direction except for grab tensile elongation and apparent opening size. Grab tensile elongation shall be minimum or maximum average roll values, as indicated. Apparent opening size shall be maximum average roll values.

* Note: Erosion protection refers to use in permanent erosion control applications; for example, as an underlayment for riprap.

B. Securing Pins: When required according to the plans, shall be as recommended by the geotextile manufacturer.

C. Certification: Manufacturer's certificate shall include the following information.

1. Name of manufacturer.

2. Product name.

3. Style number, if applicable.

4. Chemical composition of the filaments or yards.

5. Other pertinent information required to fully describe the product.

6. Shall state that the furnished geotextile meets the physical property average roll value requirements of these specifications.
as determined by the manufacturer’s product quality control program.

7. Shall be attested to by a person legally authorized to bind the manufacturer.

2.18 MORTAR AND GROUT MIXES

A. General Requirements:
   1. Mix dry in specified proportions by volume. Control and maintain accurate measurement throughout progress of work.
   2. Add sufficient water as specified to produce approved consistency.
   3. Do not mix in amount exceeding that which can be used within one hour after introduction of water.
   4. Do not retemper mix that has begun to set nor use such mix in the work.

B. Proportions:
   1. Mortar: One part Portland cement, 2-1/2 parts sand and water sufficient to produce stiff workable mix.
   2. Grout: One part Portland cement, 2 parts sand and water sufficient to produce plastic flowable mix.

2.19 FILTER MATERIAL

A. This material is soil drainage material as defined in Section 02220, “Grading, Excavating, and Backfilling”.

2.20 CORRUGATED STANDARD DECK DRAINS:

A. In accordance with drawings and manufacturer’s recommendations.

B. Acceptable Manufacturer: Contech Construction Products, Inc. or approved equal.

2.21 DRAINAGE PANEL

A. Drainage Panel: Manufacturer’s standard vertical wall drainage composites panel system designed to withstand backfill operations and hydrostatic and earth pressures, and with adequate drainage media similar to Amerdrain 500 sheet drain, Enkadrain 9010 or approved equal.

PART 3 - EXECUTION

3.1 GENERAL

A. Storm sewer system construction shall be in accordance with the NCTCOG Standard Specifications, the requirements of the jurisdictional authority, and as specified herein.

B. Make arrangements with jurisdictional authority for tie-ins and for testing, inspections, installation, or other services to be performed by jurisdictional authority and pay associated costs.

C. Provide cathodic protection where required as specified Section 13100, “Corrosion Control”.

D. Provide grounding and bonding where required as specified in Section 16450, “Grounding and Bonding”.

E. Protect and maintain existing utility services in accordance with Section 02760, “Maintenance, Support, and Restoration of Existing Utility Facilities”.

3.2 EXCAVATION FOR STORM SEWER AND DRAINAGE STRUCTURES

A. Perform excavation for sewers and drainage structures to line and grade shown in accordance with Section 02220, “Grading, Excavating, and Backfilling”, install trench support in accordance with Sections 02221, "Utility Excavation And Backfill", and 02160, "Support Of Excavation", and the following additional requirements:

1. Excavate test pits sufficiently in advance of construction of sewers and drainage structures so that reasonable changes in line and grade can be made where location of existing structures varies from that shown.

2. Excavate below horizontal plane extending 2 feet above top of sewer or drainage structures to the maximum width of trench required by the trench width.

3. If excavation exceeds permissible dimensions, encase pipe or install pipe of higher strength as required by the trench width.

4. Where necessary to place backfill or embankment so that trench can be excavated, extend backfill or embankment full depth laterally at least 2-1/2 times diameter of pipe on each side measured from centerline of pipe.

5. Soft, spongy or otherwise unstable material which will not provide a firm foundation for
the pipe shall be removed and replaced with a suitable material obtained from site excavation operations or from other sources approved by the Contracting Officer and shall be compacted as specified in Section 02220, "Grading, Excavation, and Backfilling". When unstable conditions are not corrected by the above means, the Contractor shall be required to use rock, gravel, or concrete foundations. There will be no extra compensation for this work.

6. The Contractor shall excavate all materials encountered regardless of the difficulties. There will be no extra compensation for rock excavation.

3.3 GEOTEXTILE FILTER FABRIC

A. Prepare surface to receive fabric to relatively smooth condition free of obstructions, depressions, debris, and soft or low density pockets of material.

1. Place fabric with long dimension parallel to centerline of trench and lay smooth and free of tension, stress, folds, wrinkles, or creases with sufficient excess to allow for minimum overlap of 12 inches.

2. Place strips in trench to provide minimum width of 12 inches of overlap for each joint.

3. Insert securing pins with washers through both strips of overlapped fabric at not greater than 3-foot intervals along a line through the midpoint of overlap at joints.

4. Where this method of placement conflicts with manufacturer's instructions, the manufacturer's instructions prevail.

B. At time of installation, reject fabric if it has defects, rips, holes, flaws, deterioration, or damage incurred during manufacture, transportation, storage, or handling.

C. Place fabric in manner and at locations shown.

3.4 PIPE CRADLE

A. Place pipes on cradle of aggregate or concrete where shown.

B. Place aggregate so as to avoid segregation; compact to maximum practicable density so that pipe can be laid to required tolerances.

3.5 LAYING PIPE, GENERAL

A. Excavate to lines and grades shown in accordance with Sections 02221, "Utility Excavation and Backfilling," and herein. Excavate depressions for bells.

B. Protect pipe and fittings during handling to prevent damage.

C. Place, shape, and compact bedding material to receive barrel of pipe. Type and thickness of bedding material as shown.

D. Start laying pipe at lowest point; lay true to line and grade shown.

E. Install pipe to bear on bedding material along entire length.

F. Do not place the pipe on blocking material of any type.

G. Do not use wedges while installing the pipe.

H. Install perforated pipe with perforations downward.

I. Install pipe so that bells and grooves are on upstream end.

J. Align each section of pipe with adjoining section with uniform annular space between bell and spigot and so as to prevent sudden offsets in flow line.

K. As each section of pipe is laid, place sufficient backfill to hold it firmly in place.

L. Apply lubricant to rubber gasket (O-ring) immediately before joining pipe sections.

M. Keep interior of sewer clean as work progresses. Where small pipe size makes cleaning difficult, keep suitable swab or drag in pipe and pull through each joint immediately after jointing is completed.

N. Keep trenches and excavations free of water during construction and until backfilled.

O. When work is not in progress, securely plug ends of pipe and fittings to prevent trench water or other substances from entering pipes and fittings.

P. Cut pipe ends which project into a sewer structure flush with the inside face of the structure and cover exposed pipe reinforcement with grout or epoxy, as directed.

Q. Where length of stub is not shown, install 4 foot length and seal free end with brick masonry bulkhead or approved stopper.

R. Have work approved prior to covering pipe.
S. Where shown, place additional aggregate filter around and over pipe in lifts not exceeding 6 inches loose. Place, compact and test each lift before placement of next lift.

T. Backfill in accordance with Section 02221, "Utility Excavation and Backfilling”.

U. Accomplish compaction by method that will avoid damage to pipe and will not disturb its alignment and grade. The use of vibratory rollers is prohibited until compacted cover over pipe has reached 3 feet or half the pipe diameter, whichever is greater.

V. Where cathodic protection is shown, apply coal-tar epoxy coating. For other cathodic protection requirements, see Section 13100, “Corrosion Control”.

3.6 LAYING CONCRETE PIPE

A. Bell-and-spigot joints:
   1. Prevent damage to premolded joint rings or attached couplings.
   2. Clean joint contact surfaces immediately prior to jointing. To complete joint, use lubricants, primers, or adhesives as recommended by pipe or joint manufacturer.

B. Tongue-and-groove joints:
   1. Clean groove end of preceding pipe and tongue end of succeeding pipe with wet brush and apply soft mortar to the pipe. Remove mortar from interior surface if squeezed out of joint.
   2. Perform final exterior mortaring of joints three lengths of pipe behind laying.

3.7 LAYING PLASTIC PIPE

A. Corrugated polyethylene pipe: ASTM F449.

B. Perforated pipe: Use sleeve couplings designed to hold pipe in alignment without use of sealing compound or gaskets.

3.8 LAYING CORRUGATED METAL PIPE

A. Perforated pipe for underdrains: Place aggregate filter material as indicated and in no case less than 12 inches above the bottom of the pipe.

B. Nonperforated pipe: When pipe is shown to be bituminous paved, place paved area on bottom.

3.9 LAYING POROUS CONCRETE PIPE FOR UNDERDRAINS

A. Fill joints with mortar as specified for tongue and groove joints of concrete pipe.

B. After pipe joints have been made, place additional filter material as specified.

3.10 BACKFILL

A. Perform backfilling only after inspection and approval of pipe laying.

B. On completion of construction, backfill excavation in accordance with Section 02221, “Utility Excavation and Backfill”.

3.11 JOINTS FOR CONCRETE STORM SEWER 12 INCHES TO 33 INCHES

A. Use cold applied jointing mastic for joints of storm sewer 12 inches to 33 inches in diameter.

B. Bell-and-Spigot Joints:
   1. Clean interior surface of bell and fill lower portion with mastic of sufficient thickness to make inner surfaces of abutting sections flush.
   2. Install spigot end of adjoining pipe into bell so that sections are closely fitted and aligned.
   3. Apply sufficient jointing mastic to fill remaining void in joint.
   4. Remove excess mastic from interior of pipe.

C. Tongue-and-Groove Joints:
   1. Clean groove. Apply mastic to lower half of groove.
   2. Clean tongue of next pipe and apply layer of mastic to upper half.
3. Fit tongue into groove until pipes are closely fitted and aligned and mastic covers inner and outer surfaces.

4. Remove excess mastic from interior of pipe.

### 3.12 JOINTS FOR CONCRETE STORM SEWER 36 INCHES AND LARGER

A. Where not prohibited by jurisdictional agencies, use mortar for joints of storm sewers 36 inches in diameter and larger.

B. Bell-and-Spigot Joints:
   1. Where pipe cradle is aggregate, place shallow bed of mortar under joint.
   2. Thoroughly wet bell and fill lower half with mortar.
   3. Thoroughly wet spigot and uniformly fit into bell so that sections are closely fitted and aligned.
   4. Fill remaining annular space in bell with mortar sufficient to form bead around outside of spigot end of pipe.
   5. Remove excess mortar from interior of pipe, and finish exterior and interior to smooth surfaces.

C. Tongue-and-Groove Joints:
   1. Thoroughly wet groove; apply mortar to lower half of groove.
   2. Thoroughly wet tongue of next pipe and apply a layer of mortar to top half.
   3. Fit tongue into groove until pipes are closely fitted and aligned and mortar covers inner and outer surfaces of the joint.
   4. Clean inner surface of pipes at joint and point up outside with bead of mortar.

### 3.13 JOINTS FOR WATERTIGHT STORM SEWER SYSTEM CONCRETE PIPE

A. Use rubber gasket and bell-and-spigot pipe as specified.

B. Prior to jointing pipe, liberally coat pipe joints with lubricant.

C. Fit bell or spigot with gasket in accordance with manufacturer’s instructions.

D. Joint pipes with equipment designed for purpose.

E. Before joint is completely home, check position of gasket using suitable gauge. If gasket is found to be dislocated, repeat entire joining process using new gasket.

### 3.14 CONNECTIONS TO EXISTING SEWERS

A. Make connections with existing public storm sewers in accordance with requirements of the jurisdictional authority.

B. Obtain approval prior to connecting existing sewer to sewer under construction.

### 3.15 TUNNELING AND JACKING

A. Perform tunneling and jacking by approved methods.

B. Make horizontal borings necessary to lay pipe lines true to line and grade.

C. When sewers are laid in borings, completely fill void between outside barrel of pipe and boring with cement grout pumped into place.

D. When drainage pipes are laid in borings, completely fill void between pipe and boring with sand, using water pressure to ensure that voids are filled.

E. Methods of boring and filling of voids between pipe and boring are subject to approval.

### 3.16 SEWER STRUCTURES CONSTRUCTION, GENERAL

A. Shape the bottom of new manholes and catch basins and the bottoms of existing manholes when new connections are made, to form an inlet channel from inlet pipe to outlet pipe. The channel shall be either cast-in-place concrete or sewer brick construction, unless otherwise shown.

B. Install the uppermost manhole step not more than 6 inches below the bottom of the manhole frame. Construct the manhole steps in two staggered vertical lines through the full depth of the structure. Install manhole steps to clear openings. Install drop-manhole steps directly opposite the drop.

C. Perform cast-in-place concrete in accordance with Sections 03100, “Concrete Formwork”, 03200, “Concrete Reinforcement”, and 03300, “Cast-In-Place Concrete”.

### 3.17 MODIFICATION TO EXISTING SEWER STRUCTURES

A. Perform modification of existing sewer structures as specified in Section 02150, “Underpinning, Support, And Restoration”, and Section 02760, “Maintenance, Support, and Restoration of Existing
Utility Facilities", with the following additional requirements:

1. Adjust to grade, remodel, or abandon existing sewer structures as shown.

2. When approved, reset existing manhole frames and covers and catch basin frames and gratings on sewer structures adjusted to grade.

3. When approved, existing manhole frames and covers and catch basin frames and gratings salvaged may be reset in new or remodeled sewer structures.

B. Remodeled Drainage Structures: Unless otherwise shown, perform remodeling of existing drainage structures as follows:

1. Remove the upper portion of the existing drainage structure to a depth two feet below the existing grade.

2. Dispose of existing brick, concrete, concrete block, or other material removed from the existing structure and expose a structurally sound surface.

3. Thoroughly clean the exposed surface.

4. Cover the exposed surface with a 1 inch thick mortar bed.

5. Set an 8 inch deep, reinforced, precast concrete slab, having an area sufficient to cover the drainage structure from outside face to outside face upon the prepared mortar bed.

3.18 MANHOLES

A. Construct manholes of precast sections or cast-in-place concrete. Manholes located within the rights-of-way of other jurisdictional authorities shall be constructed in accordance with jurisdictional authority's standards.

B. Provide base of precast or cast-in-place construction. Make watertight connection between base and risers.

C. Unless otherwise shown, place axes of manholes directly over centerlines of pipes.

D. Construct appropriate flow channels in bottom of manholes.

E. Where necessary, build connections for public and residential sewers into manholes. Cut pipe flush with inside wall of structure. Do not build pipe into wall; provide mortar joint between pipe and structure.

F. Install manhole steps and cast iron frame and cover for each manhole; adjust frame and cover to proper grade by brick construction.

3.19 CATCH BASINS AND INLETS

A. When grading has been substantially completed as approved, construct catch basins of cast-in-place concrete and steel reinforcement as shown, precast sections or brick as shown.

B. Cut pipe flush with inside wall of structure. Provide mortar joint between pipe and structure or install water seal as shown.

C. Install cast iron frame and grate or cover and adjust to proper grade.

D. Catch basins, curb inlets and wye inlets located within rights-of-way of other jurisdictional authorities shall be constructed in accordance with the jurisdictional authority's requirements.

3.20 CONCRETE HEADWALLS AND WINGWALLS

A. Excavation: Excavate for foundations and walls to lines and grades shown in accordance with Section 02220, "Grading, Excavating, and Backfilling".

B. Formwork and Reinforcement: Erect formwork and install reinforcement as shown and in accordance with Sections 03100, "Concrete Formwork" and 03200, "Concrete Reinforcement".

C. Concrete Work: Place concrete of class shown and protect and cure in accordance with Section 03300, "Cast-In-Place Concrete".

D. Backfilling: Backfill and compact in accordance with Section 02220, "Grading, Excavating, and Backfilling".

3.21 COATING APPLICATION AND REPAIR - METALLIC PIPES AND FITTINGS

A. Preparation of surface: Perform the following in order given:

1. Clean surfaces contaminated with oil or grease using naphtha or xylene.

2. Remove rust and mill scale from surfaces by dry abrasive blasting to commercial finish in accordance with SSPC SP 6.

3. Coat surfaces within 24 hours and before dew point is reached.
STORM SEWER SYSTEMS

4. Apply coating only to surfaces which are dry and free of contaminants. Whip blast surfaces not coated within specified time limit.

B. Application of coating:

1. Mix coating in quantity which can be applied within its pot life in accordance with manufacturer's recommendation. Thin only with approval.

2. Apply coating to exterior surfaces of pipes and fittings in accordance with recommendations of coating manufacturer and as follows:
   a. Two coats of equal thickness.
   b. Total dry film thickness: 20 mils.
   c. Pretreat first coat as required prior to application of second coat.
   d. Apply second coat before first coat has dried tack-free but not later than 24 hours after application of first coat, unless otherwise recommended by coating manufacturer.
   e. Inspect coating prior to burial. Repair damages in accordance with recommendations for field corrections by coating manufacturer.

C. Test coating as specified in Section 13100, "Corrosion Control".

3.22 SUBWAY DRAINAGE SYSTEMS

A. As specified in Section 02710, "Subway Drainage Systems".

3.23 AERIAL STRUCTURES DRAINAGE SYSTEMS

A. As specified in Section 02711, "Aerial Structural Drainage Systems".

3.24 PIPE CONNECTIONS

A. Wye Connections: The connection of one pipe to another may be accomplished with a precast wye or by means of pipe to pipe connection. A pipe to pipe connection shall be made by cutting a hole in the larger pipe slightly larger than the outside diameter of the pipe to be connected. The smaller pipe to be connected shall not project into the larger pipe. A concrete collar not less than six inches thick and six inches wide shall be placed around the smaller pipe on the exterior surface of the larger pipe.

B. End-to-End Connections: Wherever a smaller pipe is jointed end-to-end to a larger pipe, the inside tops of the two pipes shall be matched, unless otherwise shown on the Plans. The void between pipes shall be filled with cemented brick work or, where this is not possible, the void shall be filled with concrete mortar. In either case, a concrete collar not less than six inches thick and six inches wide shall be placed around the pipes over the joint.

3.25 CLEANOUTS

A. Cleanouts shall be installed as shown on the Standard Drawings.

3.26 CORRUGATED STANDARD DECK DRAIN

A. In accordance with drawings and manufacturer's recommendations for installation.

3.27 FIELD QUALITY CONTROL

A. Visual Test Method: Personnel shall inspect storm sewer systems for alignment, visual leaks, and cracks in pipe. Repair leaks, then re-inspect pipe.

B. Obstruction Tests:

1. Perform field tests to verify that installed storm sewer systems are free from obstructions.

2. Remove obstructions by excavating at the apparent obstruction and repairing or replacing the defective pipe as directed by the Contracting Officer.

C. Testing of Mortar and Grout:

1. Mortar composition and properties shall be evaluated per ASTM C780.

2. Grout shall be sampled and tested for compressive strength per ASTM C1019.

3.28 FIELD QUALITY CONTROL - TELEVISION INSPECTION

A. In order to ensure that the storm sewer conduit performs the function for which it was designed and constructed, perform a television inspection. Perform inspection of the installed storm sewer conduit after construction of the project is substantially complete at a time directed by the Contracting Officer. Generally, this inspection shall take place prior to the "make ready" inspection and final acceptance of the Project.
B. Schedule the television inspection no later than 72 hours in advance with the Contracting Officer and ensure the Contracting Officer’s representative is present for the television inspection. The Contracting Officer’s representative shall be present during the television inspection unless otherwise authorized.

C. Television inspect, as specified herein, all storm sewer conduits constructed as part of the Work including mains and laterals, unless otherwise directed.

D. When the inspection is run in an upstream direction, transitions to smaller pipe shall be ramped on 12:1 slope or flatter as required to permit television inspection without snagging or television disruption.

E. If the test is being run from manhole to manhole, the camera shall move downstream. If the test is being run from manhole to inlet, the camera shall move upstream.

F. Storm sewer conduits shall be laced with enough water to fill low points. Television inspection shall be done immediate following the lacing of the main with no water flow.

G. Equipment and Medium:
   1. Television equipment used shall have at least 450 lines of horizontal resolution and shall provide a pan of 360 degrees and tilt capacity of 240 degrees.
   2. Picture shall be in color. Videotapes shall be VHS format unless otherwise noted and shall be compatible with the Authority’s equipment.

H. Information gathered shall be legible, easily read, and of high quality.

I. A run sheet, compatible with the videotape shall be made noting deficiencies.

J. By voice on the videotape, the operator shall note the following data:
   1. Date and time the recording was made.
   2. Contractor’s name, project name, and contract number.
   3. Name of company performing the television inspection and name of operator.
   4. Location, designation, and size of the main and the direction in which test was made.

K. Criteria for acceptance:
   1. No pulled or slipped joints.
   2. No low points.
   3. Correct pipe sizes and grade
   4. No structural damage to pipe
   5. No excessive silt or debris is present in conduit as determined by the Contracting Officer.

L. The Contracting Officer will determine if repairs are required and the Contracting Officer’s decision will be final.

M. If repairs are required, another television inspection shall be made after the repairs are complete, at no cost to the Authority.

N. Tapes and run sheets shall be submitted to the Contracting Officer for storage and review and shall become the property of the Authority.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Storm sewer pipe and reinforced concrete box culvert specified in this section will not be measured, but will be paid for at the lump sum prices for “Storm Sewer Pipe” and “Reinforced Concrete Box Culvert” of each size and type.

B. Manholes, catch basins, and inlets will be measured by and paid for at the unit price for “Manhole,” “Catch Basin,” and “Inlet” per each for each size and type, including steps, frames, grates, and lids.

C. Underdrains will not be measured, but will be paid for at the lump sum price for “Underdrain” for each size and type, inclusive of perforations and geotextile.

D. Concrete headwall structures and concrete wingwalls will be measured and paid for at the unit price per each for “Concrete Headwall Structure” and “Concrete Wingwalls” for each type and size.
E. Corrugated standard deck drains will not be measured, but will be paid for at the lump sum price for "Corrugated Deck Drains", complete-in-place.

F. No separate measurement or payment will be made for the following work required for work of this section. Such work will be considered subsidiary to the various bid items:

1. Joints, cleanouts, pipe-to-pipe or wye connections, and connection to existing drainage systems.

2. Testing and inspection, including television inspection.

3. Filter fabric and filter material.

4. Concrete work, including reinforcing steel.

5. Excavating, backfilling, jacking, boring, and tunneling, including bedding material and disposal of surplus material.

6. Concrete encasement, carrier pipe, welding, enclosures, jacks, cushions and other accessories as required for utility crossings, whether constructed in open cut or by other than open cut.

7. Support of excavation for depths not exceeding 5 feet

8. Dewatering.

9. Removal or abandonment of existing pipelines, manholes, and associated items.

10. Removal and replacement of existing bases, pavements, sidewalks, curbs, and gutters.

11. Barricading and maintenance and control of traffic.

12. Maintenance and support of existing utility facilities, except as otherwise indicated in Section 02760, "Maintenance, Support, and Restoration of Existing Utility Facilities".

G. Trench Support System for trenches exceeding a depth of 5 feet will be measured and paid for as specified under Section 02221, "Utility Excavation And Backfill".

H. Cathodic protection will be measured and paid for under Section 13100, "Corrosion Control".

END OF SECTION 02700
THIS PAGE INTENTIONALLY LEFT BLANK
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies providing subway drainage systems except drainage sump pumping systems.

1.2 REFERENCED STANDARDS

A. American Association of State Highway and Transportation Officials (AASHTO):

1. AASHTO M252 - Standard Specification for Corrugated Polyethylene Drainage Pipe

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1.3 SUBMITTALS

A. Samples: Submit proposed materials not less than 30 days prior to date of expected first shipment.

B. Shop Drawings: Include complete catalog information and shop drawings for material and equipment.

C. Certification.

PART 2 - PRODUCTS

2.1 CONCRETE PIPE

2.2 VITRIFIED CLAY PIPE

A. Standard strength or extra strength, as shown: ASTM C700.

2.3 PLASTIC PIPE AND FITTINGS

A. Polyvinyl chloride (PVC) pipe: ASTM D2729 or ASTM D1785.

B. Polyethylene, corrugated pipe:

1. AASHTO M252.
2. Individual lengths not less than 10 feet.
3. Coil pipe not permitted for pipe 8 inches in diameter or larger.

C. Fittings:

1. Polyvinyl chloride: ASTM D2729 or ASTM D1785.

2.4 MANHOLES

A. Formwork: In accordance with Section 03100, "Concrete Formwork".

B. Concrete Reinforcement: In accordance with Section 03200, "Concrete Reinforcement".

C. Concrete: In accordance with Section 03305, "Portland Cement Concrete", Mix S-7.

2.5 CASTINGS

A. Manhole frames and covers, inlet frames and grates: In accordance with Section 05500, "Metal Fabrication".
B. Drainage Castings:

1. Drain inlets, cleanouts, floor and scupper drains: Fabricated from cast iron, ASTM A48, Class 25B with brass parts, Alloy Number 844; or ductile iron, ASTM A536, Grade 60-40-18.

2. Leaded red brass and leaded semi-red brass sand castings: ASTM B584.

C. Drainage Casting Covers:

1. Cast iron: ASTM A48, Class 30B.

2.6 WIRE MESH SCREEN

A. Bronze or stainless steel wire, minimum 0.047 inch diameter, 1/4 inch mesh.

2.7 POROUS SUBGRADE MATERIAL

A. Coarse aggregate: ASTM C33, Size No. 67.

B. Maximum percentage of wear: 45 percent when tested in accordance with ASTM C131.

2.8 DRAINAGE SUMP PUMP STATIONS

A. As specified in Section 15160, "Pumps".

PART 3 - EXECUTION

3.1 EXCAVATION

A. Excavate to lines and grades shown on the Contract Drawing in accordance with Section 02221, "Utility Excavation and Backfill".

3.2 POROUS MATERIAL PLACEMENT

A. Place porous material for subgrade around main track drain and drain pipes and for trench backfill as shown.

B. In rock excavation, place material only on stable rock surfaces. Do not place porous subgrade material on excavated rock surface until surface has been flushed with water to remove fine dust and sludge.

3.3 VITRIFIED CLAY PIPE

A. Place vitrified clay pipe to lines and grades shown.

B. Make joints in accordance with manufacturer's instructions.

C. Place concrete encasement where shown in accordance with Section 03300, "Cast-In-Place Concrete." Secure pipe to avoid displacement during concrete placement.

3.4 POROUS CONCRETE PIPE

A. Lay pipe on porous subgrade material so as to provide full bearing and grades shown.

B. Install joints in accordance with the manufacturer's instructions.

C. Place porous material over and around the pipe as shown.

D. Place perforated pipe as shown.

E. Place concrete for encasement in accordance with Section 03300, "Cast-In-Place Concrete".

F. Place and brace pipe for encasing to prevent displacement during placing of concrete.

3.5 PLASTIC PIPE

A. Lay plastic pipe as specified for porous concrete pipe.

B. Use cast iron, concrete, or vitrified clay pipe for last two feet at exposed termination points. Provide standard adapter fittings for connections between differing pipe materials.

C. Use nonpressure pipe for drainage.

D. Plastic pipe may be used only if buried or encased in concrete. Its use is prohibited in exposed locations.

3.6 MANHOLES

A. Construct cast-in-place concrete manholes as shown.

B. Construct flow channel in manhole where shown.

C. Place axis of manholes directly over centerlines of pipes unless otherwise shown.

D. Set manhole frame and cover or grate to required elevation. Set ballast screen where shown.
3.7 INSTALLATION OF PIPE AND CASTINGS

A. Install cast iron, ductile iron, nickel-copper alloy steel pipe and fittings in accordance with Section 15060, "Piping and Accessories".

B. Install drainage piping to the lines and grades shown.

C. Locate drainage castings and set to the finished floor elevation, slabs, or inverts.

D. Install cleanouts at the locations shown.

3.8 PROTECTION OF DRAINAGE SYSTEM

A. During the course of construction, maintain drainage lines free of debris and in undamaged condition.

B. Plug or close ends of completed runs of piping until the Contracting Officer approves their use.

C. Cover the inlet end of drainage piping used to convey water to wet wells at the existing drainage pumping stations with wire mesh screen.

3.9 FIELD QUALITY CONTROL

A. Where drainage piping is located below invert slabs, conduct a ball, shuttlecock, or mandrel test to ensure that the line is free of obstructions subsequent to the placing of porous subgrade material over the line and prior to the placement of the concrete invert slab.

B. Upon completion of the test and determination that the line is free of obstructions, plug, cap or otherwise close the open end or ends of the installed piping to prevent the entrance of debris into the lines.

C. Immediately prior to final inspection of the work, remove debris from manholes, drain inlets, and floor scupper drains. In the presence of the Contracting Officer, prove by one of the methods specified above that the piping is free of obstructions.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work specified in this section will not be measured but will be paid for at the lump sum price for "Subway Drainage Systems".

END OF SECTION 02710
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies aerial structure drainage systems.

1.2 REFERENCED STANDARDS

A. American Association of State Highway and Transportation Officials (AASHTO):
   1. AASHTO M190 - Standard Specification for Bituminous Coated Corrugated Metal Culvert Pipe and Pipe Arches
   2. AASHTO M218 - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized), for Corrugated Steel Pipe

B. American Water Works Association (AWWA):
   1. AWWA C110/A21.10 - Ductile-Iron and Gray-Iron Fittings, 3 in. Through 48 in. (76 mm Through 1219 mm), for Water
   2. AWWA C111/A21.11 - Rubber-Gasket Joints for Ductile-Iron Pressure Pipe and Fittings
   3. AWWA C151/A21.51 - Ductile-Iron Pipe, Centrifugally Cast, for Water

C. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   3. ASTM D2287 - Standard Specification for Nonrigid Vinyl Chloride Polymer and Copolymer Molding and Extrusion Compounds

1.3 SUBMITTALS

A. Samples: Submit samples of proposed materials not less than 30 days prior to date of expected first shipment.

B. Shop Drawings: Include complete catalog information and shop drawings for material and equipment.

C. Certification.

PART 2 - PRODUCTS

2.1 CAST IRON PIPE AND FITTINGS

A. In accordance with AWWA C 110, C 111, and C 151, extra heavy (XH), with hub and spigot ends so constructed that joints may be made with gaskets.

2.2 CASTINGS:

A. Drainage Castings:

B. Drainage Casting Covers:
   1. Cast Iron: ASTM A48, Class 30B.

2.3 WIRE MESH SCREEN

A. Bronze or stainless steel wire, minimum 0.047 inch diameter, 1/4 inch mesh.

2.4 POLYVINYL CHLORIDE (PVC) PIPE AND FITTINGS

A. Marking and identification: PVC pipe shall be continuously and permanently marked with the following information: manufacturers name, size, type of pipe and material, SDR number, product standard number and the National Sanitation Foundation (NSF) seal.

B. PVC pipe fittings shall be of the same material as the PVC pipe to be joined.

C. Flexible PVC shall be made from virgin PVC material and shall comply with ASTM D2287.

2.5 SPLIT 8-INCH DECK DRAIN PIPE

A. Fabricate form zinc-coated galvanized sheets in accordance with AASHTO M218: bottom pan, 12 gage steel; end plates, 14 gage steel. Bituminous coated in accordance with AASHTO M190; perforated as indicated on Drawings.

2.6 FILTER FABRIC

A. As specified in Section 02220, "Grading, Excavation and Backfill".
PART 3 - EXECUTION

3.1 INSTALLATION OF PIPE AND CASTINGS

A. Locate drainage scuppers, inlets, and castings, and set to finished deck or slab elevation.

B. Piping layout is diagrammatic. Route pipe in such a way as to maintain proper reinforcement spacing. Piping shall be adequately supported to prevent damage and displacement during concrete placement.

C. Install cleanouts at the locations shown.

D. Cover scuppers and inlets with wire mesh screen, as shown.

E. Paint exposed metal surfaces in accordance with Section 09970, "Coatings for Steel".

3.2 PIPE INSTALLATION

A. General:
   1. Lower and place pipe in manner which will prevent damage.
   2. Lay pipe true to alignment and grades indicated, beginning at low point of system.
   3. Assemble joints in accordance with manufacturer’s recommended installation procedures.

B. Deck Drain: Place deck drain pipe at locations and in position indicated on Drawings.

3.3 PROTECTION OF DRAINAGE SYSTEM

A. During the course of construction, maintain drainage lines free of debris and in undamaged condition.

3.4 FIELD QUALITY CONTROL

A. Immediately prior to final inspection of the work, remove any debris from scuppers, inlets, and drainage lines.

B. In the presence of the Contracting Officer, demonstrate that the piping is free of obstructions by mandrelling lines.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Aerial structure drainage systems will not be measured, but will be paid for at the lump sum price for “Aerial Structural Drainage System”.

B. Downspout piping, cleanout, bends, and fittings and connection to storm sewer system will not be measured separately, but will be considered subsidiary to the aerial structure drainage system.

C. Wire mesh screen, where required, will not be measured for payment, but will be considered as subsidiary to the work specified in this section.

END OF SECTION 02711
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section specifies the furnishing, installing, and testing of sanitary sewer systems (called hereafter wastewater in the specifications).

1.2 REFERENCED STANDARDS

A. North Central Texas Council of Governments (NCTCOG)

1. Standard Specifications for Public Works Construction, as revised (NCTCOG Standard Specifications).

B. Occupational Safety and Health Administration (OSHA)

1. 29 CFR 1926 Subpart P; 1926.652 – Requirements for Protective Systems

1.3 SUBMITTALS

A. Shop Drawings.

B. Certification.

C. Documentation:

1. Submit bill of materials for materials used on this project for approval.

2. Submit videotapes and run sheets of television inspections.

D. Procedures for tunneling, jacking, or boring, if required.

E. Submit concrete mix designs and test data. Test data shall not be older than 6 months.

PART 2 - PRODUCTS

2.1 GENERAL

A. All materials (including their delivery, storage, handling and testing) necessary for the completion work described in this Section shall be in accordance with the NCTCOG Standard Specifications, the requirements of the jurisdictional authority, and indicated in the Contract Documents.

PART 3 - EXECUTION

3.1 CONSTRUCTION

A. Wastewater systems construction shall be in accordance with NCTCOG Standard Specifications,

3.2 EXCAVATION

A. Perform excavation as specified in Section 02221, “Utility Excavation and Backfill”.

B. Protect and maintain existing utility services in accordance with Section 02760, “Maintenance, Support, and Restoration of Existing Utility Facilities”.

3.3 WASTEWATER SERVICE CONNECTIONS

A. Make residential and commercial wastewater service connections as described below:

B. Replacement of existing service: Replace all existing services from the new wastewater main to existing laterals at the property line with a clean-out per the requirements of the jurisdictional authority. The minimum size of all wastewater laterals shall be 6 inches or the same size as the existing lateral whichever is larger. Refer to Section 02760, “Maintenance, Support, and Restoration of Existing Utility Facilities”, for additional information.

C. Connection of new service: Connect all new wastewater services to the new or existing wastewater main per the requirements of the jurisdictional authority, with a clean-out at the property line. Connect the service line from the clean-out to the proposed or existing facility or as shown on the Contract Documents.

3.4 FIELD QUALITY CONTROL - TELEVISION INSPECTION

A. In order to ensure that the wastewater system performs the function for which it was designed and constructed, perform a television inspection. Perform inspection of the installed wastewater conduit after construction of the project is substantially complete at a time, at a time directed by the Contracting Officer. Generally, this inspection shall take place prior to the “make ready” inspection and final acceptance of the Project.

B. Schedule the television inspection no later than 72 hours in advance with the Contracting Officer and ensure the Contracting Officer’s representative is present for the television inspection. The Contracting Officer’s representative shall be present during the television inspection unless otherwise authorized.

C. Television inspect, as specified herein, all wastewater conduits constructed as part of the Work including mains and laterals, unless otherwise directed.
D. When the inspection is run in an upstream direction, transitions to smaller pipe shall be ramped on 12:1 slope or flatter as required to permit television inspection without snagging or television disruption.

E. Test shall be run from manhole to hole and the camera shall move downstream.

F. Equipment and Medium:
   1. All television equipment used shall have at least 450 lines of horizontal resolution and shall provide a pan of 360 degrees and tilt capacity of 240 degrees.
   2. Picture shall be in color. Video recordings shall be digital recordings, format unless otherwise noted and shall be compatible with the Authority’s equipment.

G. All information gathered shall be legible, easily read, and of high quality.

H. A run sheet, compatible with the videotape shall be made noting deficiencies.

I. By voice on the videotape, the operator shall note the following data:
   1. Date and time the recording was made.
   2. Contractor’s name, project name, and contract number.
   3. Name of company performing the television inspection and name of operator.
   4. Location, designation, and size of the main and the direction in which test was made.
   5. Identify every 50 station.
   6. Identify the station of each manhole.
   7. Identify the location and station of deficiencies.
   8. Identify the location and direction of entry of laterals.

J. Criteria for acceptance;
   1. No pulled or slipped joints.
   2. No low points.
   3. Correct pipe sizes and grade
   4. No structural damage to pipe
   5. No excessive silt or debris is present in conduit as determined by the Contracting Officer.

K. Contracting Officer will determine is repairs are required and the Contracting Officer’s decision will be final.

L. If repairs are required, another television inspection shall be made after the repairs are complete, at no cost to the Authority.

M. Tapes and run sheets shall be submitted to the Contracting Officer for storage and review and shall become the property of the Authority.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Wastewater pipe and wastewater pressure pipe will not be measured, but will be paid for at the lump sum prices for “Wastewater Pipe” and “Wastewater Pressure Pipe”, for each diameter and type of pipe material.

B. Wastewater manholes will be measured by and paid for at the unit price for “Wastewater Manholes” for each structure for each size and type, inclusive of pipe connections, frame and lid, existing manhole adjustments, and any other associated or incidental items.

C. Standard Mainline Clean-outs will be measured by and paid for at the unit price for “Standard Mainline Clean-Outs” per each.

D. No separate measurement or payment will be made for the following work required for work of this section. Such work will be considered subsidiary to the various bid items:
   1. Sanitary sewer service replacement, cutting and plugging existing service line, tapping, or providing the connection to new sewer main, lateral cleanouts, and other associated items related with service connection.
   2. Joints, cleanouts, pipe-to-pipe or wye connections, connection to existing systems
   3. Testing and inspection, including television inspection.
   4. Concrete work, including reinforcing steel.
   5. Excavating, backfilling, jacking, boring, and tunneling, including bedding material and disposal of surplus material.
   6. Concrete encasement, carrier pipe, welding, enclosures, jacks, cushions and other accessories as required for utility crossings, whether constructed in open cut or by other than open cut.
   7. Support of excavation for depths not exceeding 5 feet.
8. Dewatering.

9. Removal or abandonment of existing pipelines, manholes, and associated items.

10. Removal and replacement of existing bases, pavements, sidewalks, curbs, and gutters.

11. Barricading and maintenance and control of traffic.

12. Maintenance and support of existing utility facilities, except as otherwise indicated in Section 02760, “Maintenance, Support, and Restoration of Existing Utility Facilities”.

E. Trench Support System for trenches exceeding a depth of 5 feet will be measured and paid for as specified under Section 02221, “Utility Excavation and Backfill”.

F. Cathodic protection will be measured and paid for under Section 13100, “Corrosion Control”.

G. Standard Mainline Wastewater Access Devices will be measured by and paid for at the unit price for “Standard Mainline Wastewater Access Devices” per each.

Note: Time, in seconds, for pressure to drop from 3.5 to 2.5 psig shall not be less than that indicated.

1. Time for intermediate lengths shall be interpolated.

END OF SECTION 02730
PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies the installation of an underground sanitary sewer storage tank as shown on the Contract Drawings.

1.2 REFERENCED STANDARDS
A. American Society of Mechanical Engineers (AMSE):
   1. ASME/ANSI B16.5 – Pipe Flanges and Flanged Fittings
B. American Water Works Association (AWWA):
   1. AWWA D120 – AWWA Standard for Thermosetting Fiberglass-Reinforced Plastic Tanks
C. North Central Texas Council of Governments (NCTCOG)
   1. Standard Specifications for Public Works Construction, as revised (NCTCOG Standard Specifications)
D. Texas Commission on Environmental Quality
   1. TAC Title 30, Part 1, Chapter 285 – On-Site Sewage Facilities
E. Underwriters Laboratories, Inc. (UL):

1.3 SUBMITTALS
A. Product Data: Manufacturer’s data sheets on each product to be used, including:
   1. Certification reports showing compliance with AWWA D120 and UL 1316 Standards.
   2. Preparation instructions and recommendations
   3. Installation instructions and recommendations.
   4. Operation and Maintenance Data

1.4 QUALITY ASSURANCE
A. Comply with codes and regulations of the jurisdictional authorities including the following:
   1. NCTCOG Standard Specifications
   2. TAC Title 30, Part 1, Chapter 285

1.5 WARRANTY
A. Warranty shall be manufacturer’s standard limited warranty for underground septic tanks in effect at time of purchase.

PART 2 - PRODUCTS

2.1 SINGLE-WALL FIBERGLASS REINFORCED PLASTIC (FRP)
A. Underground Storage Tanks:
   1. Loading Conditions — Standard tank design shall meet the following criteria:
      a. Internal Load—Tank shall be designed to withstand a 5-psig air-pressure test (3 psig for a 12 foot diameter tank) with a 5:1 safety factor. When tank is designed for on-site testing, contractor shall individually test tank for leakage prior to installation. Maximum test pressure is 5 psig (3 psig for a 12 foot diameter tank).
      b. Surface Loads—Tank shall withstand surface H-20 axle loads when properly installed according to tank manufacturers current Installation Manual and Operating Guidelines.
      c. External Hydrostatic Pressure—Tank shall be capable of being buried in ground with 7 feet of overburden over the top of the tank, the hole fully flooded and a safety factor of 5:1 against general buckling.
      d. Tank shall support accessory equipment—such as inlet and outlet piping, effluent filter chamber, high level alarm, ladders and baffles—when installed according to tank
ON-SITE SANITARY SEWER FACILITY

B. Product Storage Requirements:

1. Tank shall be capable of storing wastewater products limited to the collection and storage of human solid or liquid organic sewage.
2. Tank shall be vented to atmospheric pressure.
3. Tank shall be capable of storing products identified in the manufacturer's current standard limited warranty.

C. Materials:

1. Tank shall be manufactured with 100% resin and glass-fiber reinforcement. No sand fillers.
2. Resin used in tank and accessories shall be premium isophthalic polyester.

D. Tank Dimensions (Refer to manufacturer’s literature on capacity):

1. Tank shall have a minimum nominal capacity of 3000 gallons.
2. Tank shall have a minimum nominal outside diameter of 7.5 feet.

2.2 ACCESSORIES

A. Piping:

1. Schedule 40 PVC or FRP pipe shall be used for inlet and outlet piping with a minimum size of 3 inches.
2. When a PVC pipe is affixed to the tank, a fiberglass lay-up is used.
3. All piping shall be factory-sealed to enable field tightness testing with at least one pipe opening provided with a threaded fitting for connecting a pressure-test manifold.
4. A 5 foot goose neck vent stack shall be installed to ventilate gas and vapor build up with in the tank.

B. Access Openings:

1. All access openings 24 inches in diameter or larger shall be manufactured of FRP.

2. Location(s) shall be as shown on tank drawings.
3. Optional riser extensions shall be FRP or PVC.
4. All access openings shall be factory-sealed to enable field tightness testing, and to prevent tank odors from escaping the tank when closed.

C. Anchor Straps:

1. Straps are required and shall be FRP anchor straps as supplied by tank manufacturer.
2. Number and location of straps shall be specified in current literature by tank manufacturer.

D. Fittings:

1. All threaded fittings shall be constructed of carbon steel or FRP.
2. All standard threaded fittings shall be half-couplings and shall be 2 inches, 4 inches or 6 inches in diameter. Reducers are to be used for smaller sizes where shown and provided by contractor.
3. All FRP and PVC nozzles shall be flat-faced and flanged, and shall conform to ASME/ANSI B16.5 Class 150 bolting pattern.

E. Ladders:

1. Ladders shall be the standard ladder as supplied by tank manufacturer.

F. Optional Internal Pump Platforms:

1. Pump platforms shall be FRP.
2. Contact tank manufacturer with pump details, such as dimensions and weight.

G. High Level Alarm:

1. High level alarm shall be linked to the local crew quarters facility as well as DART’s Central Rail Operating Facility and Operations Control Center.
2. Provide 2 sets of Form C Normally open and normally closed dry contacts in the sewer holding tank control panel. Refer to Specification 16868, “SCADA RTU Subsystem – Communications System”, for SCADA RTU Subsystem details.
a. The normally open contacts shall be connected to the station demarcation cabinet or Communications Room SCADA equipment for the following alarm function:

1) Sanitary sewer high level alarm.

PART 3 - EXECUTION

3.1 TESTING

A. Testing—Tank shall be tested according to the manufacturer’s Installation Manual and Operating Guidelines in effect at time of installation.

B. Tank-Tightness Testing — Prior to installation, a tank-tightness test consisting of a 5 psig air pressure/soap test shall be performed (3 psig for 12-foot-diameter tanks) per the tank testing procedures outlined in the manufacturer’s Installation Manual and Operating Guidelines in effect at time of installation.

3.2 INSTALLATION

A. The installation contractor shall purchase the required On Site Sewer Facility permit for the holding tank before installation begins.

B. Contractor shall be licensed in proper installation procedures by TCEQ, the tank manufacturer, or other approved agency.

C. A scheduling pumping contract with a waste transporter, holding a current registration with the TCEQ executive director, shall be provided to the permitting authority before the holding tank is installed.

D. Tank shall be installed according to the manufacturer’s Installation Manual and Operating Guidelines and TCEQ regulations in effect at time of installation.

E. Calculate the depth of hole considering 12 inches for bedding below the tank. Plan for all water lines and the tank bed “underdrain” when such a drain can be installed.

F. Back slope or bench the excavation walls to provide a safe working environment. Properly bed the entire floor of the hole with 12 inches of approved backfill gravel and rake it level where the tank and deadmen will be positioned.

G. Backfill Procedure:

1. Backfill must be applied in lifts no greater than 12 inches deep at any time to allow

proper hand shoveling and probing of the material between all ribs and under the tank’s belly and haunches. Work evenly around the tank, shoveling and probing until gravel fills all the voids and even resistance is felt as the probe is plunged in below the tank. Probing is time consuming and physically taxing, especially if the system is large. However, there is no other way to do this job properly and create the uniform balanced support required to cradle the many tons of water involved. Hand probe soil along any underground tank relative to the face of a clock, in multiple lifts from the 4:00 position around underneath to the 8:00 position.

H. Hydrostatic Leak Testing

1. Leak testing can only be done safely in the field by filling the tank with water and waiting to see if the level drops over a period of time. The tank must be backfilled for proper support before water is added beyond the 10 percent desirable for initial ballasting. Once the backfill gravel has reached the top of the tank and is at the natural angle of repose on all 4 sides, then and only then can the tank be completely filled. Plug the top mounted fittings and install the manway extension with gasket. Slowly fill the tank until the water is up even with the manway flange gasket, at the joint between the flanged tank collar and the extension. Observe the water level over a 24 hour period. Replace the cover securely overnight for safety. It may be necessary to add a small amount of water as the liquid temperature stabilizes to match the temperature of the soil. Trapped air at the top of the tank can also cause minor variations. Generally, the water will maintain a stable level at the gasket surface with less than 1/4 inch variation. In the unlikely event that you are experiencing a drop in water level after several additions, call the manufacturer for help in determining how to best proceed from this point.

I. Geotextile or “filter fabric” is recommended as a barrier or separator medium between the backfill gravel and the soil cover. Geotextile material is inexpensive, readily available, and keeps the cover soil from migrating down into the porous rock interface. This helps reduce subsidence of the cover mound over time and increases the frost resistance of the site in general by keeping the insulating air spaces open between individual gravel particles. It is not necessary to use filter fabric over the areas covered with foam board insulation since the insulation also effectively stops this downward soil migration.
J. Provide surface water a natural run off path, away from the tank site. Seed grass to prevent erosion and padlock or bolt the manway cover closed to discourage curious children. All PVC pipe & fittings exposed to sunlight should be painted to reduce long term ultraviolet degradation (unpainted PVC gets brittle with time).

K. Bolt or padlock the manway cover to discourage children and vandals.

L. Paint exposed PVC pipe risers for long term protection against sunlight.

M. Call for final inspection and notify the appropriate permitting agency or district.

PART 4 - MEASUREMENT AND PAYMENT

4.1 PAYMENT

A. The work describe in the section will be measured for payment but will be paid for on an each basis for “On Site Sanitary Sewer Facility”.

B. Excavation and earthwork, including backfill, soil reinforcing, and backfill material within the excavated area for the sanitary sewer facility will not be measured separately for payment, but shall be considered subsidiary to the construction of the facility.

END OF SECTION 02735
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies protecting, supporting, maintaining, and reconstructing existing utility facilities affected by construction and as shown or directed.

B. Existing Utility Facilities: Existing utility facilities include, the following facilities:
   1. Storm and sanitary sewer facilities.
   2. Water distribution and services.
   3. Gas distribution and services.
   4. Electric light and power facilities and services.
   5. Telephone, telegraph, and communication facilities and services.
   6. Police and fire alarm systems.
   7. Traffic signals and street lighting, temporary and permanent.
   8. Cable television and computer data transmission facilities and services.

1.2 REFERENCED STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1.3 DEFINITIONS

A. Facility: Utility structures and system components belonging to utility company including service lines which are used to provide service to utility's customers and product which these facilities convey.

B. Utility: Company, agency, owner, or operator of facility concerned.

C. Abandoned: Use of facilities shown as existing has been discontinued by the owners and operators. Demolish or remove such facilities to the extent they conflict with proposed work.

D. To be abandoned: Replace particular facility with new facility after written notice is received by Contractor that service is no longer required.

Perform work necessary to maintain service for as long as required, which may include temporary support, rerouting, substitution of temporary facility, or other measures. Demolish or remove such facilities to the extent they conflict with proposed work.

E. Maintenance: Ensuring continuous and satisfactory service during construction.

F. Proposed facility:
   1. Constructing new facility and, if necessary, temporarily supporting it in place.
   2. Constructing temporary facility, supporting it in place and ultimately removing it and constructing new facility.
   3. Constructing new facility at completion of rapid transit construction.

G. Temporary facility: Facility provided by the Contractor in lieu of existing or proposed facility to ensure continuity of service.

H. Maintain complete-in-place: Support and maintenance, in serviceable condition, of existing facilities during construction, which may include constructing permanent support, temporary support, or other measures necessary to maintain continuous service utilizing existing facility.

I. Maintain service and replace:
   1. Constructing new facility in same location and supporting it in place.
   2. Providing temporary facility and ultimately removing it and constructing permanent replacement facility in its original location.
   3. Temporarily supporting original facility and ultimately replacing it with new facility.
   4. Expose and maintain existing cables and replace ducts and manholes: Removal of existing duct and manhole structures, construction of temporary manholes, placement of existing cables in split conduits and replacement of spare ducts with whole conduit, maintenance of this system during construction, reconstruction of permanent concrete manholes and encasement of conduits in concrete as specified. Unless authorized by the utility owner, leave cables for electric power and telephone facilities exposed, separated, and supported by the electric power and telephone companies.
J. Remove and replace: Removing existing facility without providing temporary replacement and reconstructing new facility in same location at completion of construction.

1.4 SUBMITTALS

A. Shop Drawings and Working Drawings:

1. Submit to the utilities and the Contracting Officer working drawings showing plan and scheduling for performance of the Work.

2. Show actual location of existing facilities, interference which these facilities present to new work, proposed method of proceeding with actual construction and details of proposed support systems.

3. Do not commence work until written approval has been received from the utility and the Contracting Officer.

4. Submit working drawings of instrumentation location layout as specified under Section 02316, Geotechnical Instrumentation.

B. Documentation:

1. Notice of commencement of work: Submit copies of notices of commencement to the Contracting Officer.

2. Settlement measurement points: Submit monitoring documentation as specified under Section 02316, Geotechnical Instrumentation.

C. Upon delivery of salvaged items, submit the following: Inventory of all salvaged materials. When salvaged materials are delivered for storage, give one copy of inventory to the receiver at the delivery point and two copies to the Contracting Officer.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Coordinate with utilities who are furnishing materials for the work to determine availability, locations, and required methods of storage and care of materials prior to incorporation into the work.

B. Transport, store and handle materials in accordance with the requirements of the utilities.

1.6 NOTIFICATIONS

A. Notice of commencement of work: Give notice at least two weeks prior to date of intended commencement of operations to parties having surface, subsurface, or overhead structures in the construction area.

B. Establish and maintain direct contact with the owner or operator of each utility facility which may be affected by the Work.

C. Notify utility companies before beginning excavation work in accordance with each utility’s notification requirements and have them locate and mark the facilities as specified under the Article entitled “Location of Facilities” under Part 3 herein.

1. For those utilities that participate in Texas Excavation Safety System, call 1-800-DIG-TESS.

D. During the process of construction, if any utility is damaged or interrupted, notify the corresponding utility representative and the Contracting Officer immediately. List of utility agency contacts is included in the Contract Specifications.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Materials for Storm, and Sanitary Sewer: Section 02700, "Storm Sewer Systems", and Section 02730, "Sanitary Sewer Systems".

B. Materials for Water Distribution and Services: Section 02660, "Water Distribution Systems".

C. Materials for Ducts and Manholes: Section 02780, "Underground Electrical and Communications Distribution Systems".

D. Concrete: Section 03100, "Concrete Formwork", and Section 03300, "Cast-In-Place Concrete".

E. Reinforcement: Section 03200, "Concrete Reinforcement".
F. Sand Backfill Around High Voltage Conduits and Pipes

1. Thermal Resistivity Value (RHO) of not more than 70 and the following sieve analysis when tested in accordance with ASTM C136:

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>Percent Passing</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>94-100</td>
</tr>
<tr>
<td>8</td>
<td>80-90</td>
</tr>
<tr>
<td>16</td>
<td>60-80</td>
</tr>
<tr>
<td>30</td>
<td>35-60</td>
</tr>
<tr>
<td>50</td>
<td>31-35</td>
</tr>
<tr>
<td>100</td>
<td>3-13</td>
</tr>
<tr>
<td>200</td>
<td>1-5</td>
</tr>
</tbody>
</table>

2. The electrical utility, through the Contracting Officer, will inform the Contractor of approved sources for this material.

PART 3 - EXECUTION

3.1 GENERAL

A. Location of Facilities:

1. Utility facilities known to the Authority are shown on the Contract Drawings. Locations of existing facilities shown are plotted from available records; however, these locations are not guaranteed nor is it guaranteed that other utility facilities are not present.

2. Verify by field investigation locations of facilities within and adjacent to limits of project which may be affected by construction operations. Avoid damage or disruption of facilities during operation.

3. Notify utility companies which have underground facilities within the limits of work before beginning excavation work in accordance with each utility's notification requirements and have them locate and mark the facilities within the area of excavation. (Refer to Article entitled "Notifications" herein for additional notification requirements.)

   a. For those utilities that participate in Texas Excavation Safety System, call 1-800-DIG-TESS.

4. Potholing: Prior to any excavation, excavate, expose, and verify the location of existing utility mains and laterals and other existing underground facilities which cross or are in close proximity to proposed underground facilities through potholing. Locate existing facilities by hand digging where necessary. In addition to hand digging, use whatever means of potholing required by utility owner and the Contracting Officer. Do not proceed with underground installations until related pothole work has been completed to the satisfaction of the Contracting Officer.

   a. Immediately notify the Contracting Officer of conflicts in which there is less than one foot of separation between the existing and proposed facility.

5. Upon encountering existing facility which is not shown or upon ascertaining that facility differs from that shown, determine ownership, use and disposition of such facility and proceed as follows:

   a. If facility is abandoned or is to be abandoned, perform necessary work for either condition as specified.

   b. If facility is to remain in service, perform support and restoration work in accordance with these specifications and the "CHANGES" Paragraph of the General Provisions.

B. Responsibilities:

1. Maintain and protect facilities including building service connections.

2. Give notice of commencement of work in accordance with the General Requirements and as specified.

3. Notify the Contracting Officer and the utility of damage to facilities caused by construction operations. When authorized by the utility owner, repair such damage.

4. Provide access including temporary decking in accordance with Section 01533, "Temporary Decking," through the work for utility personnel for inspection of facilities and for emergencies involving utility services.

5. Permit free and clear access to utility personnel for purposes of inspection, maintenance, and providing additional service.

6. When approved working or shop drawings show temporary facility provided for the Contractor's benefit, supply necessary materials and perform necessary work.
7. The Contractor shall be directly responsible for payments to a utility when, as an aid to the Contractor's construction operations, the utility performs work not shown or required for the execution of this Contract.

8. Adjust existing manhole frames and covers, valve boxes, water meter boxes, and other utility facilities and service access structures which are to be left in place, as required, to the final finish surfaces.

C. Coordination with Utilities:

1. Establish, through the Contracting Officer, direct and continuous contact with respective utilities and cooperate with them in all phases of the work.

2. Contact utility early enough to allow them sufficient time to accomplish the work. Give special consideration to lead times required for cable work. Provide schedule of utility relocation to the utility to permit coordination with Authority's construction sequence.

3. Comply with printed standards and practices of Utilities affected by the work.

4. Aerial facilities shown to be relocated by others will be relocated by facility owner. The Contractor is responsible for coordinating relocation work with utility owner as far as possible in advance of required time of relocation.

5. Protect and support utilities in a manner satisfactory to the utility.

3.2 SETTLEMENT OR MOVEMENT

A. Where settlement or movement monitoring system is shown, provide monitoring program in accordance with Section 02316, Geotechnical Instrumentation.

B. Take immediate remedial measures to correct conditions causing settlement or other movement and to repair damages thus caused.

3.3 EXCAVATION AND BACKFILLING OF UTILITY TRENCHES

A. Excavate and backfill utility facility trenches in accordance with Section 02221, "Utility Excavation And Backfill".

B. Provide Trench Support System as specified under Section 02221, "Utility Excavation And Backfill".

C. Proceed with caution in areas of utility facilities; expose them by hand excavation or other methods acceptable to facility owner.

3.4 PAVEMENTS, SIDEWALKS, CURBS, AND GUTTERS

A. Remove pavements, sidewalks, curbs and gutters where necessitated by utility trenches in accordance with Section 02072, "Removal and Restoration of Miscellaneous Existing Facilities".

B. Replace pavements, sidewalks, curbs and gutters in accordance with Section 02525, "Curbs, Gutters, and Walks", Section 02511, "Bituminous Pavement", and Section 02550, "Concrete Pavement".

C. Place temporary pavements where necessitated by sequence of operations.

3.5 UNSAFE AND UNSUITABLE UTILITY STRUCTURES

A. General Requirements: If, upon exposure, condition or location of facility requiring in place support is found to be unsafe for maintenance or support, replace or reconstruct facility as required after receiving prior approval of the Contracting Officer and utility.

B. Electric, Communication, and Similar Type Facilities:

1. If structures containing electrical, communication, and similar types of cables shown to be maintained complete in place are found upon exposure to be incapable of being maintained in place because of condition, location, or both, replace such structures with timber enclosures or split ducts after prior approval of the Contracting Officer and utility.

2. When service box, manhole, or conduit structure containing electrical or communication cables is broken away, replace it immediately with temporary structure having facilities for racking and supporting cables equivalent to existing facilities.

3. Exercise care when working in vicinity of telephone structures containing coaxial cable which cannot withstand movement.

4. Give timber enclosures one interior and one exterior coat of fire-retardant paint of type specified by owners and operators.

5. Replace temporary timber enclosures with permanent structures in accordance with details shown and restore facilities to the satisfaction of the Contracting Officer and
Utilities prior to completion of work. Remove materials of temporary nature after completion of permanent installation.

C. Procedures for payment of costs of work on unsafe and unsuitable utility structures are governed by the "CHANGES" Paragraph of the General Provisions.

3.6 STORM AND SANITARY SEWER FACILITIES

A. Maintain service in storm and sanitary sewers, house connections, and laterals at all times.

B. Perform work on storm and sanitary sewer facilities in accordance with Section 02700, "Storm Sewer Systems", and 02730, "Sanitary Sewer Systems".

C. Maintain connections between existing roof drains and storm sewers.

D. Take precautions to avoid flooding. When working in large storm sewers, provide safety measures to prevent increased flow due to sudden storms.

E. Prevent entry into sewers of material which might clog, damage or otherwise interfere with operation of sewer. Refer to Section 01560, "Environmental Protection", and Section 01562, "Soil Erosion and Sediment Control", for additional requirements.

F. Fully enclose flumes. Prevent flow of sewage across surface of streets or into excavation.

G. Work on Abandoned or To-Be-Abandoned Sewers, Culverts, Catch Basins, and Manholes:

1. For sewers under 36 inches in diameter and catch basin connections, construct bulkheads of brick masonry in accordance with Section 02700, "Storm Sewer Systems", Section 02730, "Sanitary Sewer Systems", Section 04100, "Mortar, Grout, and Masonry Accessories", and Section 04210, "Brick Masonry", or 3000 psi concrete 9 inches thick where shown.

2. For sewers 36 inches in diameter and larger, use one of the following methods for abandonment:
   a. Remove sewer completely.
   b. Remove top of sewer and fill remainder with sand or other approved material.
   c. Fill sewer with grout or lean concrete.
   d. Place bulkheads of brick masonry in accordance with Section 02700, "Storm Sewer Systems", Section 02730, "Sanitary Sewer Systems", Section 04100, "Mortar, Grout, and Masonry Accessories", and Section 04210, "Brick Masonry", or 3000 psi concrete 9 inches thick where shown.

3. Remove catch basins and sewer manholes to a minimum depth of 2 feet below finish grade. Punch holes not less than one square foot through base slab. Fill remainder of structure with sand or other approved material installed in layers and compacted.

4. Salvage frames and covers. Reuse them where approved. Deliver surplus and unapproved frames and covers to the utility.

3.7 WATER DISTRIBUTION AND SERVICES:

A. Ensure continuity of service, except when it is necessary to cut existing mains. Arrange and coordinate such work so as to minimize interruption of service.

B. Perform work on water facilities in accordance with Section 02660, "Water Distribution Systems".

C. Do not disturb, tamper with, or remove fire hydrants, water meters, meter pits, valves, and appurtenances without prior approval from responsible agency. Give not less than 10 days advance notice of work on such items. Water valves will be operated only by utility.

D. Work on Water Mains and Service Connections Which Are Abandoned or To Be Abandoned:

1. Cap ends of cut mains as shown. Place concrete blocking to bear between cap on line main and solid earth.

2. Where mains to be abandoned are removed to a tee or valve, provide tee or valve with harnessed cap or plug as required or remove tee and hook up straight.

3. Abandon house service connections by disconnecting them at corporation stop.

4. For water mains 20 inches in diameter and larger, construct bulkheads of 3000 psi concrete, minimum one pipe diameter thick at manholes, catch basins, and at cut ends.

5. For water mains smaller than 20 inches in diameter, install bulkheads using brick
masonry, 3000 psi concrete, cast iron plugs or cast iron caps at end of abandoned sections.

6. Remove valve vaults to a minimum depth of 2 feet below finish grade and punch holes not less than one square foot through base slab. Fill remainder of structure with sand or other approved material installed in 6 inch layers and compacted.

7. Salvage frames and covers. Reuse when approved. Deliver surplus and unapproved frames and covers to utility.

3.8 ELECTRIC TRANSMISSION, DISTRIBUTION, AND SECONDARY FACILITIES

A. Perform electrical work in accordance with applicable codes, regulations, reference standards, and specifications, with standard procedures and practices of the electric power company and with Section 02780, "Underground Electrical And Communications Distribution System".

B. Maintain continuity and integrity of existing facilities of electric power company.

C. Support vitrified clay and asbestos cement ducts independently of Authority decking system. Where these facilities are part of permanent system, do not expose to traffic vibrations. Support and maintenance of such ducts will be subject to critical inspection by the owners for acceptance as a permanent facility.

D. High-Voltage Facilities:

1. Support conduits or pipes containing high voltage cables. Protect conduit or pipe from puncture or vibration damage. Have mastic coating immediately repaired if damaged. Provide temporary saddles for supporting circuits, conduits and pipes.

2. After completion of transit structure, provide required permanent supports. Furnish and place sand backfill as specified herein around conduits and pipes.

E. Temporary Duct Systems:

1. Number of temporary ducts will be determined by electric power company.

2. Number of split ducts which house secondary cables and cables for street lights and traffic signals which may subsequently be encased as a permanent facility but may be limited in accordance with the requirements of the facility owner.

F. Work to be performed and materials to be furnished by electric power company is shown on the drawings.

3.9 TELEPHONE COMPANY FACILITIES

A. Maintain continuity of existing communications services of telephone company. Support, protect, relocate, and reconstruct facilities during construction operations and ultimately restore such facilities.

B. Furnish material and perform work in accordance with Section 02780, "Underground Electrical and Communications Distribution Systems", and telephone company practices.

C. Where shown, remove existing conduits and structures. Replace spare ducts with whole conduit and immediately replace conduit containing cable with split plastic duct approved by telephone company.

D. Where existing facilities are to be relocated and new ducts provided, provide whole ducts, construct new manholes, provide temporary supports and permanent concrete supports, and encasement. The Contractor may, at his option, provide temporary manholes where new manholes are shown and ultimately provide permanent concrete manholes.

E. Where whole thin-walled conduit is used, encase such conduit in concrete immediately upon installation. Encase thick-walled conduit and split conduit in concrete during backfilling.

F. Where new duct work is to be jointed to existing structure containing cable in service, break into structure wall under the supervision of telephone company.

G. Test new conduit for continuity by pulling test mandrel or by pneumatically rodding from structure to structure in accordance with telephone company practices. Leave polyethylene pull line in each conduit.
H. When existing conduits and manholes are shown to be abandoned, maintain complete-in-place until abandonment is allowed by telephone company.

I. Work to be performed and materials furnished by telephone company is shown on the drawings.

3.10 POLICE AND FIRE ALARM SYSTEMS

A. Maintain continuity of existing police and fire alarm services. Support, protect, and relocate police and fire alarm boxes and conduits serving them.

B. Should relocation or removal of any of police and fire alarm systems be required, inform the Contracting Officer of the requirement in writing so that three weeks advance notice can be provided to the appropriate department.

3.11 TRAFFIC SIGNALS AND STREET LIGHTING

A. Within limits of work shown, where transit construction or traffic maintenance require, existing street lights and traffic signals will be removed and ultimately replaced or relocated by jurisdictional agency and electric power company. Where street lights and traffic signals are removed for duration of construction, install temporary street lights and traffic signals in accordance with the approved Traffic Control Plan. Refer to Section 01570, “Maintenance and Control of Traffic”, for requirements.

B. Jurisdictional agency and electric power company will provide and subsequently remove luminaries, signal heads, and other appurtenances.

C. Make arrangements with appropriate agency to obtain temporary lighting poles for installation on traffic decking. Erect lighting poles and install temporary conduit on decking.

D. Upon completion of work, remove and dispose of temporary poles and conduit as directed.

E. Electric power company and appropriate agencies will provide permanent street and traffic lights where shown at completion of backfill operations.

F. Where street lights are to be mounted on brackets integral with subway vent shaft structures, provide conduit to within 1 foot of outside face of structure.

G. When necessary to have changes made to street and traffic light facilities, inform the Contracting Officer at least eight weeks before changes are to be effected. Furnish him a plan showing locations of temporary lighting and schedule of construction operations.

H. Traffic Control Detectors and Devices:

1. Traffic control detectors mounted on poles or standards will be disconnected, removed and ultimately replaced or relocated by the jurisdictional agency.

2. Remove detectors mounted in elongated trough boxes installed as treadles in traffic lanes and store as directed for reinstallation by the jurisdictional agency.

3.12 OTHER UTILITY FACILITIES

A. Maintain continuity of other existing utility facilities. Protect, support, relocate, and reconstruct such facilities, regardless of jurisdictional control.

3.13 SALVAGE

A. Salvage and clean material shown to be salvaged.

B. Reuse salvaged items after inspection and approval for reuse has been given by the utility.

C. Repair or replace salvaged items which are damaged or destroyed.

D. Where salvaged items are not designated for reinstallation as part of the work of the Contract or are otherwise not reused in the work, deliver such materials to the utility's storage area.

E. Salvage Records: Maintain records and storage facilities for salvaged items. Indicate in the records the condition of the salvaged items and their storage locations. Prepare inventory of delivered salvaged items. Have available for inspection a detailed record including signed vouchers and receipts.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Maintenance and support of existing utilities crossing or lying alongside excavations used to construct other facilities will not be measured for payment separately; such maintenance and support will be considered subsidiary to the cost of the new facilities being constructed.

B. Maintenance, support, or restoration of existing utilities as directed or shown in the Contract Documents will not be measured but will be paid for at the lump sum price for “Maintenance, Support, or Restoration of Existing Utility Facilities”. No separate measurement will be made for work related to “abandoned” and “to be abandoned” sewers and water mains and other utilities which
are considered an integral part of the finished work.

C. Relocated utilities are shown on the Contract Drawings. Trench Support System for trenches exceeding a depth of 5 feet shall be measured and paid for as specified under Section 02221, "Utility Excavation And Backfill". Support of excavation for depths not exceeding 5 feet will not be measured or paid for directly, but considered subsidiary to the various bid items.

END OF SECTION 02760
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies the construction of new ducts, manholes, and handholes for underground electrical and communications facilities.

1.2 REFERENCE STANDARDS

A. American National Standards Institute (ANSI):
   1. ANSI A14.3 - Ladders - Fixed - Safety Requirements.
   2. ANSI A14.5 - Ladders Portable Reinforced Plastic - Supplement to Safety Requirements.
   3. ANSI C80.1 - Rigid Steel Conduit - Zinc Coated (GRC)
   4. ANSI/UL 651 - Standard for Schedule 40 and 80 Rigid PVC Conduit

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A36/A36M - Standard Specification for Carbon Structural Steel
   4. ASTM A320/A320M - Standard Specification for Alloy-Steel and Stainless Steel Bolting Materials for Low-Temperature Service
   5. ASTM A536 - Standard Specification for Ductile Iron Castings
   6. ASTM A615/A615M - Standard Specification for Deformed and Plain Carbon Steel Bars for Concrete Reinforcement
   7. ASTM C33 - Standard Specification for Concrete Aggregates
   9. ASTM C979 - Standard Specification for Pigments for Integrally Colored Concrete
   10. ASTM D635 - Standard Test Method for Rate of Burning and/or Extent and Time of Burning of Plastics in a Horizontal Position
   15. ASTM D3786 - Standard Test Method for Hydraulic Bursting Strength of Textile Fabrics-Diaphragm Bursting Strength Tester Method

C. National Electrical Manufacturers Association (NEMA):
   1. NEMA TC 2 - Electrical Polyvinyl Chloride (PVC) Conduit
   2. NEMA RN 1 - Polyvinyl-Chloride (PVC) Externally Coated Galvanized Rigid Steel Conduit and Intermediate Metal Conduit
   3. NEMA TC 6 and 8 - Polyvinyl Chloride (PVC) Plastic Utilities For Underground Installations
   4. NEMA Bulletin No. TCB 2-2000 - NEMA Guidelines For The Selection And Installation Of Underground Nonmetallic Duct

D. American Association of State Highway Transportation Officials, Inc. (AASHTO)
   1. AASHTO HB17 - Standard Specifications for Highway Bridges

1.3 DEFINITIONS

A. Conduit: Individual electrical raceway.

B. Duct: Assembly of conduits in configurations shown, concrete encased, with reinforcement.
1.4 SUBMITTALS

A. Shop Drawings:

1. Prior to manufacturing the Contractor shall submit for approval drawings for each cast-in-place manhole.

2. Prior to manufacturing the Contractor shall submit for approval typical drawings for each size and configuration of precast manhole, handhole, systems elements boxes and junction box with details of fabrication, assembly, accessories and joints.

3. Prior to manufacturing the contractor shall submit for approval diagrams of each manhole, handhole, system elements box and junction box, showing dimensioned locations for openings and knockout panels for express trough, duct and stub-up penetrations of manhole walls.

4. Prior to proceeding with Directional bores, Core bores and Hydro-jetting for duct bank and stub-up crossings/locations, submit for approval working plans, materials and installation details sufficient to fully indicate the crossing installation.

5. Submit, 21 days prior to installation, Shop Drawings representing planned conduit and/or Ductbank Work for this Specification Section.

B. Documentation: Prior to manufacturing the contractor shall submit for approval calculations to demonstrate compliance with required load-bearing capacity, certified by a Professional Engineer, registered in the State of Texas.

C. Certification: Submit certificates on furnished material from manufacturers of materials.

1. Product data or certification indicating compliance of all elements with the standards and requirements listed in this section.

D. Samples:

1. Submit for approval sample, specification data, and manufacturer’s installation instructions for nonwoven filter fabric.

2. Submit for approval sample and specification data for security bolts.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Receive, transport, and store until use, those materials supplied by utility companies.

1.6 QUALITY ASSURANCE

A. Comply with codes and regulations of the jurisdictional authority.

B. Ladders and steps shall comply with OSHA Standards.

1.7 MAINTENANCE MATERIALS PROVIDED

A. Furnish and deliver to the Contracting Officer, ten sockets to fit security bolts provided.

B. Furnish fiberglass extension ladders in quantity, length, and type as shown on Manhole Schedule drawings and deliver to the Authority as directed by the Contracting Officer.

PART 2 - PRODUCTS

2.1 CONCRETE WORK

A. Concrete formwork: As specified in Section 03100, “Concrete Formwork”.

B. Reinforcing steel: As specified in Section 03200, “Concrete Reinforcement”.

C. Concrete:

1. Cast-In-Place: As specified in Section 03305, “Portland Cement Concrete”, Mix S-7. Mix design for a Utility Company manhole shall be as required by the Utility Company for its facilities. Encasement for Underground Ducts shall be Mix M-1. Mix design for a Utility Company ductbank shall be as required by the Utility Company for its facility.

2. Precast: As specified in Section 03430, “Structural Precast Concrete”, Mix S-3 as specified in Section 03305, “Portland Cement Concrete”.

D. Flowable fill: As specified in Section 02220, “Grading, Excavating, and Backfilling”.

E. High-density polymer concrete (HDPC) for handholes, junction boxes and pull boxes: Sized as shown on the Manhole Schedule drawings.

1. HDPC or aggregates bound together with polyester resin and/or reinforced with continuous woven glass strands or glass
fiber. Precast concrete shall be fire resistant and electrically non-conductive.

2. Precast HDPC concrete mix shall have the following certified, tested minimum characteristics:
   a. Compressive strength (28-day): 10,300 psi
   b. Tensile strength: 1,800 psi
   c. Flexural strength: 3,600 psi
   d. Modulus of elasticity: $1.83 \times 10^6$
   e. Freeze/thaw resistance (2,500 cycles): No change
   f. Fire resistance (Maximum): 10 when tested in accordance with ASTM E84; or maximum burning rate of 0.3 inches per minute for each 0.1 inch of thickness when tested in accordance with ASTM D635
   g. Shear (Minimum): 6,000 psi

3. Concrete formwork: As specified in Section 03100, “Concrete Formwork”.

4. Quality assurance: As specified in Section 03300, “Cast-In-Place Concrete”.

2.2 COATINGS

Not used.

2.3 CONDUIT AND FITTINGS

A. PVC conduit and fittings:
   1. Concrete encased: ANSI/UL 651 or NEMA TC2; Type-Schedule 40 PVC.
   2. Direct burial: ASTM F512, Type DB-120.

B. Galvanized rigid steel conduit and fittings: ANSI C80.1.

C. Galvanized rigid steel conduit and fittings with polyvinyl-chloride external coating: NEMA RN 1

2.4 SPACERS

A. Conduit spacers shall be installed in duct banks at the rate of 3 spacers per 20 linear feet or the equivalent, maximum interval of 78 inch centers along the entire conduit run. Plastic conduit spacers provided shall be specified for use in duct banks and be standard factory preformed spacers.

2.5 END BELLS

A. Flared, smooth-surfaced fittings of same material as conduit; if fittings are of different material, include adapter for connection to conduit.

2.6 AGGREGATE

A. Aggregate for Subgrade Foundation where required: ASTM C33, coarse aggregate No. 4 or No. 67.

2.7 CHANNEL INSERTS

A. Fiber-reinforced polymer (FRP) channel shall be of pultruded glass-reinforced polyester or vinyl ester resin: ASTM D3917 and ASTM D4385, length and minimum width and depth sizes as shown on drawings, heavy duty, surface-mounted, slotted back with mounting slots on a maximum of 8 inch centers, channel configuration to accommodate standard metal framing fasteners.

2.8 CABLE PULLING IRON

A. Fabricated of plain steel reinforcement bar, ASTM A615, Grade 60; welded; size as shown: Hot-dip galvanized after fabrication, ASTM A123.

2.9 MANHOLE AND HANDBOLE FRAMES AND COVERS

A. Handhole Frame and Cover: Steel, ASTM A36/A36M; size as shown, with the DART Logo cast in the cover.

B. Manhole Frame and Cover:
   1. Authority manhole, rectangular access cover: Size as shown on drawings.
      a. Covers shall be designed by a registered Civil Engineer licensed in Texas in accordance with AASHTO HS20 loading requirements and ASTM C857.
      b. Each Access Door shall be provided with a zinc plated and chromate sealed torsion assist mechanism to reduce the lifting requirements and shall be able to open to a 90 and/or 180-degree position.
      c. Frames and covers shall be hot dipped galvanized per ASTM A123 as last revised to reduce corrosion.
      d. Each access door shall be manufactured with a minimum 1/4 inch steel floor plate.
      e. Torsion Bars shall be removable or exchanged without removing the covers from the frame assembly.
f. Covers shall have the DART logo as shown on the Contract Drawings.
g. Covers shall be provided with recessed flush lift handles to assist opening covers.
h. Miscellaneous hardware shall be zinc plated and chromate sealed for corrosion resistance.
i. Countersink hole at bolt locations to prevent bolts from extending more than 1/8 inch above cover. The hole shall have a diameter that is large enough to accommodate the socket for the bolt heads.

2. Authority manhole, round access cover: Size as shown on drawings.
   a. Cast iron, ASTM A48, Class 30, with the DART logo cast in the cover.
   b. Cast or drilled countersink hole at bolt locations to prevent bolts from extending more than 1/8 inch above cover. The hole shall have a diameter that is large enough to accommodate the socket for the bolt heads.

C. Impedance Bond Box: Frame with Lid and Fabricated Metal Box:
   1. Frame and lid shall adhere to the requirements of Section 05500, “Metal Fabrications”. Fabricated metal box shall be constructed of either galvanized ASTM A36/A36M Carbon Steel; Cast Iron, ASTM A48, Class 40; or ductile iron, ASTM A536. DART logo shall be cast into cast and ductile iron lids.
   2. Box elements shall be a minimum of 1/4 inch thick. Frame/lid assembly shall be connected to the fabricated metal box to form a monolithic item, resulting in a watertight case.

2.10 MANHOLE STEPS
   A. Unless otherwise shown: Fiberglass or rebar.
   B. As shown on Manhole Schedule drawings, provide at manhole steps a telescoping safety post as specified herein.

2.11 HANDBOLES AND MANHOLES
   A. Unless otherwise shown, Contractor’s option of either cast-in-place or precast.

1. Cast-in-place concrete:
   a. Size and configuration as shown on the detail drawings, the schedules, and as specified.
   b. Manholes shall be designed for AASHTO HS20-44 truck loading.
   c. Handholes shall be designed for AASHTO HS20-44 truck loading when indicated on the detail drawings and the schedules.
   d. Manhole: Include lifting rings, manhole steps, pulling irons, sump, hole through floor for ground rod. Precast extensions included where required by Utility or by manhole schedule or detail drawings.

2. Precast concrete:
   a. Size and configuration as shown on the detail drawings, the schedules, and as specified.
   b. Designed for AASHTO HS20-44 truck loading.
   c. Manhole: Include lifting rings, manhole steps, pulling irons, sump, hole through floor for ground rod, and seal or sealant for sealing joints between sections. Precast extensions included where required by Utility or by manhole schedule or detail drawings.

2.12 GROUNDING
   A. As specified in Section 16450, "Grounding and Bonding".

2.13 WARNING TAPES
   A. Polyethylene non-detectable tape for direct burial, extra stretch, minimum of 7 mil thick and a minimum of 6 inches wide for use in trenches. Approved manufacturers are Terra-Tape, Blackburn Manufacturing, Seton, or Authority approved equal.
   B. Provide printed warning label text. The text shall be placed on three foot centers with tape placed continuously over ducts and conduits. The tape shall be colored as follows:

1. For communication and signal ducts: Orange tape with black printed labeling: "Caution-Communications Cable Buried Below" or "Warning – Communications Cable Buried Below", or Authority approved standard language. Communication ducts are those that run between Communications/Signal Manholes (CSMH),
or run from a CSMH to a Communication Facility, stub-up, stub-out, handhole, or junction box.

2. For electrical ducts or cable: Red tape with black printed labeling: “Caution – High Voltage Cable Buried Below” or “Warning – High Voltage Cable Buried Below”, or Authority approved standard language. Electrical ducts are those that run between Utility Manholes (UTMH), between Traction Power Manholes (TPMH), between UTMH and TPMH and Traction Power Substations, or run from a UTMH or a TPMH to a stub-up.

2.14 CONCRETE COLORING AGENT

A. Red Iron Oxide: ASTM C979

1. Include in ductbank concrete encasement mix design, or apply and mix in top layer of ductbank concrete immediately following concrete placement, where indicated on drawings.

2.15 SECURITY BOLTS

A. Two security bolts shall be required to lock down a manhole, handhole, junction box, or pull box cover in order to prevent unauthorized access.

B. Security bolt shall be fabricated to be a direct replacement of existing bolts, where applicable, and shall comply with the following physical specifications:

1. Bolt shall be made from 304 Class 2 or equal stainless steel, conforming to ASTM A320/A320M.

2. Bolt shall be made with a flat pentagonal 0.845 inch head (0.56 inch side), 0.3 inch minimum depth.

3. Bolt shall be torqued by means of a matching tool steel socket, which fits a 1/2 inch drive wrench.

4. Bolt lengths shall be as required to fully engage the threads and shall be held to plus or minus 0.1 inch.

5. Bolt for junction boxes shall be 3/8 inch diameter, 16 threads per inch, class UNC-2A. Bolt for manholes, handholes, and pullboxes shall be 1/2 inch diameter, 13 threads per inch, class UNC-2A.

C. Apply marine grade anti-seize calcium sulfonate lubricant or equal to bolt threads prior to final installation of security bolt.

2.16 LADDERS

A. Authority manhole: Length and type of ladder as shown on Manhole Schedule drawings.

1. Structural steel ladders shall conform to Specification Section 05500, “Metal Fabrications”.

2. Fiberglass ladders shall conform to the requirements of ANSI A14.5, Type 1A - Industrial - Extra Heavy Duty.

3. Fiberglass extension ladders shall conform to the requirements of ANSI A14.5, Type 1A - Industrial - Extra Heavy Duty.

4. Fixed ladders shall conform to the requirements of ANSI A14.3.

B. Utility Company manhole: Ladder as required by the Utility Company.

C. As shown on Manhole Schedule drawings, provide at manhole ladders a telescoping safety post as specified herein.

2.17 TELESCOPING SAFETY POST

A. As shown on Manhole Schedule drawings, provide on manhole steps and ladders an aluminum telescoping safety post with stainless steel hardware conforming to OSHA requirements extending not less than 36 inches above the top of the manhole ring or cover.

2.18 NON-WOVEN FILTER FABRIC

A. Use non-woven material for subgrade separation/stabilization at locations indicted on the Contract Drawings.

B. Shall adhere to the following requirements:

<table>
<thead>
<tr>

PART 3 - EXECUTION

3.1 EXCAVATING AND BACKFILLING

A. Excavating and backfilling: In accordance with Section 02220, “Grading, Excavating, and Backfilling”. Refer to Section 02221, “Utility Excavation and Backfill”, for support of excavation.

1. Requirements for duct trench and manhole backfill material are modified to include native, excavated soil and similar borrow.
For duct banks, stub-ups and stub-outs, this only applies to backfill areas equivalent from the top of encasement to finished grade or stabilized base for track bed. All required level-up or other supporting materials shall remain as controlled flowable fill or select fill. Use of native, excavated soil for manholes and handholes/junction boxes shall be restricted to sidewalks and areas above the structural floor. Required level-up or support bedding material shall remain as indicated on the Contract Drawings or controlled flowable fill. Native excavated soil for backfill shall be free of roots, grass, trash and other organic material. The requirements for compaction and other items specified as Execution remain unchanged.

B. Ducts and manholes installed on backfill over utilities or structures:

1. Place and compact backfill up to grade shown for ducts and manholes; compact as specified in Section 02220, “Grading, Excavating, and Backfilling”; ensure the manhole sets level.

2. Schedule completion of backfilling to allow sufficient time for installation of ducts and manholes.

C. Where shown for subgrade foundation, use layers of coarse aggregate ASTM C33, No. 4 and No. 67 in combinations and proportions as determined by field conditions.

D. Protect and maintain existing utility services in accordance with Section 02760, “Maintenance, Support, and Restoration of Existing Utility Facilities”.

3.2 PAVEMENTS, SIDEWALKS, CURBS, AND GUTTERS

A. Remove pavements, sidewalks, curbs, and gutters where necessitated by construction of ducts and manholes in accordance with Section 02050, “Demolition”, as indicated on the drawings.

B. Place temporary bituminous pavement in accordance with Section 02511, “Bituminous Pavement”, when required by the sequence of operations.

C. On completion of distribution systems construction, replace pavements, sidewalks, curbs, and gutters, in accordance with Section 02525, “Combined Curb and Gutters, Curb Ramps, and Walks”, when required by the sequence of operations.

D. Reconstruction of roadway or track slab necessary for the installation of new power switches, insulated joints and related systems elements shall be completed in accordance with Section 03300 "Cast-In-Place Concrete", when required by the sequence of operations.

E. Upon completion of distribution system construction, replace and reset pavers in accordance with Section 02515, “Unit Pavers”, when required by the sequence of operations. The requirements of Section 02515 for the preparation, installation, and finishing of new unit pavers shall also apply to the preparation, installation, and finishing of existing pavers that are to be reused.

3.3 PLACING DUCTS

A. Depending on encasement necessary for duct formation, place conduits on spacers and, where required, construct concrete base prior to placing bottom tier of conduits.

B. Minimum bend radius for raceways installed underground shall be as shown in Specification Section 16110, Table 3.1, except where otherwise indicated.

C. Lay conduits for encased ductbanks and stub-ups/outs using preformed plastic spacers installed at maximum interval of 78 inch centers along the entire conduit run, to provide tier spacing as shown. For Utility Company facilities use spacers recommended by that Utility Company.

D. Make tight conduit joints by complying with recommendations of conduit manufacturer, using coupling jointing compound or solvent cement.

E. Use non-metallic conduit, unless otherwise shown.

F. Where required, properly place and compact concrete around conduits in accordance with Section 03300, “Cast-In-Place Concrete”. Where required, properly place and compact controlled flowable fill around conduits in accordance with Section 02220, “Grading, Excavating, and Backfilling”. Placing of flowable fill around conduits shall be performed in a manner that prevents conduit floating. Conduits shall be sufficiently restrained to a point that the duct bank conduit configuration has not been changed from that designed and that clearance and encasement dimensions are satisfied along the entire length of duct bank or bundled stub-outs.

G. Where shown, install reinforcing steel in encasement in accordance with Section 03200, “Concrete Reinforcement”.

H. If not already in concrete mix, immediately following concrete placement, substantially apply and mix concrete coloring agent in liquid form to fully saturate the entire top surface of encasement concrete and to provide a strong red color, where shown on drawings.

I. Clear conduit by rod and pull an approved test mandrel from structure to structure.

J. Install Authority approved nylon or polyester pull line in each conduit. Tag each pull line to identify the corresponding point of origin.
K. Directional Bore:

1. Where indicated, or used as an alternate means of construction, install conduit by directional bore. Excavation of the boring pits shall proceed in accordance with Section 02221 “Utility Excavation and Backfill”.

2. Where concrete casing is required for installation of the 4-inch communication conduits and duct banks, the borehole shall be a minimum of 10-inch diameter. Any voids that develop between communication conduits and walls of the borehole shall be filled with grout in accordance with Section 03305 “Portland Cement Concrete”.

L. Direct Burial:

1. Duct should be fully surrounded by a selected backfill to prevent more than the desired deflection and, in power ducts, to provide for heat dissipation. A separation of 1 inch both vertically and horizontally between ducts is a recommended minimum to provide room for heat dissipation and for good compaction of backfill. Other spacing may be required for different applications in which case the additional spacers manufacturing data shall be included in to submittal.

2. Duct formation may be built up layer by layer. After each layer is placed, the selected backfill should be placed over it to a minimum depth of 1-inches. This fill should be spread evenly and compacted to provide continuous support for the next tier of ducts. Any temporary spacers used should be removed from each layer of duct as soon as backfill is completed in that layer. To maintain clearance between ducts, joints for adjacent ducts should be offset about 6 inches both horizontally and vertically.

3. If alternate methods and materials are deemed necessary due to site conditions and other RR limitations, contractor shall submit a work plan of methods and material selections to the Authority for approval. See Article 1.4, Submittals for requirements.

M. Core-Bore:

1. Where indicated, or used as an alternate means of construction, install conduit by core-bore method.

2. Where concrete casing is required for installation of the 4 inch and 2 inch communication conduits and duct banks, the core-borehole shall be a minimum of 10 inch diameter for 4 inch conduit, and 8 inch diameter for 2 inch conduit. Any voids that develop between communication conduits and walls of the core-borehole shall be filled with grout in accordance with Section 03305 “Portland Cement Concrete”.

3.4 INSTALLATION OF WARNING TAPES

A. After placing a minimum of 6 or a maximum of 12 inches of backfill over the ducts, place the appropriate warning tapes above and parallel to the centerline of the duct for the entire length of the duct trench.

3.5 CONSTRUCTION OF MANHOLES AND HANDHOLES

A. Cast-in-Place:

1. Provide drainage facilities for manholes where shown. If connection is made to existing line, install connection in accordance with Section 02700, “Storm Sewer Systems”.

2. After pit excavation, place filter fabric, gravel setting bed & compact prior to forming the MH floor and walls. Wrap filter fabric completely around gravel setting bed and overlap loose ends. Secure in-place by forming MH on the fabric wrapped setting bed to line and correct elevation as indicated on the plans.

3. Erect formwork in accordance with Section 03100, “Concrete Formwork”.

4. Place reinforcing in accordance with approved shop drawings.

5. Provide for location of duct entrances and inserts in walls as shown.

6. Place concrete as specified in Section 03300, “Cast-In-Place Concrete”.

7. Install conduits of material shown.

8. Install end bells on conduits where ducts terminate in manhole and handholes.

9. Build duct formations into walls of manholes and seal around openings.

10. If location of manhole or handhole openings will be obstructed, inform the Contracting Officer immediately.

11. Install frame and cover, adjust to finished grade by using precast neck extenders, grout and, if necessary, brick chimney as specified in Section 02700, “Storm Sewer Systems”.

12. Seal conduit openings with approved conduit plugs.
13. Install ground rods where shown. If soil conditions prevent driving rod to required depth, install alternative grounding system as approved.

14. Provide channel inserts along interior walls as shown. Perform pull-out test.

15. Backfill in accordance with Section 02220, "Grading, Excavating, and Backfilling", except as modified herein regarding the use of excavated soil, in accordance with Paragraph 3.1A.1.

16. Install ladder and telescoping safety post where required by Manhole Schedule drawings.

17. Complete grounding of metal components in accordance with Section 16450, "Grounding and Bonding":

B. Pre-cast:

1. Provide drainage facilities for manholes where shown. If connection is made to existing line, install connection in accordance with Section 02700, "Storm Sewer Systems".

2. After pit excavation, place filter fabric, gravel setting bed & compact prior to setting the MH section. Wrap filter fabric completely around gravel setting bed and overlap loose ends. Secure in-place by setting MH section on the fabric wrapped setting bed to line and correct elevation as indicated on the plans.

3. Install conduits of material shown.

4. Install end bells on conduits where ducts terminate in manhole and handholes.

5. Build duct formations into the bulkhead of manholes and seal around openings.

6. If location of manholes or handholes openings will be obstructed inform the Contracting Officer immediately.

7. Install factory provided asphaltic/poly-silicone type joint sealing strips to wall joints. Place and secure MH top including the frame and cover, adjust to finished grade by using precast neck extenders, when required.

8. Seal conduit openings with approved conduit plugs.

9. Install cable pulling irons and steps as shown.

10. Install ground rods where shown. If soil conditions prevent driving rod to required depth, install alternative grounding system as approved.

11. When installing sections of precast manholes, prevent damage to joints seals.

12. Provide channel inserts along interior walls as shown. Perform pull-out test.

13. Paint exterior of manhole, which is below grade, with two coats of epoxy coal tar, 18 mils minimum total dry film thickness.

14. Backfill in accordance with Sec. 02220, "Grading, Excavating, and Backfilling", except as modified herein regarding the use of excavated soil, in accordance with Paragraph 3.1A.1.

15. Install ladder and telescoping safety post where required by Manhole Schedule drawings.

16. Complete grounding of metal components in accordance with Section 16450, "Grounding and Bonding":

3.6 CLEAN-UP

A. Remove debris from manholes and ensure complete installation is left in neat and finished condition.

3.7 CONSTRUCTION TOLERANCES

A. Construct System Elements to the following tolerances:

<table>

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Duct banks for electrical and communications facilities will not be measured, but will be paid for at lump sum price for “Duct Banks”.

B. Concrete encased PVC, galvanized rigid steel (GRS) and flex metal conduit stub-ups and stub-outs will not be measured separately, but shall be considered subsidiary to the related Duct Bank item.

C. Manholes will be measured by and paid for at the unit price for “Manholes” per each, for each type and size.

D. Handholes will be measured by and paid for at the unit price for “Handholes” per each, for each type and size.

E. Junction boxes, pullboxes, and systems elements boxes will be measured by and paid for at the unit price for “Junction Box”, “Pullbox”, “Impedance Bond Box”, and “System Element Box” per each, for each type and size.

F. No separate measurement or payment will be made for the following work required for work of this section. Such work will be considered subsidiary to the various bid items:

1. Ladders, steps, telescoping safety post, and other accessories.

2. Socket tools for access cover security bolts and fiberglass extension ladders.

3. Concrete work, including reinforcing steel.

4. Excavating, backfilling, jacking, boring, and tunneling, including concrete encasement, bedding material, and disposal of surplus material.

5. Support of excavation for depths not exceeding 5 feet.

6. Dewatering.

7. Removal and replacement of existing bases, pavements, sidewalks, curbs, and gutters.

8. Barricading and maintenance and control of traffic.

9. Maintenance and support of existing utility facilities, except as otherwise indicated in Section 02760, “Maintenance, Support, and Restoration of Existing Utility Facilities”.

G. Trench Support System for trenches exceeding a depth of 5 feet will be measured and paid for as specified under Section 02221, “Utility Excavation and Backfill”.

END OF SECTION 02780
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies providing at-grade express troughs, for communications and signal systems.

1.2 REFERENCED STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A320/A320M - Standard Specification for Alloy-Steel and Stainless Steel Bolting Materials for Low-Temperature Service
   2. ASTM A563 – Standard Specification for Carbon and Alloy Steel Nuts
   3. ASTM D635 - Standard Test Method for Rate of Burning and/or Extent and Time of Burning of Plastics in a Horizontal Position
   5. ASTM C666/C666M Standard Test Method for Resistance of Concrete to Rapid Freezeing and Thawing

B. National Fire Protection Association (NFPA):
   1. NFPA 70 - National Electrical Code (NEC)

C. Precast/Prestressed Concrete Institute (PCI):
   1. PCI/CONCRT MNL-128 - Recommended Practice for Glass Fiber Reinforced Concrete Panels

D. American Association of State Highway Transportation Officials, Inc. (AASHTO)
   1. AASHTO HB17 - Standard Specifications for Highway Bridges

1.3 DEFINITIONS

A. Express Trough Unit: A fabricated precast cable trough, including cover with a multiple open (cells) interior space for enclosing low voltage, medium voltage and fiber optics cables.

1.4 SUBMITTALS

A. Shop Drawings: Drawings for express trough and bend.

1. Scaled, detailed installation drawings corresponding to the proposed express trough system shall be submitted prior to trough installation, complete with offset distances and clearances from tracks, ties, switches, pushbuttons and OCS Foundations, showing allowed 5 foot standard minimum track to trough clearance maintained. Plan drawings are diagrammatic and shall be evaluated with other Systems equipment and Systems standard drawings to prepare the detailed installation drawing submittal.

2. Details of bends and multiple trough sizes connections, dimensions and location of each utilized type of trough for the proposed express trough system shall be submitted prior to trough installation. Work closely with trough manufacturer to design/draw bends and/or size transition pieces and submit for approval. Submit cutting means and methods if pre-formed factory pieces are not used.

B. Calculations: Submit calculations to demonstrate that the express trough design meets the required load-bearing capacity, and minimum and maximum dimensions shown on the standard details, certified by a Professional Engineer, registered in the State of Texas.

C. Certification: Submit certificates on furnished material properties and characteristics from manufacturers of materials, including composite material mix qualification.

D. Test results: Submit laboratory or “in-situ” test results on furnished materials and products showing mix qualifications and express trough units with covers meet strength and loading requirements, certified by a Professional Engineer, registered in the State of Texas.

E. Drawings, details and certifications of the specialty securing bolt system that demonstrates the specialty bolts comply with the fastening requirements indicated on the drawing and in these specifications. Drawing and details shall indicate the type, size, material and strength characteristics as well as the fastening mechanism(s) to the trough sidewalls and cover.

F. Samples: Submit a sample of the complete trough unit (body and cover), as directed by the Contracting Officer.
1.5 QUALITY ASSURANCE
A. Comply with:
1. AASHTO standards for H20 loading.
2. PCI/CONCRT MNL-128
3. Codes and regulations of the jurisdictional authority
4. NFPA 70

1.6 PRODUCT DELIVERY, STORAGE, AND HANDLING
A. Deliver precast express trough units and structures to the Worksite in such quantities and at such time to assure continuity of installation.
B. Store and handle units at the Worksite in such a manner to prevent cracking, chipping, distorting, warping, or other physical damage. Lift and support units only at designated lifting or supporting points as shown on approved shop drawings.

1.7 MAINTENANCE MATERIALS PROVIDED
A. Furnish and deliver to the Contracting Officer, ten sockets to fit specialty securing fasteners provided.

PART 2 - PRODUCTS
2.1 CONCRETE WORK
A. Trough material shall consist of either high-density polymer concrete (HDPC) consisting of aggregates bound together with polyester resin and/or reinforced with continuous woven glass strands or glass fiber, precast composite polymer/sheet molded compound trough section consisting of HDPC and glass reinforced polymer mortar (GRPM) consisting of fine sand and glass fiber found together with resin binder or a Portland cement type concrete with steel reinforcement. Precast HDPC, HDPC/GRPM concrete/mortar mix types shall be fire resistant and electrically non-conductive. Material type shall be specified on the Contract Drawings.
B. Precast HDPC and GRPM mortar concrete mix shall have the following certified, tested minimum characteristics:
1. Compressive strength (28-day): 10,300 psi
2. Tensile strength: 1,800 psi
3. Flexural strength: 3,600 psi
4. Modulus of elasticity: 1.83x10^6
5. Freeze/thaw resistance (2,500 cycles): Cycling between 0 degree and 40 degrees F.
6. Fire resistance (Maximum): 10 when tested in accordance with ASTM E84; or maximum burning rate of 0.3 inches per minute for each 0.1 inch of thickness when tested in accordance with ASTM D635
7. Shear (Minimum): 6,000 psi
C. Concrete formwork: As specified in Section 03100, "Concrete Formwork".
D. Quality assurance: As specified in Section 03300, "Cast-In-Place Concrete".
E. Concrete/cement: Portland cement type concrete in accordance with and as specified in Section 03305, "Portland Cement Concrete", mix S-3.

2.2 EXPRESS TROUGH
A. Express Trough: Shall meet the minimum dimensions shown on the plans for the installation of signal and communication cables. Express trough unit shall be designed to withstand AASHTO H20 traffic loading on a regular basis, including impact and live load surcharge forces, without any permanent deformation, deflection or failure as a result of applied loads. Actual structure dimensions shall be as designed by the manufacturer but must recognize the constraints of adjacent facilities. Actual structure dimensions shall be as designed by the manufacturer but must recognize the constraints of adjacent facilities. Include drainage holes, the number required per unit length to ensure adequate drainage.
B. Covers: Shall be provided with appropriate lifting devices for easy removal during cable installation and maintenance. Covers shall be designed to withstand AASHTO H20 traffic loading on a regular basis, including impact loads, without permanent deformation, sagging or failure as a result of applied loads. Each cover shall have non-slip, no skid surface and the DART logo permanently affixed thereto. Covers shall have recessed areas to house the security bolt heads. Each recessed area shall have a diameter that is large enough to accommodate the socket for the bolt heads.
C. Lifting Devices: Fabricated units shall be provided with appropriate lifting devices to facilitate construction operations without causing chipping, cracking, or other damage.

2.3 SECURITY BOLTS
A. Two specialty security fasteners shall be required to lock down an express trough cover in order to prevent unauthorized access to the express trough.
B. Specialty security fastener shall be fabricated to comply with the following physical specifications:

1. Bolt shall be Grade A307 zinc (galvanized) plated carbon steel conforming to ASTM A563; Nuts and Washers shall be Grade A563.

2. Bolt shall be made with a flat pentagonal 0.845 inch head (0.56 inch side), 0.3 inch minimum depth.

3. Bolt shall be torqued by means of a matching tool steel socket, which fits a 1/2 inch drive wrench.

4. Bolt lengths: As required to fully engage the threads and held to plus or minus 0.1 inch.

5. Bolt: 3/8 inch diameter, 16 threads per inch, class UNC-2A.

C. An electroplated metal washer shall be positioned under the bolt head to prevent stress and wear on the trough cover.

D. Apply marine grade anti-seize calcium sulfonate lubricant or equal to threads prior to final installation of security bolt.

PART 3 - EXECUTION

3.1 GENERAL

A. Express troughs installed in the ballast areas of ballasted track construction shall be installed with the covers one inch above final grade, per manufacturer’s recommendations.

B. Express troughs installed in the sub-ballast areas of track construction shall be installed with the covers one inch above final grade, per manufacturer’s recommendations.

C. Express troughs shall not be installed in the bottoms of storm water ditches, swales or other sump areas that collect water, thus causing controlled storm water drainage to enter the cable trough.

D. Express troughs shall be kept free of construction debris, rock, or earth. Foreign materials shall be removed from the outdoor express trough channels prior to installation of cables and covers.

E. Express troughs shall not be left uncovered. Contractor shall install the furnished express trough covers.

F. Express troughs shall be protected against deformation and damage during construction in work areas of track work installation and placing and tamping of ballast material associated with cranes, backhoes, front-end loaders, or other heavy equipment. Contractor shall avoid placing heavy construction loads immediately adjacent to express trough body sidewalls without providing appropriate protective measures to include trough cover installation. Trough cover removal and installation shall be maintained as designed.

3.2 EXCAVATING AND BACKFILLING

A. Where Express Trough is installed in the ballast areas of ballasted track construction, use AREMA Grade 4 ballast as backfill and base around the express trough units in accordance with Section 02460, "Ballasted Track Construction".

B. Where Express Trough is installed in the sub-ballast areas of construction, use sub-ballast as backfill and base around the express trough units in accordance with, Section 02451 “Sub-Ballast” and Section 02453 “Track Ballast”.

C. Where Express Trough installation extends below the level of sub-ballast, or into an area without ballast and sub-ballast, excavate and backfill in accordance with Section 02220, “Grading, Excavating and Backfilling”.

3.3 PLACING EXPRESS TROUGH SYSTEM

A. Where Express Trough is installed in the ballast areas of ballasted track construction, prepare the sub-ballast and the first 6 inches of ballast per Section 02460, “Ballasted Track Construction”.

B. Where Express Trough is installed in the sub-ballast areas of construction, prepare the sub-ballast per Section 02451, “Sub-Ballast” and Section 02453, “Track Ballast”.

C. Using mechanized equipment and lifting equipment recommended by the manufacturer, set express trough units in place on the ballast or sub-ballast to the line and grade required.

D. Adjacent proposed and existing units are to be butt-jointed to each other with appropriate accessories and features to prevent vertical and horizontal separations. Caution shall be exercised during construction to protect existing express trough and any other utilities and elements that are located in areas of work. If necessary the contractor is responsible for relocation of existing utilities as per project requirements and/or replacement of damaged utilities/elements as caused by installation of these systems elements.

E. Polyurethane based, one part elastomeric sealant meeting the requirements of Specification Section 07900, “Seals and Sealants”, shall be applied to trough connection to each bridge and manhole and to butt joint at abutments of each ballasted bridge.

F. Install horizontal and vertical bends at locations shown on approved layout drawings. Miter joints to the angle required providing uniform, tight butt joints to the tolerances indicated.
G. Where Civil plans and cross-sections indicate a changing vertical profile relative to ballast and sub-ballast final grading, the express trough profile shall follow final grading up to a maximum trough slope of 1:4. Additional ballast shall be installed, as needed, to ensure adequate trough sidewall burial indicated in Paragraph 3.1. A & 3.1.B above.

H. Ballast or sub-ballast backfill shall be placed against the sides of the express trough system simultaneously on both sides in successive layers of 4 inches and compacted.

I. Temporary covers shall be used during installation of the express trough system to prevent damage to the units from ballast or sub-ballast falling into the prefabricated units.

J. If a concrete shell is required by the manufacturer to ensure that the prefabricated units comply with H20 loading requirements, the Contractor shall form and construct this shell per approved shop drawings. This shell and prefabricated unit shall be constructed on the initial sub-ballast and/or 6-inch ballast construction prior to completing the ballast backfill to the finished grades.

K. Express cable troughs shall be inspected for any burrs or rough places that could damage cable insulation. Burrs or rough places will be removed or repaired. Cable troughs shall be thoroughly cleaned of debris, rocks, or other material. Permanent covers shall be placed on the trough units as specified in Paragraph 3.1.E above.

L. Butt joints shall be wrapped with geo-textile fabric prior to placement of ballast or subballast.

M. Where express trough is installed between cross ties, provide a minimum of 2 inch clearance from the top of the trough to the bottom of the rail. Ensure that express trough installed parallel to cross ties.

N. Interior corner guards shall be provided to prevent cables insulation from being damaged during the installation activities.

3.4 LENGTH ADJUSTMENTS

A. Polymer concrete express trough units shall be cut with special cutting equipment recommended by the manufacturer to adjust for lengths and angles. Cut ends shall be joined by a method recommended by the manufacturer to prevent vertical and lateral displacements and maintain the design H-20 loading.

3.5 CONSTRUCTION TOLERANCES

A. Construct Express Trough to the following tolerances:

<table>
<thead>
<tr>
<th>Construction Type</th>
<th>Elevation</th>
<th>Station</th>
<th>Offset</th>
<th>Slope</th>
</tr>
</thead>
<tbody>
<tr>
<td>Express Trough</td>
<td>+1/2&quot; / -1/2&quot;</td>
<td>N/A</td>
<td>+1&quot; / -1&quot;</td>
<td>N/A</td>

</tbody>
</table>
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies providing express troughs on aerial structures for communications and signal systems.

1.2 REFERENCE STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A320/A320M - Standard Specification for Alloy-Steel and Stainless Steel Bolting Materials for Low-Temperature Service
   2. ASTM D257 - Standard Test Methods for DC Resistance or Conductance of Insulating Materials

B. Precast/Prestressed Concrete Institute (PCI):
   1. PCI/CONCRT MNL-116: Manual for Quality Control for Plants and Production of Precast and Prestressed Concrete Products
   2. PCI/CONCRT MNL-128: Recommended Practice for Glass Fiber Reinforced Concrete Panels

C. American Concrete Institute (ACI):
   1. ACI 548.1R - Guide for the Use of Polymers in Concrete

D. National Fire Protection Association (NFPA):
   1. NFPA 70 - National Electrical Code (NEC)
   2. NFPA 130 - Standard for Fixed Guideway Transit and Passenger Rail Systems

C. Texas Department of Licensing & Regulation:
   1. TAS - Texas Accessibility Standards

1.3 DEFINITIONS

A. Express Trough: A fabricated precast cable trough with a multiple open interior space for enclosing low voltage cables.

B. Security Bolt: A bolt assembly unit with specified material and geometric characteristics which prevent removal or damage due to normal use or attempted vandalism. The security bolt shall have pentagonal head and require a unique key to remove or tighten and be considered “tamper resistant”.

C. Plinth: A cast-in-place structure to establish the proper elevation for the express trough and for security bolt placement located on aerial structures per supplier’s details.

1.4 SUBMITTALS

A. Shop Drawings: Submit to the Contracting Officer’s Representative (COR) drawings for express trough and bends.

1. Scaled, detailed plan layout drawings for the proposed express trough system shall be submitted to the COR complete with offset distances and clearances from tracks, appurtenances, and all wayside structures including installation details.

2. Provide scaled, detailed drawings of the trough unit, covers, and plinths that include dimensions, inside area, extensions for security bolts, and any appurtenances required for this item.

3. Diagrams showing dimensioned tie-in for each type of manhole, junction box, and transition to ballasted trough at the abutments.

4. Lifting equipment for personnel and for mechanical equipment.

5. Provide installation schedule.

B. Documentation: Submit to the COR calculations to demonstrate that the express trough design meets the required load-bearing capacity, NFPA 130 requirements, and minimum and maximum dimensions shown on the standard details, certified by a Professional Engineer, licensed in the State of Texas.

C. Certification: Submit to the COR certificates on furnished materials from manufacturers of materials, including Certification of Compliance with NFPA 130 for the quantity of materials used on aerial structures.

D. Test results: Submit to the COR test results on furnished materials, including security bolts, showing that units meet requirements as specified in Part 2.

E. Mock-up: After submittals have been approved by the COR, a mock-up of the approved troughs including cover, security bolts, spacers, and expansion joints with all appurtenances required for a complete system shall be constructed to illustrate system is in compliance before installation may begin.

1.5 QUALITY ASSURANCE

A. Comply with:
   1. PCI/CONCRT MNL-116
EXPRESS TROUGH FOR AERIAL STRUCTURES

2. PCI/CONCRT MNL-128
3. ACI 548.1R
4. NFPA 70 (NEC)
5. NFPA 130, Chapters 1 - 3
6. TAS Section 4.5.2 Ground and Floor Surfaces.

B. Qualifications:
1. Precast work to be performed by a PCI certified plant regularly engaged in design and construction of structural precast, prestressed concrete members with a minimum of five years experience.
2. Submit name, qualifications and evidence of five years experience on work comparable to that specified.
3. Do not commence work until fabricator (precastor) has been approved.

C. Testing Laboratory and Quality Control: In accordance with Section 01450, “Quality Control”, Section 03300, “Cast-In-Place Concrete” and Section 03430, “Structural Precast Concrete”.

1.6 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Deliver precast express trough units and structures to the worksite in such quantities and at such time to assure continuity of installation.

B. Store and handle units at the worksite in such a manner to prevent cracking, chipping, distorting, warping, or other physical damage. Lift and support units only at designated lifting or supporting points as shown on approved shop drawings.

C. Supplier shall provide spacers for the express trough. Spacers shall be designed to prevent warping in the express trough and shall only be removed by the contractor immediately before cable installation.

D. Security bolt concrete inserts shall be provided with a plastic plug insert in the factory. Plug shall not be removed until it is ready to be replaced with a security bolt.

1.7 AUTHORITY TOOLS

A. Furnish and deliver to the Contracting Officer, ten sets of lifting equipment for the cover lifting devices provided. Five sets for personnel to lift covers and five sets for mechanical lifting.

PART 2 - PRODUCTS

2.1 CONCRETE WORK

A. Concrete Formwork: As specified in Section 03100, “Concrete Formwork”.

B. Reinforcing Steel: As specified in Section 03200, “Concrete Reinforcement”.

C. Concrete: As specified in Section 03300, “Cast-In-Place Concrete” and Section 03430, “Structural Precast Concrete”.

D. Grout: As specified in Section 04100, “Mortar, Grout, And Masonry Accessories”.

2.2 HIGH DENSITY POLYMER CONCRETE

A. Trough and cover material shall consist of high-density polymer concrete (HDPC) or aggregates bound together with polyester resin and/or reinforced with continuous woven glass strands or glass fiber. Precast polymer concrete shall be fire resistant and electrically non-conductive per ASTM D257.

B. The precast concrete mix shall have the following certified, tested minimum characteristics:
   1. Compressive strength (28 day): 10,300 psi
   2. Tensile strength: 1,800 psi
   3. Flexural strength: 3,600 psi
   4. Modulus of elasticity: $1.83 \times 10^6$
   5. Freeze/thaw resistance (2,500 cycles): No change
   6. Fire resistance (Maximum): 10

2.3 PORTLAND CEMENT CONCRETE

A. Design the express trough units to conform to Section 02781, “Precast Express Trough” and cover to be designed for a live load of 250 psf, and a concentrated live load of 500 pounds acting on an area measuring 1 foot square and placed in a position that will cause maximum stress. The loads need not be applied simultaneously.

B. Plinth concrete shall be Mix Design S-3 as specified in Section 03305, “Portland Cement Concrete”.

02782 - 2
2.4 EXPRESS TROUGH

A. Express Trough: Shall meet the minimum dimensions shown on the plans for the installation of signal and communication cables. Actual structure dimensions will be as designed by the manufacturer but must recognize the constraints of adjacent facilities and shall meet NFPA 130 specifications for use on aerial structures. Express trough for direct fixation bridges shall have weepholes located on low side or bottom of each cell with a maximum spacing of 5 feet. Weepholes shall be 1-1/2 inch in diameter with a galvanized metal screen mesh inside. The trough shall have some means to secure the trough to the plinths.

B. Covers: Shall be provided with appropriate lifting devices as approved on shop drawings for easy removal during cable installation and maintenance. Each cover shall have the DART logo and weight recessed so as not to create tripping hazard. Bridge trough covers shall have a width as shown in the plan details and shall meet NFPA 130 specifications. The trough covers shall have oversize longitudinally slotted holes to receive recessed bolts to prevent the security bolts from becoming a tripping hazard. Refer to the Texas Accessibility Standards criteria for maximum allowable surface tolerance. Covers shall have a non-slip surface with minimum static coefficient of friction (SCOF) of 0.5. Broom-finished concrete is acceptable. Covers shall not weigh in excess of 140 pounds each. Each cover shall be stamped with the actual weight, approved on the shop drawings, on top of the lid. Supplier shall design plinths to accommodate the cover locations.

C. Lifting Devices: The fabricated units shall be provided with lifting devices as approved on shop drawings to facilitate maintenance and construction operations without causing chipping, cracking, or other damage.

D. Plinth: The express trough will be affixed to the bridge deck utilizing plinths. The plinth shall be cast-in-place concrete as specified in Section 03300, “Cast-In-Place Concrete” and Section 03305, “Portland Cement Concrete”, Mix Design S-3. The plinth shall be designed by the supplier to accept their specific trough and coordinated with the covers and secured to the bridging slab. Plinths shall not be continuous.

2.5 SECURITY BOLTS

A. A minimum of two security bolts, depending upon the length of the trough unit as designed by the manufacturer, shall be required to lock down an express trough cover in order to prevent unauthorized access to the express trough.

B. The security bolt shall be fabricated to the following physical specifications:

3. Bolt shall be torqued by means of a matching 1/2 inch drive, tool steel socket wrench.

4. Bolt lengths shall be as required to fully engage threads and shall be held to plus or minus 0.1 inch.

5. Bolt shall be 3/8 inch diameter, 16 threads per inch, Class UNC-2A.

C. An electroplated metal washer and lock washer shall be positioned under the bolt head to prevent stress and wear on the trough cover.

D. Apply marine grade anti-seize calcium sulfonate lubricant or equal to threads prior to final installation of security bolt.

E. Security Bolt pentagonal heads shall match the security bolts provided in Section 02781, “Precast Express Trough”.

PART 3 - EXECUTION

3.1 GENERAL

A. Express troughs shall be installed on the structure and anchored in place as shown on the plans.

B. Joints in pre-cast cable troughs shall match the expansion joints in the aerial structure deck and parapet walls.

C. Express troughs installed on aerial structures shall be installed with the top of the covers 8 inches above the top-of-rail measured from the closest edge to the rail.

D. Express troughs shall be kept free of construction debris, rock, or earth. Foreign materials shall be removed from the outdoor express trough channels prior to installation of cables and covers.

E. Express troughs shall not be left uncovered. The Contractor shall install the furnished express trough covers.

F. Express troughs shall be protected against damage in areas of working cranes, backhoes, front-end loaders, or other equipment.

3.2 PLACING EXPRESS TROUGH SYSTEM

A. Set express trough units in place to the line and grade required using mechanized equipment and lifting equipment recommended by the manufacturer; shim and grout as needed.

B. Adjacent units are to be butt-jointed to each other with appropriate accessories and features to prevent vertical and horizontal separations.
EXPRESS TROUGH FOR AERIAL STRUCTURES

C. Polyurethane based, one part elastomeric sealant meeting the requirements of Specification Section 07900, “Seals and Sealants” shall be applied to trough connections at each bridge expansion joint.

D. Express cable troughs shall be inspected by the Contractor for any burrs or rough places that could damage cable insulation. Burrs or rough places shall be removed or repaired before payment is made. The cable troughs shall be thoroughly cleaned of any debris, rocks, or other material to the satisfaction of the COR. The permanent covers shall be placed on the troughs with the security bolts installed.

E. Any exposed metal used with the exception of the security bolts shall be grounded per Section 16450, “Grounding and Bonding”.

3.3 LENGTH ADJUSTMENTS

A. Polymer concrete express trough units and covers shall be cut with equipment recommended by the manufacturer to adjust for lengths and angles. The cut ends shall be joined by a method recommended by the manufacturer to prevent vertical and lateral displacements and maintain the design loading.

3.4 CONSTRUCTION TOLERANCES

A. Construct Express Trough to the following tolerances:

<table>
<thead>
<tr>
<th>Construction Type</th>
<th>Elevation</th>
<th>Station</th>
<th>Offset</th>
<th>Slope</th>
<th>Gap</th>
</tr>
</thead>
<tbody>
<tr>
<td>Express Trough</td>
<td>+/- 1/2”</td>
<td>N/A</td>
<td>+/- 1/8”</td>
<td>N/A</td>
<td>3/8”</td>
</tr>
</tbody>
</table>

B. The Contractor is responsible for making repairs per manufacturer’s prescribed repair procedures to cracks that are less than 1/16 inch wide, chips that are less than 1/4 inch deep and less than 12 square inches, and uneven saw cut edges. The COR may reject any units that are outside of these tolerances.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Precast express trough systems will be measured by the linear foot, complete-in-place, of each type specified. Measurement will be along the centerlines of the express trough system including troughs, covers, plinths, security bolts and all appurtenances, across aerial structures from front face of back wall of each abutment.

END OF SECTION 02782
SECTION 02830
CHAIN LINK FENCING

PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies providing chain link fencing and gates.

1.2 REFERENCED STANDARDS
A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A121 - Standard Specification for Zinc-Coated (Galvanized) Steel Barbed Wire
   2. ASTM A123/A123M - Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products
   3. ASTM A392 - Standard Specification for Zinc-Coated Steel Chain-Link Fence Fabric
   4. ASTM A413/A413M - Standard Specification for Carbon Steel Chain
   5. ASTM A491 - Standard Specification for Aluminum-Coated Steel Chain-Link Fence Fabric
   7. ASTM B221 - Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes
   8. ASTM F567 - Standard Practice for Installation of Chain-Link Fence
   9. ASTM F626 - Standard Specification for Fence Fittings
   10. ASTM F668 - Standard Specification for Poly(Vinyl Chloride) (PVC) and Other Organic Polymer-Coated Steel Chain-Link Fence Fabric
   13. ASTM F1083 - Standard Specification for Pipe, Steel, Hot-Dipped Zinc-Coated (Galvanized) Welded, for Fence Structures

B. American Welding Society (AWS):
   1. AWS D1.1/D1.1M - Structural Welding Code Steel

C. Military Specification (MIL):
   1. MIL-P-21035 - Paint High Zinc Dust Content, Galvanizing Repair (Metric)
   2. MIL-PRF-26915 - Primer Coating, for Steel Surfaces.

D. The Society for Protective Coatings (Formerly known as Steel Structures Painting Council) (SSPC):
   1. SSPC Paint 20 - Zinc-Rich Primers (Type I, "Inorganic," and Type II, "Organic").

1.3 SUBMITTALS
A. Shop Drawings:
   1. Site plan with fence showing physical breaks at intervals as directed, and locations of bracing, gates, ground rods, depression closures, and other special fence construction.
   2. Details of gates, gate post foundations, depression closures, and other special construction showing fabrication and installation.
   3. Details for installation of accessories.

B. Certification: Submit certification of all materials to be used.

1.4 JOB CONDITIONS
A. Right of Access to Adjacent Private Property: As indicated in the Contract Documents.
1.5 EXTRA MATERIALS

A. Deliver to Contracting Officer, extra materials described below that match products installed, are packaged with protective covering for storage, and are identified with labels describing contents.

1. ABLOY locks and Knox padlocks: 10.0 percent of amount installed of each.

PART 2 - PRODUCTS

2.1 FENCE FABRIC

A. Steel: Hot-dip galvanized after weaving, ASTM A392; Class 2 coating, 2 inch mesh, No. 9 gauge wire, height shown, selvage twisted and barbed at top and bottom.

B. Aluminum: Aluminum alloy fabric woven from 9 gauge wire, conforming to ASTM A491. Minimum tensile strength after weaving 1560 pounds with 2 inch mesh, selvage twisted and barbed at top and bottom.

C. Poly (vinyl chloride) (PVC) coated steel fabric, ASTM F668, Class 2b, with 9 gauge wire, 2 inch mesh, selvage twisted and barbed at top and bottom. Color to be black.

2.2 POSTS, GATES, TOP RAIL, AND BRACES

A. Posts: Pipe used for posts shall conform to ASTM A123 or F1083. Line posts shall be fitted with watertight malleable iron caps. Provide standard weight 1-1/2 inch nominal diameter galvanized steel pipe weighing 2.72 pounds per foot. Provide 11 gauge minimum fabric tie wire spaced at 14 inch centers.

B. End, Comer, and Pull Posts: Provide 2-1/2 inch nominal diameter standard weight galvanized steel pipe weighing 5.80 pounds per foot.

C. Top Rail: Where shown, provide 1-1/4 inch nominal diameter galvanized steel pipe weighing 2.27 pounds per foot.

D. Provide standard weight ASTM A123 or F1083 galvanized steel pipe of the following size at each side of gate opening:

<table>
<thead>
<tr>
<th>Leaf Width, in Feet</th>
<th>Gate Post, in Inches</th>
<th>Weight per Linear Foot, in Pounds</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up to 6</td>
<td>2-1/2 NPS</td>
<td>5.80</td>
</tr>
<tr>
<td>Over 6 to 13</td>
<td>3-1/2 NPS</td>
<td>9.12</td>
</tr>
<tr>
<td>Over 13 to 18'</td>
<td>6 NPS</td>
<td>18.99</td>
</tr>
<tr>
<td>Over 18</td>
<td>8 NPS</td>
<td>28.58</td>
</tr>
</tbody>
</table>

E. Gates shall comply with ASTM F900 and ASTM F1184. Gate frame including top rail, bottom rail, braces, supports, and similar members shall be made of aluminum alloy 6063-T6 (in accordance with ASTM B221) or galvanized steel pipe, unless shown otherwise. Gate material to match fence in which installed.

1. Gate Hardware: Furnish a malleable iron ball and socket bottom hinge and a 180-degree wraparound-type top hinge to allow gate to swing 90 degrees or 180 degrees. Provide a padlocking device, center rests and semi-automatic catch to secure driveway gates in open position.

F. Galvanized Steel Gates:

1. Frames: Furnish 2 inch outside diameter galvanized pipe with pressed steel on malleable iron corner ells, securely riveted with four rivets per corner, or welded corners hot-dipped after fabrication.

2. Internal Bracing: Provide 1-5/8 inch outside diameter pipe brace and 2-3/8 inch adjustable truss rods.

G. Where vinyl (PVC) coated posts, rails, braces and accessories shall be PVC coated galvanized products in accordance with ASTM F668, Type 2b and ASTM F1043. Color to be black.

2.3 ACCESSORIES

A. Hot-dip galvanized, in accordance with ASTM A123 and F626, Class 40.

B. Wire ties: Fabric: No. 9 gauge or double strands of No. 13 gauge steel.

C. Tension wire: No. 7 gauge steel.

D. Turnbuckle: ASTM F1145, Type 1, Form 1, Class 8, Size 3/8 by six, hexagonal head, UNC threads, hot-dip galvanized.

E. Pipe sleeves for fence on retaining walls: 4 inch diameter standard weight pipe sleeve, hot-dip galvanized, 1 foot long, and centered in wall.

F. Fence fittings in accordance with ASTM F626.

G. Where vinyl (PVC) coated chain link fence is shown on the Contract Drawings, accessories shall be PVC coated galvanized products in accordance with ASTM F668, Type 2b and ASTM F1043. Color to be black.
2.4  **BARBED WIRE**

A. In accordance with ASTM A121, 12-1/2 gauge steel wire with 14 gauge four-point round barbs, 5 inches on center.

2.5  **CONCRETE AND GROUT**

A. Concrete: Minimum compressive strength at 28 days of 3,000 psi, using 1 inch maximum size aggregate and five sacks of cement minimum per cubic yard, with a maximum slump of 4 inches. Concrete materials shall conform to the applicable requirements of Section 03305, “Portland Cement Concrete”.

B. Grout: Structural Non-Shrink as specified in Section 03305, “Portland Cement Concrete”.

2.6  **MISCELLANEOUS MATERIALS**

A. Galvanizing Repair Paint:
   1. For Concealed or Top Coated Surfaces:
      a. Organic zinc-rich coating containing at least 65 percent metallic zinc, by weight in dry film and meeting performance requirements of:
         1) ASTM A780.
         2) SSPC-Paint 20.
   2. For Surfaces to be Left Exposed:
      a. In addition to requirements for concealed and top coated surfaces, match aesthetic appearance of hot-dip galvanizing and meet performance requirements of:
         1) MIL-P-21035.
         2) MIL-PRF-26915.
      b. Basis-of-Design: Brite Products “Brite Zinc”.

2.7  **CHAIN**

A. In accordance with ASTM A413, Class Grade 43, case-hardened carbon-steel security chain, 3/8-inch diameter by 24 inches long for all gates.

2.8  **LOCKING SYSTEM**

A. Latch: Fabricate gates as required to receive latching device.
   1. Provide fork latch at single swing gates.
   2. Double swing gates latch: Plunger bar or rod full height of gate, to engage stop at double gates, hot dip galvanized.
   3. Latch shall be approved gate lock box, to accept padlocks specified.

B. Each gate shall have ABLOY lock (no substitution) and Knox Padlock (no substitution). Coordinate with Contracting Officer on keying of ABLOY locks and obtaining of Knox locks.

2.9  **GROUNDING SYSTEM**

A. In accordance with Section 16450, “Grounding and Bonding”.

2.10  **FABRICATION**

A. Perform welding in accordance with requirements of AWS D1.1/D1.1M.

B. Gates: Materials to match fence in which installed.

**PART 3 - EXECUTION**

3.1  **FENCE INSTALLATION**

A. Installation shall be in accordance with ASTM F567 and as indicated herein.

B. Perform necessary clearing, grubbing, excavation, and filling to provide clear line-of-fence runs. Do not begin fence installation until final grading along fence line is complete.

C. Set posts in concrete footings, sized as shown.

D. Handling and placing of concrete shall conform to the applicable requirements of Section 03300, “Cast-In-Place Concrete”.

E. Extend concrete to 2 inches above ground line at posts, and slope to drain away from posts.

F. Space posts at 10 feet maximum and 8 feet minimum on centers. Place additional posts at each abrupt change in grade, and at breakpoints.

G. Where rock is encountered, drill holes 2 inches deeper than depth shown and 2 inches greater than outside diameter of post. After post is placed as shown and specified, and supported, fill remaining void with one-to-three grout mixture of cement and sand.

H. Where fence is located on concrete structure, embed 12-inch length of closed-bottom steel pipe sleeve having inside diameter 2 inches greater than outside diameter of fence posts, spaced as
shown on approved shop drawings. Fill void around fence posts with non-shrink grout.

I. Space pull posts at approximately 500-foot intervals for straight runs and at each vertical angle point. Install corner posts at each horizontal angle point. Provide corner, end and pull posts with horizontal braces and tie rods on each side of posts extending to and connecting to adjacent line posts.

J. After posts are installed, install top rail or tension wire and securely anchor at ends and to line posts before hanging fabric.

K. Secure ends of fabric by tension bars threaded through loops in fabric and secured to posts by bands with bolts and nuts or other approved devices.

L. Attach fabric outside framing system, away from Authority property. Stretch fabric by securing one end and applying sufficient tension by mechanical fence stretchers. Fasten fabric to line posts, tension wire and top railing with tie wires at spacing shown.

M. Hold bottom of fabric as uniformly as possible to, but in no case to exceed, 2 inches above finished grade.

N. Provide barbed wire where shown. Install support arms at 45 degrees upward and outward from Authority property; extend corner, gate and end posts as shown. Stretch barbed wire to remove kinks and sags and secure to bracket arms, using tension bands for attachment to posts.

O. Install gates and gate stops as shown.

P. Set gate stops in concrete accurately so that plunger can be fully engaged.

Q. Furnish one chain with one Abloy lock and one Knox padlock for each gate. Tack weld chain to gate to prevent loss or theft.

R. Grounding: For fences located fifty feet or closer to the center of any light rail track or high-voltage power line crossing (overhead or underground), fence and any appurtenances (including gate swings) shall be grounded and bonded in accordance with Section 16450, "Grounding and Bonding". For other fence locations, no grounding or bonding is necessary.

S. Install pipe sleeve and bottom eye bolt as shown on the Standard Drawings and in accordance with this section.

### 3.2 ADJUSTING AND CLEANING

A. Remove and replace fencing which is improperly located and is not true to line and grade or is defective and posts which are not plumb.

B. Galvanized Surfaces:
   1. Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A780.
   2. For surfaces to be left exposed, apply galvanizing repair paint in at least two coats.

### PART 4 - MEASUREMENT AND PAYMENT

#### 4.1 GENERAL

A. Chain link fencing and gates specified in this section will not be measured, but will be paid for at the lump sum price for "Chain Link Fencing", including excavation; backfill, disposal of surplus materials; concrete and grout; and gates, hardware; and incidentals.

B. Grounding system will be measured and paid for under Division 16, "ELECTRICAL".

C. Removal and disposal of and removal and relocation of existing chain link fence and gates will not be measured and paid for under this section. Removal and disposal of fencing and gates shall be subsidiary to Section 02050, "Demolition". Removal and relocation of chain link fences and chain link gates shall be subsidiary to Section 02072, "Removal and Restoration of Miscellaneous Existing Facilities".

END OF SECTION 02830
SECTION 02831
WOODEN SCREENING FENCE

PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies providing a wooden screening fence with galvanized steel post and accessories, and includes wooden gates as required.

1.2 REFERENCED STANDARDS
A. American Welding Society (AWS):
1. AWS D1.1/D1.1M - Structural Welding Code - Steel
B. Army Corps of Engineer (COE):
C. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
1. ASTM A53/A53M - Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless
2. ASTM A413/A413M - Standard Specification for Carbon Steel Chain
3. ASTM B695 - Standard Specification for Coatings of Zinc Mechanically Deposited on Iron and Steel
5. ASTM F1145 - Standard Specification for Turnbuckles, Swaged, Welded, Forged
6. ASTM F1083 - Standard Specification for Pipe, Steel, Hot-Dipped Zinc-Coated (Galvanized) Welded, for Fence Structures

1.3 SUBMITTALS
A. Shop Drawings:
1. Site plan with fence showing physical breaks in accordance with the Contract Documents, and locations of bracing, gates, ground rods and other special fence construction.

B. Samples:
1. Painted wooden piece to illustrate the solid color stain to be used: Two 24 inch wooden boards with the solid color stain applied to sides.

C. Certifications: Submit for the following material:
1. Cedar, certify grade of cedar to be provided.

D. Certifications and Manufacturer's Product Data: Submit for the following products:
1. Solid color stain.
2. Sealant.
3. Flat caps, latches, hinges, mounting brackets, bolts, screws, turnbuckles, and other accessories.

1.4 JOB CONDITIONS
A. Right of access to adjacent private property: As shown

PART 2 - PRODUCTS

2.1 WOODEN FENCING
A. Red Cedar No. 2 without any holes which includes all stringers, fascia, boards, and caps for the sizes shown.

B. In accordance with WWPA and WRCLA standards and as shown on the Standard Drawing, "SCREENING FENCE DETAILS".

C. Product Pattern: Rough Sawn for the full length.

2.2 POSTS
A. Pipe used for posts shall conform to ASTM A53 or F1083.

B. Line posts shall be 2 inch outside diameter Schedule 80 galvanized steel posts.
C. Line posts shall be fitted with a watertight malleable flat iron cap.

2.3 ACCESSORIES
A. Accessories shall be hot-dip galvanized, in accordance with ASTM B695, Class 40 and corrosive resistant.
B. Turnbuckle: ASTM F1145. Type 1, Form 1, Class 8, Size 3/8 inches by 6 inches, hexagonal heads, UNC threads, hot dip galvanized.
C. Latch: Plunger bar full height of the gate, to engage stop at double gates, hot-dip galvanized. Latch shall accept an approved gate lock box.
D. Pipe sleeves for fence on retaining walls: 4 inch diameter standard weight pipe sleeve, hot-dip galvanized, 1 foot long, closed bottom and centered in the wall.
E. Hinges: Hot-dip galvanized per the fence manufacturer's recommendations.
F. Cap: Watertight malleable flat iron cap, hot-dip galvanized.
G. Mounting Brackets: Hot-dip galvanized, secured to stringer with 1/4-inch by 1-1/2 inch lag screws.
H. Lag Screws: Hot-dip galvanized; size 1/4-inch by 1-1/2 inch.
I. Fence screws: Hot-dip galvanized, size shall be based on the fence manufacturer's recommendations and corrosive resistant. Nails shall not be used on cedar fencing.

2.4 CONCRETE AND GROUT
A. Concrete: Minimum compressive strength at 28 days of 3,000 psi, using 1 inch maximum size aggregate and five sacks of cement minimum per cubic yard, with a maximum slump of 4 inches. Concrete materials shall conform to the applicable requirements of Section 03305, "Portland Cement Concrete".
B. Grout: Non-shrink in accordance to COE CRD-C 621 and Section 03305, "Portland Cement Concrete".

2.5 COATING
A. Cold galvanizing compound: Z.R.C. cold galvanizing compound, or Galvanox®-Subox Co. or approved equal.

2.6 LOCKING SYSTEM
A. At gates provide a latch, which will accept a cylinder lock.
B. Cylinder lock shall be in accordance with Section 08710, "Door Hardware".

2.7 CHAIN
A. In accordance with ASTM A413, Class Grade 43, case hardened carbon steel security chain, 3/8 inch diameter.

2.8 GROUNDING SYSTEM
A. If grounding is required, it shall be in accordance with Section 16450, "Grounding and Bonding" and shown on the Contract Documents.

2.9 FABRICATION
A. Gates: Materials shall match the fence material in which it is installed and comply with all material specified herein.
B. Perform welding in accordance with requirements of AWS D1.1.

2.10 SOLID COLOR STAIN
A. Based on WRCLA a solid color stain shall be used to provide 4 to 6 years of durability.
B. Solid-Color Acrylic Stain: Factory-formulated acrylic-resin-based solid-color stain applied at spreading rate recommended by manufacturer.
   7. Or approved equal.
C. Primer: As recommended by manufacturer.
WOODEN SCREENING FENCE

2.11 CAULKING

A. Caulking shall be in accordance with the fence manufacturer's recommendations and Section 07900, "Seals and Sealants".

PART 3 - EXECUTION

3.1 FENCE INSTALLATION

A. Perform necessary clearing, grubbing, excavation, and filling to provide clear line-of-fence runs. Do not begin installation until final grading along the fence line is complete.

B. Set posts in concrete footings to line, grade and plumb as shown on the Contract Documents. Temporary supports of posts may be required to maintain plumbness and line, which is the responsibility of the Contractor. Any post to be determined by the Contracting Officer not to be plumb will be replaced at no additional cost to the Authority.

C. Extend concrete to 2 inches above the finish ground line at posts, and slope to drain away from the post.

D. Space posts at 8 feet (maximum) intervals on center. Place additional posts at each abrupt change in grade and at breakpoints.

E. Where rock is encountered, drill holes 2 inches deeper than depth shown and 2 inches greater than outside diameter of the post. After post is placed as shown and specified, and supported, fill remaining void with one-to-three grout mixture of cement and sand.

F. Where fence is located on concrete structure, embed 12 inch long steel galvanized pipe sleeve with a closed bottom into the concrete structure at the spacing and location as shown on the approved shop drawings. The pipe sleeve shall be 2 inches greater in diameter than the outside diameter of the fence post. Fill voids around the fence post with non-shrink grout.

3.2 WOODEN CEDAR FENCE AND GATES

A. After posts are installed and concrete has reached 75 percent of its 28 day strength; install the stringers with mounting brackets as shown on the plans using 1/4 inch by 1-1/2 inch lag screws.

B. Attach cedar boards on the outside framing system, away from the Authority's property, using two screws at each stringer. The top of the screw head should be flush with the surface of the board.

C. Hold bottom of cedar boards as uniformly as possible to, but in no case to exceed, 2 inches above the finished grade.

D. Install cap and fascia as shown on the plans. Caulk all joints along the cap and fascia board with an approved sealant.

E. Install gates and gate stops as shown on the shop drawings.

F. Set gate stops in concrete accurately so that the plunger can be fully engaged.

G. Using a brush, apply a coat of primer and two coats of solid color stain to cedar. Once the primer has completely dried, notify and obtain the Contracting Officer inspection of the paint coverage. Any areas that appear to be covered inadequately shall be retouched to the satisfaction of the Contracting Officer. After completing the primer application, apply two coats of solid color stain. Allow first coat to dry thoroughly before applying second coat. The application of the primer and stain shall be in accordance to the stain manufacturer's recommendations.

H. Grounding of posts and gates shall be in accordance to Section 16450, "Grounding and Bonding", and as directed by the Contracting Officer.

3.3 DEFECTIVE WORK

A. Remove and replace fencing, which is improperly located and is not true to line and grade, and posts, which are not plumb.

B. Repair damaged galvanizing by thoroughly wire brushing damaged area to remove loose and cracked zinc coating and painting with two coats of cold galvanized compound. Allow first coat to dry thoroughly before applying second coat.

C. Repair damaged cedar boards by replacing them. Once they have been replaced to the Contracting Officer's satisfaction the primer and two coats of solid color stain shall be applied.

3.4 CLEANUP

A. The Contractor shall remove all debris, pieces of concrete, surplus lumber, hardware, accessories, etc. from the work site as directed by the Contracting Officer.

B. The ground surface along each side of the fence shall be regraded, as necessary, to conform to the finish grade as shown on the Contract Drawings.
PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Wooden cedar fencing and gates specified in this section will not be measured, but will be paid for at the lump sum price for “Wooden Cedar Fencing”, including excavation; backfill, and disposal of surplus materials; concrete and grout; and gates, hardware, and incidentals.

B. Grounding systems will be measured and paid for under Section 16450, “Grounding and Bonding”.

C. Private fencing and gates to be relocated, which are in salvageable condition, as determined by the Contracting Officer, will not be measured or paid for directly, but shall be subsidiary to Section 02072, “Removal and Restoration of Miscellaneous Existing Structures”.

D. Removal and disposal of existing fences and gates will not be measured or paid for separately, but will be considered as subsidiary to the work specified in Section 02050, “Demolition”.

E. No measurement or payment will be made for existing fences or gates, which are removed and relocated to temporary location or temporary or permanent rights-of-way. Any fence and gates, including private wooden fences or gates, and chain link fences and gates to be removed and relocated, shall be subsidiary to Section 02072, “Removal and Restoration of Miscellaneous Existing Structures”.

END OF SECTION 02831
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies procuring and installing permanent traffic control signs, other than those placed within the DART Light Rail Transit Station areas. Refer to Section 10441, “Specialty Post And Pole Mounted Signs”, for requirements for signs to be placed within LRT Station areas, and other parking areas being improved by DART.

B. Contractor shall furnish and install signs, sign posts, foundations, and hardware. Pathfinder sign panels shall be omitted as further described in Section 10441, “Specialty Post and Pole Mounted Signs”.

1.2 REFERENCED STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM A653/A653M - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process

B. Texas Department of Transportation (TxDOT)

1.3 SUBMITTALS

A. Samples: Submit shop drawings of signs, sign components, fittings, parts, and installation procedures showing layout, jointing, and complete anchoring and supporting systems for the various applications and mounting details for signs that are not standard TMUTCD regulatory warning, or temporary construction signs.

1.4 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Signs shall be stored at the approved Contractor's staging area or at locations approved by the Contracting Officer.

1.5 JOB CONDITIONS

A. Location of Underground Facilities and Structures:

1. Prior to excavating for sign post foundations, Contractor shall verify locations of underground facilities and structures. Locations shown for utility facilities are taken from the various utility records and are approximate.

2. Verify locations of existing utilities in accordance with Section 02760, “Maintenance, Support and Restoration of Existing Utility Facilities”.

PART 2 - PRODUCTS

2.1 PERMANENT TRAFFIC CONTROL SIGN PANELS AND DEVICES

A. Sign panels will be fabricated from 0.125 inch thick aluminum.

2.2 SUPPORT POSTS

A. Support posts for permanent signs located on City streets shall be 2 inch galvanized steel, Unistrut, ASTM A653/A653M, Grade A or Contracting Officer approved equivalent. Sign post shall be installed with Telespar breakaway anchor system or Contracting Officer approved equivalent.

B. Support posts for permanent signs located on streets under the jurisdiction of TxDOT shall be 3 inch round posts and shall be mounted on TxDOT approved triangular slip base systems as shown in the plans.

2.3 FASTENINGS

A. Steel hex-lag bolts, corner bolts, washers, and nuts as per post manufacturer specifications. Paint exposed fastenings to match adjacent areas.

2.4 CONCRETE

A. In accordance with Section 03305, “Portland Cement Concrete”, Mix S-7.

2.5 PATHFINDER SIGNS

A. Pathfinder sign panels are specified in Section 10441, “Specialty Post and Pole Mounted Signs”.

PART 3 - EXECUTION

3.1 ERECTION OF SIGNS

A. Excavate for concrete foundations in accordance with Section 02220, “Grading, Excavating, and Backfilling.” Install concrete foundations in accordance with Section 03300, “Cast-in-Place Concrete”.

B. Set posts at locations as specified on the Contract Drawings and such that vertical and lateral clearances of sign panel with respect to ground surface and curb face meet TMUTCD requirements.
C. Sign posts for permanent traffic control signs shall be set with breakaway anchors in accordance with the manufacturers installation instructions.

D. Sign posts shall be set plumb and centered in concrete footing of no less than 2 foot depth.

E. Dispose of surplus excavated material.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Permanent traffic control signs described in this section will be measured by and paid for at the unit price for “Traffic Control Signs” per each sign for each type and size. Inclusive of sign panels, sign posts, hardware, excavation, and foundations.

B. Pathfinder signs will be measured by and paid for under Section 10441, “Specialty Post and Pole Mounted Signs”. Inclusive of sign posts, hardware, excavation, and foundations. Sign panels are not included.

C. Temporary traffic control signs will not be measured for payment, but shall be considered subsidiary to the pay item in Section 01570, “Maintenance And Control of Traffic”.

END OF SECTION 02845
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies providing metal beam guard rail, supported on timber, steel, or concrete posts.

1.2 REFERENCED STANDARDS

A. American Association State Highway and Transportation Officials (AASHTO):
   1. AASHTO T68 - Standard Method of Test for Tension Testing of Metallic Materials

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   5. A653/A653M - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process

C. American Wood-Preserver’s Association (AWPA):
   1. Unless otherwise indicated or specified, pressure treated in accordance with AWPA U1 (Use Category UC4A).

D. Texas Department of Transportation (TxDOT),
   1. Statewide Standard Details Sheet
      a. MBGF-03 Metal Beam Guard Fence

1.3 SUBMITTALS

A. Shop Drawings: Site Plans showing metal beam guard rail, materials, details of post connections and foundations.

B. Certification: Submit certification of all materials to be used.

PART 2 - PRODUCTS

2.1 GUARD RAIL POSTS

A. Steel posts and brackets: Structural steel: ASTM A36.

B. Wood posts and bracket blocks:
   1. Number 1, Dense SR southern pine, minimum stress grade 1400f.
   2. Well seasoned, sound and free from splits, cracks, and other defects.
   3. Unless otherwise indicated or specified, pressure treated in accordance with AWPA U1 (Use Category UC4A).

C. Concrete posts:
   1. Concrete reinforcement: In accordance with Section 03200, “Concrete Reinforcement”.
   2. Concrete: In accordance with Section 03305, “Portland Cement Concrete”, and Section 03430, “Structural Precast Concrete”.

2.2 GUARD RAIL ELEMENTS

A. Metal beam guard rail shall conform to TxDOT Standard Design Detail MBGF-03.

B. Rail elements fabricated from open-hearth or electric-furnace steel of thickness shown. Sheet shaped into beam with longitudinal corrugations forming section 12 inches minimum width and three inches minimum depth.

C. Fabrication:
   1. Edges of rail element straight and smooth.
   2. Steel sheet subject to standard mill tolerances for gauge.

D. For steel beam type guard rail installed on curves having radius of more than 20 feet and less than 150 feet: Rail elements convex or concave as shown.

E. Elongation of two inch specimen of sheet steel used for rail elements: 12 percent minimum when tested in tension in accordance with AASHTO T68.

F. Comply with the following:
   1. Tensile strength of specimen of full size of rail element, including a splice at center of specimen: 70,000 psi minimum.
2. Post connections to withstand 5,000 pounds side pull in both directions.

3. Section of rail with traffic face up, freely supported at both ends of 12 foot span, to support concentrated load of 2,000 pounds at center of span with maximum deflection of two inches.

2.3 HARDWARE

A. Bolts and nuts: Steel, ASTM A307, Grade A.

B. Post and splice bolts machined, button head, shoulder bolts with roll threads, Class 2A fit before galvanizing. Shoulder or neck shall have an oval shape as shown. Hexagon nuts for rail connections to be machined American Standard heavy type with recess to accommodate shoulder on bolts.

C. Bolts and nuts for offset steel brackets: American Standard heavy type.

D. Plate washers fabricated from steel conforming to requirements specified for rail elements and terminal connections.

2.4 GALVANIZING

A. Rail elements shall be galvanized in accordance with ASTM A653, Designation G210.

B. Steel posts, post anchors, brackets, and terminal sections hot-dip galvanized after fabrication in accordance with ASTM A123.

C. Hardware hot-dip galvanized after fabrication in accordance with ASTM A153. Zinc coating: Two ounces per square foot minimum.

D. Replace components on which galvanizing is damaged with new material having properly galvanized surfaces.

2.5 END SHOES

A. End shoes, where required, shall conform to the details shown in the plans and to the materials and galvanizing requirements for rail elements.

2.6 GROUNDING

A. In accordance with Section 16450, "Grounding and Bonding".

2.7 FABRICATION AND MANUFACTURE

A. Steel Posts, Brackets, and Post Anchors:

1. Cut ends square. Punch or drill posts and brackets as shown.

2. After being cut to length and punched or drilled, hot-dip galvanize posts and brackets separately before bolting.

3. On end steel posts and adjacent posts weld steel channel anchor, 15.3 pounds per linear foot and 1 foot 3 inches long, minimum.

   a. Weld anchors to posts and hot-dip galvanize.

   b. Welding: Section 05120, "Structural Steel - Bridges".

4. Replace components on which galvanizing is damaged with new material having properly galvanized surfaces.

B. Wood Posts and Bracket Blocks:

1. Cut ends square. Drill posts and bracket blocks as shown.

2. After cutting to length and drilling, saturate cut ends and holes with same preservative as that used for pressure treatment.

C. Concrete Posts:

1. Precast concrete, Mix S-3, in accordance with Section 03305, "Portland Cement Concrete", 8 inches square by 5 feet 9 inches long.

2. Reinforcement as shown and in accordance with Section 03200, "Concrete Reinforcement".

3. Cure in accordance with Sections 03300, "Cast-In-Place Concrete", and Section 03430, "Structural Precast Concrete".

4. Formwork shall be in accordance with Section 03100, "Concrete Formwork".

2.8 CONCRETE

A. Concrete for encasement of base: Section 03305, "Portland Cement Concrete", Mix S-7.

PART 3 - EXECUTION

3.1 POSTS IN DRILLED HOLES

A. Drill holes plumb, accurately positioned and of diameter and depth shown.

B. Position posts in hole to alignment shown; brace in position until remainder of hole has been backfilled with excavated material or concrete as shown.

C. Place backfill in layers 6 inches maximum and compact in accordance with Section 02220, "Grading, Excavating, and Backfilling".
D. Dispose of surplus excavated material in accordance with Section 02220, "Grading, Excavating, and Backfilling".

E. In unpaved areas, carry backfill to height of 2 inches above surface of ground and slope to drain away from post.

F. When holes in paved areas are shown to be backfilled with excavated material, place, and compact backfill to bottom of pavement. Where pavement is Portland cement concrete pavement, fill remainder of hole with concrete to surface of pavement. Where pavement surface is asphaltic concrete, stop fill 2 inches below final grade and fill remainder of hole with asphaltic concrete of same type as existing surface. Compact asphaltic concrete well by tamping and slope to drain away from post.

G. Where shown to be encased in concrete, place concrete to a height of 2 inches above natural ground and slope to drain. Trowel finish surface.

3.2 POST DRIVEN IN PLACE

A. Ensure that posts are plumb and located as shown. Remove and re-drive posts which are not in compliance.

B. Drive steel posts before offset bracket is attached.

C. After driving, top of posts to have substantially same cross-sectional dimensions as body of posts and be free of bends and damage to galvanizing coat. Remove posts not in compliance and drive new replacement post.

D. Drive posts carefully to prevent damage to utility facilities; if such facilities are encountered, relocate posts. Repair facilities damaged by construction operations.

3.3 POST SET ON CONCRETE PAVEMENTS AND DECK SLABS

A. Where steel beam guard rail is installed on existing Portland cement concrete pavement or deck slabs, fabricate steel post assembly as shown. Anchor assembly to pavement or deck slab with through-bolts or four unit expansion anchors as shown.

B. Clean pavement or deck surface area where base plate is to be installed. Set post with base plate over bolts; plumb and shim posts to proper grade and alignment with metal shims.

C. Work nonshrink grout under plate to ensure full contact of bearing area. Finish edges true and smooth.

3.4 INSTALLATION

A. Install brackets and blocks on roadway side of posts. Tighten bolts after rail elements have been attached and entire assembly adjusted to line and grade.

B. Erection of Rail Elements:

1. Erect rail elements and terminal sections on posts and post brackets previously set to produce smooth continuous rail to line and grade shown. Install rail with double-corrugation face toward traffic.

2. Bolt edges and center corrugation fully.

3. Make vertical adjustment at posts by use of oversize bolt holes in posts and brackets as shown. If oversize holes do not permit sufficient adjustment, reset post until guard rail is properly aligned.

4. After rail has been correctly aligned, tighten bolts. Check or burr threads projecting beyond nut to prevent removal.

5. Where steel beam type guard rail is shown anchored to bridge piers or terminating at concrete parapet walls, provide metal beam end shoes and make connections as shown.

6. Install grounding, if required, in accordance with Section 16450, "Grounding and Bonding".

C. Where approved, repair damaged zinc coating by wire brushing damaged area to remove loose or cracked zinc coating and applying two coats of primer.

D. Punching, drilling, reaming, cutting, or welding rail elements or terminal pieces in the field is prohibited except as approved.

E. Grounding: For steel beam guard rail located fifty feet or closer to the center of any light rail track or high-voltage power line crossing (overhead or underground), steel beam guard rail and any appurtenances shall be grounded and bonded in accordance with Section 16450, "Grounding and Bonding". For other steel beam guard rail locations, no grounding or bonding is necessary.

3.5 FIELD QUALITY CONTROL

A. Allowable Dimensional Tolerances:

1. Steel guard rail elements fabricated to width and depth tolerance of minus 1/8 inch.

2. Dimensions of concrete posts: plus or minus 1/8 inch of dimensions shown.
3. Dimensions of timber posts and bracket blocks: plus or minus 1/2 inch of dimensions shown.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work of this section will not be measured, but will be paid for at the lump sum price for "Metal Beam Guard Rail", including excavation, backfill, disposal of surplus materials, concrete, grout, hardware, and incidentals.

B. Grounding system will be measured and paid for under Division 16, "ELECTRICAL".

END OF SECTION 02846
SECTION 02847
RIGHT-OF-WAY SAFETY SIGNS

PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies the furnishing and installation of Right-of-Way Safety Signs for the DART LRT system.

1.2 REFERENCED STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

B. DART Sign Standards Manual.

C. Federal Highway Administration (FHWA):
   1. FHWA - "Standard Highway Signs"
   2. FHWA - "Standard Alphabets for Highway Signs and Pavement Markings"

D. Texas Department of Transportation (TxDOT):
   1. TxDOT - "Standard Highway Sign Designs for Texas" manual

E. Texas Manual on Uniform Traffic Control Devices (TMUTCD).

1.3 SUBMITTALS

A. Manufacturer's Data: Submit the manufacturer's technical data for sign materials and signs. Include installation details and instructions for each type of sign and mounting required.

B. Samples: Submit full-size sample of complete sign panel and installation accessories for approval. The Contracting Officer's review of samples will be for color, texture, materials, and compliance with these specifications and noted standards only. Compliance with all other requirements is the exclusive responsibility of the Contractor.

C. Shop Drawings: Submit to the Contracting Officer, shop drawings and/or product data sheets of all sign panels, components, parts, fittings, and installation procedures showing layout, jointing, complete anchoring and support systems for the various applications and mounting details for the signs. Drawings shall clearly show provisions for all performance functions described herein. Submit shop drawings for approval of details, sections, sign panels and signs at full size scale.

1.4 QUALIFICATIONS

A. The sign manufacturer shall be an established firm which is regularly engaged in the fabrication of signs.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. A form of protective covering shall be placed on the signs and between the signs to prevent damage during shipment.

1.6 JOB CONDITIONS

A. Location of Underground Facilities and Structures:
   1. Contractor shall verify locations of underground facilities and structures. Locations shown for utility facilities are taken from the various utility records and are approximate.
   2. Verify locations of existing utilities in accordance with Section 02760, "Maintenance, Support and Restoration of Existing Utility Facilities".

1.7 WARRANTY

A. In addition to the General Provisions, Warranty of Construction, provide a 10 year warranty for the sign substrate against chipping, delaminating, and fading, and a 7 year warranty against retroreflectivity loss of not more than 50 percent for the reflective film. Both warranties shall start from the date when the Warranty of Construction commences.

1.8 SPARE SIGNS

A. Deliver spare signs to the location indicated by the Contracting Officer. Obtain receipt for delivered items.

B. Spares shall include sign panels complete with legends and symbols.

C. Package spare sign panels in a manner suitable for storage. Refer to Section 01600, "Product Requirements", for additional requirements.

PART 2 - PRODUCTS

2.1 POSTS AND FASTENERS

A. Sign Posts: Sign posts and anchors shall be square, 12 gauge galvanized steel Unistrut, or as approved by the Contracting Officer with 1/2 inch...
RIGHT-OF-WAY SAFETY SIGNS

perforation on 1 inch centers. Sign posts shall be 2 inch square.

B. Anchors: Two piece breakaway anchor consisting of a 2-1/4 inch square, 3 feet long base, and 2-1/2 inch square 1-1/2 feet long sleeve. Provide connecting bolts, fittings and hardware as shown on the Contract Drawings.

C. Concrete Grout: Fast setting, rapid strength gain 1000 plus psi in 8 hours, and 5000 plus psi in 24 hours. Grout shall be shrinkage compensating, contain no chloride, and comply with ASTM C 1107 Types B and C. Use TXI Zip Crete as provided by Texas Industries (TXI) or approved equal.

D. Framing and Bracing: Provide connecting bolts, fittings and hardware as shown on the Contract Drawings.

E. Sign Fastening: Provide pop-rivets to attach signs to Unistrut poles and tamper proof fasteners and other accessories as needed at other locations based on the Contract Drawings.

2.2 SIGN PANELS

A. Sign panels shall be fabricated from 0.125 inch thick aluminum and shall have retroreflective sheeting on the face side. Pieces shall be true, square, and free from warping, bending, blemishes and scratches. Exposed edges shall be true and smooth. All panel fabrication, including cutting, punching, and drilling of holes shall be completed prior to final surface preparation and application of retroreflective sheeting.

B. Sign panels shall be manufactured by a sole source.

C. Retroreflective Sign Sheeting: Copy and graphics shall be screen painted over 3M™ Scotchlite™ Reflective Sheeting Diamond Grade VIP (Visual Impact Performance) or equal.

D. Sign faces shall be capable of withstanding the following tests:

1. Sign face shall not be permanently defaced by steam, acids, aromatics, scratching, inks, or paints.

2. Sign face shall be readily wiped clean with paint remover or solvents without affecting the appearance or legibility of the sign finish or graphics.

3. Sign face shall retain legibility and finished appearance when sprayed with a 10 percent solution of hydrochloric, nitric, or sulfuric acid for one-half hour.

4. Sign face shall retain legibility and finished appearance when scrubbed by a brush of medium hardness using common commercial cleaning compounds such as ammonia, laundry soaps, detergents, or petroleum base solvents.

E. Fabrication: Fabricate all components in a uniform manner in compliance with the following requirements:

1. Joints and seams are not acceptable. Pieces shall be true, square, and free from warping, bending, blemishes, and scratches. Edges shall not be crazed or cracked, and the edge finish shall be smooth, clean, and neat.

2. The finished sign shall be absolutely flat.

3. Signs shall have the holes drilled and sealed per type of installation as noted in the Contract Drawings.

4. Signs shall have rounded corners with a 1-1/4 inch radius.

2.3 SIGN LEGENDS

A. Provide final camera-ready artwork.

B. Sign Legends: Sign legends shall be computer generated and machine cut. Neither hand-rendered nor hand-cut legends shall be acceptable.

C. Sign colors, lettering, symbols, and borders shall conform to the details shown in the Contract Drawings and as specified herein, and shall conform to MUTCD, DART Sign Standard Manual, Standard Highway Sign Design for Texas, and Standard Alphabets for Highway Signs and Pavement Markings.
2.4 **SIGN DESCRIPTION**

A. The Right-of-Way Safety Sign (Danger High Voltage No Trespassing) shall be fabricated with the graphics shown in the Contract Drawings.

1. Each sign comply with the following additional requirements:

<table>
<thead>
<tr>
<th>DESCRIPTION</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Alphanumerics Colors:</td>
<td>Black</td>
</tr>
<tr>
<td>Icon Colors:</td>
<td>Black, Reflective Red</td>

</tbody>
</table>

2. The “ELECTRICAL HAZARD” Icon shall have a red lightening bolt with a black circle surrounding it. The “NO TRESPASSING” Icon shall have a black walking figure and a red circle with slash. Overall sign background shall be white. “DANGER” message shall be surrounded by a red oval with a white border and then surrounded by a black rectangle with rounded edges. The alphanumeric series specified herein shall be used as a proportional guideline. Compression may be utilized for lettering.

B. Prior to signage installation, mark each sign location with a flag, paint mark, tape, or survey stick. Obtain Contracting Officer’s approval for each sign location prior to installation of each sign.

C. Verify location of underground utilities prior to installing posts.

3.2 **INSTALLATION - GENERAL**

A. Mount signs along right-of-way at locations and by methods as shown in the Contract Documents. Vertical placement shall be within pedestrian normal field of view (approximately 4 to 6 feet above top of rail or ground elevation). Horizontal placement shall be at the edge of right-of-way on the fence or a pole, at grade crossings, wall mount adjacent to track, or in other areas as shown in the schedule in the Contract Documents.

B. Install signs as shown in the approved installation detail drawings, and according to the schedule in the Contract Documents. Installation types and methods include the following:

1. Post mount: Post installation shall be in ballast, concrete, asphalt, pavers, or soil.
2. Wall Mount: Where designated, attach signs on sound walls or retaining walls with appropriate fasteners and hardware as shown on Contract Drawings.
3. Fence Mount: Where designated, attach signs to fence with hardware as shown in the Contract Drawings.

3.3 **ERECTION OF POSTS**

A. Install sign posts plumb.

B. Set posts at locations and to elevations shown.

C. Anchor the posts into the ground using two piece breakaway anchor. For each post, first drive an anchor, and then a sleeve into the ground with a pneumatic post driver. Install anchor and sleeve plumb. Drive directly into ballast rock, gravel, asphalt, dirt, and similar substrates. On concrete paving and other concrete, core drill a 4 inch diameter hole through the concrete, drive in anchor and sleeve. Then grout in between anchor sleeve and concrete, making grout flush with existing concrete. All anchors and sleeves shall be exposed from one to two inches above grade (for bolt connections). Post shall extend into anchor between 6 and 8 inches. Secure post with 90 degree bend stainless steel anchor bolt.

D. Dispose of surplus excavated material.

**PART 3 - EXECUTION**

3.1 **INSPECTION**

A. Prior to submittal of procurement and shop drawings, examine the site locations and conditions under which the signs are to be installed.
3.4  INSTALLATION OF SIGN PANELS

A.  Install sign units and components at the locations shown, securely mounted, in accordance with the requirements specified herein.

B.  Install signs level, plumb and at the proper height. Coordinate, through the Contracting Officer, with other contractors for installation of sign units to finished surface. Repair or replace damaged units as directed by the Contracting Officer.

PART 4 - MEASUREMENT AND PAYMENT

4.1  GENERAL

A.  Right-of-way safety signs shall be measured by and paid for as “Right-of-Way Safety Signs” per each sign installed, inclusive of hardware, posts, and anchors.

B.  Spare right-of-way safety sign panels shall be measured by and paid for as “Spare Right-of-Way Safety Sign Panels” per each sign delivered.

END OF SECTION 02847
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes specifications for furnishing and installing precast concrete parking bumpers (wheel stops) for vehicular parking stalls in parking structures and parking lots as indicated.

1.2 REFERENCED STANDARDS

A. American Concrete Institute (ACI):

1. ACI 503.2 - 503.4 - Three Epoxy Standards
   a. ACI 503.2 – Standard Specification for Bonding Plastic Concrete to Hardened Concrete with Multi-Component Epoxy Adhesive
   b. ACI 503.3 – Specification for Producing Skid-Resistant Surface on Concrete by the Use of Epoxy and Aggregate
   c. ACI 503.4 - Standard Specification for Repairing Concrete with Epoxy Mortar

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM C881 - Standard Specification for Epoxy-Resin-Base Bonding Systems for Concrete

1.3 QUALITY ASSURANCE

A. Precast parking bumpers shall be manufactured for the intended purpose by a company or firm specializing in the manufacture of precast concrete parking appurtenances.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Parking Bumpers:

1. Provide precast concrete parking bumpers of half octagonal configuration and dimensions indicated. Unless indicated otherwise, provide bumpers of 72 inch length.

2. Bumpers shall be manufactured of Mix S-3 or Authority approved equal reinforced concrete, as specified in Section 03305, “Portland Cement Concrete”, to withstand constant use and rough service. Each bumper shall be reinforced with two No. 4 deformed steel reinforcing bars, minimum.

3. Each bumper to be installed on at-grade asphalt pavement shall be manufactured with two holes to accommodate the installation rebar. Holes shall be positioned 6 inches in from each end.

4. Bumpers to be installed on concrete slabs of parking structures shall be manufactured without holes.

B. Adhesive: Adhesive for anchoring bumpers or wheel stops to pavement shall be an epoxy adhesive meeting ASTM C881, Type I, Grade 3.

C. Steel Bars for Installation: Epoxy-coated rebar, No. 5 size, conforming with applicable requirements of Section 03200, “Concrete Reinforcement”.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Precast concrete bumpers shall be anchored and secured in position on at-grade asphalt pavements, as indicated, with two No. 5 epoxy-coated rebar.

B. Precast concrete bumpers shall be secured in position on at-grade concrete pavements, as indicated, with an appropriate epoxy adhesive as per ACI 503.2, ACI 503.2 and ACI 503.4.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Precast concrete parking bumpers will be measured for payment as an aggregate lump-sum unit, acceptably installed and completed.

END OF SECTION 02848
SECTION 02870
MODULAR RETAINING WALL UNITS

PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies furnishing and installing modular block retaining wall units for landscape retaining walls. This system is not to be used to retain fills subject to automobile or rail traffic surcharge loading.

1.2 REFERENCED STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   2. ASTM C90 - Standard Specification for Loadbearing Concrete Masonry Units
   3. ASTM D698 - Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/ft³ (600 kN-m/m³))

1.3 DEFINITIONS

A. Unit fill: Free draining granular material, used within the concrete units. See Paragraph 2.2C in this section.

1.4 SUBMITTALS

A. Shop Drawings: Submit shop drawings including details of curved walls, if applicable.

B. Product Data: Submit modular retaining wall unit product data including manufacturer’s installation instructions.

C. Samples: Submit manufacturer’s standard concrete color samples. Submit sample of each modular unit proposed for use.

D. Manufacturer’s Certificate of Conformance: Submit for modular retaining wall units and connecting pins.

E. Project Record Documents: Document on Project Record Drawings, submitted under Section 01785, “Project Record Documents”, location and top elevation of each wall at 25 foot intervals, and at break points along the top of wall.

F. Test data for backfill materials.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Contractor shall prevent mud, wet cement, epoxy, and like materials, which may affix themselves, from coming in contact with the materials.

PART 2 - PRODUCTS

2.1 CONCRETE UNITS

A. Modular retaining wall units shapes and sizes shall be as indicated in Contract Documents.

B. Modular retaining wall units shall be concrete with a minimum 28 day compressive strength of 3000 psi in accordance with ASTM C90. The concrete shall meet the following freeze/thaw criteria with a maximum moisture absorption rate of 7 percent.

1. Specific Freeze-Thaw Criteria: Demonstrate either by documented field performance or, if required by the Contracting Officer, by laboratory tests that the units have adequate resistance to freezing and thawing, suitable for the geographic region of Dallas, Texas. If a laboratory test is used, when tested in accordance with ASTM C67, specimens shall have no breakage and not greater than 3 percent loss in dry weight of any individual unit when subjected to 50 cycles of freezing and thawing. This test shall have been conducted not more than 24 months prior to delivery of units.

C. Retaining wall unit shall provide a minimum of 100 pounds of lateral resistance per square foot of wall face area. Any fill, which is contained within the dimensions of the units, may be considered as 80 percent effective weight.

D. Units shall have flat or angled sides and be capable of attaining concave and convex alignment curves with a minimum radius of 10 feet.

E. Units shall be interlocked as to provide a minimum of 1/4 inch of setback per each course of wall height. Units shall be formed to accommodate connecting pins.

F. Units shall have a facial color of gray, tan, or brown. Final color selection will be made by the Contracting Officer.

G. Overall dimension of units (width, height, or length) shall vary no more than 1/8 inch (3.2 mm) from the specified dimensions.

H. Units shall be sound and free of cracks or other defects that would interfere with the proper placing of the unit or significantly impair the strength or permanence of the construction. Minor cracks incidental to the usual method of manufacture, or minor chipping resulting from customary methods of handling in shipment and delivery, are not grounds for rejection.

I. The face or faces of units that are to be exposed shall be free of chips, cracks, or other imperfections when viewed from a distance of 30 feet.
J. The units shall have a demonstrated mechanism to resist shear and/or sliding forces up to height of 3 foot without soil reinforcement. The units shall have geogrid reinforcement where noted on Contract Drawings as specified in Section 02275, "Geogrid Wall Reinforcement".

K. Finished retaining wall shall have an appearance similar to that of the Keystone or Versa-Lok, or approved equal retaining wall units with a rough rock surface finish. The Contracting Officer reserves the right to reject any systems, which in his judgment do not meet appearance criteria.

2.2 OTHER MATERIALS

A. Connecting Pins: Pins shall have a minimum shear strength of 13,000 psi and shall consist of a non-corrosive material.

B. Base Material: Material for footing shall consist of 6 inch thick crushed stone with a maximum nominal size of 1 inch or unreinforced concrete base footing in accordance with Mix S-7, as specified in Section 03305, “Portland Cement Concrete”, at the Contractor’s option unless otherwise indicated in the Contract Documents. Footing material for geogrid reinforced retaining walls shall be as specified under Section 02275, “Geogrid Wall Reinforcement”.

C. Unit Fill: Fill for units shall consist of free-draining, granular fill. Granular fill shall be graded within the following limits: 100 percent passing 3/8 inch sieve; 50 percent passing the No. 40 sieve, and 10 percent passing the No. 200 sieve.

D. Drainage Fill: Material for drainage fill layer behind unit shall be 3/4 inch minimum up to 2 inch maximum crushed stone.

E. Underdrain and Geotextile Filter Fabric: As specified in Section 02700, “Storm Sewer”, and indicated on the Contract Drawings. Type and size of underdrain pipe shall be indicated on the Contract Drawings.

PART 3 - EXECUTION

3.1 RETAINING WALL ERECTION

A. Place first course of concrete wall “units” on the footing. Check the units for level and alignment.

B. Ensure that the units are in full contact with base. Grout any units not in full contact.

C. Place units side by side for full length of wall alignment. Alignment may be done by means of a string line or laser offset from base line or straight wall construction. Layout units for curved walls in accordance with the approved shop drawings and manufacturer’s written instructions.

D. Install connecting pins in accordance with manufacturer’s written instructions.

E. Fill units with unit fill. Compact unit fill by running hand-operated compaction equipment just behind unit. Do not run mechanical vibrating plate compactors on top of units. See Section 02275, “Geogrid Wall Reinforcement”, compact to minimum 95 percent Standard Proctor density (ASTM D698).

F. Drainage Fill: Install a minimum of 12 inches of drainage fill extending behind the wall to within 6 inches of final grade.

1. Place drainage fill in lifts no greater than 8 inches thick.

2. Incorporate underdrain into drainage fill in accordance with the Contract Drawings and approved shop drawings.

3. Completely wrap drainage fill with filter fabric and over lapped at top of drainage fill, pinning the fabric together every 24 inches across top to ensure there is no sediment migration into the drainage fill, or, through the front of the units.

G. Fill behind drainage fill with reinforced fill material according to Section 02275, “Geogrid Wall Reinforcement”.

H. Sweep excess material from top of units and install next course. Ensure each course is completely filled prior to proceeding to next course.

I. Complete wall with cap units in accordance with manufacturer’s installations and approved shop drawings.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Modular block retaining wall will be measured by and paid for at the unit price for “Modular Block Retaining Wall” per square foot of wall face projected on a straight plane surface for the full height above the foundation. No measurement will be made for surface irregularities of modular blocks. Payment will include unit fill, drainage fill, and the work specified under Section 02275, “Geogrid Wall Reinforcement”.

B. Excavation and earthwork, including backfill, soil reinforcing, and backfill material within the reinforced volume will not be measured separately for payment, but shall be considered subsidiary to the construction of the modular block retaining wall.

C. Subdrains or underdrains including filter fabric for the retaining wall will not be measured separately for payment, but shall be considered subsidiary to the construction of the modular retaining wall units.
PART 1 - GENERAL

1.1 SUMMARY

A. This section specifies furnishing and installing prefabricated block retaining wall system for landscape retaining walls. This system is to be used to retain fills subject to automobile surcharge loading.

B. The system to be used to retain fills not subject to automobile surcharge loading is specified in Section 02870, “Modular Retaining Wall Units”.

1.2 REFERENCED STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM C140 - Standard Test Methods of Sampling and Testing Concrete Masonry Units

3. ASTM C1262 - Standard Test Method for Evaluating the Freeze-Thaw Durability of Manufactured Concrete Masonry Units and Related Concrete Units

4. ASTM C1372 - Standard Specification for Segmental Retaining Wall Units

5. ASTM D448 - Standard Classification for Sizes of Aggregate for Road and Bridge Construction

6. ASTM D1556 - Standard Test Method for Density of Soil In Place by the Sand Cone Method

9. ASTM D2922 - Standard Test Method for Density of Soil and Soil-Aggregate In Place by Nuclear Methods (Shallow Depth)

1.3 DEFINITIONS

A. Geosynthetic reinforcement is a material specifically fabricated for use as a soil reinforcement.

B. Drainage aggregate is a material used around and directly behind the concrete wall units.

C. Backfill is the soil, which is used as fill behind the drainage aggregate and within the reinforced soil mass if applicable.

D. Foundation soil is the soil mass supporting the leveling pad and reinforced zone of the retaining wall system.

1.4 SUBMITTALS

A. Product Data: Manufacturer's literature, materials description.

B. Shop drawings: Retaining wall system design, including wall heights, geosynthetic reinforcement layout and drainage provisions. The shop drawings shall be signed by a registered professional engineer licensed in the State of Texas.

C. Samples:

1. Furnish one unit in the color and face pattern specified if requested by the Contracting Officer. If approved, unit may be used in the finished work.

2. 12 inches square or larger piece of the geosynthetic reinforcement specified.

D. Test reports from an independent laboratory stating moisture absorption and compressive strength properties of the concrete wall units meet the project specifications when tested in accordance with ASTM C140, Sections 6, 8 and 9.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. To prevent damage, store above ground on wood pallets or blocking. Remove damaged or otherwise unsuitable material, when so determined, from the site.

B. Faces of the concrete wall units shall be substantially free of chips, cracks and stains.

C. Prevent excessive mud, wet cement, epoxy, and like material, which may affix themselves, from coming in contact with the materials.
1. EXTRA MATERIALS
   A. Supply 3 replacement units identical to those installed on the Project.

PART 2 - PRODUCTS

2.1 MATERIALS
   A. Concrete Retaining Wall Unit: “Anchor Vertica Pro Retaining Wall Units” as manufactured under license from Anchor Retaining Wall Systems or approved equal.
      1. Concrete wall units shall meet requirements of ASTM C1372 except the maximum water absorption shall be limited to 7.0 percent and unit height dimensions shall not vary more than plus or minus 1/16 inch from that specified.
      2. Concrete wall units are required to have a minimum of 0.94 square foot face area.
      3. Color as selected by Contracting Officer from manufacturer's standard selections.
      4. Face pattern: Geometry: Beveled or Straight;
      5. Texture: Smooth or Split Rock Face.
      6. The concrete units shall include an integral concrete shear connection, flange/locator.
   B. Geosynthetic reinforcement: Polyester fiber geogrid, geotextile, or polypropylene woven geotextile for use as soil reinforcement.
   C. Base: Material shall consist of drainage aggregate, sand and gravel and/or concrete as shown on the construction drawings. A minimum of 6 inches of compacted base is required.
   D. Drainage aggregate: Fill between units shall consist of free-draining, crushed coarse aggregate that meets the gradation requirements of ASTM D448, Designation 57, 67, 6, 7 or 8.
   E. Backfill: Materials are suitable non-organic soils at a moisture content which enables compaction to the specified densities. Unsuitable soils are organic soils and those soils with the USCS classification symbol of CH, OH, MH, OL, or PT. CL soils with a Plasticity Index (PI) greater than 25 are also considered unsuitable soils.
   F. Drain tile: The drainage collection pipe shall be a perforated or slotted PVC or corrugated HDPE pipe. The pipe may be covered with a geotextile filter fabric to function as a filter.

PART 3 - EXECUTION

3.1 EXAMINATION
   A. Examine the areas and conditions under which the retaining wall is to be erected and notify the Contracting Officer in writing of conditions detrimental to the proper and timely completion of the work. Do not proceed with the work until unsatisfactory conditions have been corrected. Promptly notify the wall design engineer of any site conditions, which may affect wall performance or may require a reevaluation of the wall design.
   B. Foundation soil shall be examined by the project geotechnical engineer to ensure that the actual foundation soil strength, meets or exceeds that required on the Contract Documents.

3.2 EXCAVATION
   A. Excavate to the lines and grades shown on the construction drawings. Over-excavation not approved by the Contracting Officer shall not be paid for and replacement with compacted fill and/or wall system components will be required at the Contractor's expense. Do not disturb base beyond the lines shown. The Contractor shall be responsible for the stability of the excavation and it's influence on adjacent properties and structures.

3.3 FOUNDATION PREPARATION
   A. Foundation soil shall be excavated as required for footing or base dimension shown on the construction drawings, or as directed by the engineer.
   B. Soil not meeting the required strength shall be removed, sufficiently oversized from the front of the block and the back of the reinforcement and back-filled with suitable material.
   C. Over-excavated areas shall be filled with suitable compacted backfill.

3.4 BASE COURSE PREPARATION
   A. Base materials shall be placed as shown on the construction drawings with a minimum thickness of 6 inches.
   B. Base materials shall be installed upon undisturbed soils, or foundation soils prepared in accordance with Article 3.3.
   C. Material shall be compacted so as to provide a level, hard surface on which to place the first course of units.
   D. Base materials shall be prepared to ensure complete contact of retaining wall unit. Gaps shall not be allowed.
E. Base materials shall be to the depths and widths shown on the plans. Reduced the depth of sand and gravel and replace with a 1 to 2 inch concrete topping. Concrete shall be lean, unreinforced and a maximum of 2 inches thick. Where a reinforced footing is required, place below the frost line.

3.5 ERECTION

A. First course of concrete wall units shall be placed on the prepared base material. Units shall be checked for level and alignment. The top of all units in base course shall be at the same elevation.

B. Ensure that concrete wall units are in full contact with base.

C. Concrete wall units shall be placed side by side for full length of wall alignment. Alignment may be done, by using a string line or offset of wall line.

D. Fill all voids between and within concrete wall units with drainage aggregate.

E. Minimum of 12 inches of drainage aggregate shall be placed behind the concrete wall units.

F. Drain tile shall be installed at the lowest elevation possible to maintain gravity flow of water to outside of the reinforced zone. The drainage collection pipe shall be day-lighted to an appropriate location away from the wall system at not more than every 75 feet and at low points of the wall.

G. Remove excess fill from top of units and install next course. Ensure drainage aggregate and backfill are compacted before installation of next course.

H. Install each succeeding course. Backfill as each course is completed. Pull the units forward until the locating surface of the unit contacts the locating surface of the units in the preceding course. Pull the units forward as far as possible.

I. Install geosynthetic reinforcement in accordance with geosynthetic manufacturer's recommendations and the design drawings.

3.6 BACKFILL PLACEMENT

A. Reinforced backfill shall be placed, spread and compacted in a manner that will minimize slack in the reinforcement.

B. Fill in the reinforced zone shall be placed and compacted in lifts not to exceed 6 to 8 inches in loose thickness where hand operated compaction equipment is used and not exceeding 12 inches loose thickness where heavy, self-propelled compaction equipment is used.

C. Fill placed in the reinforced zone must be compacted to a minimum of 95 percent of the soil's standard Proctor density (ASTM D698) or as recommended by the project geotechnical engineer.

D. Only lightweight hand-operated equipment shall be allowed within 4 feet of the back of the retaining wall units.

3.7 CAP UNIT INSTALLATION

A. Apply construction adhesive to the top surface of the unit below and place the cap unit into desired position.

B. Cap units may need to be cut to obtain the proper fit.

C. Backfill and compact to finish grade.

3.8 ADJUSTING AND CLEANING

A. Damaged units shall be replaced with new units during construction.

B. Remove debris caused by this construction and leave adjacent paved areas broom clean.

3.9 QUALITY CONTROL

A. The wall installation contractor is responsible for quality control of installation of all materials. The contractor should enlist the assistance of a qualified independent third party to verify the correct installation of all materials according to these specifications and the construction drawings.

B. Work found to be deficient according to these specifications or the construction drawings must be corrected at the contractor's expense.

C. The retaining wall will not be considered complete until accepted by the Contracting Officer.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Prefabricated block retaining wall system will be measured by and paid for at the unit price for “Prefabricated Block Retaining Wall System” per square foot of wall face projected on a straight plane surface for the full height above the foundation. No measurement will be made for surface irregularities of blocks. Payment will include unit fill, drainage fill, and the work specified under Section 02275, “Geogrid Wall Reinforcement”.

B. Excavation and earthwork, including backfill, soil reinforcing, and backfill material within the
reinforced volume will not be measured separately for payment, but shall be considered subsidiary to the construction of the prefabricated block retaining wall system.

C. Subdrains or underdrains including filter fabric for the retaining wall will not be measured separately for payment, but shall be considered subsidiary to the construction of the modular retaining wall units.

END OF SECTION 02871
PART 1 - GENERAL

1.1 DESCRIPTION

A. This work shall consist of mechanically stabilized earth (MSE) retaining walls constructed in accordance with these Specifications and in conformity with the lines, grades, design, and dimensions shown on the Contract Drawings or established by the Contracting Officer. MSE wall design calculations, construction plans, and installation are the sole responsibility of the Contractor.

1.2 REFERENCED STANDARDS

A. American Association for State Highway and Transportation Officials (AASHTO):

1. AASHTO HB-17 - Standard Specification for Highway Bridges
2. AASHTO M85 - Standard Specification for Portland Cement
3. AASHTO T22 - Standard Method of Test for Compressive Strength of Cylindrical Concrete Specimens
4. AASHTO T23 - Standard Method of Test for Making and Curing Concrete Test Specimens in the Field
5. AASHTO T24 - Standard Method of Test for Obtaining and Testing Drilled Cores and Sawed Beams of Concrete

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM A36/A36M - Standard Specification for Carbon Structural Steel
2. ASTM A123/A123M - Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products
3. ASTM A153/A153M - Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware
5. ASTM A563 - Standard Specification for Carbon and Alloy Steel Nuts
6. ASTM A1011/A1011M - Standard Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability
7. ASTM C88 - Standard Test Method for Soundness of Aggregates by Use of Sodium Sulfate or Magnesium Sulfate
9. ASTM D512 - Standard Test Methods for Chloride Ion In Water
10. ASTM D516 - Standard Test Method for Sulfate Ion in Water
11. ASTM D698 - Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/ft³ (600 kN-m/m³))
13. ASTM D2000 - Standard Classification System for Rubber Products in Automotive Applications
15. ASTM D4253 - Standard Test Methods for Maximum Index Density and Unit Weight of Soils Using a Vibratory Table
16. ASTM D4254 - Standard Test Methods for Minimum Index Density and Unit Weight of Soils and Calculation of Relative Density
18. ASTM F436 - Standard Specification for Hardened Steel Washers
20. ASTM G57 - Standard Test Method for Field Measurement of Soil Resistivity Using the Wenner Four-Electrode Method

1.3 SUBMITTALS

A. Shop Drawings: Submit shop drawings for walls and railings.

B. Product Data: Submit product data for retaining wall system and products including installation instructions: Include product data for fasteners, bearing pads, precast copings, and filter fabric.

C. Samples: Submit one sample of concrete face panels.

D. Manufacturer's Certificate of Compliance: Submit for concrete panels, embedded connectors, and soil reinforcement.

E. Concrete test results as specified in Paragraph 2.1.C herein.

1.4 DESIGN REQUIREMENTS

A. Design of retaining wall shall be performed by and shop drawings and computations shall be signed and sealed by the Contractor's engineer who shall be a Professional Engineer licensed in the State of Texas.

B. Shop drawings shall include all details, dimensions, and cross sections necessary to construct the wall.

C. Shop Drawings shall include plan and elevations of each wall. Plan and elevation drawings shall be developed in accordance with the lines and grades shown in the Contract Drawings.

D. Elevation view of the wall shall indicate the following information:
   1. Elevation at the top of the wall at the frequency shown in the Contract Documents;
   2. Elevations at the top of leveling pads;
   3. Distance along the face of the wall to all steps in the leveling pads;
   4. Designation as to the type of panel;
   5. Length, size, and number of soil reinforcements and the distance along the face of the wall to where changes in length of the soil reinforcements occur; and;
   6. Location final ground line at face of the wall.

E. Plan view of the wall which shall indicate the following information:
   1. Offset from the construction centerline to the face of the wall at all changes in horizontal alignment;
   2. Limit of the widest panel and strip, and;
   3. Centerline of any drainage structure or drainage pipe which is behind or passes under or through the wall.

   4. Identify obstructions or penetrations within the limits of the reinforced soil volume.

F. Shop Drawings shall also include, the following, as applicable.
   1. General notes required for design and construction of the wall.
   2. Cross section showing limits of construction and in fill sections, limits, and extent of backfill material placed above foundation soil.
   3. Limits and extent of reinforced soil volume.
   4. Limits and magnitude of applied bearing pressures.
   5. Details including any reinforcing bar bending details. Bar bending details shall be in accordance with Project drawings.
   6. Details for foundations and leveling pads, including details for steps in the leveling pads.
   7. Details of face panels. The details shall show all dimensions necessary to construct the element, all reinforcing in the element, and the location of reinforcement element attachment devices embedded in the facing.
   8. Details for construction of the wall around drainage facilities, overhead sign footings, catenary pole foundations, manholes, and similar items shall be clearly shown.
   9. Location of proposed internal drainage system in profile and its connections to drainage systems shown on the Contract Drawings beyond MSE wall.
   10. Details of the architectural treatment shall be shown.
   11. Details of elastomeric expansion joints, if required, shall be shown.

G. Design Computations: The method of analysis shall be a tie back wedge method as described in AASHTO HB-17. Designs shall be based on the design requirements indicated in the Contract Drawings.
   1. Submit design calculations for concrete face panels, anchor system, and concrete coping located at the top of the wall.
   2. Calculations shall include design of reinforcing around obstructions within the reinforced soil volume.
   3. Submit design computations on 8-1/2 inches by 11 inches sheets.
1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Contractor shall prevent mud, wet cement, epoxy, and like materials which may affix themselves from coming in contact with the materials.

B. Units shall be handled, stored, and shipped in such manner as to eliminate the danger of chipping, cracks, fractures, and excessive bending stresses. Damaged material shall not be incorporated into the mechanically stabilized earth wall. Panels in storage shall be supported on firm blocking located immediately adjacent to embedded connectors to avoid bending the soil reinforcement.

1.6 PROJECT RECORD DOCUMENTS

A. As part of preparation of project record drawings or “as-built” drawings specified in Section 01785, “Project Record Documents”, accurately record as built location and accurately record the top elevation of each wall at the frequency shown in the Contract Documents.

2.1 CONCRETE FACE PANELS

A. Concrete Strength: Cement shall conform to AASHTO M85. Cement shall have a minimum compressive strength of 4000 psi at 28 days. Air entrainment shall be 4 to 7 percent by volume. The distribution and steel reinforcement shall comply with the crack control provisions of AASHTO HB-17 for moderate exposure. Retarding agents, accelerating agents, or any additive containing chloride shall not be used without approval of the Contracting Officer.

B. Concrete Inserts: Tie strips, connecting pins, and PVC tubes and lifting and handling devices shall be set in place to the dimensions and tolerances shown on the plans prior to casting.

C. Testing and Inspection: Acceptability of the precast units will be determined on the basis of compressive strength and visual inspection. The Contractor or his supplier shall furnish facilities and an independent testing agency shall perform all necessary sampling and testing in an expeditious and satisfactory manner. Testing agency shall meet requirements of Section 01450, “Quality Control”. Panels, at the option of the Contracting Officer, may be acceptable for placement in the wall when 7-day strengths exceed 85 percent of 28-day requirements.

D. Casting: The panels shall be cast on a flat area, the front face of the form at the bottom, the back face at the upper part. Guides shall be set on the rear face to support the embedded connectors. The concrete in each unit shall be placed without interruption and shall be consolidated by the use of an approved vibrator, supplemented by such hand-tamping as may be necessary to force the concrete into the corners of the forms and prevent the formation of stone pocket or cleavage planes. Clear form oil of the same manufacture shall be used throughout the casting operation.

E. Curing: The units shall be cured for a sufficient length of time to ensure that the concrete will develop the specified compressive strength.

F. Removal of Forms: The forms shall remain in place until they can be removed without damage to the unit.

G. Concrete Finish: Unless otherwise indicated, the concrete surface of the front face shall have a bush hammered finish with penetrating acrylic stain. Bush hammered finish shall be formed by flexible form liner. Penetrating acrylic stain shall be as specified in Section 09980, “Coatings for Concrete and Masonry”. Color shall match Autumn Tan by United Coatings. The rear face of the panel shall have a uniform surface finish roughly screeded to eliminate open pockets of aggregate and surface distortions in excess of 1/4 inch.

H. Tolerances: Units shall be manufactured within the following tolerances:

1. Dimensions within 3/16 inch.

2. Angular distortion with regard to the height of the panel shall not exceed 0.2 inch in 5 feet.

I. Compressive Strength: Acceptance of the concrete face panels with respect to compressive strength will be determined on a lot basis. The lot shall consist of all production units (batches of concrete or panels) produced within a week’s or 7-day production operation. Production units shall be randomly selected in accordance with the production day sample sizes of Table A and tested for compressive strength. Compression tests shall be made on standard 6 inch by 12 inch test specimen prepared in accordance with AASHTO T23 or cores obtained and prepared in accordance with AASHTO T24. Compressive strength testing shall be conducted in accordance with AASHTO T22.

1. When standard 6 inch by 12 inch test specimens are utilized, a minimum of four cylinders shall be cast for each production unit sampled. Two of these specimens shall be cured in the same manner as the panels and tested at 7 days. The remaining two cylinders...
shall be cured in accordance with AASHTO T23 and tested at 28 days. The test value of each two cylinder group will be their average compressive strength.

2. Lot will be acceptable if all acceptance tests in a lot are greater than 4,000 psi or provided no individual 28 day compressive strength test result falls below 3,600 psi and the average 28 day compressive strength of all test results for the lot equals or exceeds the acceptance limits set forth in Table B. The acceptance limits of Table B shall also apply to core compressive strength test results.

* (Range) The difference between the largest and smallest acceptance test result.

J. Rejection: Units shall be subject to rejection because of failure to meet any of the requirements specified above. In addition, any or all of the following defects shall be sufficient cause for rejection:

1. Defects that indicate imperfect molding.
2. Defects indicating honeycombed or open texture concrete.
3. Defects such as chips, cracks, or fractures that cannot be repaired to restore structural integrity and appearance of panel.

K. Marking: The date of manufacture shall be clearly scribed on the rear face of each panel.

L. Concrete panels shall comply with Section 03450, “Architectural Precast Concrete”, as applicable.

2.2 SOIL REINFORCEMENT AND EMBEDDED CONNECTORS

A. Embedded connectors shall be shop fabricated of hot rolled steel conforming to the minimum requirements of ASTM A1011, Grade C or equivalent. They shall be hot dip galvanized to conform to minimum requirements of ASTM A123. Soil reinforcement shall be hot rolled from bars to the required shape and dimensions. Their physical and mechanical properties shall conform to ASTM A36 or equivalent. They shall be hot dipped galvanized to conform to the minimum requirements of ASTM A123.

B. Embedded connectors shall be cut to length and tolerances shown on the plans. Holes for bolts shall be punched in the locations shown. All soil reinforcement and embedded connectors shall be carefully inspected to ensure they are true to size and free from defects that may impair their strength and durability.

2.3 FASTENERS

A. Connections shall be positive, structural connections subject to the same metal loss rates and allowable stress requirements. For wire mesh systems using multiple-loop panel embeds and connector rods (or similar type connections), each longitudinal wire shall be securely engaged to its corresponding panel embed by the connector rod without the use of wedges.

B. Bolts and nuts shall be hexagonal cap screw, high strength conforming to ASTM A325, Type 1 for bolts. ASTM A563, Grade as recommended in Table X1.1, in ASTM A563, for nuts. ASTM F436, Type 1 for washers. Galvanized per ASTM A153/A153M. They shall be a minimum 1/2 inch in diameter, 1-1/4 inch in length with 3/4 inch thread length.

2.4 BEARING PADS

A. Bearing pads to be installed in horizontal joints between panels shall be preformed elastomeric pads conforming to ASTM D2000, M2AA 807, high density polyethylene pads with a minimum density of 0.946 g/cm² in accordance with ASTM D1505, or equal as approved by Contracting Officer.

2.5 MSE WALL REINFORCED VOLUME BACKFILL MATERIAL

A. MSE wall backfill material used in the reinforced volume shall be free from organic or otherwise deleterious materials and shall conform to the following specifications.

B. The backfill material shall consist of granular free-draining materials with a minimum effective angle of shearing resistance of 34 degrees. The granular material may include sand, crushed limestone, railroad ballast, sand-gravel mixture, and sand-crushed stone mixture.

C. The material shall have the following gradation for sections of the wall backfill that are not subject to flood water inundation and sections of the wall where the wall backfill is subject to flood water inundation:

</tbody>
</table>
Particles larger than 0.25 inches shall be angular or crushed. Rounded rock or gravel will not be allowed.

D. Material smaller than the No. 200 sieve size shall have a PI of 6 percent or less. A complete grain-size distribution shall be measured in accordance with ASTM C136. The coefficient of uniformity, Cu = D60/D10, shall be included with the grain size analysis. The liquid and plastic limits of the percent passing the No. 200 sieve shall be determined by ASTM D4318.

E. Granular material shall also conform to the following:
   1. Soundness: No soft, poor durability particles. Magnesium sulfate soundness loss of less than 30 percent after 4 cycles and sodium sulfate loss of less than 15 percent after 5 cycles, in accordance with ASTM C88 testing method.
   2. Resistivity: minimum 3,000 ohm-cm at 100 percent saturation; in accordance with ASTM G7 testing method.
   3. pH: 5 to 10, in accordance with ASTM G51 testing method.
   4. Chlorides: Maximum 100 ppm when resistivity is less than 5,000 ohm-cm; in accordance with ASTM D512 testing method
   5. Sulfates: Maximum 200 ppm when resistivity is less than 5,000 ohm-cm; in accordance with ASTM D516 testing method.

F. Angle of shearing resistance for portions of the granular material that passes a No. 10 sieve shall be determined by ASTM D3080, Consolidated Drained Direct Shear Test. Granular materials that have been crushed and that have 80 percent of the grain size greater than 0.75 inches do not need to be tested to confirm that these materials meet the 34 degree angle of shearing resistance provided the material meets the requirements listed above.

2.6 CONCRETE LEVELING PAD

A. Material for pad shall consist of a minimum 6 inch thick, concrete base leveling pad in accordance with Mix S-7 as per Section 03305, “Portland Cement Concrete”.

2.7 COPING

A. Concrete coping may be either precast or cast-in-place. Cast-in-place concrete shall comply with the requirements of Section 03300, “Cast-In-Place Concrete”.

2.8 GALVANIZED METAL RAILING

A. Galvanized metal railing shall be in accordance with the requirements of Section 05520, “Pipe and Tube Railings”.

2.9 FILTER FABRIC

A. Filter fabric placed along wall joints and at interface with other structure shall be in accordance with Section 02700, “Storm Sewer Systems” for Subsurface Drainage.

PART 3 - EXECUTION

3.1 WALL EXCAVATION

A. Excavation shall be in accordance with the requirements of Section 02220, “Grading, Excavating, and Backfilling”, and in conformity to the limits and construction stages shown on the Contract Drawings.

3.2 SUBGRADE PREPARATION

A. Subgrade for the structure shall be graded level for the width equal to or exceeding the length of the MSE soil reinforcement or as shown on the Contract Drawings.

B. Prior to construction the subgrade shall be proof rolled, except where rock is present at the base of the wall. Proof roll in accordance with Section 02220, “Grading, Excavating, and Backfilling”. Proof roll under the observation of the Contracting Officer.

C. Where it is not feasible to proof roll, the subgrade shall be checked using a dynamic cone penetration test. The test shall be performed in accordance with ASTM D6951. The cone shall be advanced to a depth of at least 3 feet or to hard layer, whichever is shallower. The number of blows to drive the cone shall be recorded. One cone test per 50 linear feet of wall subgrade or part thereof shall be performed. A minimum of three tests shall be performed.

D. If the Contracting Officer notes any soft, rutting, or shoving areas or dynamic cone results that indicate the presence of soft subgrade conditions, the soft subgrade conditions shall be removed and replaced with structural fill. Structural fill shall be placed in accordance with Section 02220, “Grading, Excavating, and Backfilling”, or as required by the Contracting Officer.

E. The subgrade shall then be compacted with a smooth wheel roller.

F. At each panel subgrade level, a concrete leveling pad shall be provided as shown on the approved plans.

G. The leveling pad shall cure for a minimum of 24 hours before placement of wall panels.

3.3 PANEL ERECTION

A. Precast concrete panels shall be initially placed at the batter necessary to achieve a vertical position following compaction of backfill.

B. Panels shall be placed in successive horizontal lifts in the sequence shown on the plans as backfill placement proceeds. As fill material is placed behind a panel, the
panels shall be maintained in a vertical position by means of clamps placed at the junction of adjacent panels and temporary wooden wedges placed in the horizontal joint at the junction of the two adjacent panels on the external side of the wall. External bracing may also be required for each lift.

C. Bearing pads of the dimensions and thickness shown in the approved shop drawings shall be installed in the horizontal joints.

D. Filter fabric shall be placed behind all wall joints, and at the intersection of retaining walls with other structures. Filter fabric shall cover joints a minimum of 6 inches on each side and shall be positively held in place by an adhesive approved by the Contracting Officer. The adhesive shall be applied to the panels and not the filter fabric. The filter fabric shall be placed to prevent the loss of wall backfill soils through the panel joints. The minimum width and lap shall be 12 inches.

E. Vertical tolerances (plumbness) and horizontal alignment tolerance shall not exceed 3/4 inch when measured along a 10-foot straight edge. The maximum allowable offset in any panel joint shall be 3/4 inch. The overall vertical tolerance of the wall (plumbness from top to bottom) shall not exceed 1/2 inch per 10 feet of wall height. Panel joint gaps shall be a minimum width of 1/2 inch and a maximum width of 1 inch.

3.4 BACKFILL PLACEMENT

A. Backfill placement shall closely follow the erection of each lift of panels. At each soil reinforcement level, backfill shall be roughly leveled before placing and attaching soil reinforcement. Except as shown on the plans, soil reinforcement shall be placed normal to the face of the wall.

B. Field cutting or bending (deforming) of the soil reinforcements will only be permitted as specifically detailed on approved shop drawings and in accordance with the manufacturer’s recommendations. To avoid conflicts with piles or utility obstructions the following may be done:

1. Soil reinforcement may be skewed 15 degrees from normal position (provided no deformation occurs).

2. Soil reinforcements may be connected to a structural yoke which straddles or bypasses the obstruction.

C. The maximum lift thickness shall not exceed 10 inches (loose) and shall closely follow panel erection. The Contractor shall decrease the lift thickness if necessary to obtain the specified density.

D. Compaction of Wall Backfill Placed Three or More Feet from the Wall Face:

1. Wall backfill with a well-defined moisture-density relationship shall be compacted to at least 95 percent of the standard Proctor maximum dry density (ASTM D698 with oversize corrections where warranted) between minus 2 and plus 3 percentage points of the optimum moisture content.

2. Coarse aggregate free-draining soils that do not have a well-defined moisture-density curve shall be compacted to a relative density of at least 70 percent as determined by test methods ASTM D4253 and D4254. Granular backfill shall be compacted at a moisture content that will allow the desired density to be achieved.

3. Where the backfill material consists of more than 30 percent retained on the 0.75 inch sieve and sand cone or nuclear density measurements can not be made, a method specification shall be used to control compaction. The method specification shall be based on a test compaction section to establish the number of passes required to where there is no visible change in the test lift thickness caused by the steel drum roller. The method specification shall define the lift thickness and fill moisture content requirements for the approved steel drum roller. The number of passes required for compaction shall not be less than four.

E. Compaction of Wall Backfill Within Three Feet of Wall Face.

1. Backfill soils shall be compacted using light mechanical tampers either single or double drum, walk-behind vibratory rollers or vibratory plate compactors.

2. Fill shall be compacted to at least 90 percent of the maximum dry density as determined by ASTM D698 and shall not receive less than three passes of the light compactor.

3. Except for the bottom course, placement of fill within three feet of the face shall not lag behind the remainder of the structural fill by more than one foot. The bottom course shall be placed after the first lift is placed and compacted above the lowest soil reinforcement level.

F. Only smooth drum compactors shall be used. Grid or sheepsfoot rollers are not permitted.

G. Flooding of the backfill to achieve compaction requirements is not permitted.

H. Backfill shall be placed in a manner as to avoid any damage or disturbance of the wall materials or misalignment of the facing panels or reinforcing elements. Any wall materials that become damaged during backfill placement shall be removed and replaced at the Contractor’s expense. Any misalignment or distortion of the wall facing panels due to placement of backfill outside the limits set forth in this specification shall be corrected at Contractor’s expense.
I. Backfill shall be placed and compacted parallel to the wall facing panels. Backfill placement shall work from a distance of no less than 3 feet from the wall panels and work towards the end of the soil reinforcement.

J. At the end of each workday, the Contractor shall shape the last level of backfill to permit runoff of rainwater away from the wall face or shall provide positive means of controlling runoff away from the wall.

3.5 DRAINAGE SYSTEM AND UNDERDRAINS

A. Install wall drainage systems and underdrains in accordance with approved shop drawings, the Contract Drawings, and Section 02700, “Storm Sewer Systems”.

3.6 FIELD QUALITY CONTROL

A. Backfill conformance testing frequency shall be as follows:

1. Gradation of Granular Backfill: One test per 5,000 tons, change in material source, or as required by Contacting Officer.

2. Soundness and Electrochemical Properties: One test per 10,000 tons, change in material source, or as required by Contacting Officer.

3. Angle of Shearing Resistance: One test per 10,000 tons, change in material source, or as required by Contacting Officer.

B. Compaction Test Frequency:

1. For each fill area less than 5,000 square-feet perform a minimum of three moisture and density tests for each layer of compacted fill.

2. For fill areas in excess of 5,000 square-feet, perform a minimum of one moisture and density test for every 5,000 square-feet. for each layer of compacted fill.

3. For wall subgrades, perform a minimum of one moisture and density test for every 5,000 square-feet or portion thereof.

C. Testing shall be at the expense of the Contractor.

D. Testing shall be accomplished by a testing laboratories complying with requirements of Section 01450, “Quality Control”.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Mechanically stabilized earth retaining wall will be measured by and paid for at the unit price for “Mechanically Stabilized Earth Retaining Wall” per square foot on the front surface area of the wall, from the top of the leveling pad to the top of the coping. The quantity measured and paid for will be that shown on the Contract Drawings. Should the actual area installed vary from the plans quantity shown on the Contract Drawings, no additional payment will be made for additional square footage.

B. Excavation and earthwork, including backfill, soil reinforcing, and backfill material within the reinforced volume will not be measured separately for payment, but shall be considered subsidiary to the construction of the mechanically stabilized earth retaining wall.

C. Subdrains or underdrains for the retaining wall will not be measured separately for payment, but shall be considered subsidiary to the construction of the mechanically stabilized earth retaining wall.

D. Reinforcing, formwork, concrete, joint filler, leveling pad and other pertinent items will not be measured separately for payment, but shall be considered incidental to the construction of the mechanically stabilized earth retaining wall.

E. Drainage systems not for the retaining wall shall be measured and paid for in accordance with Section 02700, “Storm Sewer System”.

F. Penetrating concrete stain shall be measured and paid for in accordance with Section 09980, “Coatings for Concrete and Masonry”.

G. Handrail will be measured and paid for under Section 05520 - Pipe and Tube Railings".

END OF SECTION 02872
PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies the procurement and installation of the station furnishings to be located on the station platforms. Such furnishings include trash receptacles, newspaper dispensers, bicycle lockers, seating and bus shelters, including their miscellaneous connections and attachments.

1.2 REFERENCED STANDARDS
A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A36/A36M - Standard Specification for Carbon Structural Steel
   3. ASTM A500 - Standard Specification for Cold-Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes
   5. ASTM D1044 - Standard Test Method for Resistance of Transparent Plastics to Surface Abrasion

1.3 SUBMITTALS
A. Product data: Submit manufacturer's data for each type of station furnishings item specified, with installation instructions for each type that is connected or attached to other construction. Include methods of installation for each type of substrate.
B. Shop Drawings: Submit shop drawings showing installation, details of accessories permanently affixed to construction, including full scale installation details of special conditions.
C. Samples: Submit full-size samples for approval purposes of each station furnishings item consisting of manufacturer's standard size samples showing connection and attachment details. If approved, these samples can be incorporated in the finished installation.
D. Submit manufacturer's printed instructions for maintenance of station furnishings, including methods and frequency recommended for maintaining optimum condition under anticipated use conditions. Include precautions against materials and methods which may be detrimental to finishes and performance.

1.4 PRODUCT DELIVERY, STORAGE, AND HANDLING
A. Transport furnishings to Worksite from the storage area in original factory wrappings and containers, clearly labeled with identification of manufacturer, brand name, and lot number.
B. Store materials in original undamaged packages and containers, inside well-ventilated area protected from weather, moisture, soiling, extreme temperatures, and humidity. Place materials on at least 4 inch high sills on floors in a manner that will prevent damage and rusting. Avoid the use of non-vented plastic or canvas shelters which could create a humidity chamber.
C. Comply with instructions and recommendations of manufacturer for special transportation, storage, and handling requirements.
D. Securely package furnishings items in crates, boxes, or containers to protect them from being scratched, dented, scraped, marked, or blemished in any way during shipping or storage.
E. Upon delivery of furnishings at the storage area in Dallas, examine all packages of furnishings for damage and repair any minor damage as directed by the Contracting Officer. Furnishings which are not repairable as determined by the Contracting Officer shall be removed and replaced with acceptable furnishings.
F. Do not install damaged furnishings, but furnishings damaged in transportation will be replaced.
G. Inspect all furnishings prior to transporting to determine if item is damaged. Do not transport damaged furnishings.

1.5 SEQUENCE AND SCHEDULING
A. Sequence accessory installation with other work to minimize possibility of damage and soiling during remainder of construction period.

PART 2 - PRODUCTS

2.1 TRASH RECEPTACLES
A. Trash receptacles shall be constructed with a wire grid panel of 5/16 inch frame and bars 2-1/2 inches on center with 1/8 inch cross wires 1/2 inch on center, set in 7/8 inch steel rings. As manufactured by Landscape Forms, Inc. or approved equal, the style shall be the Plexus Collection (LX5002-20-40), 20 inch receptacle, with tamper proof custom...
mounting brackets. Finish shall be powder coat, "Driftwood" color.

B. Trash receptacles shall be furnished with a clear polyethylene liner that accepts poly trash bags and a spun-metal hinged side-opening lid with locking device; finish shall be powder coat, "Dove" color.

C. Trash receptacles shall be provided and installed with custom wall mounted brackets from trash receptacle manufacturer, finish to be powder coat, "Driftwood" color.

2.2 NEWSPAPER DISPENSERS

Not used.

2.3 BICYCLE RACKS

A. Frame: Stainless steel.

1. ASTM A312, Schedule 40S, TP 304.

B. Style: Serpentine or ribbon.

C. Overall Height: Nominal 36 inches.

D. Overall Width: Nominal 62 to 64 inches.

E. Embed Depth: 12 inches minimum below top of concrete.

F. Capacity: Designed to accommodate not less than seven bicycles.

G. Installation Method: Embedded (E), cast in concrete.

H. Stainless-Steel Finish (S): Satin No. 4.

I. Manufacturer and Model:

1. AAA Ribbon Rack Co., Inc., Division of Brandir International, "Ribbon Rack" Model RB 07-S-E.
2. Columbia Cascade Company, "Original CycLoops", Model 2170-7-S-E.
4. Huntco, Model BR7-S-E.
5. Madrax, A T.L. Graber Co., "Heavy Duty Challenger", Model H36-7-IG-S.
6. Or approved equal.

2.4 BICYCLE LIDS

A. Molded composite bicycle lid enclosures shall be manufactured with fiberglass reinforced plastic with a solid color stipple texture finish, 2 bike model.

B. Color: As selected from manufacturer’s standard colors.

C. Manufacturer and Model:

3. Or approved equal.

2.5 SEATS

A. Seats shall be constructed with a wire grid panel of 5/8 inch frame and bars 2-1/2 inches on center, with 1/8 inch cross wires 1/2 inch on center inserted in 7/8 inch steel frame as manufactured by Landscape Forms, Inc. or approved equal. Style shall be Rialto flat rectangular seat, (RLFS02) finish to be powder coat finish, color as selected. Size of rectangular seat is 17-1/2 inches wide by 20 inches deep.

B. Seats shall include embedded support, finished with a powder coat finish, color to match seats.

2.6 BUS SHELTERS

A. Vertical Support Columns: 2-1/2 inch square and 2-1/2 inch by 5 inch rectangular steel tubing (ASTM A500, Grade B or better) with minimum 0.188 inch wall thickness.

B. Slipfitter Bases: For lowermost end of each vertical support column. Base plate of 0.25 hot rolled steel (ASTM A576). Base plate can be configured for either internal or exterior mounting.

C. Horizontal Framing System: 2-1/2 inch square steel tubing (ASTM A500, Grade B or better) with minimum 0.188 inch wall thickness. Framing system shall have cross members or be fabricated such that the wall glazing cannot be flexed or be kicked out.

D. Roof Framing Assembly: 2-1/2 inch square steel tubing (ASTM A500, Grade B or better) with minimum 0.188 inch wall thickness and 2-1/2 inch structural steel angle (ASTM A36/A36M) with minimum 0.25 inch thickness.

2. Glazing bars: 0.25 inch carbon steel flat stock (ASTM A36/A36M).
3. Roof end caps: 12 gauge cold rolled steel.

E. Benches: Steel benches at both ends of shelter.

F. Configuration: Center windscreen shall allow patrons to ingress and egress form both front and rear of shelter.

H. Color to match Benjamin Moore No. 1600.

I. Glazing:

1. Abrasion and UV-Resistant, Monolithic Polycarbonate Sheet: Sheet coated on both surfaces to produce an abrasion resistance of 0.8 to 2 percent maximum haze increase for 100 revolutions of CS-10F wheel per ASTM D1044.

2. Protected with adhesive backed protective paper until removal in the field.

3. Thickness:
   a. Wall glazing: 0.25 inch.
   b. Roof glazing: 0.188 inch.

4. Manufacturer and Product:
   b. GE Plastics, Structured Products, “LEXAN MR5”.
   c. Sheffield Plastics, Inc., “HYZOD AR”.
   d. Or approved equal.

J. Manufacturer and Model:

1. JWI, Inc., “Street Smart Designs” Model SV-56-3M-C-A.

2. Or approved equal.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas where installation is to be performed.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION, GENERAL

A. Comply with manufacturer’s written installation instructions, unless more stringent requirements are indicated. Complete field assembly of site and street furnishings, where required.

B. Unless otherwise indicated, install site and street furnishings after landscaping and paving have been completed.

C. Install site and street furnishings level, plumb, true, and securely anchored at locations indicated on Drawings.

D. Posts Set into Voids in Concrete: Form or core-drill holes for installing posts in concrete to depth recommended in writing by manufacturer of site and street furnishings and 3/4 inch larger than OD of post. Clean holes of loose material, insert posts, and fill annular space between post and concrete with nonshrink, nonmetallic grout, mixed and placed to comply with anchoring material manufacturer’s written instructions, with top smoothed and shaped to shed water.

3.3 CLEANING

A. After completing site and street furnishing installation, inspect components. Remove spots, dirt, and debris. Repair damaged finishes to match original finish or replace component.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will be paid for on a lump sum basis for station furnishings per location indicated wherein no measurement will be made.

END OF SECTION 02873
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes specifications for placing topsoil or site soil; soil preparation and fine grading; furnishing and installing trees, shrubs, and groundcovers; seeding; and staking and guying trees as indicated.

B. Plant-establishment time periods are in:
   1. Section 02950, "Landscape Planting"
   2. Section 02930, "Seeding and Sodding - Irrigated Areas"
   3. Section 02931, "Seeding and Sodding - Non-Irrigated Areas"

C. Slope protection and hydroseeding are specified in Section 02271, "Ditch Lining and Slope Protection".

D. Landscape irrigation is specified in Section 02810, Landscape Irrigation System.

1.2 SUBMITTALS

A. Plant Substitutions: Plant substitutions will not be permitted unless the Contractor furnishes the Contracting Officer with written evidence from no less than three nurseries that the plants specified are not obtainable. Such evidence shall be submitted within 30 calendar days after the effective date of the Notice to Proceed.

1.3 QUALITY ASSURANCE

A. Installer's Qualifications: Installer shall be a specialist in installing and planting landscape products, with documented experience in performing landscape work of comparable size, scope, and quality.

B. Supervision: Provide the services of at least one qualified person who shall be present during execution of the work of this Section. That individual, who shall direct the work, shall be thoroughly familiar with the types of materials being installed and the proper methods for their installation.

C. Contracting Officer's Observance:
   1. The work specified herein will be observed by the Contracting Officer. The Contractor shall request observance at least 24 hours in advance of the time such observance is required. Observance is required on the following portions of the work:
      a. During preliminary grading and soil preparation;
      b. When finish grading has been completed, and before the planting of grass, turf, and groundcover;
      c. When shrubs and trees are spotted for planting, before planting holes are excavated;
      d. When planting begins;
      e. When planting and other work has been completed;
      f. Before trenching; and
      g. Before any trenching is covered.

2. The Contractor shall require the supervisor of the landscape planting work to be on the site at the time of each such observance.

1.4 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Delivery:
   1. Deliver fertilizer and other chemicals to the site in original unopened containers bearing manufacturer's guarantied chemical analysis, weight, manufacturer's name, trademark, and conformance with state law.
   2. Deliver plant materials to the jobsite no earlier than three calendar days prior to planting.
   3. Protect plant material during delivery to prevent damage to root ball or desiccation of leaves.
   4. If trees and plants are transported in open trucks, trees and plants shall be wrapped to prevent damage and windburn. Adequate protection shall be placed between trees so that trunks are not scarred in transport and branches are not broken. Tree trunks shall be wrapped with protective covering prior to handling and loading. Covering shall be removed at the time of plant materials inspection at the job site.
   5. Notify the Contracting Officer in advance of delivery of plant materials, and submit an itemized list of the plants in each delivery.
B. Handling: Exercise care in handling, loading, unloading, and storing of plant materials. Plant materials damaged in any way shall be discarded and replaced with undamaged materials.

C. Storage:
1. Protect plant materials from wind, excessive sun, and drying out.
2. Fertilizer and lime shall not be stored with other landscape material. Herbicides and pesticides shall not be stored with other landscape material.

1.5 ENVIRONMENTAL REQUIREMENTS

A. Planting shall not be performed during weather conditions which may adversely affect landscape materials, plants, and planting conditions.

1.6 SITE CONDITIONS AND SCHEDULING

A. Landscape work shall not begin until structures, utilities, paving, and other improvements, which require access to or through planting areas, have been installed and accepted unless approved by the Contracting Officer. Planting work shall not begin until the landscape irrigation system is installed in place, tested, and accepted by the Contracting Officer.

1.7 WARRANTY

A. Warrant that trees, shrubs, groundcovers, and other plant materials will take root and grow vigorously within one year after final acceptance of plantings, when such plants have received normal care and maintenance. Warranty commences at end of plant establishment period and final acceptance.

B. The warranty shall include replacement of trees and other plant materials that die back and lose the form and size as originally specified, even though they may have taken root and are growing after the die-back.

C. Corrective work shall include removal and replacement of warranted plant materials which, for any reason, fail to meet the requirements of the warranty. Replacements shall meet the same requirements as specified for the original materials. Replacements shall carry the same warranty period which shall start from the time the replacements are planted and accepted.

D. The maintenance period shall be for the entire one-year warranty period as specified in the General Conditions.

PART 2 - PRODUCTS

2.1 PLANT STOCK

A. Plant stock and materials are indicated in the Planting List or Schedule on the Contract Drawings. Provide trees and plants of the varieties, sizes, and quantities indicated. Provide nursery-grown stock only, which is free from insect pests and diseases.

B. Plants shall comply with Federal and State laws requiring inspection for plant diseases and infestations. Inspection certificates required by law shall accompany each shipment of plants, and the certificates shall be delivered to the Contracting Officer. Plants shall be true to species, varieties, and the sizes indicated, and shall be labeled in accordance with the recommended practice of the American Association of Nurserymen.

C. Label trees and bundles, containers or flats of the same shrub, ground cover and vine with durable waterproof labels and weather resistant ink. Labels shall state the correct plant name and size as specified in the Plant List on the Contract Drawings, and shall be legible for 60 days after delivery to the planting site. Plant material which is not labeled will be rejected.

D. Plants shall be healthy, shapely, and well-rooted. Roots shall show no evidence of having been root bound, restricted, or deformed. Plant material which has just been upgraded in container size will be rejected. Root condition of plants in containers will be inspected by the Contracting Officer by removal of earth from the roots of not less than two plants of each species or variety from each source. Plant materials requiring inspection by the Contracting Officer shall be assembled and available for such inspections. If the sample plants inspected are found to be defective, the Contracting Officer reserves the right to reject the entire lot or lots of plants represented by the defective samples.

E. Trees shall have straight trunks with the leader intact, undamaged, and uncut. Old abrasions and cuts shall be completely calloused over. Trees shall be measured when their branches are in their normal position. The height of a tree shall be measured from root crown to top of plant. The width of a tree shall be measured at branching at the widest point. Sizes shown on the Contract Drawings are before pruning. Trees shall not be pruned prior to delivery except upon approval of the Contracting Officer.

F. Trees shall be well tapered in the trunk so that when the nursery stake is removed, the tree supports itself upright without further staking. Trees shall have a main leader. The main branches shall be spaced vertically and alternately along the
trunk. Branching shall not be concentrated in one location and there shall be no severe crossing of branches. Branches shall be smaller in diameter than the trunk. Branch attachments shall be free of embedded bark. Branching along the lower two-thirds of the trunk shall have at least one half of the foliage of the tree.

G. Rejected plant materials shall be removed from the site and replaced with materials which conform to specified requirements.

H. Plant material shall be grown under similar climatic conditions to those found at the project site.

I. Ground cover and vines shall be rooted plants, grown in flats unless indicated otherwise on the Contract Drawings, or as approved by the Contracting Officer.

2.2 SOURCE QUALITY CONTROL

A. The Contracting Officer will inspect the source of supply (landscape nursery) of the proposed plant materials prior to shipment to the site.

B. Plant materials shall be properly labeled as herein before specified, before the Contracting Officer’s inspection of proposed plant materials. Plant materials which do not conform with specified requirements will be rejected, and shall be replaced with Contracting Officer-approved plants.

C. Notify the Contracting Officer at least ten days before shipment of plant materials from the source of supply.

PART 3 - EXECUTION

3.1 COORDINATION

A. Coordinate layout and installation of plant materials with installation of the irrigation system to ensure that there will be complete and full irrigation coverage of the planted areas.

3.2 EXCAVATION AND BACKFILL

A. Excavate and backfill areas to be landscaped as indicated and specified herein.

B. Excavations for soil removal shall be to within 6 inches of back of curb or edge of walk. The Contractor shall be responsible for protecting and maintaining the integrity of compacted base rock and subgrade materials under paving and curbs, and for protecting other structures in the excavated areas. Review with the Contracting Officer, the distance to remain away from other structures within the excavated areas. Do not undercut sides of excavation. Damage to base rock, subgrade, paving, curbs or structures shall be repaired or replaced. Remove and dispose of asphalt debris, concrete, base rock, and existing soil in landscaped areas from the site.

C. Refer to Section 02910 and drawings for depths of backfill.

D. Backfill excavated tree and shrub planting areas with topsoil. Prior to installing topsoil, scarify the bottom of the excavation to a 6 inch depth. Do not scarify or undercut sides of excavations. The Contractor shall be responsible for protecting base rock and subgrade compaction under adjacent paving and curbs. Provide topsoil backfill in 6 inch lifts. Incorporate the first 6 inch lift of topsoil into the existing soil at the bottom of the excavation.

E. Refer to Section 02220, “Grading, Excavating and Backfilling”, for requirements for disposal of surplus material from planting bed excavations.

3.3 ROUGH GRADING

A. Prior to planting, grade areas to be landscaped. Fill as needed or remove surplus dirt and float areas to a smooth uniform grade. Slope planting areas to drain. Roll, scarify, rake, and level as necessary to obtain true, even planting surfaces. Rough grading shall be inspected and approved by the Contracting Officer before amendments and fertilizers are added.

B. Planting areas shall be thoroughly wetted down. Allow soil to dry so as to be workable, after which thoroughly cultivate to a depth of 6 inches using a rotary hoe.

3.4 PLANTING OF TREES AND SHRUBS

A. Stake Plant Locations. Mark tree and shrub locations on site using stakes or similar means. Make adjustments to locations, where required by the Contracting Officer, and locations shall be approved by the Contracting Officer before plant holes are dug.

B. Planting Holes: Dig pits with vertical sides as indicated. After pits are dug, break the sides to open the wall of the pit for root penetration, and loosen the bottom of the pit to a depth of 3 inches. Perform a drainage test, as specified in Section
LANDSCAPING - GENERAL

02950, where required. Construct foot-tamped mound in the bottom of the pit to support the plant at the proper level.

C. Root Barriers: Install root barriers as indicated.

D. Watering Holes: Install watering holes as indicated.

E. Landscape Fabric: Install landscape filter fabric where indicated on the drawings. The fabric shall be tucked into the soil 2 inches along the perimeter of the landscaped areas. Provide 1 foot overlaps at sides and ends. Secure against movement with specified anchorage staples. Furnish cutouts in the fabric to accommodate irrigation items and at tree, shrub, and vine planting locations.

F. Placement of Plants:

1. Do not move or handle container plants by the tops, stems, or trunks. Lift plants so that the root ball is supported from the underside. Plants that do not have a satisfactory root system will be rejected.

2. Cut the root ball vertically in a few places to encourage new feeder root development along the perimeter of the root ball.

3. Plants shall be planted immediately after rootballs are cut.

4. Place each plant in an upright and plumb position. Plants, up to 15 gallon size, shall be typically set so that the top of the root ball will be 1 to 3 inches above the finish grade to allow for settling.

5. Ground cover shall be installed at spacings indicated on Contract Drawings, and shall be evenly spaced and staggered in rows. Place each plant in a pit so that the root system lies free without doubling and so that the roots are planted vertically. Firm the soil around each plant and water the area immediately to avoid drying out.

G. Backfilling:

1. Backfill holes and pits with amended topsoil. Ensure that proper irrigation will be maintained to the rootball. Taper backfill around sides and up to the top of the rootball so that sides of the rootball are not exposed.

2. Backfill for planting in areas where topsoil has been placed earlier shall be topsoil excavated from the planting hole. Backfill for plants in areas where existing site soil remains shall be the topsoil amended in accordance with the Soil Analysis Report (see Section 02930, "Seeding and Sodding - Irrigated Areas") and as specified on the drawings.

3. Construct a 4 inch high berm (watering basin) around plant holes and fill the watering basin with root stimulator solution. Mix and apply the solution in accordance with the manufacturer's written instructions.

4. Backfill shall be watered until the backfill material is moist to the full depth of the hole.

H. Pruning: Pruning shall not be performed unless specifically requested or approved by the Contracting Officer. Examine trees requiring pruning with the Contracting Officer. Trees that are damaged due to improper pruning or wind damage shall be replaced.

I. Bracing: Use tree bracing as shown on the drawings to set tree plumb.

J. Adjustment of Plants:

1. Plants that settle deeper than specified shall be raised to the correct level.

2. Plants that go out of plumb shall be straightened and stabilized.

K. Top Dressing: Install a 3 inch layer of mulch in landscaped areas. Mulch shall be kept away from stems and trunks of plants, and shall be kept off the foliage of ground cover.

3.5 DRAINAGE TEST AND AUGER HOLES

A. Requirements: After tree pits are dug and before planting operations, tree pits shall be water tested for drainage if requested by Contracting Officer.

B. Tests: Fill tree pits with water. Check holes after 24 hours to determine if water has drained out. If the water has not drained out, bring this to the attention of the Contracting Officer for remedial course of action. Adjustment of pit size, adjustment of pit location, or addition of auger holes will be required by the Contracting Officer if a drainage problem exists.
C. Auger Holes: Auger one 6 inch diameter hole through the bottom of each excavated plant hole that does not drain within the specified 24 hour period. Depth of the drill measured from the bottom of the excavation to the bottom of the drill hole shall be 4 feet. Backfill auger holes with 3/4 inch diameter, well-graded drain rock up to bottom of the plant hole. Cover drain rock in the auger hole with a 2 feet by 2 feet piece of landscape filter fabric.

3.6 CLEANUP
A. Comply with the requirements of Section 01740, Cleaning.
B. Neatly dress and finish landscaped areas.
C. Broom clean pavements.

3.7 PRELIMINARY TO FINAL INSPECTION
A. At completion of the work of this Section, the Contractor shall request a preliminary inspection to determine the condition theof landscaped areas.
B. Inspection shall be requested three working days in advance.
C. The Contractor and Contracting Officer shall be represented at the inspection.
D. Construction considered ready for inspection shall conform with the following requirements:
   1. Planting shall be healthy and free of infestations.
   2. Landscaped areas shall be free of weeds.
   3. Stakes and stabilizers shall be as specified.
   4. Mulch shall be raked to a uniform surface.
   5. Debris shall be removed from the landscaped area, pavements shall be broom clean, and foliage shall be washed clean.
   6. Plants shall be installed in place as indicated and specified.

3.8 FINAL INSPECTION AND ACCEPTANCE
A. Final inspection will be conducted at the end of the Plant Establishment Period. Notice requesting final inspection shall be submitted by the Contractor to the Contracting Officer at least 14 calendar days prior to the anticipated date.
B. Care shall be taken to prevent the deposit of fertilizer on stems or leaves. Fertilizer shall be spread with a mechanical spreader wherever possible. Fertilizer shall be applied only during favorable weather conditions to prevent dissipation by wind. Plants shall be thoroughly watered after fertilizer has been applied.
C. Mulch shall be raked away from around plant bases. Fertilizer shall be spread around each plant base and worked into the top 2 inches of soil. Mulch shall then be replaced.
D. Prior to final inspection, the Contractor shall also have performed weeding and a thorough cleaning of the landscaped areas.
E. The irrigation system shall be tested at the final inspection. Refer to Section 02975, “Landscape Irrigation System”, for additional information.
F. At the final inspection, the Contracting Officer will determine the condition of the plants and improvements. Acceptance of this work will be contingent upon proper maintenance and the establishment of vigorous plant materials. Plants which are dead, unhealthy, or missing, whether by disease, neglect, vandalism, or any other reason, shall be replaced with the same species and sizes originally specified and following these same specifications for installation.
G. Provide plant replacements within 30 days after final inspection, and extend the Plant Establishment Period for an additional 30 calendar days after replacement planting has been accepted by the Contracting Officer. The Contracting Officer will then repeat the final inspection for the replaced plants at the end of the extended Plant Establishment Period.

3.9 MAINTENANCE FOR PLANT ESTABLISHMENT
A. Maintain plant materials from the time of planting until end of plant establishment period.
B. Maintenance shall include watering, cultivating, weeding, remulching, repair of stakes, fertilizing, cultivation, spraying, and pruning as required to keep the plant material in a healthy growing condition and to keep the planted areas neat and attractive in appearance throughout the maintenance period. Maintenance shall also include treatment for fungus, diseases, rodents, insects, and repair of vandalism.
C. Plants in irrigated areas shall be watered not less than twice a week. Each watering shall be of such quantity as to provide optimum growing conditions. Rinse foliage of plant materials as often as necessary to keep foliage free of dust.
D. Rocks, clods, and debris which appear on the surface shall be removed. Heaved, settled, or eroded areas shall be restored by excavating, addition of topsoil, filling, finish grading, and rolling as required.

E. Gravel, surplus earth, papers, trash and debris, which accumulate in the landscaped areas and the areas directly adjacent to the paved areas, shall be removed and disposed of weekly. Such areas shall be cared for as required to present a neat and clean condition.

F. Provide weeding of areas, at intervals of not more than 14 days, as follows:

1. Weeds which appear in asphalt, concrete, or paved areas within Contract limits shall be killed before they exceed 2 inches in height or spread, by spraying with a contact herbicide which shall not stain the surfacing.

2. Weeds in ground cover shall be killed by spraying with a contact herbicide, approved by the Contracting Officer, before they exceed 2 inches in height or spread, or shall be removed by pulling with roots intact before they exceed 4 inches in height or spread.

3. Weeds between basins in areas planted with trees and shrubs shall be removed by pulling before they exceed 4 inches in height or spread. Weeds shall be removed from within basins, including basin walls, and from within planter boxes. Weed not killed by spraying shall be pulled with its roots intact.

4. Before using herbicide or pesticide, the Contractor shall obtain permits and approval from the jurisdictional authority for the proposed material and for the rate of application.

a. The Contractor shall submit material safety data sheets for herbicides and pesticides in accordance with the requirements of Section 01600, “Product Requirements”.

b. The Contractor shall be responsible for protecting plants, on or off the site, from damage by spraying operations. Weed control shall be performed as often as required to maintain the project in a neat and weed-free condition.

G. Watering shall be adequate to provide maintenance of healthy plant growth, and shall be controlled to prevent over saturation of soil leading to plant failure. Basins, where required, and basin walls shall be kept well formed.

H. Trees, shrubs, and ground cover shall be maintained by regular watering, cultivating, and weeding. Stakes and ties shall be repaired as needed. Plants shall be sprayed for insect pests and pruned as necessary or when requested by the Contracting Officer. Damaged, unhealthy or dead trees, shrubs and ground cover shall, upon discovery of loss or damage, be replaced immediately with new stock of a size to match the remaining healthy plants of the same variety.

I. Until the end of the Plant Establishment Period, plants which are damaged by herbicide, diseased, dead, or which are in an unhealthy condition exhibiting weakness and the probability of dying, shall be replaced within two weeks after notification from the Contracting Officer. Replacements of plants shall be made in the same manner as specified for the original planting.

J. On the last day of the Plant Establishment Period, complete the weeding and raking of planting areas. The site shall be cleared of debris and presented in a neat and orderly condition. Plants shall be in a healthy, thriving condition. Stakes shall be vertical. Paved areas shall be broom cleaned, and areas damaged by erosion shall be repaired, including the replacement of plants.

**PART 4 - MEASUREMENT AND PAYMENT**

**4.1 GENERAL**

A. The work specified in this section will not be measured separately for payment, but all costs in connection therewith will be considered incidental to the work specified in other 02900 Series Sections such as Section 02910, “Topsoil and Finished Grading”.

END OF SECTION 02900
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section includes specifications for finished grading including addition of sandy loam and compost in preparation for planting.

1.2 REFERENCED STANDARDS

A. US Composting Council (USCC)
   1. Test Methods for Examination of Composting and Compost (TMECC)
      a. TMECC 02.02-B Sample Sieving for Aggregate Size Classification
      b. TMECC 04.06 Heavy Metals and Hazardous Elements
      c. TMECC 04.10-A 1:5Slurry Method, Mass Basis
      d. TMECC 04.11-A 1:5 Slurry pH
      e. TMECC 05.05-A Seedling Emergence and Relative Growth
      f. TMECC 05.07-A Loss on Ignition Organic Matter Method
      g. TMECC 05.08-B Carbon Dioxide Evolution Rate
      h. TMECC 07.01-B Fecal Coliforms

1.3 SUBMITTALS

A. Samples: Submit for testing two 1/2 cubic foot samples of the material proposed for sandy loam and compost.

B. Test Results: Submit certified test results for sandy loam and compost performed by an independent testing laboratory approved by the Authority certifying that the proposed material complies with the specifications. Contractor shall bear costs of the tests.

C. Documentation of permits for disposal of excavated material: (If required)
   1. Obtain written permits and releases from owners of property where material will be deposited in accordance with Section 02100, "Site Preparation".
   2. Submit copies of written permission and releases from owner of the property where excess materials and landscape waste shall be deposited. Submit copy of permission and releases to Contracting Officer seven calendar days prior to disposal of material.

1.4 QUALITY ASSURANCE

A. Notify the Contracting Officer and obtain Contracting Officer’s inspection and approval of product source prior to transporting materials.

1.5 JOB CONDITIONS

A. Existing Drainage:
   1. Refer to Section 01562, "Soil Erosion and Sediment Control", for related requirements.
   2. Preserve, protect, and maintain existing operable drains and sewers during grading operations.

B. Refer to Section 01500, "Temporary Facilities and Services" for requirements for barricades and other protective devices.

C. Location of Underground Facilities and Structures:
   1. Contractor shall verify locations of underground facilities and structures. Locations shown for utility facilities are taken from the various utility records and are approximate.
   2. Verify locations of existing utilities in accordance with Section 02760, "Maintenance, Support and Restoration of Existing Utility Facilities".

D. Toxic, Hazardous, and Combustible Substances:
   1. Comply with the requirements of Section 01560 "Environmental Protection".
   2. During excavation, provide equipment and carry out such tests as necessary to detect presence of toxic, hazardous, and combustible substances.
   3. Take action to safeguard persons and property in accordance with rules and regulations of jurisdictional agencies and utility owners.
   4. Promptly notify utility owners when problems concerning their facilities become apparent.
1.6 WARRANTY

A. Warranty of Construction required under the General Provisions shall include correction of settled, eroded, or rutted areas.

PART 2 - PRODUCTS

2.1 SANDY LOAM

A. Sandy loam: Friable, fertile, dark, loamy soil, free of clay lumps, subsoil, stones and other extraneous material and reasonably free of weeds and foreign grasses. Loam containing Dallisgrass or Nutgrass will be rejected.

B. Physical properties as follows:

1. Clay: Between 7 to 27 percent.

2. Silt: between 15 to 35 percent.

3. Sand: less than 52 percent.

4. Organic matter: between 2 to 12 percent of total dry weight.

5. pH: between 6.0 and 8.7.

C. Obtain sandy loam from naturally well-drained areas a uniform loam, which is free from subsoil, slag, brush, objectionable weeds and other litter, and free from clay lumps, stones, stumps, roots, or other objects larger than 1 inch in diameter. Sandy loam shall also be free from toxic substances and other material or substances which might be harmful to plant growth or be a hindrance to grading, planting and maintenance operations.

2.2 COMPOST

A. Compost that has been produced by aerobic (biological) decomposition of organic matter and meets the requirements set forth by the United States Department of Agriculture and the United States Composting Council (USCC), “Test Methods for the Examination of Composting and Compost” (TMECC), shown in Table 02910 - 1. Compost feedstock may include, but is not limited to, leaves and yard trimmings, biosolids, food scraps, food-processing residuals, manure or other agricultural residuals, forest residues, bark, and paper. Ensure compost and wood chips do not contain any visible refuse, other physical contaminants, or any substance considered to be harmful to plant growth. Do not use mixed municipal solid waste compost. Provide compost meeting all applicable United States Code of Federal Regulations (CFR), Title 40, Part 503 standards for Class A biosolids and Texas Commission on Environmental Quality (TCEQ) health and safety regulations as defined in the Texas Administrative Code (TAC), Chapter 332, including the time and temperature standards in Subchapter B, Part 23. Meet the requirements of the USCC Seal of Testing Assurance (STA) program.

Table 02910 - 1

<table>
<thead>
<tr>
<th>Physical Requirements for Compost</th>
</tr>
</thead>
<tbody>
<tr>
<td>Particle Size: 95 percent passing 5/8 inch, 70 percent passing 3/8 inch in accordance with TMECC 02.02-B</td>

<tr>
<td>Fecal Coliform: Pass in accordance with TMECC 07.01-B</td>
</tr>
</tbody>
</table>

* A soluble salt content up to 10.0 dS/m for compost used in CMT will be acceptable.

B. Before delivery of the compost, provide Quality Control documentation that includes the following:

1. The feedstock by percentage in the final compost product,

2. Statement that the compost meets federal and state health and safety regulations,

3. Statement that the composting process has met time and temperature requirements,

4. Copy of the producer’s STA certification, and

5. Copy of the lab analysis, performed by an STA-certified lab, verifying that the compost meets the requirements of Table 02910 - 1.

6. When furnishing biosolids compost, also provide a copy of the current TCEQ Compliance Statement signed by the facility manager.

C. Provide a designated project stockpile of unblended compost for sampling and testing at the producer’s site. Samples from each stockpile will be taken by the Department for Quality Assurance. Make payment to the STA-certified lab chosen by the Owner’s Representative for the required Quality Assurance testing.

D. Maintain compost in designated stockpiles at the producer’s site until accepted by the Owner’s Representative. The Owner’s Representative reserves the right to sample compost at the job site.
TOPSOIL AND FINISHED GRADING

PART 3 - EXECUTION

3.1 FINISHED GRADING

A. Finished grading: Finished grading shall consist of preparation of areas designated to be planted and addition and incorporation of sufficient quantity of Sandy Loam and Compost to bring areas to required finish elevation in accordance with Section 02220, “Grading, Excavating and Backfilling”.

B. Areas to receive sandy loam and compost shall be ripped to depths shown in details over areas modified by work of this contract which are not covered by building, walk or paving.

C. Place sandy loam and compost in areas ripped to depth shown in detail of area to be modified and till into existing soils until sandy loam and compost are uniformly distributed. Areas to be modified are to be tilled and amendments thoroughly mixed with existing soils to depths as shown on drawings.

D. When weeding and soil conditioning have been completed and soil has been thoroughly water settled, landscaped areas shall be finish graded for placement of plant materials. Grading shall be performed when the soil is at an optimum moisture content for working.

E. Uniformly distribute soil mixture to required grades; feather back to where grades remain unchanged.

F. Finished grades shall be in accordance with the grading details for mounding in landscaped areas. Landscaped areas shall slope uniformly for positive drainage.

G. Grades not otherwise indicated shall be uniform levels or slopes between points where elevations are given, or between points established by walks, paving, curbs or catch basins. Finish grades shall be smooth, even, and on a uniform plane with no abrupt change of surface and no erosion scars.

H. Grading shall provide for natural runoff of water without low spots or pockets. Flow line grades shall be accurately set and shall be not less than two percent gradient unless otherwise indicated or approved by the Contracting Officer.

I. Finish grade of earth in landscaped areas shall be one inch below the top of adjacent pavement, curbs or headers, unless indicated otherwise on the Contract Drawings. Finish grade of earth shall be one inch below the top of pull and utility boxes or utility structures. Pull and utility boxes shall be adjusted by raising or lowering to conform with grading requirements in landscaped areas.

J. Tops and toes of slopes shall be rounded to produce a gradual and natural-appearing transition between relatively level areas and slopes.

K. Protect areas against compaction by construction equipment.

L. Use water to settle areas being modified and repair settled, eroded, or rutted areas through fine grading process to achieve finish grades. Add soil mix as needed after settling to maintain finish grades.

M. Remove rubbish, vegetation and rocks over one inch in diameter. Rake areas smooth and leave suitable for establishment of lawns and planting. Correct irregularities and areas where water will stand.

N. Place Soil Mix in the platform tree wells in 6 inch compacted lifts.

O. Non lime treated native soil from on–site stockpile may be used for parking lot island.

3.2 PROTECTION

A. Protect newly graded areas from traffic and erosion; keep free of trash and rubbish.

B. Repair settled, eroded or rutted areas.

3.3 FIELD QUALITY CONTROL

A. Allowable Tolerance:

1. Construct finished grade: 0.1 foot plus or minus the elevation shown, or top of curb.

2. Construct finished grades in landscape areas as follows:

   a. Sod areas: 0.2 foot below established finished grade.

   b. Seed areas: 0.1 foot below established finished grade.

3.4 FINISHING

A. On completion of work, clean ditches and channels.

B. Slope and shape areas to provide positive drainage. Crown parking lot islands for positive drainage.

C. Remove and dispose of unsuitable soil and surplus excavated materials in accordance with Section 02220, “Grading, Excavating, and Backfilling”.

D. Leave Site in neat, presentable condition.

E. Protect newly graded areas from traffic and erosion; keep free of trash and rubbish.

F. Continue repair of settled, eroded or rutted areas and maintain finish grade until such time that turf is established in lawn areas or plant materials have rooted in bedding areas.
PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will be measured and paid for at the unit price per cubic yard (loose volume on truck) for "Sandy Loam" and "Compost".

B. Measurement will not include additional yardage caused by slips, slides, cave-ins, settling, or fill material due to the action of the elements or the carelessness of the Contractor.

END OF SECTION 02910
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies providing topsoil, fine grading, temporary and permanent seeding, and sodding at irrigated areas.

B. Temporary seeding is specified in Section 01562, “Soil Erosion and Sediment Control”.

C. Seeding and sodding at non-irrigated areas refer to Section 02931, “Seeding and Sodding - Non-Irrigated Areas”.

D. Facilities Contractor shall provide temporary seeding of station sites.

E. Landscape Contractor shall install permanent turf grass indicated on landscape drawings.

1.2 REFERENCED STANDARDS

A. American Association of State Highway and Transportation Officials (AASHTO):
   1. AASHTO M140 - Standard Specification for Emulsified Asphalt
   2. AASHTO M208 - Standard Specification for Cationic Emulsified Asphalt

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM C33 - Standard Specification for Concrete Aggregates
   2. ASTM C51 - Standard Terminology Relating to Lime and Limestone (as Used by the Industry)

C. Texas Department of Agriculture
   1. Texas Administrative Code (TAC) Title 4, Part 1, Chapter 9 – Seed Quality

1.3 SUBMITTALS

A. Samples and Certification: Submitted in accordance with Table 02930 - 2, at the end of this section, and as follows:
   1. Seed: Each seed bag bearing the following upon delivery:
      a. Analysis tag.
      b. Certification tag.
   2. Sod: Certified, each delivery bearing a certification tag and label as required by law.

3. Fertilizer: Labeled with manufacturer’s name and address, guaranteed analysis, including nutrient and its derived source, listing of potential acidity, and toxic materials.

4. Mulch: Labeled with manufacturer’s name and address, material components, trademark, chemical analysis, species, age and source.

5. Sandy Loam and Compost: Submit supplier’s name and address and source of topsoil. Submit certified report of soil laboratory test results listing textures, pH, P and K nutrients, soluble salt, organic matter and mechanical analysis as to percentage of sand, silt and clay. Do not deliver topsoil to site until approved. Approval does not constitute final acceptance. See Section 02910, “Topsoil and Finished Grading”.

6. Herbicide: Labeled with manufacturer’s name and address and chemical analysis.

1.4 SOIL ANALYSIS REPORT

A. Provide soil tests which include the following requirements:
   3. Particle Size/Appraisal: pH, salinity, organic percent, USDA Particle size.

1.5 PRODUCT INSPECTION, DELIVERY, STORAGE, AND HANDLING

A. Materials and supplies are subject to inspection and sampling for testing. Allow no seed, sod, fertilizer, straw, or other agronomic materials or supplies on Worksite other than those for the Project.

B. Seed: Deliver with labels and tags.

C. Sod:
   1. Deliver sod to job within 24 hours after being cut; place sod within 36 hours after being cut.
2. Prior to and after delivery during wet weather, allow sod to dry to the extent that will prevent tearing during handling and laying. During dry weather, water sod to ensure its vitality and prevent dropping of the soil in handling.

PART 2 - PRODUCTS

2.1 SEED

A. Provide seed free of quack grass, bent grass, clover, dock, cheat, chess, chickweed, dallisgrass, plantain, black medic, red fescue, and tall fescue.

B. Refer to plan for areas scheduled for sodding, drill seeding, broadcast seeding, hydroseeding or hydromulching.

C. Lawn Seed:
   1. Bermuda grass (Cynodon dactylon) or variety specified on drawings.
   2. Buffalo grass (Buchloe dactyloides) “Topgun” Primed KNO3 or variety specified on drawings.

D. Buffalo grass seed shall be pre-treated by soaking the seed for 24 hours in a 0.5 percent solution of potassium nitrate, then storing in moist environment at 41 degrees Fahrenheit for 4 to 6 weeks followed by drying rapidly at temperature not to exceed 110 degrees Fahrenheit.

E. Native Grass and Wildflower seed: Each wildflower species must meet minimum purity standard of 95 percent. Each species must be labeled and indicate percent germination, germination test date and quantity supplied. Submit seed vendor’s certification for required percentage of purity and germination
   1. Germination shall include hard seed and/or firm seed and/or dormant seed as determined by an approved certified seed testing laboratory.
   2. Seed must meet the requirement of the TAC Title 4, Part 1, Chapter 9, including testing and labeling for bulk seed.
   3. Seed shall be of the previous season’s crop and within 7 months prior to the planting date.
   4. Seed must be labeled and free of noxious weeds. Each seed container must have at least 1 approved Department of Agriculture seed tag on the inside of the container and one secured to the outside of the container. The seed tags shall indicate the botanical name, common name, purity and germination as specified the TAC Title 4, Part 1, Chapter 9. Wildflower seed must be delivered in a separate container for each species.

5. Seed shall be incorporated into the soil with a drill-type seeder, specifically calibrated for each size and type of seed used to guarantee uniform distribution of each species. Substitute application must guarantee uniform distribution, germination and full stand.

2.2 SOD

A. Well-rooted certified sod, at least 18 months old.
   Variety: Buffalo grass (Buchloe dactyloides) “Prairie”, or “Midiron” Bermuda grass (Cynodon dactylon) or variety specified on drawings. Refer to drawing for location.

B. Sod and attached soil free from noxious weeds such as quack grass, garlic, Johnson grass, Canada thistle, and other turf weeds.

C. Mowed in production field to height of not more than 2-1/2 inches within 5 days prior to lifting.

D. Machine cut in sections not less than 2-1/2 feet neither in length nor less than 12 inches in width and to a depth equal to growth of fibrous roots, uniform soil thickness of 3/4 inch, plus or minus 1/4 inch. Measurement for thickness to exclude top growth and thatch.

E. Cut in sections or strips strong enough to support its own weight and retain size and shape when suspended vertically from firm grasp on upper 10 percent of section. Small, irregular or broken pieces of sod are prohibited. Sod on Beck Roll is permitted.

2.3 OTHER MATERIALS

A. Fertilizer: For grass seeded and sodded areas: Approved commercial fertilizer 10-20-10.

B. Mulch:
   1. Wood cellulose fiber:
      a. Containing no growth or germination inhibiting factors and dyed green.
      b. Fibers furnished air-dry in packages not exceeding 50 pounds gross, with net weight shown on package.
   2. Straw: Wheat, barley, oat or rye straw, threshed, air-dried, and free from Canada thistle, dock, Johnson grass, and other foreign matter.
      a. 180-foot lengths or greater.
SEEDING AND SODDING - IRRIGATED AREAS

b. U-shaped staples: As standard with mulch blanket manufacturer.

C. Mulch with Tackifier:

1. Virgin wood fiber mulch with tackifier:
   a. Degradable, pure virgin wood fiber, made from whole wood chips with tackifier incorporated in the mulch from the mulch manufacturer. The mulch must be free from weeds, containing no growth or germination inhibiting factors or other foreign matter toxic to seed germination. Mulch must be suitable for hydromulching and dyed green.
   b. Acceptable product is available from Conwed, Weyerhaeuser and Camfor.

2. Apply mulch at minimum rate of 2000 pounds per acre (or 50 pounds per 1000 square feet). Cover seeded slopes where grade is 4 inches per foot or greater with tackifier at increased rate of 3000 pounds per acre (or 75 pounds per 1000 square feet).

D. Mulch Binder:

2. Synthetic binder for use with wood cellulose fiber or straw: Equal to Terra Tack 1, Grass Growers, Plainfield, New Jersey 07061; Soil Gard, Alco Chemical Company, Philadelphia, Pennsylvania 19013.

E. Fertilizer - For seeded and sodded areas: Approved commercial fertilizer applied at rate to distribute 2 pounds of nitrogen and 1 pound of phosphorous per 1000 square feet.

PART 3 - EXECUTION

3.1 APPROVAL OF AREAS

A. Delineate the areas scheduled for seeding and sodding on the site using the drawing to scale the shape and sizes of the planting areas for each mix.

B. The Contracting Officer shall approve the areas delineated to receive seed or sod prior to planting.

3.2 PREPARING SOIL AND FINE GRADING

A. Note: During hauling operations, keep walkway and roadway surfaces clean. Promptly remove sandy loam or other material.

B. After completion of construction work in the area, prepare surface of subsoil. Scalp areas that were planted with Avena oats or temporary seeding. Finish to lines shown and parallel to proposed finished grade as approved. Remove rocks and other foreign materials 1 inch or greater in any dimension.

3.3 SOIL PREPARATION

A. Soil shall be loosened and pulverized to prepare an acceptable bed for seed and sod. Pulverize soil with disc, chisel plow, tiller or other method approved by Contracting Officer, making minimum of one pass to break up clods. Do not till if soil is wet. Do not penetrate soil deeper than two inches so as not to encourage weed growth.

B. Soil Amendments, Fertilizers, and Cultivating:

1. Provide soil amendments, chemicals, and fertilizers herein before specified for both imported and approved on-site soils. These are minimum requirements. Provide such additional amendments and chemicals as are required by the Soil Reports.

2. Spread soil amendment and fertilizer evenly over ground cover areas at the following rates:
   a. Soil Amendment: As specified on the drawings
   b. Fertilizer: As specified above.

3. After approval of amendment and fertilizer applications by the Contracting Officer, incorporate soil amendments and fertilizers into the soil by repeated rotary-hoe cultivation at depth specified on drawings.

C. Watering: At completion of soil amendment and fertilizer installation, water the soil in landscaped areas for a period of 14 days. Maintain sufficient soil moisture to induce weed seed germination, but not to saturate the soil. Soil shall be moist to a minimum depth of 24 inches. In locations where irrigation is by drip or bubblers, the Contractor may, at its option and expense, install a temporary irrigation system to keep the soil moist.

D. Fine grade, level and scarify with a weighted spike harrow, spike float drag, or by hand raking. Leave no depressions, ruts, soft spots or humps. Finish to lines or elevations shown and parallel to proposed finished grade, as approved. Maintain positive drainage on site. Remove rocks, clods, weeds, trash or debris from area to be seeded or sodded. Legally dispose debris off site.
3.4 HERBICIDE APPLICATION

A. Herbicide Application:

1. At the end of the watering period, spray the area with an Contracting Officer-approved herbicide.

2. Apply herbicide according to the manufacturer's written application instructions. Alternate weeding methods may be used upon approval of the Contracting Officer.

3. Area scheduled for wildflowers, native grasses and buffalo grass: Totally remove grasses and weeds, unless directed otherwise by Contracting Officer. Apply a non-selective herbicide (e.g. “Roundup” or approved equal) to thoroughly exterminate existing grasses, weeds, or other vegetation (unless noted on the drawing for protection) in area scheduled to receive seeding or hydromulching for grasses or wildflowers.

4. Area scheduled for native grasses: Use a selective herbicide or post-emergent herbicide for spot application to remove dallisgrass, crabgrass, Johnson grass, nutsedge, dandelion and other noxious weeds identified in the field by the Contracting Officer. If native grasses exist on the site, verify with Contracting Officer if they are to remain or to be eliminated.

B. Pre-Emergent Herbicide Application:

1. Pre-emergent herbicide shall be applied to landscaped areas, including plant basins. Apply prior to mulching.

2. Pre-emergent herbicide shall be applied only when winds, if present, do not exceed 5 miles per hour.

3.5 LAWN SEEDING

A. After soil preparation and weed removal is approved by the Contracting Officer, commence with seeding for buffalo grass, Bermuda grass, or ryegrass.

B. Timing: If weeds should germinate prior to seeding, re-apply herbicide to eradicate weeds. The following lawn grasses should be seeded within these respective dates:

1. Bermuda grass and Buffalo grass: May 1 - August 1

C. Seeding: Clean seeders as approved prior to starting work. Apply seed mixture directly after fertilizing with Brillion seeder, drill seeder, or other approved mechanical seeder at rate specified for various areas.

D. Buffalo grass: Drill seeding with hydromulch cap: (Minimum 2 applications in lawn areas). Preferred method to be used in seeding unless written approval received for alternate method.

1. Drill seed or broadcast buffalograss seed in designated area using two pounds pure live seed per 1000 square feet for lawn area; one pound pure live seed per 1000 square feet for wildflower and native grass area. Incorporate seed into soil to a depth of 1/4 inch to 1/2 inch. Roll and wet seeded areas prior to mulching.

2. Finish as follows:

a. Lawn areas with slopes less than 3:1: Raked surface.

b. Roadside area with slopes less than 3:1: Scarified surface.

c. Slopes 3:1: or greater: Leave surface of topsoil in irregular condition with ridges running parallel to contour of slope to prevent erosion.

d. Rolling: Directly after seeding, roll lawn areas with slopes less than 3:1 using approved lawn roller, weighing 40 to 60 pounds, per foot of width, unless intervening precipitation would cause such rolling to be detrimental.

3. Apply a Hydromulch cap over seeded area at specified rate.

4. Reseed entire area scheduled for lawn (unless approved otherwise) within 30 to 45 days of first seeding at rate approved by the Contracting Officer based upon extent of establishment of first seeding. Do not reapply buffalo grass in areas to receive wildflowers or native grasses.

5. Spot seed bare spots in lawn area remaining every 2 weeks in order to establish healthy stand of buffalo grass with 100 per cent coverage of the area within 120 days.

6. Do not sow immediately following rain, when ground is too dry, or during windy periods.

7. Cover seeded slopes where grade is 4 inches per foot or greater with tackifier at increased rate of 3000 pounds per acre.

8. Replacement: Replant areas of lawn as needed in order to achieve 100 per cent coverage within the specified time frame to establish the lawn.

9. Reapply fertilizer at specified rate every 3 to 4 weeks for 3 months in lawn area.
E. Bermuda grass: Hydroseeding:

1. Spraying equipment: Use conventional hydromulch equipment as manufactured by Bowie Machine Works, or approved equal. Clean hydroseeders as approved prior to coming on site. Use water tank equipped with liquid-level gauge calibrated in increments no larger than 50 gallons over entire range of tank capacity with gauge visible to nozzle operator. Use tank equipped with agitation system capable of maintaining solids in complete suspension until used.

2. Fertilizing and seeding:
   a. Apply fertilizer at specified rate.
   b. Apply seed in designated area using 1.5 pounds pure live seed per 1000 square feet.
   c. Mix seed and fertilizer together in proportions specified, add mulch to seed and fertilizer mixture. Wood cellulose fiber at the rate of 50 pounds per 1,000 square feet.

3. Agitate mixtures constantly from time mixed until application. Use mixtures within eight hours after mixing.

4. Application method:
   a. Spray mixtures of seed and commercial fertilizer on previously prepared seed beds.
   b. Apply mixtures by means of high-pressure spray directed upward into air so that mixtures fall to ground in uniform spray. Directing nozzle of hand-held hose toward ground in manner that would produce erosion or runoff is prohibited.
   c. Make uniform application at specified rate to prevent misses.
   d. Utilize batter board against planting beds, walks, signs or structures.

5. Reseed bare area scheduled for lawn (unless approved otherwise) within 30 to 45 days of first seeding at rate approved by the Contracting Officer’s Technical Representative based upon extent of establishment of first seeding.

6. Spot seed bare spots remaining every 2 weeks in order to establish healthy stand of Bermuda grass with 100 percent coverage of the areas within 120 days.

7. Do not sow immediately following rain, when ground is too dry, or during windy periods.

8. Cover seeded slopes where grade is 4 inches per foot or greater with tackifier at increased rate of 3000 pounds per acre.

9. Replacement: Replant areas of lawn as needed in order to achieve 100 percent coverage within the specified time frame to establish the lawn.

10. Reapply fertilizer at specified rate every 3 to 4 weeks for 3 months.

3.6 WILDFLOWER AND NATIVE GRASS SEEDING

A. Weed removal: Use selective herbicide on entire area OR post-emergent herbicide for spot application to remove dallisgrass, crabgrass, Johnson grass, nutsedge, dandelion and other weeds listed in Section 02950, “Landscaping - Planting”. Do not injure buffalo grass seeded in area. Native grasses existing on the site, such as switchgrass, little bluestem, lovegrass or other grasses designated on the plan or identified in the field by the Landscape Architect, shall not be eliminated by herbicide treatment.

B. The areas designated as wildflower or native grass planting areas shall be “scalped”, i.e., mowed to a maximum height of one inch above the existing ground level and cut material removed and disposed of as directed by the Contracting Officer.

C. Do not disk, plow or disturb the soil greater than 1 inch in depth so as to not release dormant seed within the subsoil.

D. Drill seed or broadcast seed wildflowers and native grasses in designated areas.

E. Time of seeding:
   1. Wildflowers: September 15 - October 31.
   2. Native grasses: April 1 - May 31 or September 1 - October 31. (Some species may need to be planted no later than August 15)

F. The wildflower and grass seed shall be uniformly and evenly distributed over the areas shown on the plans. Broadcast only one species at a time. The planting method used shall insure that the seed make positive contact with the soil but shall not be planted deeper than the seed size of the species being planted. Apply 1 part wildflower seed with 4 parts damp, masonry sand and tamp into soil (except bluebonnet seed).

G. Apply hydromulch cap as specified for buffalo grass.
H. Do not sow immediately following rain, when ground is too dry, or during windy periods.

I. Seed Protection:
1. Identify seeded areas with stakes and string around area periphery. Set string at minimum height of 12 inches. Space stakes at maximum 20 feet o.c.
2. Cover seeded slopes where grade is 4 inches per foot or greater with tackifier at increased rate of 3000 pounds per acre.

J. Replacement: Replant areas of native grasses or wildflowers as needed in order to achieve 100 per cent coverage within one year of final acceptance.

3.7 SODDING

A. Sod bed preparation: Apply fertilizer at a per-acre rate determined by approved soil test and mix to depth of 4 inches minimum.

B. Laying Sod:
1. Time frame for laying sod is year round if needed, except under conditions noted below.
   a. Lawn areas: Sod varieties identical to Seed Mixture No.1, Table 02930-3, at the end of this section.
2. Extend or reduce specified period as approved and as necessitated by weather and soil conditions.
3. Final selection of sod: As approved.
4. Do not lay sod when sodding area is muddy or frozen or when sod is frozen. When soil surface is hot or dry, wet soil to a depth of 2 inches, 6 to 8 hours prior to sodding.
5. Lift sod from trucks or storage piles and place by hand with close joints and no overlapping. When Beck Roll of sod is used, lay as specified and in accordance with the supplier’s instructions.
6. Lay first row of sod in straight line. Place subsequent rows parallel to and tightly against each other. Stagger lateral joints to promote more uniform growth and strength. Do not stretch sod. On slopes, lay sod parallel to contours of slope.
7. Peg sod placed on slopes 3:1 or greater. Peg each strip or section of sod with at least two stakes not more than 2 feet apart. Use stakes 1/2 inch by 1 inch by 12 inches driven flush with top of sod so that roots are in contact with topsoil.
8. Water sod immediately to prevent excessive drying during progress of work. Sod which dries out will be rejected.
9. Roll entire area as sodding is completed in one section so that sod is without surface irregularities, such as depressions and high spots.
10. Irrigate immediately after rolling to wet underside of sod and 1 inch of soil immediately below.

3.8 ESTABLISHMENT PERIOD AND REPLACEMENT

A. The establishment period for seeding of grasses shall commence during installation and continue until final acceptance.

1. The establishment period for sodded areas shall commence at completion of sodding and continue for a minimum of 60 days.
2. The establishment period for seeded areas shall commence at completion of first seeding and continue for a minimum of 100 days.

B. Maintain seeding, sodding and incidental work by performing the following and other operations of care necessary for promotion of growth so that work is in an approved condition throughout maintenance period: uniform in color, quality, and coverage; and free of weeds, insects, diseases, surface damage, and other imperfections.

1. Watering: Provide labor and materials for establishment watering. A partial underground irrigation system will be in place in seeded areas.
   a. First 2 to 3 weeks: Perform watering daily to keep seed beds continuously moist and to maintain moist topsoil to a depth of at least 4 inches. Water during heat of day to help prevent wilting. Water with frequent, light watering and avoid runoff or puddling. Water may be needed more than once a day depending on weather conditions. Water to insure germination and root growth for reseeding work.
   b. Remaining weeks: Perform watering weekly, decreasing frequency and increasing amount per application to encourage deep root growth. Water more frequently as needed for germination of reseeding. Water during heat of day to help prevent wilting.
C. Eliminate weeds that emerge after seeding in a timely fashion mechanically and/or chemically. Use a herbicide that will not injure the newly seeded grass and apply according to manufacturer's recommendations. The Contractor should allow for a minimum of two herbicide applications of areas scheduled for grasses during the maintenance period. Weeds that are taller than Bermuda grass seedlings should be mowed to a 2 to 3 inch height.

D. Mowing: Lawn grass
   1. Mow Bermuda and Buffalo grass when it reaches a height of 4 inches. Do not mow until seed is firmly rooted and securely in place. Mow to height of 2 inches at first cutting. Thereafter, for Bermuda grass do not remove more than 1/3 of grass leaf at any cutting and mow only to enhance root growth. After Bermuda grass is established, mow every 10 days until final acceptance.
   2. Mow Buffalo grass after first mowing only as needed to help control weed growth.
   3. After the first mowing of the grasses, apply fertilizer at specified rate.

E. Edging: Edge walks during alternate mowings.

F. Rolling: Roll to maintain uniform surface.

G. Fertilizing:
   1. Bermuda and Buffalo grass: After performing initial fertilizing to establish grass, continue to apply fertilizer at specified rate once every three months until final acceptance. Contractor to allow for three fertilizations subsequent to initial fertilization.

H. Applying herbicides, fungicides or insecticides:
   1. Apply as needed to insure 100 percent coverage of turf grass that is weed, disease and pest free.
   2. Apply in spray form by certified applicator.
   3. Do not apply when temperature exceeds 80 degrees F or during periods of drought.
   4. Treat fire ant mounds as they appear.

I. Replacing seeding:
   1. During maintenance period, replace seeded areas that are dead or are in an unhealthy, unsightly, or badly impaired condition as soon as possible during specified planting seasons.
   2. Make such replacements in the same manner as specified for original seeding.

J. Coordinate watering schedules with other plantings during installation and until final the contract.

K. The establishment period for seeding and sodding shall commence during installation and continue until final acceptance.
   1. For seeded areas: Establishment period shall consist of 100 days minimum.
   2. For sodding 45 days.

L. Maintain seeding, sodding, and incidental work by performing the following and other operations of care necessary for promotion of growth so that work is in an approved condition throughout establishment period; uniform in color, quality, and coverage; and free of weeds, insects, diseases, surface damage, and other imperfections.

M. See Section 02981, “Landscape Maintenance - Irrigated Areas” for specific instructions.

N. Replacing seeding and sodding:
   1. During maintenance period, replace seeded and sodded areas that are dead or are in an unhealthy, unsightly, or badly impaired condition as soon as possible during specified planting seasons.
   2. Make such replacements in the same manner as specified for original seeding and sodding.

3.9 TEMPORARY LAWN SEEDING (ADD ALTERNATE TO BID)

A. Temporary Lawn Seeding: Depending on construction schedule, it may be necessary to establish temporary lawn to prevent erosion and provide an acceptable appearance of areas scheduled to receive lawn. A temporary lawn will be required in those areas designated for lawn grass for which installation must be delayed until the specified seeding dates. Lawns must be accepted after June 1 and prior to November 15, otherwise a temporary lawn must be installed. Perform seeding, fertilizing, watering, weeding and other maintenance to insure full coverage of temporary lawn.

   1. Eliminate weeds from areas to be seeded as specified in Article 3.4.

   2. Broadcast perennial rye grass seed over entire area at the rate of 10 pounds P.L.S. per 1,000 square feet.

   3. Broadcast or Pneumatic blow seed mixed with Compost Mix over areas to be seeded to a depth of 1-1/4 inch depth after natural settlement and will conform to minus 3/4 inch from finish lines, grades and elevations.
4. Water all seeded areas to establish full stand within 60 days. Do not allow areas to become dry, or water to the extent that seed will be lost by erosion.

5. When it is time to install the permanent turf grass or other planting in these areas, kill the temporary lawn with herbicide and scalp to height of 1/2 inch to receive new grass seed.

6. Broadcast spreading or Pneumatic blow permanent turf grass seed mixed with Compost Mix over areas to be seeded to depth which will produce a 3/4 inch depth after natural settlement and will bring soil to finish lines, grades and elevations.

3.10 CLEAN-UP

A. Daily removal of rubbish and debris caused by this work from the site.

B. Keep site clean during establishment period.

3.11 FINAL ACCEPTANCE

A. Due to seasonal requirements, final acceptance of this section may not coincide with that of the remaining contract work.

B. Request inspection for final acceptance at least 10 calendar days before the end of the maintenance period.

C. Final acceptance shall be considered the time at which sodding and seeding, cleanup, and maintenance period are 100 percent completed.

D. Replace rejected seeded and sodded areas as specified so that repair or replacement is rooted and established prior to approval.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Seeding and sodding described in this section will not be measured, but will be paid for at the lump sum prices for “Seeding for Irrigated Areas” and “Sodding - Irrigated Areas”, for each mixture, including fertilizer, mulch, and related items.

B. The lump sum prices for “Seeding” and “Sodding” will include any supplemental reseeding or resodding needed to achieve full coverage for Final Acceptance.

C. Temporary seeding will not be separately measured and shall be considered as incidental to the work of the Contract.

END OF SECTION 02930
SECTION 02931
SEEDING AND SODDING - NON-IRRIGATED AREAS

PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies providing temporary and permanent seeding and sodding for non-irrigated areas.
B. Temporary seeding is specified in Section 01562, "Soil Erosion and Sediment Control".

1.2 REFERENCE STANDARDS
A. American Association of State Highway and Transportation Officials (AASHTO):
   1. AASHTO M140 - Standard Specification for Emulsified Asphalt
   2. AASHTO M208 - Standard Specification for Cationic Emulsified Asphalt
B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM C33 - Standard Specification for Concrete Aggregates
   2. ASTM C51 - Standard Terminology Relating to Lime and Limestone (as Used by the Industry)

1.3 SUBMITTALS
A. Samples and Certification: Submitted in accordance with Table 02931 - 1, at the end of this section, and as follows:
   1. Seed: Each seed bag bearing the following upon delivery:
      a. Analysis tag.
      b. Certification tag.
   2. Sod: Certified, each delivery bearing a certification tag and label as required by law.
   3. Fertilizer: Labeled with manufacturer's name and address, guaranteed analysis including nutrient and its derived source, listing of potential acidity, and any toxic materials.
   4. Mulch: Labeled with manufacturer's name and address, material components, trademark, chemical analysis, species, age and source.
   5. Herbicide: Labeled with manufacturer's name and address and chemical analysis.

1.4 PRODUCT INSPECTION, DELIVERY, STORAGE, AND HANDLING
A. Materials and supplies are subject to inspection and sampling for testing. Allow no seed, sod, fertilizer, straw, or other agronomic materials or supplies on Worksite other than those for the Project.
B. Seed: Deliver with labels and tags.
C. Sod:
   1. Deliver sod to job within 24 hours after being cut; place sod within 36 hours after being cut.
   2. Prior to and after delivery during wet weather, allow sod to dry to the extent that will prevent tearing during handling and laying. During dry weather, water sod to ensure its vitality and prevent dropping of the soil in handling.

PART 2 - PRODUCTS

2.1 SEED
A. Except where specified in Table 02931 - 2, at the end of this section, provide seed free of quack grass, bent grass, clover, dock, cheat, chess, chickweed, dallisgrass, plantain, black medic, red fescue, and tall fescue.
B. Grass Seed: Dated material from last available crop, with date of test not more than nine months before date of sowing and as specified in Table 02931 - 2.

2.2 SOD
A. Well-rooted certified sod, at least 18 months old. Provide "Prairie" Buffalograss (Buchloe dactyloides), "Midiron" Bermudagrass (Cynodon dactylon), or as specified on the drawings or approved equal.
B. Sod and attached soil free from noxious weeds such as quack grass, garlic, Johnson grass, Canada thistle, and other turf weeds.
C. Mowed in production field to height of not more than 2-1/2 inches within five days prior to lifting.
D. Machine cut in sections not less than 2-1/2 feet neither in length nor less than 12 inches in width.
SEEDING AND SODDING - NON-IRRIGATED AREAS

and to a depth equal to growth of fibrous roots, uniform soil thickness of 3/4 inch, plus or minus 1/4 inch. Measurement for thickness to exclude top growth and thatch.

E. Cut in sections or strips strong enough to support its own weight and retain size and shape when suspended vertically from firm grasp on upper 10 percent of section. Small, irregular or broken pieces of sod are prohibited. Sod on Beck Roll is permitted.

2.3 OTHER MATERIALS

A. Fertilizer: Approved commercial fertilizer applied at rate to distribute 2 pounds of nitrogen and 1 pound of phosphorus per 1000 square feet.

B. Mulch:

1. Wood cellulose fiber:
   a. Containing no growth or germination inhibiting factors and dyed green.
   b. Fibers furnished air-dry in packages not exceeding 50 pounds gross, with net weight shown on package.

C. Mulch with Tackifier:

1. Wood cellulose fiber mulch with tackifier:
   a. Degradable, pure virgin wood fiber, made from whole wood chips with tackifier incorporated in the mulch from the mulch manufacturer. The mulch must be free from weeds, containing no growth or germination inhibiting factors or other foreign matter toxic to seed germination. Mulch must be suitable for hydromulching and dyed green.
   b. Acceptable product is available from Conwed, Weyerhauser and Camfor.
   c. Apply mulch at minimum rate of 2000 pounds per acre (or 50 pounds per 1000 square feet). Cover seeded slopes where grade is 4 inches per foot or greater with tackifier at increased rate of 3000 pounds per acre (or 75 pounds per 1000 square feet).

D. Mulch Binder:

2. Synthetic binder for use with wood cellulose fiber or straw: Equal to Terra Tack 1, Grass Growers, Plainfield, New Jersey 07061; Soil-Gard, Alco Chemical Company, Philadelphia, Pennsylvania 19013.

E. Mulch blanket: Knitted construction of biodegradable yarn with uniform openings.

   1. 180-foot lengths or greater.
   2. U-shaped staples: As standard with mulch blanket manufacturer.

PART 3 - EXECUTION

3.1 PREPARING SOIL AND FINE GRADING

A. After completion of construction work in the area, prepare surface of subsoil. Scalp areas that have been planted with Avena spp (oats) or temporary sodding. Finish to lines shown and parallel to proposed finished grade.

3.2 SEEDING

A. Seed areas that are 3:1 slope or less.

B. Dry seeding:

1. This method shall be used only upon written request and approval of the Contracting Officer if hydroseeding is not possible.

2. Seed bed preparation: After placing topsoil as specified, proceed as follows:
   a. Fertilizing: Within 24 hours before seeding, apply fertilizer at specified rate using machine spreader.
   b. Fertilizer shall be uniformly mixed into the top 4 inches of soil by harrows, rotary tillers or other equipment necessary to satisfactorily implement work.
3. Seeding: Clean seeders as approved prior to starting work. Apply seed mixture directly after fertilizing with Brillion seeder, drill seeder, or other approved mechanical seeder at rate specified for various areas.

   a. Grass seed mixtures for sowing is specified in Table 02931-3, at end of this section.

      1) Sow grass seed Mixture No. One at minimum rate of 1.25 pounds per 1000 square feet.
      2) Sow grass seed Mixture No. Two at minimum rate of 5.5 pounds per 1000 square feet.

   b. Incorporate seed into soil to a depth of 1/4 inch to 1/2 inch. Roll and wet seeded areas prior to mulching.

   c. Finish as follows:

      1) Roadside area with slopes less than 3:1: Scarified surface.
      2) Slopes 3:1: or greater: Leave surface of topsoil in irregular condition with ridges running parallel to contour of slope to prevent erosion.
      3) Rolling: Directly after seeding, roll lawn areas with slopes less than 3:1 using approved lawn roller, weighing 40 to 60 pounds, per foot of width, unless intervening precipitation would cause such rolling to be detrimental.

C. Hydroseeding:

   1. Preferred method used in seeding unless written approval received.

   2. Spraying equipment: Use conventional hydromulch equipment as manufactured by Bowie Machine Works, or approved equal. Clean hydroseeders as approved prior to coming on site. Use water tank equipped with liquid-level gauge calibrated in increments no larger than 50 gallons over entire range of tank capacity with gauge visible to nozzle operator. Use tank equipped with agitation system capable of maintaining solids in complete suspension until used.

3. Fertilizing and seeding:

   a. Apply fertilizer at specified rate.

   b. Apply seed mixtures as specified in Table 02931-3, at end of this Section.

      1) Sow grass seed Mixture No. One at minimum rate of 1.25 pounds per 1000 square feet.
      2) Sow grass seed Mixture No. Two at minimum rate of 5.5 pounds per 1000 square feet.

   c. Mix seed and fertilizer together in proportions specified, add mulch to seed and fertilizer mixture. Wood cellulose fiber at the rate of 50 pounds per 1,000 square feet.

4. Agitate mixtures constantly from time mixed until application. Use mixtures within eight hours after mixing.

5. Application method:

   a. Spray mixtures of seed and commercial fertilizer on previously prepared seed beds.

   b. Apply mixtures by means of high-pressure spray directed upward into air so that mixtures fall to ground in uniform spray. Directing nozzle of hand-held hose toward ground in manner that would produce erosion or runoff is prohibited.

   c. Make uniform application at specified rate to prevent misses.

   d. Utilize batter board against planting beds, walks, signs or structures.

3.3 SODDING

A. Sod areas that exceed 3:1 slope or areas designated on the drawings.

B. Sod bed preparation:

   1. Place topsoil as specified.

   2. Apply fertilizer at a per-acre rate of 1,500 pounds per acre and mix to depth of four inches minimum.

   3. Compact topsoil with lawn roller or tractor roller to 3 inches of final compacted thickness as approved.
C. Laying Sod:

1. Time frame for laying sod is year round if needed, except under conditions noted below.
   a. Lawn areas: Sod varieties identical to Seed Mixture No. One, Table 02931 - 3, at the end of this section.

2. Extend or reduce specified period as approved and as necessitated by weather and soil conditions.

3. Final selection of sod: As approved.

4. Do not lay sod when sodding area is muddy or frozen or when sod is frozen. When soil surface is hot or dry, wet soil to a depth of 2 inches, six to eight hours prior to sodding.

5. Lift sod from trucks or storage piles and place by hand with close joints and no overlapping. When Beck Roll of sod is used, lay as specified and in accordance with the supplier’s instructions.

6. Lay first row of sod in straight line. Place subsequent rows parallel to and tightly against each other. Stagger lateral joints to promote more uniform growth and strength. Do not stretch sod. On slopes, lay sod parallel to contours of slope.

7. Peg sod placed on slopes 2:1 or greater. Peg each strip or section of sod with at least two stakes not more than 2 feet apart. Use stakes 1/2 inch by one inch by 12 inches driven flush with top of sod so that roots are in contact with topsoil.

8. Water sod immediately to prevent excessive drying during progress of work. Sod which dries out will be rejected.

9. Roll entire area as sodding is completed in one section so that sod is without surface irregularities, such as depressions and high spots.

10. Irrigate immediately after rolling to wet underside of sod and 1 inch of soil immediately below.

B. Establishing seed and sodding and incidental work by performing the following and other operations of care necessary for promotion of growth so that work is in an approved condition throughout maintenance period; uniform in color, quality, and coverage; and free of weeds, insects, diseases, surface damage, and other imperfections.

1. Watering: Provide labor and materials for establishment watering.
   a. First week: Perform watering daily to keep soil on sod pads continuously moist and to maintain moist topsoil to a depth of at least 4 inches. Water to prevent wilting or as approved. Water may be needed more than once a day depending on weather conditions.
   b. Remaining weeks: Perform watering weekly or as needed to keep grass from wilting and to promote growth.

2. Mowing:
   a. Do not mow until seed is firmly rooted and securely in place and has grown to height of four inches.
   b. Mow to height of two inches at first cutting. Thereafter, do not remove more than 1/3 of grass leaf at any cutting.
   c. Maintain Common Bermuda between height of 1-1/2 and 2-1/2 inches, unless otherwise directed.

3. Applying herbicides:
   a. Apply in spray form by certified applicator.
   b. Do not apply when temperature exceeds 80 deg. F or during periods of drought.

4. Replacing seed and sodding:
   a. During establishment period, replace seeded and sodded areas that are dead or are in an unhealthy, unsightly, or badly impaired condition as soon as possible during specified planting seasons.
b. Make such replacements in the same manner as specified for original seeding or sodding.

5. Rolling: Roll to establish and maintain uniform surface.

3.5 CLEAN-UP

A. Daily removal of rubbish and debris caused by this work from the site.

B. Keep site clean during maintenance period.

3.6 FINAL ACCEPTANCE

A. Due to seasonal requirements, final acceptance of this section may not coincide with that of the remaining contract work.

B. Request inspection for final acceptance at least 10 calendar days before the end of the maintenance period.

C. Final acceptance shall be considered the time at which seeding and sodding, cleanup, and establishment period are 100 percent completed.

D. Replace rejected seeded and sodded areas as specified so that repair or replacement is rooted and established prior to approval.

TABLE 02931-1

This chart indicates minimum length of time by which material samples must be submitted for approval before intended use and minimum quantity of each. Usable samples will be returned.

### TABLE 02931-3

**GRASS SEED MIXTURES**

For areas with slopes less than 2:1, unless otherwise shown.

**Seed Mixture No. One:** (April 15 - September 1)
- Roadside (Hulled Seed)
- 100% Common Bermuda.

**Seed Mixture No. Two:** (September 1 - April 15)
- 50% Italian Rye
- 25% Unhulled Common Bermuda
- 25% Kentucky 31 Tall Fescue

**Seed Mixture No. Three:** (All temporary seeding)
- 100% Avena (oats)

END OF SECTION 02931
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies providing complete landscape planting as shown on Drawings.

1.2 REFERENCED STANDARDS

A. American Association of State Highway and Transportation Officials (AASHTO):

B. Army Corps of Engineers (COE):
   1. COE CWGS 02378 - Geotextiles Used as Filters

C. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM C33 - Standard Specification for Concrete Aggregates

D. American National Standards Institute, Inc. (ANSI):
   1. ANSI Z60.1 - Nursery Stock

1.3 DEFINITIONS

A. Contracting Officer’s Technical Representative (COTR): The landscape architect or other specialist who will be called upon by the Contracting Officer to represent the Contracting Officer in regard to specific tasks related to landscaping.

1.4 SUBMITTALS

A. Samples:
   1. Provide representative quantities (1 quart containers) of shredded hardwood mulch, filter fabric, crushed stone and decorative gravel.

2. Submit 1 representative sample of each variety of ornamental trees, shrubs, and groundcover plants.

3. After approval: Tag, install, and maintain as representative samples for final installed plant materials.

B. Confirmation of Plant Order:

1. Submit documentation within 150 days after award of contract that all trees and plants have been located and ordered. Include source for each. If required by the Contracting Officer, submit copies of plant material invoices.

2. Submit Tree Tagging Schedule in a form acceptable to the Contracting Officer. Include for each tree and plant material requiring tagging: Tree type, size, location (i.e. nursery), character as specified on the Contract Drawings, date of proposed tagging, and space for tag numbers. See Table 02950 - 1 for sample.

3. Submit a photograph of the finished product specimen with a human being for scale showing trunk form and branching pattern to use as an accepted example.

C. Submit written listing of source bed preparation materials required for the project. This data shall be furnished in addition to representative samples.

D. Submit results of percolation test, and when drainage system is required, submit Contractor’s proposed layout of drainage system.

1.5 QUALITY ASSURANCE

A. Observation at growing site does not preclude right of rejection at the Worksite. Plants damaged in transit or at the Worksite shall be rejected.

B. Personnel: Perform work only with qualified personnel familiar with required landscaping.

1.6 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Balled and Burlapped (B&B) Plants: Dig and prepare shipment in a manner intended to protect roots and branches from damage and protect the shape, and future development.

B. Do not deliver plants until site conditions are ready for planting. If planting is delayed, heel-in bare rooted or freshly dug plants in a bed containing adequate shredded hardwood mulch to keep roots moist. Separate bundles and trim roots, if long or...
damaged, using sharp pruning shears. Place plants in flats, pots, or other containers in a sheltered spot protected from sun, wind and mechanical damage and keep roots moist. Storage is at Contractor’s own risk.

1.7 PROJECT CONDITIONS

A. Planting Restrictions: Perform actual planting only when weather and soil conditions are suitable in accordance with locally accepted practice. Commence landscaping work when the Site is free of rocks and debris.

B. Protection:

1. Do not move equipment over existing or newly placed structures without approval of Contracting Officer.
2. Provide board-roading as required to protect paving.
3. Protect other improvements from damage, with protection boards, ramps, and protective sheeting.

C. Utilities:

1. Protect and maintain existing utility services in accordance with Section 02760, “Maintenance, Support, and Restoration of Existing Utility Facilities”.
2. Determine locations of underground utilities and perform work in a manner, which is intended to avoid possible damage. Hand excavate, where required, to minimize possibility of damage to underground utilities.
3. Coordinate work with Contracting Officer to prevent damage to underground sprinkler system.

1.8 WARRANTY

A. Refer to the General Provisions, Warranty of Construction. The Warranty in regard to landscape planting shall include the following replacements:

- Replace dead materials and materials not in vigorous, thriving condition as soon as weather permits. Replace plants, including trees, which have partially died thereby damaging shape, size, or symmetry. The opinion of the Contracting Officer as to what constitutes a dead plant shall be final.

Warranty duration as follows:

1. One year from date of final acceptance
2. One year from any replacement date.

B. Replace plants and trees with same kind and size as originally planted. The Contractor’s warranty with respect to plants or trees replaced will run for 1 year from the date of replacement. Replace trees at start of next planting or digging season, unless the Contracting Officer approves earlier replacement in writing. In such cases, remove dead trees immediately. Protect irrigation system, other piping conduit, or other work during replacement. Repair any damage immediately.

C. Warranty excludes replacement of plants after final acceptance because of injury by storm, hail or vandalism.

D. At end of warranty period, remove vertical staking, and bracing materials. Below grade bracing material may be left in place unless the material is exposed and pose a safety threat.

PART 2 - PRODUCTS

2.1 PLANTS

A. General: Provide healthy, field-grown plants, well-formed No. 1 grade from a recognized nursery, and of the species and variety shown on the Contract Drawings, complying with the requirements of ANSI Z60.1. Listed plant heights are from tops of root balls to nominal tops of plants. Caliper inches is measured at 6 inches above the rootball for 4 inch caliper trees and less and 12 inches above the rootball for trees above 4 inch caliper unless noted on the plant listing.

B. Shrub and Ground Covers: Nursery grown, healthy, vigorous, of normal habit of growth for species, free from disease, insect eggs, and larvae. Specified sizes are before pruning and measured with branches in normal position. Plants to be well rooted and established in the container.

C. Ornamental and Shade Trees: No. 1 grade nursery stock healthy, vigorous, full-branched, well-shaped, trunk diameter, and height requirements as specified.

1. Ensure balls are firm, neat, slightly tapered, and well burlapped. Reject trees with loose or broken balls at time of planting.
2. Obtain the Contracting Officer’s approval of each tree, individually.
3. Root balls: 10 inches in diameter for each 1 inch caliper, measured 6 inches above root ball.

D. Container Stock: Verify that container stock has been grown in the containers in which delivered for at least 6 months, but not over 2 years. Samples must prove to be free of kinked, circling or girdling roots and with no evidence of a pot-bound
condition. Do not install container plants that have cracked or broken balls of earth when taken from container. Field grown plants recently transplanted into containers will not be accepted.

2.2 SOIL PREPARATION MATERIALS
A. Sandy Loam: See Section 02910, “Topsoil and Finished Grading”.
B. Compost: See Section 02910, “Topsoil and Finished Grading”.
C. Commercial Fertilizer: Complete fertilizer 10-20-10 (1:2:1 element ratio) with minimum 8 percent sulphur and 4 percent iron plus micronutrients.

2.3 MISCELLANEOUS MATERIALS
A. Steel Edging: 4 inches by 1/8 inch, painted green. Ryerson Steel, heavy gauge.
B. Tree Paint: Asphalitic based paint with antiseptic properties, manufactured for use on tree wounds.
C. Mulch: Shredded hardwood or cedar mulch.
D. Crushed Stone: Mill run 3/4 inch to 1-1/2 inch native crushed white limestone complying with ASTM C33.
E. Staking Materials for Trees:
   1. Braces: 2 inch by 2 inch untreated wood.
   2. Screws: 2-1/2 inch unfinished drywall screws.
   3. Stakes: 2 inch by 2 inch untreated wood.
F. Wood Retainer: Pressure treated 2 inches by 4 inches construction grade pine lumber.
G. Root Stimulator: Polystart 80.

2.4 JUTE MATTING (MESH)
A. Provide jute matting of a uniform, plain weave with warp, and wool yarns of approximately the same size.
B. The physical requirements shall be:
   1. Width: 45 inches to 48 inches, plus or minus 1 inch.
   2. 78 warp ends per width.
   3. 41 weft ends per yard.
   4. Weight: 1.80 lbs. (average) per running yard.

2.5 FILTER FABRIC (SOIL SEPARATOR FABRIC)
A. In accordance with AASHTO M288 and the following additional requirements:
   1. Woven or non-woven pervious filter fabric weighing approximately 5.6 oz. per square yard; free of defects.
   2. Fabric: Long chain synthetic polymer composed of at least 85 percent by weight of propylene, ethylene, ester, amide or vinyl-chloride, and with stabilizers or inhibitors to make fabric resistant to deterioration due to ultra violet and heat exposure.
   3. Fabric formed or treated so that filaments retain their positions relative to each other.
   4. Edges selvaged.
   5. Physical strength:
      a. Wide-Width Tensile strength: 1740-pound minimum in each direction, ASTM D4595.
      b. Elongation at failure: 15 percent, ASTM D4632.
   6. Flow Rate: 18 gallons per minute per square foot.
   7. Percent of open area: Not less than 4 percent or more than 6 percent.

2.6 BOULDERS
A. Provide boulders at sizes and location indicated on the Contract Drawings. Boulders to be supplied include "mossy boulders" and limestone boulders as described below:
   1. Mossy boulders - Gray to brown sandstone boulders with moss and/or lichens growing on the surface. Freestanding boulders shall be irregular in shape. Boulders used to form dry stack wall shall be more rectangular in shape. Mossy boulders shall meet appearance and material quality of those as supplied by Custom Stone Supply, Dallas, TX.
   2. Limestone boulders - Cream color limestone boulders with rust accents. Boulders shall be roughly half-spherical in shape.
LANDSCAPE PLANTING

Limestone boulders shall meet appearance and material quality of those as supplied by Custom Stone Supply, Dallas, TX.

B. Obtain the Contracting Officer’s approval and individually tag each boulder meeting the above criteria at the stone suppliers yard.

2.7 DECORATIVE GRAVEL

A. Provide decorative gravel where indicated on the Contract Drawings. Decorative gravel shall be New Mexico River Rock, medium size, as supplied by Custom Stone Supply, Dallas, TX, or approved equal. Gravel shall be rounded and vary in colors of gray, black, tan and red.

B. The gravel shall be graded in size from 2 to 4 inches.

2.8 PERFORATED AND NON-PERFORATED PIPE

A. Provide Schedule 40 perforated and non-perforated pipe for tree drainage system as detailed on the Contract Drawings. Use non-perforated pipe in sleeves.

2.9 DECOMPOSED GRANITE

A. Decomposed granite material consisting of material mix of decomposed granite gravel, ¾ inch down to 0 graduation.

B. Decomposed granite color shall be as indicated on the Contract Drawings.

C. Decomposed granite sources: Custom Stone Supply, Dallas, Texas or approved equal.

PART 3 - EXECUTION

3.1 SITE PREPARATION

A. Request the Contracting Officer’s inspection of the Worksite, and obtain the Contracting Officer’s written approval that the Worksite is ready.

B. Examine subgrade and verify conditions under which work is to be performed. Do not proceed with work until all grading and related work is completed in a satisfactory manner so that the landscape installation can proceed. Lumps, clods, and debris over 1 inch in diameter shall be removed from the Worksite.

3.2 BED PREPARATION

A. Refer to Section 02220, “Grading, Excavating, and Backfilling” for excavation and removal of soil, and Section 02260, “Topsoil and Finished Grading”, for addition of topsoil (sandy loam and soil conditioner) to site and bedding mix to platform tree wells.

B. Fertilize topsoil with 10-20-10 fertilizer at the rate of 30 pounds per 1000 square feet.

C. Place filter fabric or jute mesh, as shown on the Contract Drawings. Use filter fabric under crushed rock, decorative gravel and at weep holes. Use jute mesh on slopes 2:1 or greater in planted areas.

3.3 SHRUB AND GROUNDCOVER PLANTING

A. Place plants in position on bed areas before containers have been removed.

B. Obtain approval from Contracting Officer.

C. The Contracting Officer reserves right to interchange or shift locations of plants prior to planting.

D. Do not remove burlap from balled and burlapped plants.

E. Plant where shown, setting plants with tops of balls even with tops of beds, and compact soil carefully around each plant ball. Water thoroughly to eliminate air pockets.

F. Carefully prune plants to remove dead or broken branches and hand-rake bed areas to smooth even surfaces.

3.4 TREE PLANTING

A. Ornamental Trees:

1. Stake locations for approval.
2. Plant in pits at size indicated on drawings.
3. Backfill with topsoil and compost at ratio specified on drawings.
4. Backfill to be places in 6 inch layers and watered in thoroughly.

B. Shade Trees:

1. Stake locations for approval.
2. Plant in pits at size indicated on drawings.
3. Backfill with topsoil and compost at ratio specified on drawings
4. If rock is encountered:
   a. Contracting Officer may select alternative location if possible.
   b. Rock shall be removed to a minimum of 6 inches below the plant if an alternative location cannot be selected.
3.5 TOP DRESSING
A. After planting has been completed and approved, top dress bed areas with bark mulch, 3 inches deep.

3.6 PRUNING OF NEW TREES
A. Prune trees to preserve natural character of plant. When directed by the Contracting Officer, remove approximately 1/3 of wood by thinning. Do not cut back terminal branches. Remove sucker growth and broken or badly bruised branches. Thin native trees heavier than nursery grown plants.

3.7 TREE SAUCERS
A. Form a watering saucer around each new tree per planting detail. Contractor is responsible for deep watering throughout plant establishment period.

3.8 TREE STAKING
A. Stake and brace trees as detailed immediately following planting operation. Take precautions during staking operation to prevent damage or injury to branches and roots.

3.9 STEEL EDGING
A. Provide steel edging at interface of planted areas and lawn areas unless indicated otherwise on Drawings. Set edging as indicated in true lines as designed with top of edging a minimum of 1 inch above finish grade.

3.10 JUTE MESH
A. Install jute mesh per manufacturer's recommendations on slopes 2:1 or greater in planting beds and where indicated.

3.11 BOULDERS
A. Flag location of boulders for approval of COTR
B. Boulders which were damaged or broken during shipping will be rejected.
C. The COTR will number the boulders to specify the location of each boulder.
D. The Contractor shall move the boulders to the location for installation. If boulders are broken or damaged in transit, they will be rejected.
E. Excavate soil to set boulder below grade approximately 2 to 6 inches at the COTR's direction. Obtain the COTR's approval of each boulder installation in the field.

3.12 DECORATIVE GRAVEL
A. Obtain approval of finish grades prior to beginning work in this section. Excavate so that the top of gravel will meet finish grades, where required. Obtain the COTR's approval of the bed layout and excavated grade prior to commencing installation.
B. Cover area to receive gravel with filter fabric. Use u-shaped steel pins, approximately 2 inches in length, to secure filter fabric. Place pins approximately 24 inches on center. Apply 2 layers of filter fabric. Apply second layer at 90 degrees to first layer. Pin corners.
C. Obtain the Contracting Officer's approval of filter fabric application prior to installing gravel.
D. Pressure wash gravel prior to installation. Spread gravel to 2 inch depth and rake while washing to thoroughly clean gravel.
E. Spread remaining 2 inches of gravel and rake level while washing.
F. Spread gravel and trim filter fabric so none is visible.

3.13 DECOMPOSED GRANITE MULCH
A. The decomposed granite mulch shall be thoroughly blended with organic binder material at a rate of 10 pounds of binder material per ton of crushed granite screenings. Blending shall be done with a cement mixer, pug mill, or similar equipment prior to placing and spreading the blended decomposed granite mulch over the hand-compact backfill.
B. The mulch shall be placed in two 1-1/2 inch deep lifts compacted to a minimum 3 inch depth. Each lift shall be thoroughly moistened with water and then compacted to a minimum 85 percent relative density, with the finish surface of decomposed granite flush with surrounding curb and sidewalk.

3.14 TREE DRAINAGE SYSTEM
A. Obtain approval from COTR through the Contracting Officer for extent and layout of proposed tree drainage system. Install a tree drainage system as approved if tree pits fail percolation test described in this Section.
B. Provide 4 inch perforated pipe (Schedule 40) in gravel fill at low end of tree pit as shown on the Contract Drawings. Connect tree pits with pipe in gravel maintaining positive drainage of pipe. Extend pipe to approved low point on site and “daylight” pipe in approved manner. Use nonperforated pipe to connect perforated pipe sections.
3.15 REMOVING AND TRANSPLANTING TREES ON SITE

A. Flag trees for removal and transplanting with different color ribbon at 5 feet height on trunk. Obtain COTR’s approval for trees scheduled to be removed and trees to be transplanted. Obtain approval from COTR for location where trees will be transplanted. Stake each location and clearly label each stake for tree to be replanted at each location.

C. Trees scheduled for transplanting (Designated "Transplant" on the Contract Drawings):
   1. Prune and trim approximately 1/4 to 1/3 of tree canopy.
   2. Dig root ball providing 1 foot diameter of root ball per 1 inch of tree caliper measured twelve inches above grade.
   3. If Vemeer or other mechanical digger is not used, Contractor shall wrap root ball in burlap or other biodegradable material in order to hold the root ball intact during transport.
   4. Plant the tree as specified herein.
   5. Manually deep water tree roots as needed to promote growth. Apply root stimulant at transplanting per manufacturer’s recommendations.

3.16 PLANT ESTABLISHMENT PERIOD

A. Water: When irrigation system is not operational, provide necessary hoses and other watering equipment required to complete landscaping.

B. Establish plantings and trees by watering, cultivating, weeding, spraying, cleaning, and replacing as necessary to keep landscape in a vigorous, healthy condition, and rake bed areas as required until final acceptance.

C. Coordinate watering schedules during installation and until final acceptance. Provide deep root watering to newly installed trees at a minimum of once every 2 weeks during summer months or as weather conditions indicate.

D. Coordinate work of this Section with Sections 02980, “Landscape Maintenance - General”, 02981, “Landscape Maintenance - Irrigated Areas”, and 02982, “Landscape Maintenance - Non-Irrigated Areas”, as applicable.

3.17 CLEAN-UP

A. Keep premises neat and orderly including organization of storage areas. Remove trash and debris from excavated planting areas, preparing beds, or planting plants from Worksite daily as work progresses. Keep paved areas clean by sweeping or hosing.

3.18 FINAL ACCEPTANCE

A. Due to seasonal requirements, final acceptance of this section may not coincide with that of the remaining contract work.

B. Request inspection for final acceptance at least 10 calendar days before the end of the maintenance period.

C. Final acceptance will be considered the time at which planting and related work, as well as, clean-up are 100 percent completed, as determined by the Contracting Officer.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will be paid for on a lump sum basis for “Landscaping” per location indicated wherein no measurement will be made.

B. Topsoil and compost installed as part of the work of this Section in backfill will be measured or paid for directly under Section 02910.

C. Performing and documenting percolation tests will not be measured or paid for directly, but will be considered subsidiary to the lump sum price for “Landscaping - Planting”. If tree drainage system is required, payment for tree drainage system will be covered under the General Provisions, “Changes”.

SECTION 02975
LANDSCAPE IRRIGATION SYSTEM

PART 1 - GENERAL

1.1 SCOPE

A. Furnish work and materials, appliances, tools, equipment, facilities, transportation, and services necessary for and incidental to performing operations in connection with the installation of underground irrigation system complete, as shown on drawings and/or specified herein. When the term "Contractor" is used in this section, it shall refer to the Irrigation Subcontractor.

1.2 REFERENCE STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM D2241 - Standard Specification for Poly(Vinyl Chloride) (PVC) Pressure-Rated Pipe (SDR Series)

1.3 SUBMITTALS

A. The Contractor shall submit shop drawings or manufacturer's "cut sheet" for each type of sprinkler head, pipe, controller, valves, check valve assemblies, valve boxes, wire, conduit, fittings, and all other types of fixtures and equipment which he proposes to install. The submittal shall include the manufacturer's name, model number, equipment capacity, and manufacturer's installation recommendation, if applicable, for each proposed item.

B. No partial submittal will be accepted and submittals shall be neatly bound into a brochure and logically organized. After the submittal has been approved, substitutions will not be allowed except by written consent of the Contracting Officer.

C. Shop drawings shall include dimensions, elevations, construction, details, arrangements, and capacity of equipment, as well as manufacturer's installation recommendations.

D. Record Drawings:

1. Record dimensioned locations and depths for each of the following:

a. Point of connection, water meter, double check valve and backflow preventer.

b. Irrigation pressure pipe routing (provide dimensions for each 300 linear feet (maximum) along each routing, and for each change in directions).

c. Gate valves.

d. Irrigation control valves.

e. Control wire routing.

f. Other related items as may be directed by the Contracting Officer.

2. Locate all dimensions from two permanent points (buildings, monuments, sidewalks, curbs, or pavements).

3. Record all changes, which are made from the Contract drawings, including changes in the pressure and non-pressure pipes.

4. Record all required information on a set of blackline prints of the Contract drawings. Do not use these prints for any other purpose.

5. Maintain information daily. Keep Contract drawings at the Worksite at all times and available for review by the Contracting Officer.

6. When record drawings have been approved by the Contracting Officer, transfer all information to a set of reproducible mylars using permanent ink. Changes using ball-point pen are not acceptable. Make dimensions accurately at the same scale used on original Drawings, or larger. If photo reduction is required to facilitate controller chart housing, notes or dimension must be a minimum 1/4 inch in height.

7. Reproducible mylars will be furnished by the Contracting Officer at cost for printing and handling.
E. Controller Charts:

1. Do not prepare charts until record drawings have been approved by the Contracting Officer.

2. Provide one controller chart for each automatic controller installed.
   
   a. Chart may be a reproduction of the record drawing, if the scale permits fitting it into the controller door. If photo reduction prints are required, keep reduction to maximum size possible to retain full legibility.

   b. Chart shall be blackline print of the actual system, showing the area covered by that controller.

3. Identify the area of coverage of each remote control valve, using a distinctly different pastel color, drawn over the entire area of coverage.

4. Following approval of charts by the Contracting Officer, they shall be hemetically sealed between two layers of 20 mil. thick plastic sheet.

5. Charts must be completed and approved prior to final acceptance of the irrigation system.

F. Operating and Maintenance Manuals:

1. Provide five individual bound manuals detailing operating and maintenance requirements for irrigation systems.

2. Manuals shall be delivered to the Contracting Officer no later than 10 days prior to final acceptance of work.

3. Provide descriptions of installed materials and systems in sufficient detail to permit maintenance personnel to understand, operate, and maintain the equipment.

4. Provide the following in each manual:
   
   a. Index sheet, stating Irrigation Contractor's name, address, telephone number, and name of person to contact.

   b. Duration of guarantee period.

   c. Equipment list providing the following for each item:

   1) Manufacturer's name.

   2) Make and model number.

   3) Name and address of local manufacturer's representative.

   4) Spare parts list in detail.

   5) Detailed operating and maintenance instructions of major equipment.

G. Checklist:

1. Provide a signed and dated checklist, and deliver to the Contracting Officer prior to final acceptance of the work.

2. Use the following format:

   a. Plumbing permits: if none required, so note.

   b. Material approvals: approved by and date.

   c. Pressure pipe tests: by whom and date.

   d. Record Drawings: received by and date.

   e. Controller charts: received by and date.

   f. Materials furnished: received by and date.

   g. Operation and maintenance manuals: received by and date.

   h. System and equipment operation instructions: received by and date.

   i. Manufacturer's warranties if required: received by and date.

   j. Written guarantee: received by and date.

   k. Lowering of heads in lawn areas: if incomplete, so state.

1.4 CODES/PERMITS

A. Work under this section shall comply with the provisions of these Specifications, as illustrated on the accompanying drawings, as directed by the Contracting Officer and shall satisfy all applicable local codes, ordinances, or regulations of the
governing bodies and all authorities having jurisdiction over this Project.

B. Installation of equipment and materials shall be done in accordance with requirements of the National Electrical Code, Plumbing code of jurisdictional city, and standard plumbing procedures. The drawings and these Specifications are intended to comply with all the necessary rules and regulations; however, some discrepancies may occur, the Contractor shall immediately notify the Contracting Officer in writing of the discrepancies and apply for an interpretation. Should the discovery and notification occur after the execution of a contract, any additional work required for compliance with the regulations shall be paid for as covered by these Contract documents.

C. The Contractor shall give all necessary notices, obtain all permits, and pay costs in connection with his work; file with all governmental departments having jurisdiction; obtain all required certificates of inspection for his work and deliver these to the Contracting Officer.

D. The Contractor shall include in the work all labor, materials, services, apparatus, or drawings in order to comply with all applicable laws, ordinances, rules, and regulations whether or not shown on the drawings and/or specified.

E. The installation of the irrigation system shall be made by an individual or firm duly licensed under Article No. 8751 VTCS, Titled "Licensed Irrigators Act", S.B. No. 259 as passed by the 66th Texas Legislature.

F. Hard wiring 50 volt and above shall be performed by a licensed electrician.

1.5 EXISTING UTILITIES - LOCATION AND ELEVATIONS

A. Locations and elevations of various utilities included with the scope of this work have been obtained from the most reliable sources available and should serve as a general guide without guarantee to accuracy. The Contractor shall examine the site and verify to his own satisfaction the locations and elevation of utilities and availability of utilities and services required. The Contractor shall inform himself as to their relation to the work and the submission of bids shall be deemed as evidence thereof. The Contractor shall repair at his own expense, and to the satisfaction of the Contracting Officer, for damage to any utility shown or not shown on the plans.

B. Should utilities not shown on the plans be found during excavations, Contractor shall promptly notify the Contracting Officer for instructions as to further action.

C. Contractor shall make necessary adjustments in the layout as may be required to connect to existing stub-outs, should such stub-outs not be located exactly as shown and as may be required to work around existing work, this shall be done at no increase in cost to the Authority. All such work will be recorded on record drawings and turned over to the Contracting Officer prior to final acceptance.

1.6 ELECTRIC POWER

A. Electric power to operate the controller shall be furnished by the Facilities Contractor unless otherwise noted on the plans. Service wiring to the controller cabinet shall be furnished by the Landscape Contractor.

1.7 WATER FOR TESTING

A. Unless noted otherwise on the plans or elsewhere, furnish water necessary for testing, flushing, and jetting.

1.8 SLEEVES AND ELECTRICAL CONDUITS

A. Sleeves and electrical conduits have been installed as noted on the drawings. Contractor shall be responsible for locating sleeves and conduits at no additional cost to the Authority.

1.9 WARRANTY AND MAINTENANCE

A. The Contractor shall warranty material and workmanship for one year from final acceptance including repair and replacement of defective materials, workmanship, and repair of backfill settlement.

B. Maintenance during warranty shall include, but not necessarily be limited to, the following:

1. Adjustment of sprinkler height and plumb to compensate for settlement and/or plant growth.

2. Backfilling of trenches.

3. Adjustment of head coverage (arc of spray) as necessary.

4. Unstopping heads plugged by foreign material.

5. Adjustment of controller as necessary to insure proper sequence and watering time.

6. Maintenance necessary to keep the system in good operating order. Repair of damage caused by vandals, other contractors or
PART 2 - PRODUCTS

2.1 GENERAL

A. Unless otherwise noted on the plans, all materials shall be new and unused. The irrigation equipment catalog numbers used for reference in these Specifications are to establish minimum quality standards and may be substituted with an "approved equal" as outlined in Paragraph 1.5 of this section.

2.2 POLYVINYL CHLORIDE PIPE (PVC PIPE)

A. PVC pipe manufactured in accordance with ASIM Standards noted herein.

B. Marking and Identification: PVC pipe shall be continuously and permanently marked with following information: Manufacturer's name, size, type of pipe, and material, SDR number, Product Standard number, and the NSF (National Sanitation Foundation) Seal.

C. PVC pipe fittings: Same material as the PVC pipe specified and compatible with PVC pipe furnished. Solvent weld type shall be Schedule 40.

D. PVC Pipe: Class 200 solvent weld, SDR-21, PS 22-70 for all sizes 3/4 inch to 2 inches. 1/2 inch pipe shall be solvent weld SDR-13.5, Class 315.

E. Flexible Connectors: Flexible connections to rigid PVC shall be manufactured by F.P. Parker Mfg. Inc. under the name of Cobra Connector. Flexible nipples shall be factory assembled only.

F. Pipe sleeves: Class 200 solvent weld, SDR-21, PS 22-70.

2.3 SWING JOINTS

A. PVC swing joints shall be pressure rated at 315 PSI and be Sch. 80 PVC rated units. The unitized assembly shall have NPT threads on both the inlet and outlet fittings.

2.4 WIRE AND SPLICES

A. Wire: Single strand solid copper, minimum 14 gauge with type UF insulation which is Underwriters Laboratory approved for direct underground burial when used in a National Electrical Code Class II Circuit (30 volts AC or less) as per Articles 725 and 300. Voltage drop shall be taken into consideration.

B. Wire: Color coded so that the common wire shall have white insulation and the signal wires shall have red insulation.

C. Wire connectors: Scotch Brand DBY or DBR style connectors with the appropriately sized Scotchlok wire nut connecting the bare copper wires together.

D. Connectors: UL listed, rated 600 volt, for PVC insulated wire. No wire splices shall be buried.

2.5 QUICK COUPLING VALVES

A. Quick coupling valves shall be composed of a bronze cast body with a weighted metal cover and be a Weathermatic V075 unit.

B. The valve shall accept a single lug 3/4 inch bronze valve key for operation.

C. Provide one Weathermatic CO75 coupler and one No. 10 hose swivel ell for each quick coupling valve shown on the plans.

D. Valves are to be installed as shown in the details. Units to be isolated from main pressure pipe with a ball valve as noted in the detail.

2.6 MANUAL VALVES

A. Manual valves 2-1/2 inches and smaller shall be all brass, globe type with composition disc rated at 150 pounds W.O.G.

B. Valves shall have brass cross handles.

2.7 VALVE BOXES

A. Valve boxes shall be made of high-strength injection molded high density polypropylene or polyolefin plastic suitable for shrub bed irrigation purposes.

B. Boxes shall be suitable in size and configuration for the operability and adjustment of the valve.

C. Manufactured extension sections will be used as appropriate to the depth of piping.
D. Valve box covers shall bolt down or have locking mechanisms and shall be colored green or black as selected by the Contracting Officer.

2.8 POP-UP SPRAY HEADS

A. The sprinkler body and elated parts shall be plastic cycolac or polycarbonate. They shall have a spring retraction for positive return action of the pop-up nozzle. They shall have an internal check valve to prevent low head drainage of lateral piping.

B. The spring for retraction and the adjustable nozzle screw shall be made of corrosion resistant materials. A filter screen is required under each nozzle.

2.9 ROTARY HEADS

A. The sprinkler shall be gear driven, closed case rotary type unit having the following minimum characteristics. It shall have radius adjustment capabilities by means of a stainless steel nozzle retainer/radius adjustment screw or have the ability to be adjusted by a top-mounted single adjustment screw which changes the discharging nozzle and angle of throw.

B. The sprinkler shall be available in both full and part circle configurations. The adjustable part shall be adjustable from a minimum of 40 degrees to 330 degrees. The units shall have a minimum of a 4 inch rise and be equipped with an internal drain check valve to prevent low-head drainage and be capable of holding back water up to a 10 foot rise.

C. The unit shall have a rubber cover attached to the top of the riser. When specified, the unit shall have a cover molded in purple rubber to indicate the use of reclaimed water. Each unit shall have NPT female threads and be either 1 inch or 3/4 inch in diameter. The unit shall be serviceable after installation from the top and each unit shall have a filter screen installed. There must be a stainless steel spring from positive retraction of the riser upon completion of a cycle. Each unit shall be attached to a lateral pipe by means of a swing joint.

D. The unit shall carry a full 2 year exchange warranty from the date of installation.

2.10 ELECTRIC CONTROLLER

A. Electric irrigation controller shall be capable of operating the number of stations as indicated on the drawings. The system is designed to operate one solenoid valve at a time, unless otherwise noted.

B. Power source shall be standard 115 volt, 60 Cycle AC. Output for operation of companion solenoid actuated valves shall be 24 volts, 60 Cycle AC. A "back-up" battery shall hold the time of day and the day of the week in the event of a power loss.

C. Operation of the controller shall be full automatic, incorporating one 24 hour clock and 14 day calendar per controlled number of electric valves shown on the plan to start the irrigation cycle any hour or hours of the day or night of any day or days over a repeating 14 day period.

D. The controller shall be capable of repeating watering cycles as required with a maximum delay between the ending of one cycle and the beginning of the next not to exceed 2 hours. Control shall provide optional semi-automatic operation whereby the automatic cycle may be started independent of the clock and manual operation whereby any station may be operated by hand independent of all timing mechanism. The choice of automatic day or hour programming shall be available to the operator on the face of the control panel without the use of tools.

E. The automatic controller shall be equipped with rainproof housing.

2.11 ELECTRIC REMOTE CONTROL VALVES

A. Electric remote control valves shall have plastic bodies and covers and shall be globe-type diaphragm valves of normally closed design.

B. Operation shall be accomplished by means of integrally mounted heavy-duty, 24 VAC solenoid complying with National Electrical Code, Class II Circuit. Solenoid coil shall be potted in epoxy resin within a plastic coated stainless steel housing. Solenoids shall be completely waterproof, suitable for underground placement.

C. A flow stem adjustment handle shall be included on each valve.

2.12 BACKFLOW PREVENTER

A. A double ball valve isolated, double check valve assembly shall be located and sized as shown on the plans.

B. Construction shall be all brass for sizes 3/4 inch to 2 inches in diameter.

C. This assembly shall be installed in a vault with lid conforming to the City Plumbing Codes.
2.13 TEMPERATURE SENSOR & RAIN SENSOR

A. Temperature sensor shall be Freeze-Clik freeze sensor, manufactured by Hunter Industries or Rainguard freeze guard sensor, manufactured by WCS.

B. Rain Sensor shall be Mini-Clik I rain sensor, manufactured by Hunter Industries or Rainguard sensor, manufactured by WCS.

2.14 Drip Irrigation

A. Self-Cleaning, Pressure-Compensating Dripperline: The dripperline shall consist of nominal sized one half inch low density linear polyethylene tubing, housing internal pressure compensating, self cleaning, integral drip emitters. The tubing shall be brown in color and conform to an outside diameter (O.D.) of 0.67 inches and an inside diameter (I.D.) of 0.57 inches. The emitters shall have the ability to independently regulate discharge rates, with an input pressure of seven to seventy pounds per square inch (PSI), at a constant flow and with a coefficient of variation (Cv) of 0.03. The emitter discharge rate shall be either .61 gallons per hour (GPH) or 0.92 gallons per hour (GPH) utilizing a combination turbulent flow/reduced pressure compensation cell mechanism and a diaphragm to maintain uniform discharge rates. The emitters shall continuously clean themselves while in operation. The dripperline shall be installed at 12 inch spacings between emitters. Use Toro or approved equal.

B. Fittings: Techline connections shall be made with approved Techline 17mm (0.57") insert fittings. Use Toro or approved equal.

C. Accessories:

1. Flush Valve: Drip systems shall utilize Netafim Automatic Line Flush Valves at the end of each independent zone area or dripperline (maximum flow per valve: 15 GPM). This valve shall be capable of flushing one gallon at the beginning of each irrigation cycle. The valves to be used shall be Toro Model Numbers TLO50MFV - One Gallon Flush Valve with 1/2 inch Male Pipe Thread Connection or TLFV One Gallon Flush Valve with the Techline Connection for connecting directly to Techline Dripperline or approved equal. Use Toro (Netation) or approved equal.

2. Air/Relief Valve: Each independent irrigation zone shall utilize a TLAVRV Techline Air/Vacuum Relief Valve at its high point(s). The purpose of this valve is to evacuate air from the zone at start up and to relieve vacuum at system shut down. Use Toro or approved equal.

3. Pressure Regulation Valve: The pressure regulator shall be a Netafim piston type unit with an externally accessible regulation unit that can be serviced without removing the valve from the system. The regulator shall have a built in indicator that shows when the proper outlet pressure is reached. It shall be able to respond immediately to any inlet pressure variation. The regulator shall be capable of regulating from 15 PSI to 50 PSI using interchangeably color coded springs. Use Toro (Netation) or approved equal.

4. Disc Filter: The filter shall be a multiple disc filter with color coded filter elements indicating the mesh size of the element being used. The discs shall be constructed of chemical resistant thermoplastic for corrosion resistance. The filter shall be a Toro Model Number DFAP4C-100 or approved equal.

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

A. Design Pressure: This irrigation system has been designed to operate with a minimum static inlet water pressure of 50 psi at the point of connection or as designated on the drawings. The Contractor shall take a pressure reading prior to beginning construction. If the pressure reading is less than above, the Contractor shall notify the Contracting Officer.

B. Contractor Responsibility: The Contractor shall not willfully install the irrigation system as shown on the drawings when it is obvious in the field that obstructions, grade differences or discrepancies in equipment usage, area dimensions or water pressure exist that might not have been considered in the engineering. Such obstructions or differences shall be brought to the attention of the Contracting Officer in writing. In the event this notification is not performed, the Contractor shall assume full responsibility for any revision necessary.

C. Staking: Before installation is started, place a stake or marking flag where each sprinkler is to be located, in accordance with drawing. Staking shall be approved by the Contracting Officer before proceeding.

D. Piping Layout: Piping layout is somewhat diagrammatic. Route piping around existing trees and shrubs in such a manner as to avoid damage to plantings. Cut roots with a sharp axe to provide
a clean cut. Do not dig within the ball of newly planted trees or shrubs.

E. In areas where trees are present, trenches are to be adjusted on site to provide a minimum clearance of four times the trunk diameter of the tree (at its base) between any tree and any trench.

F. Material and equipment shall be delivered to the Worksite in unbroken reels, cartons or other packaging to demonstrate that such material is new and of a quality and grade in keeping with the intent of these Specifications.

3.2 EXCAVATION AND TRENCHING

A. The Contractor shall perform excavation to the depth indicated in these Specifications and Contract drawings. The banks of trenches shall be kept as nearly vertical as practicable. Trenches shall be wide enough to allow a minimum of 4 inches between parallel pipes and/or electrical wiring. Where rock excavation is required, or where stones are encountered in the bottom of the trench that would create a concentrated pressure on the pipe, the rock or stones shall be removed to a depth of 6 inches (minimum) below the trench depth indicated. The over depth rock excavation and excess trench excavation shall be backfilled with loose, moist earth or sand, thoroughly tamped. Whenever wet or otherwise unstable soil that is incapable of properly supporting the pipe is encountered in the trench bottom, such shall be removed to a depth and length required, and the trench backfilled to trench bottom grade as hereinafter specified, with course sand, or other suitable material.

B. Bottom of trench grade shall be continued past ground surface deviations to avoid air pockets and low collection points in the line. The minimum cover specifications shall govern regardless of variations in ground surface profile and the occasional deeper excavation required at banks and other field conditions. Excavation shall be such that a uniform trench grade variation will occur in all cases where variations are necessary.

C. Trench excavation shall comprise the satisfactory removal and disposition of all materials, and shall include all shoring and sheeting required to protect the excavation and to safeguard employees as required by OSHA.

D. During excavation, material suitable for backfilling shall be stockpiled in an orderly manner a sufficient distance back from edge of trenches to avoid overloading and prevent slides or cave-ins. Material unsuitable for backfilling shall be wasted as directed by the Contracting Officer. When excavated material is of a rocky nature and the

topsoil or any other layer of excavated material is suitable for pipe bedding and backfill in the vicinity of the pipe, such material shall be separately stockpiled for use in such bedding and pipe backfill operations, unless satisfactory imported material is used.

E. Excavations and backfill shall be unclassified and covered in the basic bid. No additional compensation will be allowed for rock encountered.

F. Restore all surfaces, existing underground installations, etc., damaged or cut as a result of the excavations to their original conditions in a manner acceptable to the Contracting Officer.

G. Electrical conduit cut or broken is the responsibility of the contractor to correct unless the conduit is above 24 inches in depth or unmarked.

H. Trenching, pipe and wire installation shall be approved by Contracting Officer's Technical Representative before back-filling.

3.3 PIPE INSTALLATION

A. Irrigation Mains: Irrigation mains are that portion of piping from water source to solenoid valves. This portion of piping is subject to surges since it is a closed portion of the irrigation system. Irrigation mains shall be installed in a trench with a minimum of 18 inches of cover.

B. Lateral Piping: Lateral piping is that portion of piping from a solenoid valve out to an irrigation head. This portion of piping is not subject to constant pressure since it is an "open end" portion of the irrigation system. Lateral piping shall be installed in a trench with a minimum of 12 inches of cover.

C. Remove lumber, rubbish, and rocks from trenches. Provide firm, uniform bearing for entire length of each pipeline to prevent uneven settlement. Wedging or blocking of pipe will not be permitted. Remove foreign matter or dirt from inside of pipe before welding, and keep piping clean during and after laying pipe.

D. PVC pipe shall not be installed or welded where there is water in the trench, nor shall PVC pipe be laid when temperature is 32 deg. F or below or when rain is imminent. PVC pipe will expand and contract as the temperature changes. Therefore, pipe shall be snaked from side to side of trench bottom to allow for expansion and contraction.

E. Flush mainline piping prior to head installation.
3.4 PVC PIPE AND FITTING ASSEMBLY

A. Solvent: Use only solvent recommended by manufacturer to make solvent-welded joints following standards noted herein. Thoroughly clean pipe and fittings of dirt, dust, and moisture with an approved PVC purple tinted primer before applying solvent. Bevel male ends of pipe prior to making solvent welds.

B. PVC to Metal Connection: Work metal connections first. Use a non-hardening pipe dope such as Permatex No. 2 or "Teflon" tape on threaded PVC to metal joints. Use only light wrench pressure to tighten.

C. Threaded PVC Connections: Where required, use threaded Sch. 40 PVC adapters into which pipe may be welded.

3.5 HYDROSTATIC TESTS

A. Pressure Test: After the pipe is laid, the joints completed, and the trench partially backfilled, leaving the joints exposed for examination, the newly laid piping or anyvalved section of main pressure piping shall, unless otherwise specified, be subjected for four hours to a hydrostatic pressure test at normal city water pressure. Enclosed pipe, joints, fittings, and valves shall be carefully examined during the partially open trench test. Joints showing visible leakage shall be replaced or remade, as necessary. Cracked or defective pipe, joints, fittings, or valves leaking during this pressure test shall be replaced and retested until the test results are satisfactory. Replacement and repair shall be at Contractor’s cost.

3.6 CONTROL WIRE INSTALLATION

A. Control wire less than 500 feet in length shall be continuous without splices or joints from the controller to the valves. Connections to the solenoid valves shall be made at the valve using connectors specified in Paragraph 2.4 of this section, unless otherwise approved by the Contracting Officer in writing.

B. Control wires shall be installed at least 18 inches deep. Contractor shall obtain the Contracting Officer’s approval for wire routing when installed in a separate ditch. Control wires may be installed in a common ditch with piping; however, wires must be installed a minimum of 4 inches below or to one side of piping.

C. Wire passing under existing or future paving, sidewalk construction, etc., shall be encased in PVC Schedule 40 conduit extending at least 2 feet beyond the edges of paving, sidewalks, or construction.

D. Tape control wire bundles at 30 feet on center maximum.

3.7 POP-UP SPRAY AND ROTARY HEADS AND BUBBLERS

A. Provide heads and nozzles as specified and install in locations as shown on the Contract Drawings.

B. Pop-up spray heads shall be installed on a flexible connector directly to lateral piping as detailed on the Contract drawings.

C. Heads shall be installed with the top of the case and nozzle flush with the soil level in turf areas and the top of the mulch layer in shrub beds.

D. Contractor will be required to adjust heads as necessary after establishment of grass or other plant material.

E. Bubblers will be installed on flexible connectors and set to grade as noted and illustrated in the details.

F. Thoroughly flush lateral and main lines before installing heads.

3.8 QUICK COUPLING VALVES

A. Quick coupling valves shall be installed as illustrated in the details.

B. Quick coupling valves shall be installed on a swing-joint assembly as detailed on the drawings.

C. Under the warranty, the Contractor shall return after grass is established and adjust valves and valve boxes to proper grade.

3.9 MANUAL VALVES

A. Manual valves shall be sized and located where shown on the Contract drawings.

B. Valve boxes shall be adjusted to be flush with finished grade. The Contractor will be required to adjust after establishment of grass.

C. Valve boxes shall be properly supported and of sufficient construction that tractors and mowers crossing over the boxes will not push boxes down and crush the pipe, valve, or box.

3.10 VALVE AND VALVE BOX PLACEMENT

A. Manual, electric, and quick coupling valves shall be in boxes as specified in Paragraph 2.7 of this section, and shall be set with a minimum of 12 inches of space between their top surfaces. Boxes shall be in a straight line and evenly spaced off adjacent hardscape a minimum of three feet.
B. Valves shall be fully opened and fully closed to ensure that parts are in operating condition.

C. Valve boxes shall be set plumb, vertical, and concentric with the valve stem.

D. A valve box, which has moved from this required position so as to prevent the use of the operating wheel of the valve or the ball valve, shall be reset by the Contractor at his own expense.

3.11 **ELECTRIC CONTROLLER**

A. Electric controller shall be located as shown on the plans and shall be capable of operating the number of stations indicated.

B. The system is designed to operate one station at a time, unless otherwise noted on the plans. Install unit in strict accordance with the manufacturer’s published installation instructions.

3.12 **ELECTRIC SOLENOID CONTROL VALVES**

A. Solenoid valves shall be located and sized as shown on the plans. Electrical connections shall be made when the weather is dry with connection kits as specified in Paragraph 2.4 of this section in strict accordance with manufacturer’s recommended procedures. Remote control valves shall be installed in a horizontal position, in accordance to the manufacturer’s published installation instructions.

B. It shall be the responsibility of the Contractor to furnish and install the proper size wire on each of the low voltage circuits from the controller to the solenoid control valves.

C. Consideration shall be given to each circuit for allowance of voltage drop and economy consistent with accepted practices of electrical installation. Under no circumstances shall the voltage of any circuit be reduced more than proper due to length of run exceeding the maximum allowable for the wire size used.

3.13 **TEMPERATURE SENSORS & RAIN SENSORS**

A. The irrigation system shall have a temperature sensor and a rain sensor for each controller. Sensors shall not be installed in a location that will allow the irrigation spray to contact the sensors.

B. The freeze sensor shall be installed with a by-pass switch.

3.14 **DRIP IRRIGATION**

A. Install drip irrigation system as required by the manufacturer. Test lines for flow as recommended by manufacturer. Install dripperline at depth of 2 to 4 inches and spacing at 12 inches. Provide drippers at 12 inches on center with flow rate of 1.0 gallon per hour.

B. The drippers are designed to regulate for the specified output from 7 to 70 psi with a maximum recommended pressure of 45 psi when using insert fittings.

C. Use the dripline manufacturer’s Insert Fittings for connections to ensure the integrity of the connection. Improperly sized fittings will cause leaks.

D. Dripline can be installed by: Trenching, laying it out on a sub-grade lower than finished grade and back filling to the specified finished grade depth, or surface installation using Techline Staples to hold it in place with specified soil and mulch cover.

3.15 **BACKFILL AND COMPACTION**

A. After system is operating and required tests and inspections have been made, the trenches shall be carefully backfilled with the excavated materials approved for backfilling, consisting of earth, loam, sandy clay, sand, or other approved materials free from large clods of earth or stone. Rock, broken concrete, or pavement, shall not be used as backfill material. The backfill shall be thoroughly compacted and brought even with the adjacent undisturbed soil level.

B. Compact trenches by thoroughly flooding the backfill and compacting. The jetting process may be used in areas when flooding.

C. Compaction Densities:

1. In areas subjected to or influenced by vehicular traffic, backfill trenches to at least 95 percent of maximum density as determined by ASTM D698.

2. In areas not subjected to or influenced by vehicular traffic, backfill trenches to a density comparable with adjacent undisturbed material.

D. Trenches improperly backfilled, or where settlement occurs, shall be reopened to the depth required for compaction, then refilled and compacted with the surface restored to the required grade and left in a completed surface condition as described above.

E. Specifically tamp backfill under heads and around the flange of heads for one foot by a suitable means after trench backfill has dried from flooding to prevent movement of heads.
### 3.16 Final Adjustment

A. After installation has been completed, make final adjustment of irrigation system prior to Contracting Officer's final inspection.

B. Completely flush system to remove debris from pipes without forcing debris through nozzles. Remove nozzles from heads and turn on valves until clean water is being discharged. Replace nozzles.

C. Check nozzling for proper coverage. Prevailing wind conditions may indicate that an arc or angle of spray should be other than as shown on the drawings. In this case, change nozzles to provide correct coverage and furnish record data to Contracting Officer with each change.

D. Check and adjust each section for the proper operating pressure by use of the flow adjustment on each solenoid valve. Minimize any "misting" from sprinkler nozzles.

E. After system is thoroughly flushed and ready for operation, each section of sprinklers shall be adjusted to control pressure at heads.

F. Verify operation of each zone with wireless remote. Provide wireless remote during final inspection.

### 3.17 Clean-up

A. The Worksite shall be thoroughly cleaned of waste materials and unused or salvaged materials, equipment, tools, etc.

B. After completion of the work, areas disturbed shall be leveled and the Worksite shall be raked clean and left in an orderly condition.

### Part 4 - Measurement and Payment

#### 4.1 General

A. The work described in this section will be paid for on a lump sum basis for "landscape irrigation systems" per location indicated wherein no measurement will be made.

END OF SECTION 02975
SECTION 02976
IRRIGATION SLEEVES

PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes specifications for underground irrigation sleeves and boring.

B. For irrigation system, see Section 02975, “Landscape Irrigation System”.

1.2 REFERENCE STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM D1785 - Standard Specification for Poly(Vinyl Chloride) (PVC) Plastic Pipe, Schedules 40, 80, and 120

1.3 DEFINITIONS

A. A sleeve is a pipe within which another pipe for carrying water will be installed.

B. A wire sleeve is a pipe used to carry low voltage irrigation wires for operation of electric solenoid valves.

1.4 COORDINATION

A. Contractor shall coordinate placement of sleeves with construction of platform, paving and track modifications or elements in timely manner.

PART 2 - MATERIALS

2.1 GENERAL

A. Polyvinyl Chloride Pipe (PVC): Provide PVC pipe and fittings manufactured in accordance with standards noted herein:
   1. Marking and Identification: PVC pipe shall be permanently marked with the following information: SDR number, ASTM standard number, and the NSF (National Sanitation Foundation) seal.

PART 3 - EXECUTION

3.1 INSTALLATION OF SLEEVES

A. Borings: Direct bores are required to place sleeves under existing trackwork and pavement. Bores under trackwork shall meet DART standards. Bores under paving shall meet NCTCOG and TxDOT standards.

B. Coverage: Provide minimum of 18 inches cover over top of sleeve from finish grade of pavement or lawn/planting areas or 12 inches of cover from the bottom of the pavement subgrade. Provide minimum of 5 feet cover over top of sleeve from finish grade of rail track when sleeve cross under tracks.

C. Sleeve Extensions: Extend sleeves a minimum two feet past edge of pavement or concrete walls. Install a 90 degree elbow on each sleeve end and add additional length of same size pipe to extend 2 feet (minimum) above finish grade. Cap pipe ends using PVC caps to keep debris out. Clean pipe and fittings of dirt, dust and moisture before applying solvent.

D. Field verify location of sleeves with Contracting Officer prior to pouring concrete.

3.2 BACKFILL

A. Compaction: Place excavated soil over sleeves in 6" lifts. Tamp firmly into place taking care not to damage sleeve. Complete backfill and compaction to prevent future settlement.

B. Excavations are unclassified and include earth, loose rock, rock, or combination thereof in wet or dry state. Backfill trenches with material removed, provided the earth is free of rock, trash and debris. In event rock or other debris is found during trenching, pipe shall be installed in accordance with details on Drawings, utilizing sand cushion and for pipe.
C. Damage: Repair damage resulting from improper compaction including pavement repair and replacement.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Irrigation Sleeves described in this section will not be measured, but will be paid for at the lump sum price for “Irrigation Sleeves”, for each size, including trenching, gluing, sleeves, sleeve extensions, capping and backfilling.

B. Bored Irrigation Sleeves described in this section will not be measured, but will be and paid for at the lump sum price for “Bored Irrigation Sleeves”, for each size, including boring, trenching, gluing, sleeves, sleeve extensions, capping, and backfilling.

END OF SECTION 02976
PART 1 - GENERAL

1.1 SCOPE

A. General requirements for Landscape Maintenance for the specified project.

B. Work under this Contract shall be performed in accordance with:
   1. Section 02981, "Landscape Maintenance - Irrigated Areas"
   2. Section 02982, "Landscape Maintenance - Non-Irrigated Areas"

1.2 SAFETY

A. The Construction Safety Orders of the State Division of Industrial Safety and the Department of Labor Occupational Safety and Health Administration.

1.3 SUBMITTALS

A. Material List.

B. The Contractor shall furnish the articles, equipment, or processes specified by name in the specifications. No substitution will be allowed without prior written approval by the Contracting Officer.

   1. A complete material list (fertilizer, chemical, etc.) shall be submitted prior to performing any work. Material list shall include the manufacturer, model number, and description of all materials and equipment to be used.

C. Equipment or materials (fertilizer, chemical, etc.) installed or furnished without prior approval of the Contracting Officer may be subject to rejection, and the Contractor required removing such materials from the site at his own expense.

D. Approval of any item, alternate, or substitute indicates only that the product or products apparently meet the requirements of the drawings and specifications on the basis of the information of samples submitted.

E. Manufacturer’s warranties shall not relieve the Contractor of his liability under the guarantee. Such warranties shall only supplement the guarantee.

1.4 QUALITY ASSURANCE

A. The governing Building Code(s), governing laws, ordinances, rules, permits, regulations, and directives from governing authorities having jurisdiction over this work.

1.5 GUARANTEE

A. Guarantees in accordance with requirements of the Contract Documents, with period of guarantees as stated herein; except that if the Contract neglects to correct or complete work in the inspection check list during periods of maintenance, the Contractor shall still be responsible and required to do so after expiration dates of the guarantee(s) or the life of the Contract, until the corrective work is complete and accepted by the Contracting Officer.

PART 2 - PRODUCTS

2.1 MANUFACTURER’S DIRECTIONS

A. Where specifications require work to be performed in accordance with manufacturer’s directions, the Contractor shall obtain and distribute copies of said direction to the Contracting Officer prior to starting affected portion of the work.

PART 3 - EXECUTION

3.1 SCHEDULE

A. Work under this Contract shall be performed in accordance with the Maintenance Matrix (Refer to Table 02981 - 1 in Section 02981, "Landscape Maintenance - Irrigated Areas" and Table 02982 - 1 in Section 02982, "Landscape Maintenance - Non-Irrigated Areas".

B. The Contractor shall outline in detail, acceptable to the Contracting Officer, the schedule for installation of each portion of maintenance. This shall be in the form of a “critical path” diagram, which identifies specific dates, submittals, etc. critical to the work.

3.2 UNKNOWN UNDERGROUND UTILITIES

A. The attention of the Contractor is called to the fact that utility lines may be present, the existence and location of which is not known. The Contractor shall exercise his best judgment in the course of excavation to avoid death or injury to all persons and damage to property caused by unexpected encounters with such lines, and he shall assume all liability arising there from. The responsibility for safely accomplishing the work rests solely with the Contractor.

B. In the event that such utility lines are encountered, the Contractor shall obtain the instruction from the
Contracting Officer as to the removal or relocation or protection thereof.

3.3 AIR POLLUTION

A. Throughout the duration of the Contract, the Contractor shall conform to the applicable Federal, State, and local regulations, laws and ordinances pertaining to air pollution.

3.4 PROTECTION OF WORK IN PLACE

A. Parts of the project shall be protected from damage from all causes until the Contracting Officer accepts the project. Parts, which are damaged, shall be repaired or replaced to the satisfaction of the Contracting Officer before the project will be accepted.

3.5 PROTECTION OF EXISTING ITEMS

A. Bench marks and other reference points shall be carefully maintained, and if disturbed or destroyed, shall be replaced as directed, at no cost to the Authority.

B. Do not interrupt existing utilities serving facilities occupied and used by the Authority or others, except when permitted in writing by the Contracting Officer and then only after acceptable temporary utility services have been provided.

C. Proper notification, approval, and coordination shall be given and obtained when working in an around utility facilities. The Contractor shall comply with any terms of any easements. Refer to the drawings for information regarding utility companies currently serving the project site.

3.6 PROTECTION OF EXISTING VEGETATION AND MATERIALS

A. Native plants and natural materials shall be protected during landscape maintenance, including topsoil, rock outcropping, boulders, and plant materials. Materials that cannot be temporarily relocated so as to avoid damage thereto shall be marked and protected by flagging, or barriers, at the direction of the Contracting Officer. Parts, which are damaged, shall be repaired or replaced to the satisfaction of the Contracting Officer, at no additional cost to the Authority, before the project will be accepted.

B. Existing, native trees shall be protected from landscape maintenance activities, unless otherwise directed by the Contracting Officer. The Contractor shall not drive or park any vehicle used for maintenance or the transport of labor personnel under the drip line of the existing tree canopy at any time or for any reason. Failure to comply with these specifications will result in the Contractor being penalized monetarily for each occurrence or being dismissed from the project.

3.7 CONTRACTOR’S PERFORMANCE

A. The Contractor shall perform work required as often as necessary, and provide the necessary labor force to fulfill the spirit and intent of the Contract. The Contractor’s labor personnel shall be neat in appearance, perform their work in a professional manner, keep noise to a minimum, and stage their work from an Contracting Officer approved location on the site, out of the way of the mainstream of the project residents and users. In general, the Contractor’s presence on the site shall be as inconspicuous as possible.

B. The Contractor shall perform work required in strict accordance to any national state, county, local, or other governing agency rules, regulations, and safety standards.

C. The Contracting Officer shall monitor the Contractor’s performance.

3.8 NEGLECT AND VANDALISM

A. The Contractor at no expense to the Authority shall replace shrubs, trees, or plants that are damaged or killed due to the Contractor’s operations, negligence, or chemical applications. If plant damage or death is caused by condition beyond the Contractor’s control, replacement shall be at the Authority’s expense upon receipt of written authorization to proceed.

B. The Contractor must replace drainage systems, irrigation components, tree drains, or structures that are damaged due to the Contractor’s operations promptly, at no expense to the Authority. Likewise, the Contractor, at the Authority’s expense upon written authorization to proceed, shall correct damages by other immediately.

C. Damage to the planting by others shall be repaired at the Authority’s expense. Upon written authorization to proceed, the Contractor shall correct thefts of exterior landscaping not caused or allowed by the Contractor.

D. Replace damaged materials caused by the Contractor’s negligence. Replacement shall be at the Contractor’s expense (example: mowing over shrubs, mowing and trimming cut on tree trunks, etc.).
3.9 **EMERGENCIES**

A. The Contractor shall answer emergency or complaint calls 24 hours a day, 365 days per year, regarding conditions in exterior landscape areas. The Contractor shall correct any problem or place warning signs and advise the Contracting Officer and Property Management Company of the need for major work to be performed at the Authority’s expense upon receipt of written authorization to proceed.

B. The Contractor shall answer emergency calls 24 hours a day, every day of the Contract, regarding the landscape irrigation systems failure or need for repair.

C. The Contractor shall provide an emergency telephone number that is answered 24 hours a day, every day of the Contract, and shall make that telephone number available to the Contracting Officer.

**PART 4 - MEASUREMENT AND PAYMENT**

4.1 **GENERAL**

A. The work specified in this section will not be measured separately for payment, but all costs in connection therewith will be considered incidental to the work specified under Section 02981, “Landscape Maintenance - Irrigated Areas” and Section 02982, “Landscape Maintenance - Non-Irrigated Areas”.

END OF SECTION 02980
SECTION 02981
LANDSCAPE MAINTENANCE - IRRIGATED AREAS

PART 1 - GENERAL

1.1 DESCRIPTION

A. It is the intent of this Contract to provide the Authority with a project site that is attractive in appearance. It is also the intent of this Contract to provide the Authority with existing plant material in a healthy, vigorous condition, and to have a maintained, neat appearance. The following specifications relate to the irrigated areas:

1. Section 02930, “Seeding and Sodding - Irrigated Areas”.
2. Section 02950, “Landscape Planting”.
3. Section 02975, “Landscape Irrigation System”.

B. See Section 02980, “Landscape Maintenance - General” for general requirements for landscape maintenance.

C. See Section 02982, “Landscape Maintenance - Non-Irrigated Areas” for tree, shrub and groundcover maintenance in non-irrigated areas.

D. The Contractor shall perform grounds maintenance work necessary for DART properties as shown, utilizing acceptable horticultural standards as adopted by the Texas Association of Landscape Contractors (TALC), Texas Nurseryman Association as interpreted by the Authority needs as further specified herein. Such work shall include, but is not limited to, the following:

1. General site clean up and trash removal and products of the landscape maintenance.
2. Irrigation checks, monitoring, and repairs.
3. Irrigation scheduling and programming.
4. In non-irrigated areas, hand watering of trees, turf, ground cover and shrubs. Supplemental hand watering in irrigated areas as needed. Contractor shall be responsible for manual operation of the irrigation system and/or setting the controller as needed. (Not all properties are equipped with sprinkler systems.)
5. Trees - pruning, trimming, guy-wire adjustments, fertilizing via deep root zone and flood application, insecticide and fungicide applications, disease control, and tree well mulching.
6. Shrub and groundcover beds - pruning, trimming, hedging, fertilizing, weeding, cultivation, pre-emergent and post-emergent applications.
8. Bermuda grass - mowing, clippings pick-up, edging, trimming, fertilizing, pre-emergent, post-emergent, aerating, scalping, insecticide and fungicide applications.
9. 609 Buffalo Grass - mowing, edging, trimming, fertilizing, pre-emergent, post-emergent, aerating, insecticide and fungicide applications.
10. Rye Grass - mowing, clippings pick-up, edging, trimming, fertilizing, aerating, scalping, insecticide, fungicide applications and eradication.
11. Drainage system cleaning, checking, and monitoring.
12. Draining stand pipes at trees and shrub beds.
13. Spraying and/or hand-removal of all grass and weeds growing in cracks and expansion joints of sidewalks, platforms, along building/s, and pavement areas throughout properties, including walkways around buildings.
14. Cleanup of Right-of-Way areas. Right-of-ways shall include alleys, adjacent areas that may be defined as a part of the property service requirement, and lots as shall be defined under the listing of properties.
15. Soil and/or plant testing shall be conducted as needed and in accordance with industry standards and/or as consistent with A&M data relative thereto.
16. Responsible for a monthly site inspection walk through with Contracting Officer.
17. Responsible for written notification to Contracting Office 48 hours prior to applying any herbicides, pesticide or fertilizer for on-site verification of materials and amounts to be applied.
18. Back-fill and adjustment of sprinkler head/bubblers in planter areas as defined in Section III, B6, of Scope of Work.

E. Extra Services:

1. All services not covered under this Contract shall be considered “extra services” and will be charged separately according to the nature of the item of Work. Written consent and authorization of the Contracting Officer must be obtained prior to the performance or installation of such “extra services” items and prior to the purchase of any reimbursable materials.

2. Such Work may occur by product of vandalism or other contractors, or other site related work.

3. Replanting of plant materials with the same species and size to match others in the mass, hedge or row, when plants die due to conditions not included under the Contractor’s guarantee will be placed at a negotiated price between this Contractor and the Contracting Officer.

4. Tree and Shrub pruning outside normal seasonal pruning.

5. The consent and authorization of the Contracting Officer must be obtained prior to the performance of such “additional services” prior to the purchase of any chargeable materials and/or services. Only the Contracting Officer may authorize any work beyond the provisions of the contract. The Contracting Officer will issue Work Orders for all work defined as “Additional Services.” The Contractor shall provide a unit cost, including labor, for each additional service item to be performed consistent with the pricing information set forth under in the Schedule as provided herein, but must not proceed with any work prior to receipt of a Work Order authorization from the Contracting Officer. A copy of the Work Order must accompany billing invoices for all “additional services” work performed, itemized services and costs thereof, by facility.

1.3 QUALITY ASSURANCE

A. The Contractor shall furnish the following personnel:

1. SUPERVISOR: The supervisor shall be qualified, knowledgeable, and experienced in north Texas horticultural practices and typical native plant maintenance procedures. The Supervisor shall have a minimum of ten (10) years of experience in the landscape maintenance industry, or an equivalent secondary education, counting as part of the ten years experience. The Supervisor shall be well versed in landscape maintenance, plant identification, and personnel management (including the ability to verbally communicate with all personnel). The Supervisor shall be able to verbally communicate with the Contractor Officer. Contractor Officer may chose to conduct a site inspection with the Supervisor once a week or as needed.

2. LEAD FOREMAN: The Lead Foreman shall be a “working” qualified foreman, knowledgeable, and experienced in north Texas horticultural practices and typical native plant maintenance procedures. The Lead Foreman shall be well versed in landscape maintenance, plant identification, and personnel management. The Lead Foreman shall be present on site at all times while the Irrigation Repair Technician, Chemical Applicator and Labor are on site.

3. IRRIGATION REPAIR TECHNICIAN: The Irrigation Repair Technician shall be Licensed Irrigation Designer by the State of Texas. The technician shall be knowledgeable and well versed in the landscape irrigation industry. The Technician shall also be knowledgeable of the landscape plant materials and be familiar with the water requirements of the landscape. The Technician shall be qualified in the repair and operation all types of irrigation systems. The Contractor shall furnish the same Technician for each of the inspections and routine repairs. The Technician shall thoroughly inspect, clean, repair and adjust the irrigation system every week.

4. LABOR PERSONNEL: The labor force shall be knowledgeable of the landscape maintenance industry and qualified to perform landscape maintenance tasks. The labor personnel shall be well versed in the proper operating procedures of landscape maintenance equipment.

1.2 SUBMITTALS

A. See Section 02980, “Landscape Maintenance - General”.
5. CHEMICAL APPLICATOR: The Chemical Applicator personnel shall be skilled and knowledgeable in the selection and application of all necessary chemicals required throughout the course of the Contract. The Chemical Applicator shall be legally licensed with the State of Texas to apply all necessary chemicals to the landscape. The Chemical Applicator's license shall be current, and kept so during the duration of the Contract. The Contractor shall provide a copy of the Chemical Applicator's current license to the Contracting Officer illustrating the applicator's name, license number and date of expiration. All Supervisors, Lead Foremen, Chemical Applicators, Irrigation Repair Technicians, and Labor personnel employed on the project shall be of legal status or citizenship, as defined by the United States Federal Government, State of Texas, Dallas County, and City of Dallas, Texas.

6. All of the Contractor's personnel shall be neat, professional, and well presented in appearance at all times. All personnel shall be uniformed at all times. All uniforms shall be the same. Failure to uniform personnel properly may result in the excuse of dismissal of the personnel from the Site and Project, at the discretion of the Contracting Officer.

7. The Contracting Officer reserves the right to reject the services, dismiss, or excuse any labor personnel from the Project at any time, with or without cause. In the case of the supervisor, Lead Foremen, Chemical Applicator, Irrigation Repair Technician, or Labor personnel's absence, the Contractor shall furnish the Project with another person of equal knowledge and experience.

8. Crew Working Hours and Time:
   a. The maintenance crew shall work Monday through Friday between the hours of 7:30 a.m. and 5:30. The Contracting Officer may grant extended hours if the Contractor proves that the extension would be beneficial to the Project.
   b. The maintenance crew shall be employed during a typical work week (Monday through Friday). With prior permission from the Contracting Officer, the Contractor may work on Saturdays and Sundays.

1.4 INSPECTION OF THE SITE
   A. The Contractor shall visit the site to inspect the conditions and review the Contract Documents to become familiar with the site and the scope of the Work.

1.5 SCHEDULING / REVIEW / COORDINATION
   A. For monitoring purposes, the Contractor will be provided with monthly work orders, which will indicate the properties to be maintained, and the work to be performed. The Contractor shall deliver (fax or hand) to the Contracting Officer on a daily basis an itemized work schedule of the work performed on the previous day.
   B. The Contractor shall be required to attend monthly meetings to be held at a time and location determined by the Authority. The purpose of the meetings will be to review the Contractor's invoices and proposed times and locations where work is to be performed, by the Contractor, for the month. Also, the Contractor and the Contracting Officer's Technical Representative will be given the opportunity to discuss problems or concerns, which may have arisen during the previous month.
   C. The Contractor's invoice submitted at the "Monthly Review" meeting will pertain to services, which were accomplished the previous month. No "hold back" or "delayed billings" will be allowed.

PART 2 - PRODUCTS

2.1 FERTILIZER
   A. Shall be based on current soil analysis. See Section 1.1.B.15.
   B. Trees:
      1. February - Complete Fertilizer 10-10-10 (1:1:1) slow release.
      2. July - Complete Fertilizer 10-10-10 (1:1:1) slow release.
   C. Shrubs, groundcover:
      1. March - Complete Fertilizer 24-6-6 (4:1:1) 50 percent sulfur coat.
      2. July - Complete Fertilizer 24-6-6 (4:1:1) 50 percent sulfur coat.
      3. September - Complete Fertilizer 24-6-6 (4:1:1) 50 percent sulfur coat.
E. **Daylilies:**

1. **Spring:** Complete Fertilizer 15-30-15 (1:2:1).
2. **Fall:** Complete Fertilizer 4-8-12 (1:2:3).

F. **Warm season grass areas:**

1. **March:** Complete Fertilizer 24-6-6 (4:1:1) quick release.
2. **May:** Complete Fertilizer 21-7-14 (3:1:2) with 3 percent iron and 50 percent sulfur coat.
3. **July:** Complete Fertilizer 21-7-14 (3:1:2) with 3 percent iron and 50 percent sulfur coat.
4. **September:** Complete Fertilizer 10-20-20 (1:2:2) with 3 percent iron.

G. **Buffalo Grass**

1. **March:** Complete Fertilizer 12-4-8 or 15-5-10 (3:1:2) slow release.
2. **May:** Complete Fertilizer 12-4-8 or 15-5-10 (3:1:2) slow release.
3. **September:** Complete Fertilizer 12-4-8 or 15-5-10 (3:1:2) slow release.

H. **Cool season grass areas:**

1. **November:** Complete Fertilizer 24-6-6 (4:1:1) quick release.
2. **January:** Complete Fertilizer 15-5-10 (3:1:2) quick release.

2.2 **HERBICIDES**

A. Contractor shall submit product description and MSDA.

B. General nonspecific weed control: Roundup, or equal glyphosate product.

C. Spring and summer broadleaf weed control: Threeway, Trimec or equal.

D. Grassy weed control: MSMA, DSMA, Trimec Plus, or equal.

E. Pre-emergent weed control: Simazine, or XL by Monsanto, or equal.

2.3 **ANTCONTROL**

A. In accordance with currently acceptable industry standards as established by Federal, State, and local authorities.

2.4 **WOUND PAINT**

A. Petroleum or latex base tree wound paint, dark gray, brown or black in color. Spray type paints are acceptable. For use on genus Quercus only.

2.5 **MACHINERY AND EQUIPMENT**

A. Machinery requirements listed under this Section are NOT intended to be restriction of specific manufacturers or models, unless so stated. Specific mention of the manufacturers in intended as a guide to illustrate the final product of the maintenance operations desired. All equipment used shall be and maintained in top working condition at all times.

B. Lawn mowers shall be of the rotary or reel type, in good working order, finely tuned to protect the grass from excessive exhaust fumes. Mower blades shall be sharp at all times to reduce the tearing of the turf and shedding of the cut grass blades. Mowers shall be kept in balance with no bent blades. Lawn mowers shall be in a safe working condition at all times.

C. Edgers shall be hard blade grass edgers. Edger’s shall be maintained in safe, working condition, cutting edges shall be sharp at all times.

D. String trimmers shall be maintained in safe and working condition.

E. Pruning tools shall be maintained in safe, working condition, cutting edges shall be sharp at all times.

F. Fertilizer and insecticide spreaders shall be of the hand-held or cyclone type. Vehicle-mounted or push cyclone spreaders shall be allowed. The Contractor shall be responsible for any grade, plant material (turf, trees, shrubs, etc.), or hardscape amenity (fence, pavement, arbor, steel edging, stone wall, etc.) damage caused by the spreader and the application process. Spreaders shall be in a safe working condition at all times.

G. Insecticide and fungicide sprayers shall be of the hand-held, backpack, or vehicle-mounted type. The contractor shall be responsible for any grade plant material (turf, trees, shrubs, etc.), or hardscape amenity (fence, pavement, arbor, steel edging, stone wall, etc.) damage caused by the sprayer and the application process. Sprayers shall be in a safe working condition at all times.
H. Deep root zone tree fertilizing shall be done with a hydraulic spray rig capable of producing 15 gallons of fertilizer solution per minute at 150 - 200 p.s.i.

I. Carts, trucks, wheelbarrows, and similar wheeled conveyances used in or on any portion of the existing landscape or amenities shall be equipped with pneumatic tires.

PART 3 - EXECUTION

3.1 WATERING

A. General:

1. Maintenance procedures should assure the operation of the irrigation system. The irrigation system components (valves, nozzles and controller) should be inspected, cleaned, repaired and adjusted weekly.

2. Adjust the system's timing in accordance with the general weather conditions. Improper watering procedures causing the decline of the permanent good health and appearance of the plant material shall be replaced with the same piece of equal size and form at the cost of the Contractor.

3. Promptly repair any damage to the irrigation system caused by the maintenance operations, vandalism, excavation by other result in broken heads, risers, pipe or other similar damage; replace with the same part and manufacture.

B. Deep root water newly planted trees once every week during the first summer and once a month during the first winter, if needed. This should be adjusted to the amount of rain. However, unless it has rained at least 1/2 inch since the last scheduled watering, continue to deep root water. Complete deep root watering by filling each tree saucer three times and letting it percolate dry.

C. Shrub, Ground Cover and Seasonal Color beds should be watered as necessary to keep uniform moisture in the bed. Adjust watering practices to match water requirements of species in planting beds. Maintain uniform moisture in all planting areas during the winter months - particularly when a freeze is predicted.

D. Containers will be hand watered as necessary.

E. Be alert to over watering and discontinue watering as required. If water stands in planting areas, consider fine grading revisions to eliminate water-holding pockets. In general, a drainage problem area can be identified when water consistently remains for 12-24 hours after either sprinkler system use or heavy rains. Be especially careful to avoid over-watering the following species: Red Yucca, Paleleaf Yucca, Twisted-Leaf Yucca, Greg Dalea, Sideoats Grama, Blue Grama, Little Bluestem, Buffalo grass, Cherry Sage.

F. Buffalo Grass Lawns: Buffalo grass requires only 25 percent of irrigation typically applied to Bermuda grass. It is anticipated that after establishment, normal seasonal rainfall will meet the water requirements of Buffalo grass lawns in fall, winter and spring, except for unusually dry periods. During the summer, and during unusual dry periods throughout the year, irrigate to provide the equivalent of 1 inch to 2 inches of Water per month. This is best applied as a monthly or semi-monthly soaking to wet the soil to the depth of 6 inches. Note: Over-watering of Buffalo grass will encourage invasion of difficult to control weeds, especially nut sedge and Bermuda grass.

G. Buffalo Grass, Native Grass and Wildflower Areas: Water as per Buffalo grass lawns. Take care to provide adequate moisture during the germination period of wildflower seeds in September and October.

H. Native Ornamental Grasses: Water short growing native ornamental grasses (Sideoats Grama, Blue Grama, Little Bluestem) as per Buffalo grass lawns. Water tall-growing native ornamental grasses (Big Bluestem, Inland Sea oats, Sugarcane Plume Grass, Switch Grass) to provide the equivalent of 1 inch water per week during the growing season.

3.2 FERTILIZATION

A. General: Fertilizing procedures should reflect the manufacturer's recommendations. Use caution in handling and spreading fertilizers - concentrated amounts may result in "burning" and damage to root systems. Carefully follow label instructions.

B. For Trees:

1. Introduced trees less than 3 years in place - 3 gallons of fertilizer solution per one inch of trunk caliper (measured 12 inches above finish grade).

2. Introduced trees more than 3 years in place - 5 gallons of fertilizer solution per one inch of trunk caliper (measured 12 inches above finish grade).

3. Native trees - 5 gallons of fertilizer solution per one inch of trunk caliper (measured 48 inches above finish grade).
C. Shrub Beds at rate of 1.25 pounds of nitrogen per 1,000 square feet of bed area. Cultivate and water beds thoroughly after application.

D. Shrubs, Vines, Groundcover, Ornamental Grasses and Perennials: Top dress with 2 inch layer of compost. Cultivate lightly and water thoroughly after application.

E. Seasonal Color Beds at rate of 1 pounds of nitrogen per 1,000 square feet of bed area. Cultivate and water beds thoroughly after application.

F. Lawns of Warm Season Grasses:
   1. March - 2 pounds of nitrogen per 1000 square feet.
   2. May - 2.5 pounds of nitrogen per 1000 square feet.
   3. July - 2.5 pounds of nitrogen per 1000 square feet.
   4. September - 1.25 pounds of nitrogen per 1000 square feet.

G. Lawns of Buffalo Grass and Buffalo Grass with Wildflowers:
   1. March - 1/3 pound of nitrogen per 1000 square feet.
   2. May - 1/3 pound of nitrogen per 1000 square feet.
   3. September - 1/3 pound of nitrogen per 1000 square feet.

H. Lawns of Cool Season Grasses:
   1. November - 1.5 pounds of nitrogen per 1000 square feet.
   2. January - 1.5 pounds of nitrogen per 1000 square feet.

I. Bog and Aquatic Plants - except Louisiana Iris:
   1. March - push 1 to 3 (5-10-5) slow release fertilizer pellets (depending on the size of the clump) into the soil in the root zone of each clump of plants. 2. May - push 1 to 3 (5-10-5) slow release fertilizer pellets (depending on the size of the clump) into the soil in the root zone of each clump of plants.
   2. July - push 1 to 3 (5-10-5) slow release fertilizer pellets (depending on the size of the clump) into the soil in the root zone of each clump of plants.
   3. Make sure each pellet is completely covered by soil and pea gravel to prevent release of fertilizer directly into the water.

J. Louisiana Iris:
   1. February - push 1 to 3 (5-10-5) slow release fertilizer pellets (depending on the size of the clump) into the soil in the root zone of each clump of plants.
   2. March - push 1 to 3 (5-10-5) slow release fertilizer pellets (depending on the size of the clump) into the soil in the root zone of each clump of plants.
   3. September - push 1 to 3 (5-10-5) slow release fertilizer pellets (depending on the size of the clump) into the soil in the root zone of each clump of plants.
   4. Take care not to damage roots or rhizomes of the plants.
   5. Make sure each pellet is completely covered by soil and pea gravel to prevent release of fertilizer directly into the water.

K. Daylilies: Fertilize at rate of one pound of nitrogen per 1,000 square feet of bed area. Water beds thoroughly after application. Keep fertilizer off the foliage.

3.3 TREES

A. Trees shall be continuously and routinely inspected for girdling caused by guying and lawn maintenance equipment. Girdled trees shall be replaced at the Contractor’s expense, as determined by the Contracting Officer.

B. Tree wells with mulch shall be monitored so that build-up of mulch does not occur. The tree root flare shall remain exposed.

C. Fire Ant mounds around or on top of a tree root zone shall be treated immediately and the mound removed physically. Do not allow the mound to build on the tree trunk as this will cover the tree root flare and possibly cause injury or death. Insure that any chemical application to the Fire Ant mound is safe for application atop tree root zones.
**D.** Trees: Prune annually in the correct season for the species; spring flowering trees will be pruned after bloom, summer, fall and non-flowering trees will be pruned in mid-winter. Experienced pruning personnel shall carry out pruning.

1. Prune to encourage positive growth; remove crossing branches; and maintain the natural shape of each species.

2. Sterilize pruning tools between individual plants, especially in the genus Quercus. Paint all wounds on plants of the genus Quercus with wound paint as soon as possible. Wounds shall be painted within 1 hour of pruning. Paint accidental wounds (storm or equipment damage or vandalism) as soon as they are observed.

3. Raising to an acceptable height as approved by Contracting Officer.

4. No weed-eaters or edger’s are to be used within 12 inches of any tree. Should the need for trimming be necessary within 12 feet of any tree, it shall be done so by hand trimming only.

**E.** Tree Maintenance in Shrub and Groundcover Areas: Groundcover growing around introduced or native trees shall be maintained by use of hand trimmers, within 30 inch” of the tree. Trimming of groundcover by weed-eaters and mowers is prohibited within the 30 inch zone of the tree. Tree drainage standpipes shall be checked on a weekly basis. Pipes found to be filled with water, debris, etc.; the Contractor shall clean and pump the pipes. Pipes shall be inspected and serviced on a weekly basis throughout the year.

3.4 **SHRUBS, VINES, AND GROUNDCOVER**

**A.** Thin to remove dead wood when necessary.

**B.** Remove dead wood and freeze damaged leaves in the spring.

**C.** In no case should any shrub be sheared. Shrubs shall be selectively pruned.

**D.** All water sprout and sucker type growth shall be pruned and trimmed continuously. Pruning and trimming of any shrub shall be done so in a manner as to retain the natural character and habit of the plant. All shrubs shall be pruned to create a uniformly dense plant. Selectively thin and tip back annually, or as needed. Do not change the natural shape of the shrub by pruning unless so directed by the Contracting Officer.

**E.** Shrub and groundcover beds shall be edged, weeded, and cultivated in accordance with the Schedule.

**F.** Always prune out dead, broken, and diseased wood. All cuts shall be flush cuts. Refer to the Schedule for pruning and trimming times. Guidelines for specific shrubs, vines, and groundcover shall be as follows:

1. Red Yucca, Paleleaf Yucca, Twisted-Leaf Yucca: Remove spent flower stalks throughout the year. Remove dead foliage from the vase of the plants throughout the year. Wear eye protection when working close to these shrubs.

2. Creek Plum, Smooth Sumac: Remove dead or declining trunks at ground level to encourage growth of young shoots from rhizomes.

4. Boston Ivy, Virginia Creeper, Carolina Jessamine, Wisteria: Prune and train to cover the fences and arbor on which they are growing. Keep them routinely trained and tied up. Remove unruly growth as needed. Always keep walks clear of hanging vines to a height of 78 inches. Prune the Carolina Jessamine and Wisteria after their individual blooming cycle.

5. Bar Harbor Juniper: Allow junipers to trail over walls. Pick prune unruly growth as needed. The bottom one-third of the stonewalls shall be visible. Selectively prune junipers to accomplish this intent. Do not shear or hedge.

6. Compact Pfizer Juniper, Sea Green Juniper: Do not shear or hedge. Pick prune unruly growth as needed.

7. Asian Jasmine: Trim Asian Jasmine to an even height. Maintain to a height of 6 to 9 inches.

8. Vinca: Maintain to a height of 10 to 12 inches.

9. Liriope: Trim the previous season’s growth off in the spring as new growth emerges (See Schedule).
10. Honeysuckle: Maintain shrub areas to a uniform height without hedging. DO NOT allow honeysuckle to climb on fences. Honeysuckle allowed to climb on fences shall be maintained as directed by the Contracting Officer. Honeysuckle allowed to climb tree trunks, or trail over walls.

G. As groundcover mature, discontinue cultivation.

H. Damaged, dead, or thin areas in groundcover beds shall be replanted at the direction of the Contracting Officer. Replacement of plant material not due to the Contractor's negligence will be at the Authority's expense, upon receipt of written authorization to proceed.

I. Shrub and groundcover beds with slopes of 2:1 or steeper shall not be cultivated due to the possible erosion nuisance, unless otherwise directed by the Contracting Officer.

J. Pruning debris and limbs shall be removed completely and immediately from site, or to an Contracting Officer approved location on-site.

K. Groundcover beds shall be sheared one time per year. This shall be done in the early spring, prior to the growing season. Groundcover beds bordering on paved surfaces must be edged as needed to retain a neat edge. Do not trim vertically so as to expose the stems.

L. Cultivate soil and re-mulch beds to give the planting soil a productive consistency.

3.5 PERENNIALS

A. Perennials will be continuously inspected for signs of pests and diseases. Identify pests and diseases and treat with appropriate methods. Refer to Appendix A for specific maintenance schedule.

B. Remove spent flowers, dead leaves and stems from plants as they appear. Take care not to damage or inadvertently remove dormant (but still living) plants.

C. Maintenance guidelines for specific perennials shall be as follows:

1. Texas gold columbine: Normally dormant during summer months and in active growth during the winter. Following spring flowering, allow the plants to set and scatter seed until the planting has reached desired density, as directed by Contracting Officer.

2. Wood fern: Dormant in winter. Remove dead foliage after it has been killed by frost in fall.

3. Pavonia: A semi-woody perennial shrub, dormant in winter. After the planting has reached the desired height (3 to 4 feet), prune the plants heavily in February to encourage flowering.

4. Blue phlox: A semi-evergreen herbaceous perennial. Watch for iron chlorosis due to high soil pH, and treat with soil acidifiers and chelated iron. Watch for fungal root diseases, and treat with appropriate fungicide.

5. Daylilies: Remove scapes soon after flowering.

3.6 BOG AND AQUATIC PLANTS

A. Bog and aquatic plants used in the project are herbaceous perennials adapted to grow in saturated, shallowly submerged soils. Planting areas for these plants are designed to be flooded with 2- to 3 inches of water during normal operation of water features. The planting areas are designed to hold water, allowing the water features to be drained for short periods of time for cleaning and maintenance. If the water features are to be drained for prolonged periods (greater than 3 days), provision must be made to keep these planting areas flooded.

B. It is normal for these plants to grow very rapidly, both in height and by horizontal spread. If the plants begin to creep beyond the planting areas, prune or trim at direction of Contracting Officer.

C. Maintenance guidelines for specific bog and aquatic plants are as follows:

1. Horsetail: Semi-evergreen. If severe cold kills foliage, remove by cutting at waterline.

2. Pickerelweed and Lizardtail: Dormant in winter. When frost kills the foliage, remove it by cutting at the water line.

3. Louisiana iris: Semi-evergreen with periods of slow growth in mid-summer and mid-winter. Selectively remove dead leaves throughout the year. Do not cut back the entire plant unless unusual cold kills all foliage. Remove any seedpods that form after flowers fade in late spring.
3.7 NATIVE ORNAMENTAL GRASSES

A. Ornamental grasses used in the project are herbaceous perennials, dormant in winter. The foliage, flowers and seed Plumes die with onset of freezing weather, but persist throughout the winter. The dead but standing foliage retains its form and is one of the main aesthetic values of these plants. Maintenance activities in or around these plants must be performed carefully during the fall and winter to avoid damage to the standing foliage. If damaged, the foliage will not completely regenerate until the following summer.

B. Species of ornamental grasses are sensitive to over-fertilization, and some species are sensitive to over-watering. Over-fertilization and over-watering causes the plants to become "top-heavy", resulting in foliage and flowers that do not stand upright, but fall over in wind or rain. This destroys the fall and winter value of the plants, and may cause decreased cold-hardiness.

C. Trim ornamental grasses only once each year, except for minor shaping at the direction of the Contracting Officer. Trimming shall be done in late winter or early spring just before spring growth starts. Trim by cutting dead foliage and flowers with hedge shears or other tools, leaving a neat, even mound of dead stalks. Take care not to damage the living crown of the plant. Trim ornamental grasses at the following heights.

1. Sideoats Grama, Blue Grama, inland Sea oats, Little Bluestem: 6 inches above finish grade.

2. Big Bluestem, sugar cane Plume Grass, Switch Grass: 12 inches above finish grade.

3.8 LAWN WEED CONTROL IN WARM SEASON GRASSES

A. Regard herbicides as hazardous to your health and dangerous to the environment; only experienced personnel should handle with extreme caution and chemicals. Read and follow label directions. Limit public access to area recently treated with herbicides. Wildflowers species used in the project are sensitive to pre-emergent and post-emergent broad leaf weed killers. Where Buffalo grass turf is adjacent to wildflower areas, use extreme caution in application of herbicides. Do not allow over spray or spillage of herbicide on wildflower areas. Observe run-off patterns and notify Contracting Officer if run-off from areas treated with herbicides can enter wildflower areas.

B. Cool season annual weeds: Apply pre-emergent herbicide to lawn area at the rate specified by the manufacturer. Identify weeds and use herbicide listed for those species. Do not contact with any other plants, including trees in lawns.

C. Broad-leaf weeds: Apply post-emergent herbicide to lawn area at the rate specified by the manufacturer. Identify weeds and use herbicide listed for those species. Do not contact with any other plants, including trees in lawns.

D. Grassy weeds: Apply Post Emergent to lawn area at the rate specified by the manufacturer. Identify weeds and use herbicide listed for those species. Do not contact with any other plants, including trees in lawns.

E. Persistent weeds: Extremely persistent or toxic weeds (such as Poison Ivy) may be controlled with a glyphosate herbicide, used as label directs. Avoid contact with any other plants.

3.9 LAWN WEED CONTROL IN BUFFALO GRASS

A. Regard all herbicides as hazardous to your health and dangerous to the environment; only experienced personnel should handle with extreme caution and chemicals. Read and follow label directions. Limit public access to area recently treated with herbicides. Wildflower species used in the project are sensitive to pre-emergent and post-emergent broad leaf weed killers. Where Buffalo grass turf is adjacent to wildflower areas, use extreme caution in application of herbicides. Do not allow over spray or spillage of herbicide on wildflower areas. Observe run-off patterns and notify Contracting Officer if run-off from areas treated with herbicides can enter wildflower areas.

B. Cool season annual weeds: Apply pre-emergent herbicide to lawn area at the rate specified by the manufacturer. Identify weeds and use herbicide listed for those species. Do not contact with any other plants, including trees in lawns.

C. Broad-leaf weeds: Apply post-emergent herbicide to lawn area at the rate specified by the manufacturer. Identify weeds and use herbicide listed for those species. Do not contact with any other plants, including trees in lawns.

D. Grassy weeds: Apply Post Emergent to lawn area at the rate specified by the manufacturer. Identify weeds and use herbicide listed for those species. Do not contact with any other plants, including trees in lawns.

E. Persistent weeds: Extremely persistent or toxic weeds (such as Poison Ivy) may be controlled with a glyphosate herbicide, used as label directs. Avoid contact with any other plants.

3.10 BUFFALO GRASS TURF AND WILDFLOWERS

A. Wildflowers used in this project are annual and perennial spring-blooming species. After the bloom period in spring they set seed, then become dormant or die. When cooler, moist weather starts in September, the dormant plants resume growth and the seed germinate. During the galls and winter, the plants are in a period of slow root growth, with short rosettes of green foliage on the surface of the soil. With warm temperatures and spring rains, growth becomes rapid in February and March. Some species may begin blooming in late March or early April.

B. Do not mow any portion of the wildflower planting during the spring bloom period. Do not edge any portion of the planting during the spring bloom
period, except at the direction of the Contracting Officer.

C. As the spring bloom period ends, allow the wildflowers to set seed. Observe the plants closely to determine that seed is maturing on all species, including the last to bloom. When seed is mature and has been released from the plants, the areas can be mown. If necessary, drag or rake the mature wildflowers to separate the seeds from the dead portion of the plant.

D. Mow the wildflower areas with rotary mowers set at height of 3 inches. It may be necessary to mow more than once at successively lower settings to achieve the final height of 3 inches. Do not use any method or equipment to mow or collect clippings that can remove the wildflower seeds from the area. Do not bag clippings, or allow clippings to be blown out of the wildflower area. Hand rake to remove clippings or use other methods that allow the seeds to fall out of the clippings onto the soil before the clippings are removed.

E. After the initial mowing after the spring bloom period, mow and edge the wildflower area as described for Buffalo grass, above.

F. When cooler weather and fall rains begin (usually mid-September), the annual wildflower seeds will germinate, and the perennial species will resume growth. Look closely for seedling rosettes. As soon as these are seen, cease mowing and notify Contracting Officer. If rainfall is inadequate during fall and winter, irrigate semi-monthly to provide moisture for developing seedlings.

G. When the Buffalo grass turf becomes dormant in the fall; consult with Contracting Officer to determine the need for a final clean-up mowing. This mowing may need to be at a greater height than the normal 3" mowing for Buffalo grass in order to avoid damage to the wildflowers.

3.11 MOWING AND EDGING

A. Mow and edge grass areas as shown on attached Table 02981 - 1. Bag clippings dispose legally.

B. Mow and edge Buffalo grass area as shown on attached Table 02981 - 1. Do not bag clippings.

C. Do not scalp the grass or cut more that one-third the existing top growth in one mowing. If more than that is cut, remove or catch the clippings. Clippings shall not remain on the turf surface for more than four hours.

D. When edging, use sharp blades to give a crisp appearance along walks, curbs, edge of pavement (street, walks), permanent structures, etc.

E. When trimming, use string trimmers around non-living structures and objects. Do not allow turf to be trimmed shorter with a string trimmer than other turf areas mowed by mowers the same day.

F. When trimming, do not allow the turf to be scalped around irrigations sprinkler heads and valve boxes creating a "doughnut" appearance.

G. When trimming, never use string trimmers around tree and shrub trunks where girdling trunk damage is possible.

H. The edge of road pavement and back of curbs shall be mechanically edged.

I. No weed-eaters or edger’s are to be used within 12 inches of any tree. Should the need for trimming be necessary within 12 inches of any tree, it shall be done so by hand trimming only.

J. Irrigation heads, signs, utility poles, fire hydrants, etc., shall be mechanically trimmed; chemical control not acceptable. Use extreme caution when trimming around new or existing trees to prevent damage.

K. Mulching mowers may be used if City Ordinance no longer permits bagging of clippings.

L. Turf Mowing:

1. During periods of cool weather: Mow Bermuda turf at 1-1/2 inch height.

2. During periods of warm and hot weather: Mow Bermuda turf at 2 inch height.

3.12 MOWING AND EDGING BUFFALO GRASS

A. Mow and edge Buffalo grass area as shown on attached Appendix "A". Do not bag clippings, unless heavy clumps remain on surface of turf.

B. Do not scalp the grass or cut more that one-third the existing top growth in one mowing. If more than that is cut, remove or catch the clippings. Clippings shall not remain on the turf surface for more than four hours.

C. When edging, use sharp blades to give a crisp appearance along walks, curbs, edge of pavement (street, walks), permanent structures, etc.
3.13 SCALPING

A. In late March, scalping shall be accomplished by lowering mower as low as possible. Mower height shall not exceed 3/4 inch in height. This procedure will help stimulate Bermuda to snap out of winter dormancy by helping the soil to warm up more rapidly.

B. Clippings shall not remain on the turf surface for more than four hours. Bag clippings.

3.14 RYE GRASS

A. On or about September 20th, the turf is to be scalped to a height of 1 inch and overseed with a perennial rye at a rate of 10 pounds per 1,000 square feet.

B. Water rye 3 times daily until germination is obtained.

3.15 ANT CONTROL

A. Install ant control as per manufacturer's recommendations.

3.16 PESTICIDES

A. As required for safe control of the particular diseases or insects.

B. Assess level of damage caused by insects and diseases regularly. Minor, visually unimportant damage does not need to be treated, as long as the long-term health of the planting is not affected.

C. Carefully identify any pest that causes significant damage. Do not attempt control until the pest organism has been identified.

D. After identification, choose the least hazardous control measure possible. Read and observe all label precautions. If the least hazardous control measure is not effective, use the next least hazardous measure. Preference will be given to biological and pest-specific control measures. In pest outbreaks, review cultural practices to determine the underlying cause, and correct.

E. Regard all pesticides as hazardous to your health and dangerous to the environment; only experienced personnel should handle with extreme caution and chemicals. Limit public access to any area recently treated with pesticides.

F. Specific directions are as follows:

1. Grubworms - Grubs feed on grass roots as much as two to four inches below the surface. Heavy infestations of grubworms will severely damage the root system, making it easy to roll up the sod and causing the turf to become spongy and eventually turn brown and die. Treat with Diazinon, Dursban, Oftanol, or Triumph granules in mid-July through mid-October if there are more than 4 grubworms per square foot present. Check first in July and continue checking through mid October. After the application of granular chemicals, operate the irrigation system for 20-30 minutes for spray heads and 45-60 minutes for oscillating heads to insure control.

2. Sod Webworms - Treat when present between June and September with Diazinon, bacillus thuringiensis or Dursban.

3. Armyworms - Treat when present between May and September with Diazinon, bacillus thuringiensis, Tempo or Mavrik.

4. Fire Ants - Broadcast spread Logic or Award, and spot treat with Diazinon, Dursban or Orthene granules when present.
5. Bermuda grass mites: Treat when present from July through September with Diazinon.

G. Disease: - When they first appear, spray for diseases with an approved commercial fungicide. Recommended fungicides for the control of disease found in Bermuda turf grasses are:

1. Pythium Blight - Treat when present during warm, wet weather with Fore.

2. Rust - Treat when present between July and August with Fore.

3. Helminthosporium - Treat during the summer months with Fore or Daconil 2787 when this disease is present.

4. All leaves and debris shall be removed from shrub and ground cover beds, be bagged, removed from, and transported off-sites at each service cycle. Never shall bags of trash, litter, clippings, brush, or debris of any type be left over-night at any DART property.

H. Insects: - Control insects with regular applications of commercial insecticides as needed. Recommended insecticides for infestations found in hedges, shrubs and ground covers are:

1. Asian Jasmine: Aphids - Treat with Diazinon, Dursban, Mavrik, Tempo or Orthene.

2. Crape Myrtle:
   a. Aphids - Treat with Diazinon, Dursban, Mavrik, Tempo or Orthene when present.
   b. Cucumber Beetles - Treat when present between April and September with Diazinon, Orthene or Tempo.
   c. Borets - Treat once a month from April through September when borers are present. Spray the trunks and upper branches with Dursban. Open wounds are easily susceptible to borer attack.

3. Dwarf Barbary:
   a. Aphids - Treat with Diazinon, Dursban, Mavrik, Tempo or Orthene when present.
   b. Scale - Treat when present with Orthene, oil or a combination of

4. Dwarf Burford Holly:
   a. Aphids - Treat with Diazinon, Dursban, Mavrik, Tempo or Orthene when present.
   b. Scale - Treat when present with Orthene, oil or a combination of Orthene and oil. Follow the temperature restrictions for use of oil.
   c. Leaf Miners - Treat with Orthene or Tempo when first symptoms appear on leaves, usually in summer months.
   d. Grasshoppers - Treat when present between July and September with Sevin Tempo, or Orthene.

5. Dwarf Chinese Holly:
   a. Aphids - Treat with Diazinon, Dursban, Mavrik, Tempo or Orthene when present.
   b. Scale - Treat when present with Orthene, oil or a combination of Orthene and oil. Follow the temperature restrictions for use of oil.

6. Honeysuckle:
   a. Aphids - Treat with Diazinon, Dursban, Mavrik, Tempo or Orthene when present.

7. Indian Hawthorn:
   a. Aphids - Treat with Diazinon, Dursban, Mavrik, Tempo or Orthene when present.
   b. Scale - Treat when present with Orthene, oil or a combination of Orthene and oil. Follow the temperature restrictions for use of oil.

8. Liriope: No major insects.

9. Nandina:
   a. Cucumber Beetles - Treat when present between April and September with Diazinon or Tempo.
b. Aphids - Treat with Orthene, Tempo, or Mavrik when present.

c. Scale - Treat when present with Orthene, oil or a combination of Orthene and oil. Follow the temperature restrictions for use of oil.

10. Photinia:

a. Aphids - Treat with Diazinon, Dursban, Mavrik, Tempo or Orthene when present.

b. Scale - Treat when present with Orthene, oil or a combination of Orthene and oil. Follow the temperature restrictions for use of oil.

11. Tam Juniper: Bagworms - Treat when present between April and September with Orthene or bacilli thuringiensis.

12. Yaupon Holly:

a. Borers - Treat once a month from April through September when borers are present. Spray the trunks and upper branches with Dursban. Open wounds are easily susceptible to borer attack.

b. Aphids - Treat with Diazinon, Dursban, Mavrik, Tempo or Orthene when present.

c. Leaf Miners - Treat with Orthene or Tempo when first symptoms appear on leaves, usually in summer months.

d. Grasshoppers - Treat when present between July and September with Sevin, Tempo, or Orthene.

e. Fire Ants: To control fire ants in all shrub and hedge beds, broadcast or spread, logic or Award in these areas in April or May and spot treat as needed with Diazinon.

f. Mites: For the control of mites, treat all shrubs and ground cover when present from March through October, with Dicofol, Pentac, Avid, Mavrik or Vendex at 7-day intervals for three applications. During winter months, apply dormant oil for the control of over wintering mites.

I. Biological Insect Control - In some instances of insect infestation, organic control may be desirable. Organic controls shall be:

1. Bacillus Thuringiensis - Bacillus thuringiensis ‘kurstaki’, Bacillus thuringiensis ‘israelensis’-- This bacterial insecticide provides effective control of the larvae of many moths, mosquitoes, fungus gnats larvae and butterflies. The spores are harmless to humans, animals and beneficial insects.

2. Trichogramma Wasp - The tiny wasps attack the eggs of more than 200 pest species, including cutworms, armyworms and many moth and butterfly eggs. Wasps should be released when moths are first seen, but a sequence of releases throughout the season is preferable to a single large release.

3. Green Lacewings (Chrysoperla rufilabris) - Egg masses are sometimes available. The larvae, known as aphid lions, prey on insects including aphids, spider mites, leafhoppers, thrips, moth eggs and small larvae. Lacewings introduced into the landscape must have a ready supply of food or they will leave.

4. Whitefly Parasite (Encarsia Formosa) - This tiny wasp is similar to the Trichogramma. It is attracted to its host by the actual smell of honeydew produced by the whitefly.

5. Whitefly Predatory Beetle (Delphastus pusillus) - This new, beneficial ladybug look-alike feeds on whitefly.

6. Praying Mantis - Egg cases containing about 200 individual eggs are available from a number of sources. The mantis is a voracious predator. Food preferences include ace bugs, grasshoppers, crickets, and many other harmful insects.

7. Lady Beetle - Aphids are the preferred hosts, but lady beetles will also eat mealy bugs, scale, spider mites, and many other soft-bodied pests and egg masses.

8. Insect Pathogenic Nematodes (Steinerema Feltiae, Neoplectana carpopcapse, Steinemema carpocapsae) - These mobile nematodes control a wide range of caterpillars and larvae.

9. Predatory Mites - (Phytoseiulus persimilis, Mesoseiulus longipilos, Neoseiulus californicus, Galendromus occidentalis) - These predators feed on the undersides of leaves where spider mites are prevalent.
Select the species that is best suited for the treatment area.

J. Diseases - Recommended fungicides for the control of diseases found in hedges, shrubs and ground covers are:

1. Asian Jasmine: No major diseases.

2. Crape Myrtle: Powdery mildew - Treat when present between May and September with Daconil 2787, Funginex, Bayleton or Rubigan.

3. Dwarf Burford Holly:
   a. Leaf Spot - Treat when present between May and September with Zybam, Daconil 2787, Durosan, Clearys 3336, or Dithane M-45.
   b. Twig Blight - Treat when present with Daconil 2787, Clearys 3336, Durosan or Dithane M-45.
   c. Rust - Treat when present between July and September with Bayleton, Daconil 2787 or Dithane M-45.

4. Dwarf Chinese Holly:
   a. Leaf Spot - Treat when present between May and September with Zybam, Daconil 2787, Durosan, Clearys 3336, or Dithane M-45.
   b. Blight - Treat when present with Daconil 2787, Clearys 3336, Durosan or Dithane M-45.
   c. Rust - Treat when present between July and September with Bayleton, Daconil 2787 or Dithane M-45.

5. Honeysuckle:
   a. Leaf Spot - Treat when present between May and September with Zybam, Daconil 2787, Durosan, Clearys 3336, or Dithane M-45.
   b. Powdery Mildew - Treat when present between May and September with Daconil 2787, Funginex, Bayleton or Rubigan.

6. Indian Hawthorn:
   a. Fireblight - Treat when plants are flowering with Durosan, Clearys 3336 or streptomycin.
   b. Leaf Spot - Treat when present between May and September with Zybam, Daconil 2787, Durosan, Clearys 3336, or Dithane M-45.

7. Liriope: Fusarium Blight - Treat when present in the summer months with Bayleton Rubigan, Clearys 3336, or Durosan.

8. Nandina: Leaf Spot - Treat when present between May and September with Daconil 2787, Durosan, Clearys 336, or Dithane M-45.

9. Photinia:
   a. Leaf Spot - Treat when present between May and September with Zybam, Daconil 2787, Durosan, Clearys 3336, or Dithane M-45.
   b. Twig Blight - Treat when present with Daconil 2787, Clearys 3336, Durosan or Dithane M-45.
   c. Powdery Mildew - Treat with present between May and September with Daconil 2787, Funginex, Bayleton or Rubigan.

10. Tam Juniper:
    a. Juniper Blight - Treat when present with Daconil 2787, Dithane M-45, Durosan or Clearys 3336.
    b. Juniper Rust - Treat when present with Bayleton, Dithane M-45 or Daconil 2787.

11. American Elm:
    a. Scale - Treat with present with Orthene, oil or a combination of Orthene and oil. Follow the temperature restrictions for use of oil.
    b. Aphids - Treat with Diazinon, Dursban, Mavrik, Tempo or Orthene when present.
    c. Borers - Treat once a month from April through September when borers are present. Spray the trunks and upper branches with Dursban. Open wounds are easily susceptible to borer attack.
    d. Webworms - Treat when present between May and September with Diazinon, Mavrik, bacillus
thuringiensis, Tempo or Orthene and a spreader sticker.

e. Elm Leaf Beetle - Treat when present with Dursban, Diazinon, Mavrik, Orthene or Tempo.

12. Bald Cypress: Bagworms - Treat when present between April and September with Orthene, Tempo or bacillus thuringiensis.

13. Aristocrat Pear:
   a. Borers - Treat once a month from April through September when borers are present. Spray the trunks and upper branches with Dursban. Open wounds are easily susceptible to borer attack.
   b. Aphids - Treat with Diazinon, Dursban, Mavrik, Tempo or Orthene when present.
   c. Cankerworms - Treat April through June with Diazinon, Tempo, Mavrik, Orthene or Bacillus Thuringiensis when present.

14. Cedar Elm:
   a. Scale - Treat when present with Orthene, Oil, or a combination of Orthene and oil. Follow the temperature restriction for use of oil.
   b. Aphids - Treat with Diazinon, Dursban, Mavrik, Tempo or Orthene when present.
   c. Borers - Treat once a month from April through September when borers are present. Spray the trunks and upper branches with Dursban. Open wounds are easily susceptible to borer attack.
   d. Webworms - Treat when present between May and September with Diazinon, Mavrik, Tempo, bacillus thuringiensis, or Orthene and a spreader sticker.

15. Live Oak:
   a. Aphids - Treat with Diazinon, Dursban, Mavrik, Tempo or Orthene when present.
   b. Scale - Treat when present with Orthene, oil or a combination of Orthene and oil. Follow the temperature restriction for use of oil.
   c. Galls - Treat as leaves first start to appear in the early spring with Diazinon.
   d. Borers - Treat once a month from April through September when borers are present. Spray the trunks and upper branches with Dursban. Open wounds are easily susceptible to borer attack.
   e. Cankerworms - Treat April through June with Diazinon, Tempo, Mavrik, Orthene or bacillus thuringiensis when present.

16. Pine:
   a. Pine Tip Beetle - Treat when present with Tempo or Dursban between April and July.
   b. Pine Bark Beetle - Treat when present with Tempo or Dursban between April and July.

17. Redbud:
   a. Borers - Treat once a month from April through September when borers are present. Spray the trunks and upper branches with Dursban. Open wounds are easily susceptible to borer attack.
   b. Scale - Treat when present with Orthene, Oil, or a combination of Orthene and oil. Follow the temperature restrictions for use of oil.
   c. Aphids - Treat with Diazinon, Dursban, Mavrik, Tempo or Orthene when present.
   d. Leaf Rollers - Treat with Diazinon, Mavrik, Tempo, or Orthene and a spreader sticker between May and September when present.
   e. Leaf Miners - Treat with Orthene or Tempo when first symptoms appear on leaves, usually in summer months.
18. Red Oak:
   a. Scale - Treat when present with Orthene, oil or a combination of Orthene and oil. Follow the temperature restriction for use of oil.
   b. Borers - Treat once a month from April through September when borers are present. Spray the trunks and upper branches with Dursban. Open wounds are easily susceptible to borer attack.
   c. Aphids - Treat with Diazinon, Dursban, Mavrik, Tempo or Orthene when present.
   d. Galls - Treat as leaves first start to appear in the early spring with Diazinon.
   e. Cankerworms - Treat April through June with Diazinon, Tempo, Mavrik, Orthene or bacillus thuringiensis when present.
   f. Webworms - Treat when present between May and September with Diazinon, Mavrik, Tempo, Orthene, or bacillus thuringiensis and a spreader sticker.
   g. Twig Girdlers - Treat with Diazinon or Tempo in late July or early August if problem was present the year before.
   h. Grasshoppers - Treat when present between July and September with Sevin Tempo or Orthene.

d. Scale - Treat when present with Orthene, oil or a combination of Orthene and oil. Follow the temperature restriction for use of oil.
e. Webworms - Treat when present between May and September with Diazinon, Mavrik, Tempo, Orthene, or bacillus thuringiensis and a spreader sticker.
f. Tent Caterpillars - Treat when present between May and September with Diazinon, Mavrik, Tempo, Orthene, or bacillus thuringiensis and a spreader sticker.

K. Biological Insect Control - In some instances of insect’s infestation, organic control may be desirable. Organic controls shall be:

1. **Bacillus thuringiensis**, **Bacillus thuringiensis ‘kurstaki’**, and **Bacillus thuringiensis ‘israelensis’** - This bacterial insecticide provides effective control of the larvae of many moths, mosquitoes, fungus gnat larvae and butterflies. The spores are harmless to humans, animals and beneficial insects.

2. **Trichogramma wasp** - The tiny wasps attack the eggs of more than 200 pest species, including cutworms, armyworms and many moth and butterfly eggs. Wasps should be released when moths are first seen, but a sequence of releases throughout the season is preferable to a single large release.

3. **Green Lacewings (Chrysoperla rufilabris)** - Egg masses are sometimes available. The larvae, known as aphid lions, prey on many landscape pests including aphids, spider mites, leafhoppers, thrips, moth eggs and small larvae. Lacewings introduced into the landscape must have a ready supply of food or they will leave.

4. **Whitefly Parasite (Encarsia Formosa)** - This tiny wasp is similar to the Trichogramma. It is attracted to its host by the actual smell of honeydew produced by the whitefly.

5. **Whitefly Predatory Beetle (Delphastus pusillus)** - This new, beneficial ladybug look-alike feeds on whitefly and spider mites.

6. **Praying Mantis** - Egg cases containing about 200 individual eggs are available from a number of sources. The mantis is a voracious predator. Food preferences include lace bugs, grasshoppers, crickets, and many other harmful insects.
7. Lady Beetle - Aphids are the preferred hosts, but lady beetles will also eat mealy bugs, scale, spider mites, and many other soft-bodied pests and egg masses.

8. Insect Pathogenic Nematodes (Steinerema Feltiae, Neoplectana carpocapse, Steinemema carpocapsae) - These mobile nematodes control a wide range of caterpillars and larvae.

9. Predatory Mite - (Phytoseiulus persimilis, Mesoseiulus longipes, Neoseiulus californicus, Glaenromus occidentalis) - These predators feed on the undersides of leaves where spider mites are prevalent. Select the species that is best suited for the treatment area.

L. Mite Infestations - For the control of mites, treat all trees when present from March through October with Dicofol, Pentac, Avid, Mavrik or Vendex at 7-day intervals for three applications. During winter months, apply dormant oil for the control of overwintering mites.

M. Diseases - Recommended fungicides for the control of diseases found on trees are:

1. American Elm:
   a. Powdery Mildew - Treat when present between May and September with Daconil 2787, Funginex, Bayleton or Rubigan.
   b. Rust - Treat when present between July and September with Bayleton, Daconil 2787, Fore or Dithane M-45.
   c. Leaf Spot - Treat when present between May and September with Zybam, Daconil 2787, Fore, Durosan, Clearys 3336, or Dithane M-45.

2. Bald Cypress: Twig Blight - Treat when present with Mazat 200, Dithane M-45 or Durosan.

3. Aristocrat Pear:
   a. Leaf Spot - Treat when present between May and September with Zybam, Daconil 2787, Fore, Durosan, Clearys 3336, or Dithane M-45.
   b. Fireblight - Treat when plants are flowering with bordeaux mixture, Durosan, Clearys 3336 or streptomycin.

4. Cedar Elm:
   a. Powdery Mildew - Treat when present between May and September with Daconil 2787, Funginex, Bayleton or Rubigan.
   b. Rust - Treat when present between July and September with Bayleton, Daconil 2787, Fore or Dithane M-45.
   c. Leaf Spot - Treat when present between May and September with Zybam, Daconil 2787, Fore, Durosan, Clearys 3336, or Dithane M-45.

5. Live Oak:
   a. Leaf Spot - Treat when present between May and September with Zybam, Daconil 2787, Fore, Durosan, Clearys 3336, or Dithane M-45.
   b. Oak Leaf Blister - Treat with bordeaux mixture when leaves are appearing in the early spring, if there was a problem with this disease the year before.
   c. Powdery Mildew - Treat when present between May and September with Daconil 2787, Funginex, Bayleton or Rubigan.
   d. Oak Wilt - Inject Alamo into the root flares to prevent and control oak wilt for up to three years.

6. Pine:
   a. Pine Needle Rust - Treat when present with Bayleton.
   b. Pine Twig Blight - Treat when present with Dithane M-45, Durosan or Clearys 3336.
   c. Pine Needle Blight - Treat when present with Dithane M-45, Durosan or Clearys 3336.

7. Redbud: Leaf Spot - Treat when present between May and September with Zybam, Daconil 2787, Fore, Durosan, Clearys 3336, or Dithane M-45.

8. Red Oak:
   a. Leaf Spot - Treat when present between May and September with
b. Oak Leaf Blisters - Treat with Bordeaux mixture when leaves are appearing in the early spring, if there was a problem with this disease the year before.

c. Powdery Mildew - Treat when present between May and September with Daconil 2787, Funginex, Bayleton or Rubigan.

d. Oak Wilt - Inject Alamo into the root flares to prevent and control oak wilt for up to three years.

9. Sweetgum:

a. Leaf Spot - Treat when present between May and September with Zybam, Daconil 2787, Durosan, Clearys 3336, or Dithane M-45.

b. Twig Blight - Treat when present with Daconil 2787, Fore, Clearys 3336, Durosan or Dithane M-45.

c. Powdery Mildew - Treat when present between May and September with Daconil 2787, Funginex, Bayleton or Rubigan.

N. Drenching Materials For Control Of Root Disease - Treat all root diseases on trees with Captan, Banrot or Subdue 2E.

3. IRRIGATION SYSTEM

A. Landscape Irrigation System: The Contractor shall be totally responsible for the operation of irrigation systems, both manual and automatic, as well as programming the automatic controlling devices to produce optimum moisture levels in all plant, vegetation and tree areas. Keys shall be provided to the Contractor for irrigation controllers. If the controllers do not have locks, the Contracting Officer will provide locks upon request. It shall be the Contractor's sole responsibility to keep plants watered properly (to the extent of supplemental watering when necessary to provide the need/s, beyond that provided by irrigation systems). If there are problems with the irrigation system that prevent proper watering procedures, Contractor shall effectuate repairs (except for trunk-line repairs). Contracting Officer shall be immediately notified of trunk-line breaks, so as to prevent any plant, vegetation and/or tree loss.

1. If possible, except as dictated by extenuating circumstances (when un usual circumstances occur as necessitated by special events, location, etc.) irrigation cycles shall be set to take place during night-time hours, but in instances prior to beginning of morning rush hours.

2. If there is more than one irrigation controller on a water meter, do not program controllers to water during the same time period, as an overdraft of water meter/s will result, resulting in diminished efficiency of system. Set controllers so that one finishes its watering cycle before then next starts its watering cycle. During periods of high rainfall, set controllers to the manual or rain mode, until irrigation is needed. Do not switch controllers to "off", as this will stop the time clock.

3. Operation of sprinklers shall be monitored by contractor on a weekly basis (in conjunction with service cycle); to insure proper coverage of areas, and/or operation, the setting of turf heads at the proper height, the straightening of heads, and cleaning/adjusting of nozzles and heads to prevent water spray on windows or buildings. When adjusting nozzles, the Contractor should remember to avoid the watering of tracks and hard surface areas (parking lots, platforms, walks, walkways and/or drive-ways); placing emphasis on this need, but particularly so during winter months.

4. During cold weather, the Contractor shall be responsible to monitor the weather
closely and to turn the irrigation system to manual or rain mode to prevent the icing of sidewalks, driveways, bus-lanes and grounds, and any associated damage to plants. When weather conditions dictate, the Contractor shall drain the irrigation system so that minimum freeze damage occurs to the system.

5. Many of the properties are equipped with freeze-stats and rain-stats, or a combination of both. In maintaining the irrigation system, the Contractor shall have the use of, and be responsible for the operation of these freeze-stats and rain-stats, keeping in mind the plus-variable factor in factory settings of freeze-stats.

6. Damage caused by the Contractor (heads, pop-up heads, stand-up heads, bubblers, valves, wiring etc.), during the mowing cycles and/or during the servicing of facilities, shall be repaired at no cost to the Authority. Replacement equipment shall be of the same type, model and manufacturer to keep the warranty coverage the same. No substitutions shall be accepted unless a particular replacement part is out of production.

7. After mowing, the Contractor or his licensed irrigation subcontractor shall perform minor maintenance on the water irrigation system at each facility listed, to ensure that the system is working properly. The Contractor shall be responsible for the supply and/or replacement of all sprinkler heads “blown-off,” (including parts) broken, missing, or otherwise damaged during routine scheduled service and/or vandalism of DART transit properties. Contractor should be prepared to respond immediately to reports of irrigation problems occurring between scheduled service visits.

B. Make adjustments and settings of automatic controllers to establish frequency and length of watering periods.

C. Check systems for continuous trouble free operation.

D. Adjust heads to maintain proper coverage. Reset heads as needed to proper height relative to adjacent grade.

E. Immediately repair and replace any equipment damaged as a result of maintenance operations, at the Contractor's expense.

F. Accidental damage not resulting from Contractor's negligence shall be reported promptly to Contracting Officer with estimate of cost for correction for Contracting Officer approval.

3.18 COMPOST TOPDRESSING

A. Add one inch of compost to planting beds and trees. Lightly cultivate compost into soil. Top with munch.

3.19 MULCHING

A. Re-mulch shrub and ground cover beds once a year with shredded hardwood or cedar bark, partially decomposed, minimum 1-1/2 inch depth. Apply after and over annual top dressing with compost.

3.20 LITTER REMOVAL

A. Maintain grass, shrub and paved areas as required to be free of litter and debris. The frequency is shown on the Table 02981 - 1.

3.21 STAKING AND BRACING

A. Maintain stakes and bracing as originally installed; and replace stakes and braces with equal material on existing trees until plant is capable of standing vertical and resisting normal winds. This is generally considered to be one full year after installation. At this point, stakes and braces are to be left in the ground to compost.

3.22 DRAINAGE DITCHES, CULVERTS, AND DRAIN INLETS

A. Drainage ditches, culverts, and drain inlets shall be kept clear, clean, and free of debris.

B. The Contractor shall make routine monthly inspection of all culverts AND after any form of precipitation (rain, snow, etc.) to insure that flow lines in and out of the culverts are free of obstructions.

C. Drainage ditches shall be kept clean and free of debris, trash, grass clippings, etc.

D. Drain inlets shall be kept clean and free of debris, trash, grass clippings, silt, leaves, etc.

3.23 CLEANUP

A. Clean up and haul off any debris resulting from the maintenance operation plus any debris and trash, which may have accumulated, in the plant beds and grass areas.
3.24 MAINTENANCE RECORD

A. Contractor shall maintain a log of site maintenance visits describing all maintenance activities performed as well as an itemized listing of costs for replacing dead plant materials and irrigation equipment due to conditions excluded from the Contractor’s guarantee. A copy of the monthly maintenance record shall be submitted at each request for payment.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will be measured by and paid for at the unit price for “Landscape Maintenance” per month for each installation.

END OF SECTION 02981
THIS PAGE INTENTIONALLY LEFT BLANK
PART 1 - GENERAL

1.1 DESCRIPTION

A. It is the intent of this Contract to provide the Authority with a project site that is attractive in appearance. It is also the intent of this Contract to provide the Authority with existing plant material in a healthy, vigorous condition, and to have a maintained, neat appearance at all times. The following specifications relate to the non-irrigated areas:

1. Section 02931, "Seeding and Sodding - Non-Irrigated Areas".

B. See Section 02980, "Landscape Maintenance - General" for general requirements for landscape maintenance.

C. See Section 02981, "Landscape Maintenance - Irrigated Areas" for tree, shrub and groundcover maintenance at irrigated areas.

1.2 ADDITIONAL INFORMATION

A. The width of these tracts may vary considerably from railroad to railroad or from one end of the line to the other. The area to be maintained is from property line to property line of adjoining properties. It shall be the responsibility of the contractor to field-verify existing conditions at the various sites.

B. The degree of difficulty of access for maintenance varies from extremely difficult, (steep banks with heavy undergrowth, difficult access), to relatively easy access to flat-field terrain.

1.3 CONTRACTOR RESPONSIBILITY

A. The Contractor is to supply resources including supervision, labor, materials, equipment and transportation necessary to perform the services on the Authority's Railroad Right-of-Way.

B. The Contractor shall comply with Occupational Safety and Health Administration Standards while working on DART projects. The Contractor shall require employees to wear safety glasses with side shields when operating power mowers and trimmers. Employees shall wear safety toe shoes while operating power mowers. Employees shall protect their legs (i.e., wear thick long pants) while operating power trimmers.

C. The Contractor shall limit the use of operating gasoline-powered equipment prior to 10 a.m. on Ozone Action Days.

D. Personnel are required to wear a Authority-approved safety vest.

1.4 SCHEDULING / REVIEW / COORDINATION

A. For monitoring purposes, the Contractor will be provided with monthly work orders, which will indicate the properties to be maintained, and the work to be performed. The Contractor shall deliver (fax or hand) to the Contracting Officer on a daily basis an itemized work schedule of the work performed on the previous day.

B. The Contractor shall be required to attend monthly meetings to be held at a time and location determined by the Authority. The purpose of the meetings will be to review the Contractor's invoices and proposed times and locations where work is to be performed, by the Contractor, for the month. Also, the Contractor and the Contracting Officer's Technical Representative will be given the opportunity to discuss problems or concerns, which may have arisen during the previous month.

C. The Contractor's invoice submitted at the "Monthly Review" meeting will pertain to services, which were accomplished the previous month. No "hold back" or "delayed billings" will be allowed.

1.5 ADDITIONAL DEFINITIONS

A. The term "approved manner" means in complete compliance with federal, state, and local regulations and consistent with the requirements of this contract.

B. The term "monthly" shall mean once per calendar month, with each occurrence separated by at least 30 calendar days.

C. The term "Ozone Action Day" means that the weather conditions are high temperature, low wind and little or no cloud cover. When these conditions are predicted, the public is urged to take certain actions to minimize activities that cause emissions and therefore ozone.

1.6 SUBMITTALS

A. See Section 02980, "Landscape Maintenance - General".

PART 2 - PRODUCTS

2.1 MATERIALS

A. See Section 02981, "Landscape Maintenance - Irrigated Areas".
PART 3 - EXECUTION

3.1 CONTRACTOR PERFORMANCE CRITERIA

A. The Contractor shall perform the activities specified herein according to the following performance criteria:

1. Mowing: The Contractor will maintain grass and/or weeds below a height of six inches. With each mowing, the Contractor will remove (off site) trash; litter and all cut or dead tree vegetation from the properties. The Contractor will not be required to remove grass and weed clippings.

3. Litter Control: The Contractor shall inspect, remove and dispose of (off site) litter and trash, which may include sizeable objects such as tires, furniture, and appliances. Dumping must be at the Contractor’s own expense and at an appropriate State of Texas approved landfill. Frequency of litter control shall be as needed and directed by the Contracting Officer.

4. Weed Control: The Contractor shall control all weed and grass growth, within the site limits, utilizing mowing and other non-chemical methods as approved by the Contracting Officer.

5. Tree Trimming and Removal of Underbrush: The Contractor shall trim all trees and remove all underbrush and downed treesto assure that no vegetation or other growth or downed trees are within 12 feet of the railroad tracks. No other tree removal work shall be performed without prior approval of the Contracting Officer.

B. Refer to Table 02982 - 1 for frequency of work activity under this Section.

3.2 INSPECTION AND MONITORING

A. The Contractor shall report to the Contracting Officer any evidence of onsite vandalism, theft, apparent unauthorized use of DART property, or property damage.

B. If what is observed does not present a threat to the public safety, or the security of the site, the Contractor shall make a verbal report, followed up by a written report, to the Contracting Officer of such evidences no later than the next work day.

C. Where such evidences present a clear and present danger to either the public or the security of the site, the Contractor shall immediately report such evidences to the Contracting Officer, verbally and in writing, and immediately to the appropriate governmental authority (fire department, police, etc.).

D. The Contractor shall make a verbal report of adverse land conditions such as erosion, track washouts, debris lodged in culverts or drainage problems encountered during vegetation maintenance operations. The Contractor shall submit a written report, to the Contracting Officer, no later than the next workday.

3.3 MAINTENANCE RECORD

A. Contractor shall maintain a log of site maintenance visits describing all maintenance activities performed as well as an itemized listing of costs for replacing dead plant materials and irrigation equipment due to conditions excluded from the Contractor’s guarantee. A copy of the monthly maintenance record shall be submitted at each request for payment.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will be measured by and paid for at the unit price for each person hours and each equipment hour of the classifications of personnel and equipment listed in the Bid Schedule.

THIS PAGE INTENTIONALLY LEFT BLANK
SECTION 03100
CONCRETE FORMWORK

PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies formwork for cast-in-place concrete construction except for construction associated with Section 02525, “Combined Curbs and Gutters, Curb Ramps, and Walks”, and Section 02550, “Concrete Pavement”.

1.2 REFERENCED STANDARDS

A. American Association of State Highway and Transportation Officials (AASHTO):
   1. AASHTO HB-17 - Standard Specification for Highway Bridges
   2. AASHTO M33 - Standard Specification for Preformed Expansion Joint Filler for Concrete (Bituminous Type)
   3. AASHTO M153 - Standard Specification for Preformed Sponge Rubber and Cork Expansion Joint Fillers for Concrete Paving and Structural Construction
   4. AASHTO M220 - Standard Specification for Preformed Polychloroprene Elastomeric Joint Seals for Concrete Pavements

B. American Concrete Institute (ACI):
   1. ACI 117 - Standard Specification for Tolerances for Concrete Construction and Materials
   2. ACI 303.1 - Standard Specification for Cast-In-Place Architectural Concrete
   3. ACI 347 - Guide to Formwork for Concrete

C. American Hardboard Association (AHA):
   1. AHA/BOARD A135.4 - Basic Hardboard

D. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A53/A53M - Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless
   2. ASTM E154 - Standard Test Methods for Water Vapor Retarders Used in Contact with Earth under Concrete Slabs, on Walls, or as Ground Cover
   3. ASTM E1643 - Standard Practice for Installation of Water Vapor Retarders Used in Contact with Earth or Granular Fill under Concrete Slabs

E. California Redwood Association (CRA):
   1. CRA Standards

F. Corps of Engineers (COE):
   1. COE CRD-C 572 - Handbook for Concrete and Cement Corps of Engineers Specifications for Polyvinylchloride Waterstop

G. Federal Construction Regulations (FED):
   1. FED PS1-83 - Construction and Industrial Plywood

1.3 SUBMITTALS

A. Product Data: For each type of product specified.
   1. Material data for waterstops including material, size, preparation requirements and installation instructions.

B. Submit forming plans for walls over 8 feet tall, suspended floors and beams, and other structures as requested by the Contracting Officer. Include materials; details of form types; shoring and falsework; methods of form construction and erection; design computations; location of form joints, construction joints, and form ties; waterstops; sleeves; bonding adhesives; schedule of erection and stripping; and all dimensions controlling concrete shapes.

C. Submit 6 inch by 6 inch sample of form facing materials for concrete surfaces exposed to public view.

D. Vapor Retarder: Submit two representative samples, 6 inches by 6 inches.

E. Certification:
   1. Submit certifications that form release agent is compatible with concrete admixtures, and where required, will not prevent bonding of subsequently applied coatings.

2. For early form removal: Submit certified test reports of specified concrete tests.
F. Calculations: Submit early form removal calculations as specified certified by a Professional Engineer, licensed in the State of Texas. Submit and obtain approval from the Contracting Officer in advance of form removal if forms are to be removed before the concrete attains the minimum strength specified under Article 3.10, herein.

1.4 QUALITY ASSURANCE

A. Responsibilities: Design and construction of formwork is the responsibility of the Contractor, subject to review by the Contracting Officer.

B. Design Criteria:
   1. Design formwork for vertical loads and lateral pressures, including weather conditions, in accordance with ACI 347 and for easy removal.
   2. Design formwork system which is adequately braced and has adequate strength and stability to provide finished concrete within the specified tolerances in accordance with applicable requirements of ACI 117 and ACI 347.
   3. When necessary to maintain the specified tolerances, design camber into the formwork to compensate for anticipated deflection and creep due to the weight and pressure of the fresh concrete and weight of formwork. Limit form deflection to 1/360 of the component span.

PART 2 - PRODUCTS

2.1 FORMING MATERIALS

A. General: Use materials suitable for exterior exposure and which have the strength to produce required tolerances.

B. Form Facing in Contact with Concrete: Wood, plywood, fiberglass reinforced plastic, steel, or other approved materials capable of producing the specified finish, that will not react with fresh concrete to cause loss of strength or durability in hardened concrete and that will not be damaged by the form release agent. Do not use materials that will stain concrete surfaces exposed to view.
   1. Except where otherwise specified or shown, use materials that do not exceed the roughness of dressed lumber or FED PS1-83.
   2. Where a smooth finish is specified or shown, use plastic, steel or wood products that will produce a hardened concrete surface equivalent to that produced by concrete cast against High Density Overlaid (HDO) plywood as per requirements of ACI 303.1.

2.2 FORM TIES

A. Factory-fabricated, snap-off metal type, of adequate design to minimize form deflection and preclude concrete spalling upon removal.

B. Fabricated so that portion of tie remaining after snap-off and removal of exterior portions is at least 1-1/2 inch below concrete surface.

C. Where concrete is to be left exposed, provide ties with removable cones 1-1/2 inch deep and not more than 1-1/4 inch in diameter leaving no metal closer than 1-1/2 inch from finished concrete surface, unless otherwise shown.

D. Provide ties with a water seal washer for retaining walls, basement walls, pit walls and liquid containing structures.

2.3 FORM RELEASE AGENT

A. Non-staining liquid form release product that will not bond with concrete and that will not impair bond of subsequently applied concrete coatings.

2.4 PREFORMED EXPANSION JOINT

A. General: Provide joint fillers that are compatible with sealants used. Joint fillers shall be used at all expansion joint locations unless otherwise noted.

B. Bituminous: AASHTO M33.

C. Cork: AASHTO M153, Type II.

D. Preformed joint seals: AASHTO M220.
E. Bonding adhesive: As recommended by manufacturer of preformed expansion joint filler.

2.5 WATERSTOPS
A. PVC: In accordance with COE CRD-C 572.

2.6 CHAMFER STRIPS
A. Except where other sizes are shown, 3/4 inch by 3/4 inch triangular fillets milled from clear, straight-grain pine, surfaced each side, or extruded vinyl type.

2.7 MISCELLANEOUS
A. Miscellaneous preformed strips for reveals, rustications and similar joints: Fabricate of wood, metal, plastic, or other approved material formed to cross-sections shown.
1. Redwood boards - CRA.
2. Polystyrene foam where shown on drawings.

2.8 SLEEVES
A. Schedule 40, galvanized, ASTM A53/A53M, Type E, Grade A or B steel pipe.

2.9 VAPOR RETARDER
A. Membrane Composition: Three or five ply nylon or polyester cord reinforced high density polyethylene sheet laminated to nonwoven geotextile fabric, 30 mils thick; 15 mil polyethylene; or 15 mil polyolefin.
B. Membrane Standard: ASTM E 1745, Class A.
C. Accessories: Lap tape as recommended by membrane manufacturer for compatibility with membrane.
D. Acceptable manufacturers and product:
1. Fortifiber Building Systems Group - “Moistop Ultra ‘A’”
2. Raven Industries - “Vapor Block 15”
3. Reef Industries, Inc. - “Griffolyn Type-65G”
4. Or approved equal.

2.10 DOVETAIL ANCHORS
A. 22-gauge electrogalvanized steel with removable filler.

2.11 COIL ROD INSERTS
A. As shown on Contract Drawings and per manufacturer’s recommendations.

PART 3 - EXECUTION

3.1 CONSTRUCTION AND WORKMANSHIP
A. Concrete finishes and usage locations of various types of forms and form lining: As shown or specified.
B. Unless otherwise shown for concrete surfaces exposed to public view, use form facing materials for an architecturally smooth finish that will provide a finished concrete surface free of form joint marks between abutting panel surfaces, rustications, or control and expansion joints.
C. Construct adequately braced formwork so that resulting concrete surfaces conform to tolerances specified in ACI 117 or as otherwise shown.
D. Brace forms, falsework, and centering adequately to retain forms in position as shown on approved Forming Plans. Install sills, grillages, or foundations of suitable types and size to prevent settlement of false work, form supports, and shoring.
E. Provide mortar-tight forms which conform to shapes, lines and dimensions shown, and which produce smooth surfaces without fins and projections. Provide back-up at form joints or filled joints to prevent leakage of cement paste.
F. Fabricate forms to facilitate their removal without damaging concrete surfaces. Provide crush plates or wrecking plates where stripping may damage cast concrete surfaces. Bevel wood inserts for forming keyways, reglets, and recesses, to allow easy removal.
G. Make provisions in formwork to permit removal of debris from interior form spaces. Locate temporary openings in forms at inconspicuous locations.
H. Chamfer exposed corners and edges unless otherwise shown on drawings, using chamfer strips fabricated to produce uniform smooth lines and tight edge joints.
I. Provide groove strip on form at control joint lines and construction joints used in lieu of control joints.
J. Use form ties in arrangements, numbers and sizes to resist lateral pressures exerted by fresh concrete and to prevent form deflection. Use specific tie arrangements where shown. When tie arrangements are not shown for concrete exposed to view, arrange ties in a uniform square grid.
K. Cleaning and Tightening: Thoroughly clean forms and adjacent surfaces to receive concrete. Remove chips, wood, sawdust, dirt, or other debris just before concrete is placed. Retighten forms and bracing after concrete placement if required to eliminate mortar leaks and maintain proper alignment.
3.2 FIELD QUALITY CONTROL

A. Inspect and check complete formwork, shoring, and bracing to verify that work is in accordance with formwork design, and that supports, fastenings, wedges, ties, and parts are secure.

B. Inform the Contracting Officer when formwork is complete and has been cleaned, to allow for inspection. Do not place concrete until the Contracting Officer's inspection is complete.

C. During concrete placement, check formwork and related supports to verify that forms are not displaced and that completed work will be within specified tolerances.

3.3 COATING FORMS

A. Coat forms with Form Release Agent prior to placement of reinforcing steel.

B. Do not allow excess coating material to stand in puddles in forms nor to come into contact with concrete against which fresh concrete is to be placed.

C. Coat bolts and rods that are to be completely removed or that are to be free to move with bond breaker.

3.4 EMBEDDED ITEMS

A. Ensure that items to be embedded in concrete are free from oil and foreign matter that would weaken bond of concrete to such items.

B. Install in formwork inserts, anchors, sleeves and other items specified elsewhere. Close ends of conduits, piping and sleeves embedded in concrete with caps or plugs.

C. Install continuous dovetail anchor slots where specified or shown or where required for attachment of facing materials.

D. Before placing concrete, check location and support of piping, electrical conduits, and other items which are to be wholly or partially embedded.

3.5 OPENINGS AND RECESSES IN CONCRETE

A. Provide openings, recesses, and sleeves as shown and where required under other specification sections.

3.6 JOINTS

A. Unless otherwise approved in writing by the Contracting Officer, make contraction, expansion and construction joints only where shown.

B. Form keyways only where shown.

C. Install premolded expansion joint material in all expansion joints of the size and type shown on the drawings. Extend filler from bottom of concrete up flush to finish concrete surface or hold down below finish surface as shown or as required to receive sealant.

D. Make splices in premolded filler in a manner to preclude penetration of concrete between joint faces.

3.7 WATERSTOPS

A. Install waterstops in construction joints below grade and where shown on the drawings. Use 6 inch minimum width, except where otherwise shown.

B. Support and protect that portion of waterstop which extends beyond bulkhead, during placing of concrete and subsequent removal of forms.

C. Make field splices using manufacturer's printed instructions to develop watertightness equal to that of unspliced material. Use manufacturer's factory fabricated sections for corners and "T" intersections.

3.8 VOID BOXES

A. Where shown, place void boxes on prepared level subgrade beneath grade beams.

B. Use either rectangular or trapezoidal shaped void box as shown on the drawings. Use backfill retainers with rectangular void boxes.

C. Replace any damaged void boxes prior to placing concrete.

D. Tape ends of void boxes.

3.9 VAPOR RETARDER

A. Place, protect, and repair vapor-retarder sheets according to ASTM E1643 and manufacturer's written instructions.

3.10 REMOVAL OF FORMS, FALSEWORK, AND CENTERING

A. Unless otherwise shown or specified, maintain, and remove forms and related structures for cast-in-place concrete work in compliance with the ACI 347. For bridges refer to AASHTO HB-17.

B. In the determination of the time for removing formwork and constructing superimposed elements, consideration shall be given to the location and character of the structure, the weather, other conditions influencing setting of concrete, and material used in the mixture. Formwork shall include forms, braces, ties, guy wires, and other instruments of stabilization.
C. If removing formwork and forming for and placing concrete in superimposed elements are controlled by cylinder tests, the Contractor will be permitted to perform these operations when cylinder strengths reach the values specified in the Table 03100-1, "Requirements for Removing Formwork and Constructing Superimposed Elements". Cylinders shall be cured under conditions that are not more favorable than the most unfavorable conditions for the portions of concrete the cylinders represent.

D. The periods given in Table 03100-1, "Requirements for Removing Formwork and Constructing Superimposed Elements", exclusive of days when any portion of the concrete element surface is below 40 degrees F, shall be used if the control cylinder test is not used. The period of time shall be counted from the completion of concrete placement. These strengths and periods are intended only for indicated construction operations and shall not apply to the use of equipment or other live loads on the structure. Stockpiling materials or using unauthorized equipment on the structure will not be permitted until concrete has reached its 28 day required compressive strength (f'c).

E. Methods of form removal that will overstress concrete shall not be used. Supports shall be removed in a manner to permit the concrete to take, uniformly and gradually, the stresses caused by its own weight.

F. Do not alter loading conditions on concrete subsequent to removal of forms if alteration exceeds permissible stresses and deformations at attained concrete strengths.

3.11 COIL ROD INSERTS

A. In accordance with the Contract Drawings and the manufacturer's recommendations.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Concrete formwork will not be paid for under this section wherein no measurement will be made.

B. Concrete formwork specified in this section will not be paid for separately under this section, as all related costs will be considered as incidental or subsidiary to the particular cast-in-place or precast concrete work required by the Contract Documents.

\(^1\)Minimum 28-day design compressive strength as specified in Section 03305, “Portland Cement Concrete”, or as indicated on the Drawings.

\(^2\)The load referred to is the immediate load that will be transmitted to the structural element as a result of removing falsework and bracing, not the load that will eventually be placed on the structural element.

**Note:** Curb and parapet face forms may be removed as soon as concrete has attained sufficient set to stand without slumping. When mineral admixtures are used in the concrete mixture, requirements for removing formwork and constructing superimposed elements shall be based on percentage of strength only.

END OF SECTION 03100
SECTION 03200
CONCRETE REINFORCEMENT

PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies conventional reinforcement and reinforcement accessories for cast-in-place concrete structures, masonry construction, precast concrete, and concrete paving.

B. Prestressing reinforcement is not specified in this section; refer to Section 03365, "Prestressed Concrete".

1.2 REFERENCE STANDARDS

A. American Association of State Highway and Transportation Officials (AASHTO):

1. AASHTO HB-17 - Standard Specification for Highway Bridges

B. American Concrete Institute (ACI):

1. ACI SP-66 - ACI Detailing Manual
2. ACI 117/117R - Standard Specification for Tolerances for Concrete Construction and Materials (ACI 117) and Commentary (ACI 117R)
3. ACI 301 - Specifications for Structural Concrete
4. ACI 315 - Details and Detailing of Concrete Reinforcement
5. ACI 318/318R - Building Code Requirements for Structural Concrete (ACI 318) and Commentary (ACI 318R)

C. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM A82 - Standard Specification for Steel Wire, Plain, for Concrete Reinforcement.
2. ASTM A123/A123M - Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products
5. ASTM A568/A568M - Standard Specification for Steel, Sheet, Carbon, and High-Strength, Low-Alloy, Hot-Rolled and Cold-Rolled, General Requirements for
6. ASTM A615/A615M - Standard Specification for Deformed and Plain Carbon Steel Bars for Concrete Reinforcement.
7. ASTM A706/A706M - Standard Specification for Low-Alloy Steel Deformed and Plain Bars for Concrete Reinforcement.
8. ASTM A767/A767M - Standard Specification for Zinc-Coated (Galvanized) Steel Bars for Concrete Reinforcement.
11. ASTM A1008/A1008M - Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability
13. ASTM G12 - Standard Test Method for Nondestructive Measurement of Film Thickness of Pipeline Coatings on Steel

D. American Welding Society (AWS):

1. AWS D1.4 - Structural Welding Code - Reinforcing Steel

E. Concrete Reinforcing Steel Institute (CRSI):

1. CRSI DA4 - Manual of Standard Practice
2. CRSI DE1 - Reinforcing Bar Detailing

F. Federal Highway Administration Office Of Highway Safety (FHWA):

1. FHWA RD 74 - NBS Non-Metallic Coating For Concrete Reinforcing Bars
2. FHWA N 5080.33 - Coated Reinforcing Steel for Highways and Bridges

G. Underwriters Laboratories (UL)

1. UL 83 - UL Standard for Safety Thermoplastic Insulated Wires and Cables
2. UL 514A - UL Standard for Safety Metallic Outlet Boxes

1.3 SUBMITTALS

A. Shop Drawings:

1. Prepare and submit drawings and schedules to illustrate fabrication, placement, and support of concrete reinforcement. Comply with CRSI Manual of Standard Practice, ACI SP66, and additional requirements specified herein. Contract Documents may not be reproduced for use as part of the shop drawings unless approved in writing by the Engineer of record. Include bar bending diagrams and bar lists. Provide placement drawings, which show reinforcement and its support by using, beam elevations, slab or mat placement plans for each layer of reinforcing, wall elevations, column schedules, and details. Develop details to show proper fit and arrangement of reinforcing. Show locations of bar splices, splice lengths, and bar cutoff points on placement drawings. Show clear concrete cover over reinforcing. Include type, size, and locations of supports required to maintain position of reinforcement.

2. For prestressed concrete, show location of mild steel reinforcing with respect to prestressing tendons. Arrange mild steel to avoid interference with prestressing tendons.

B. Certification:

1. Manufacturer's certificates including origin and product data that certifies conformance with specified requirements for welded wire fabric and reinforcing accessories and supports.

2. Mill test reports on each heat showing chemical and physical analyses performed in accordance with ASTM A615/A615M or A706/A706M.

3. Qualification of welders in accordance with AWS D1.4.

4. For galvanized and epoxy-coated reinforcing bars, furnish certificates of compliance with ASTM A767/A767M for galvanized and ASTM A775/A775M for epoxy-coated bars.

5. Certification of Electrical Testing Supervisor in accordance to NACE International Certified Corrosion Specialist.

1.4 QUALITY ASSURANCE

A. Allowable Tolerances: Cut and bend reinforcing steel to conform to required dimensions within the following tolerances:

1. Sheared length: Plus or minus 1 inch.

2. Depth of truss bars: Plus zero or minus 1/2 inch.

3. Stirrups, ties and spirals: Plus or minus 1/2 inch.

4. Other bends: Plus or minus 1 inch.

5. Placement tolerances not indicated on the contract drawings or specified above shall comply with requirements of ACI 117, ACI 301, ACI 318R, or CRSI DA4.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Ship reinforcing steel in bundles limited to one size and length or one bar mark number.

B. Tag each bundle at mill with waterproof tag showing name of mill, heat number, grade and size of bars, identifying bar mark number, and structural element into which the bar is to be placed.

C. Store above surface on platforms, skids, or other supports as necessary to prevent contact with ground.

D. Protect reinforcing steel and wire fabric from damage; foreign matter such as dirt, oil, and grease; and rust-causing conditions.

PART 2 - PRODUCTS

2.1 REINFORCEMENT MATERIALS

A. Deformed Bars: ASTM A615/A615M, Grade, 60 unless otherwise shown or specified.

B. Weldable Deformed Bars: Provide low alloy steel complying with ASTM A706/A706M.

C. Spiral Reinforcement: ASTM A82 or ASTM A615/A615M Grade 60, unless otherwise shown or specified.

D. Welded Wire Fabric (WWF): Provide in flat sheets for wire sizes W2.9 and greater, conforming to ASTM A185 for plain wire and ASTM A497 for deformed wire.
2.2 ACCESSORIES SUPPORT FOR REINFORCEMENT

A. Rebar supports to be in accordance with CRSI DA4 unless otherwise shown. Where concrete surfaces will be exposed to public view in finished structure use supports of Polypropylene plastic or plastic-protected steel legs complying with CRSI Class 1 - Maximum protection. Color of plastic to match finished concrete surface. Where concrete surface will be sandblasted use supports of stainless steel.

B. Steel wire for securing reinforcing bars and embedded items: ASTM A82, plain, cold-drawn, 16 gage or heavier; ASTM A884/A884M for welded steel wire fabric - epoxy-coated.

2.3 EPOXY COATING

A. Conforming to the requirements of FHWA-RD-74 NBS Non-Metallic Coating For Concrete Reinforcing Bars, FHWA N 5080.33 Coated Reinforcing Steel for highways and bridges, or ASTM A775/A775M Epoxy Coated Reinforcing Steel Bars, elsewhere.

B. Color: Green.

C. Ensure material used for repairing damaged or uncoated areas is compatible with the epoxy coating and is inert in concrete.

D. Coating Thickness: Seven mils plus or minus two mils after cure, applied in a uniform smooth coat, measured in accordance with ASTM G12.

E. Repair damaged or uncoated surfaces by application of repair material in accordance with manufacturer's printed instructions.

2.4 METAL-FILLED SLEEVE COUPLER

A. Capable of developing in tension 125 percent of yield strength of adjoining reinforcing bars.

B. Designed to produce complete fusion with 100 percent penetration of joint.

C. Connection produced by standard exothermic process whereby molten filler metal, contained by high-strength steel sleeve, is introduced into the annular space between bars and sleeve and between ends of bars.

2.5 MECHANICAL SLEEVE COUPLER

A. Capable of developing in tension 125 percent of yield strength of adjoining reinforcing bars.

B. Connection - Produced by threaded reinforcing bar ends and threaded coupler or by metal sleeves hydraulically pressed or forged onto butt-ended reinforcing bars.

C. Couplers - Comply with local building codes if reinforcement is used in private building modifications.

D. Capable of being installed in clear space indicated.

E. “Bar-Grip” as manufactured by Barsplice Products Inc.; “Sylgab Stricon” as manufactured by Sylgab Steel & Wire Corp.

2.6 ELECTRICAL BONDING AND TEST FACILITY MATERIALS

A. Bond Cables: Size as indicated, See Section 13100, Corrosion Control.

B. Test Wires: Size as indicated. See Section 13100, Corrosion Control.

C. Bonding Straps and Plates: Carbon Steel, ASTM A1008/A1008M and ASTM A568M.

1. Straps: 1/2 inch thick by 2 inch wide, with length as required.

2. Plates: 1/4 inch thick, of size indicated.

3. Straps and Plates: Galvanized in accordance with ASTM A123.

D. Exothermic Welding Materials: Connection produced by standard exothermic process whereby molten filler metal, contained by high-strength steel sleeve, is introduced into the annular space between bars and the sleeve. Use materials conforming to the manufacturer's recommendations regarding the mold size and shape, and charge size, and alloy mixture for the powder.

E. Test Boxes: Type as indicated, See Section 13100, “Corrosion Control”.

F. Test Recess Covers: Type as indicated. See Section 13100, “Corrosion Control”.

G. Flexible Conduit: ASTM D4385 polyethylene, of diameter indicated.

H. Conduits and Fittings - Rigid galvanized as specified in Section 16111, Conduits.

I. Identification Tags - Brass or copper alloy with minimum 1 inch width and minimum 1/8 inch thickness. Identifying letters and numerals - Die Stamped.
PART 3 - EXECUTION

3.1 GENERAL

A. Fabricate and place reinforcement in accordance with ACI 117, ACI 301, ACI 318R, CRSI Manual of Standard Practice, CRSI Recommended Practice for Placing Reinforcing Bars, and approved shop drawings.

3.2 CUTTING AND BENDING

A. Perform cutting and bending in the shop. Bend steel cold. Do not bend or straighten bars so as to damage material.

B. Do not bend bars in the field except to correct minor errors and damage occurring during shipping and handling.

3.3 BAR SUPPORTS AND SPACERS

A. Support bars by means of bolsters or chairs at intervals not exceeding requirements by ACI Detailing Manual or CRSI.

B. Reinforcing steel in bottom of slabs resting on earth may be supported by concrete blocks or chairs with sand pads.

C. In walls, columns, piers and abutments hold reinforcing steel in position by means of pier sleds, bar supports or spacers wired to reinforcing steel.

D. Use of stones, clay bricks, wood blocks, or pieces of broken concrete to support reinforcing steel shall not be permitted.

E. Contractor shall not place bars or fabricated mats on layers of fresh concrete as work progresses.

3.4 PLACING AND FASTENING

A. Verify that surface over which concrete will be placed is clean and in proper condition prior to placing reinforcing.

B. Arrange and place reinforcing steel as shown within ACI 318 tolerances.

C. Reinforcing steel shall be free from rust and mill scale, dirt, oil, grease, and other materials which reduce or destroy bond with concrete.

D. Secure reinforcement positively against displacement during placing of concrete. Cut wires close to bars and bend wire away from concrete surfaces. Ensure that tie wires are not in contact with cast-in-place fastener inserts. Remove the clippings and other debris.

E. Wire or clip bars together as recommended in the CRSI Manual of Standard Practice except that reinforcing steel for bridge slabs shall be tied at each intersection.

F. Verify items to be embedded and block-outs are secure in place as required.

G. Position reinforcing steel to permit accurate location of anchor bolts for rail tie plates and other embedded items.

H. Before concrete placement, remove dirt, mill scale, rust scale, oil, grease, and other foreign matter from reinforcement and reinforcement supports.

I. Epoxy coated bars shall be fastened with nylon, epoxy, or plastic coated tie wire.

3.5 SPlicing

A. Furnish reinforcing bars in full lengths as shown on the Contract Drawings and approved shop drawings.

B. Unless otherwise shown, lap reinforcement shall have lap lengths in accordance with ACI 318.

C. Do not splice bars at locations other than those shown on Contract and approved shop drawings unless approved in writing by the Contracting Officer.

D. Lap splices shall not be made on reinforcement greater than No. 11.

E. Make mechanical or welded splices only when specified or shown, or approved in writing by the Contracting Officer. Use weldable rebar for welded splices. Weld in accordance with AWS D 1.4.

F. After installing mechanical connections on epoxy coated bars, all coating damages shall be repaired in accordance with Article 2.3 of this section. All parts of mechanical connections used on epoxy-coated bars shall be coated with same material used for repair of coating damages.

3.6 ELECTRICAL BONDING

A. Make connections between copper conductors, concrete reinforcement, and embedded metal components by exothermic-thermite welding of brazing. Procedures, materials and equipment for thermite welding - Conform to manufacturer’s recommendations. For brazing conform to AWS standard practices. Refer also to Section 16450, “Grounding and Bonding”.
B. Bonding and Longitudinal Reinforcement Steel for Track Invert:

1. Weld top layer of longitudinal reinforcement steel bars at splices in bridge decks, track slabs, bridging slabs and approach/transition slabs to form an electrically continuous path parallel to the trackway.

2. Use a minimum of two fillet welds, not less than 1 inch long, for each splice.

C. Transverse Collector Bars

1. Install transverse collector bars for top layer of longitudinal reinforcement steel at block outs, openings, changes in section, and other locations where longitudinal reinforcement is interrupted in bridge decks, track slabs, bridging slabs, and approach/transition slabs.

2. Weld transverse collector bars to top layer of longitudinal reinforcement steel bars for electrical continuity.

3. Provide test facilities at top transverse collector bar sites, as indicated.

D. Test Facilities:

1. Provide test facilities at each end of the structure and at distances along the structure not to exceed 200 feet. Connect to top layer longitudinal reinforcing steel in the concrete through connectors to the transverse collector bars. Weld top layer of longitudinal bars to transverse collector bars for electrical continuity at test station locations. Install test box with test wires for each transverse collector bar or pair of transverse collector bars at structure joints and other locations, as indicated. Terminate test wires connected to transverse collector bar in test box at an accessible location, as indicated.

2. Identify test wires terminating in test facilities with stamped brass identification tags.

E. Use polyurethane sealant in concrete notches at copper bonding: Section 07900, "Seals And Sealants".

3.7 INSTALLATION

A. Electrical Components:

1. Test boxes: Install at-grade, flush wall, and post mount, test boxes at the locations shown. Install blocking and concrete pad as shown to provide a rigid installation. Route all cabling in a manner that will not cause damage to the wire insulation. Allow enough slack to compensate for soil movements and to permit extension of the wires 18 inches minimum above the box. Coil excess wire in the box.

2. Cables: Bond mechanical joints in concrete reinforced structures as shown. Provide conduits and test wires of the size and type shown from each bonded facility and terminate at location shown. Weld bond, and test wires using exothermic welds following instructions of the manufacturer and as specified herein. Use of compression and split bolt connectors is prohibited. Identify each cable and test wire, test box using nonmetallic tags or pressure sensitive labels.

3.8 INSPECTION

A. Placement of concrete prior to approval by the Contracting Officer of reinforcement and electrical bonding work is prohibited.

B. After concrete has been placed in the accepted sections, the sections shall be retested.

3.9 CONCRETE PROTECTION FOR REINFORCEMENT (COVER)

A. Unless otherwise shown, provide concrete cover of reinforcement in accordance with ACI 318R.

B. For prestressed concrete bearing highway or transit loads provide cover in accordance with AASHTO HB-17 requirements.

3.10 QUALITY CONTROL

A. Do not cover test wires, bonding wires, and other buried and embedded components of corrosion control systems without inspection and approval of the Authority Corrosion Control Engineer. Any/all damage /defective material will be repaired/replaced at the Contractor’s expense.

B. The stations will be installed with adequate protection to insure the test station will not be damaged during subsequent construction. Contractor will be responsible for repair/replacement of the test station at no additional expense to Authority.
C. The Authority Corrosion Control Engineer will test all corrosion control systems. Tests to include, but not to be limited to, electrical continuity of bonding structures including wiring, splices, test cables, test stations. The Contractor will repair or replace deficiencies and damaged components to the satisfaction of the Authority Corrosion Control Engineer and at no additional expense to Authority.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Reinforcing steel will not be measured or paid for separately, but shall be considered subsidiary to the concrete of each structure specified in Section 03300, “Cast-In-Place Concrete”.

B. Welded wire fabric will not be measured or paid for separately, but shall be considered subsidiary to corrosion control or concrete.

C. Increases in reinforcing steel quantity or added splices for the convenience of the Contractor, even though approved by the Contracting Officer, will not be measured for payment.

D. Materials and work related to the bonding and testing of the reinforcing steel will not be measured or paid for separately, but shall be considered subsidiary to concrete of each structure specified in Section 03300, “Cast-In-Place Concrete”.

END OF SECTION 03200
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes specifications for delivering, conveying, placing and curing cast-in-place Portland cement concrete in combination with Section 03305, “Portland Cement Concrete”, as indicated.

B. Finishing of formed and unformed concrete surfaces, are specified in Section 03350, “Concrete Finishing”.

C. Forming Requirements are specified in Section 03100, “Concrete Formwork”.

1.2 REFERENCED STANDARDS

A. American Concrete Institute (ACI):

1. ACI 116R - Cement and Concrete Terminology
2. ACI 117 - Standard Specification for Tolerances for Concrete Construction and Materials
3. ACI 301 - Specifications for Structural Concrete for Buildings
4. ACI 303.1 - Standard Specification for Cast-In-Place Architectural Concrete
5. ACI 304R - Guide for Measuring, Mixing, Transporting, and Placing Concrete
6. ACI 304.2R - Placing Concrete by Pumping Methods
7. ACI 305R - Hot Weather Concreting
8. ACI 306.1 - Standard Specification for Cold Weather Concreting
9. ACI 308.1 - Standard Specification for Curing Concrete
10. ACI 309R - Guide for Consolidation of Concrete
11. ACI 318/318R - Building Code Requirements for Structural Concrete (ACI 318) and Commentary (ACI 318R)
12. ACI 336.1 - Specification for the Construction of Drilled Piers
13. ACI 503.2 - 503.4 - Three Epoxy Standards

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM C31/C31M - Standard Practice for Making and Curing Concrete Test Specimens in the Field
2. ASTM C94/C94M - Standard Specification for Ready-Mixed Concrete
3. ASTM C171 - Standard Specification for Sheet Materials for Curing Concrete
4. ASTM C309 - Standard Specification for Liquid Membrane-Forming Compounds for Curing Concrete

C. Texas Department of Transportation (TxDOT):

1. TxDOT Standard Specifications for Construction and Maintenance of Highways, Streets and Bridges.
2. TxDOT Construction Bulletin C-1 – Concrete Construction Manual
3. TxDOT Construction Bulletin C-11 – Procedures for the Design and Control of Portland Cement Concrete Mixtures

1.3 DEFINITIONS

A. Mass Concrete: All pier stems and caps with a least dimension equal to or greater than 5'. Aerial station support columns and drilled shafts are excluded from mass concrete requirements.
1.4 SUBMITTALS

A. Implementation:

1. Submit plans for controlling concrete temperature and for placing concrete taking into account sun, heat, wind, ambient air temperature, and other limitations of facilities that will prevent proper finishing and curing.

2. Submit quality control plan for floor treatment prior to installation.

3. Submit field quality control test reports no more than 1 day after tests are made.

B. Product Data: Submit manufacturer’s product data for epoxy adhesive.

C. Records and Reports: Report the location in the finished work of each mix design, and the start and completion times of placement of each batch of concrete placed for each date concrete is placed. Reports shall be submitted no later than 1 day after placement.

D. Thermal Control Plan:

1. Prior to mass concrete construction, submit a Thermal Control Plan with design calculations.

2. Thermal Control Plan shall show complete details and determine the maximum allowable temperature differentials between the hottest point of the concrete and the exterior faces based on the design assumption that cracking as a result of heat of hydration shall not occur. As a minimum, the Thermal Control Plan shall include the following:
   a. Mix design.
   b. Duration and method of curing.
   c. Procedures to control concrete temperature at time of placement.
   d. Methods of controlling temperature differentials.
   e. Temperature sensor types and locations.
   f. Temperature monitoring and recording system.
   g. Field measures to ensure conformance with the maximum concrete temperature and temperature differential requirements.

1.5 QUALITY ASSURANCE

A. Tolerances:

1. Concrete Tolerances: Comply with the requirements of ACI 117 as applicable. Coordinate with the requirements specified in Section 03100, “Concrete Formwork”.

2. Tolerances for Slabs and Flatwork: Comply with the requirements specified in Section 03350, “Concrete Finishing”.

3. Tolerances tighter than those indicated in ACI 117 shall be provided at specific locations identified in the Contract Documents.
   a. Concrete supporting the glass fiber concrete warning strips shall be within plus or minus 1/2 inch of horizontal and vertical contract line and grade.

B. Architectural Concrete: Where concrete is indicated as architectural concrete and where concrete is exposed to public view, such concrete shall be produced in accordance with applicable requirements of ACI 301 and ACI 303.1.

1. Approved site mock-ups shall set the standard for the various architectural concrete features, formed finishes, and colors of the concrete. Provide as many mock-ups as required to show all the different features and formed surfaces of the concrete.

C. Cold Joints: Cold joints in concrete will not be permitted unless planned and treated properly as construction joints.

D. Qualifications of Contractor’s Engineer: Thermal Control Plan for mass concrete work shall be prepared by a Professional Engineer licensed in the State of Texas. Submit proof of licensing and qualifications to Contracting Officer. Contractor’s Engineer shall be qualified to evaluate mass concrete work, review reports and consult on related issues.

1.6 PROJECT CONDITIONS

A. Environmental Requirements:

1. Delivering and placing of concrete in hot weather and cold weather shall conform with applicable requirements of ACI 305R and ACI 306.1 and Section 03305, “Portland Cement Concrete”.

2. Do not place concrete when the rate of evaporation of surface moisture from concrete exceeds 0.2 pounds per square
PART 2 - PRODUCTS

2.1 MATERIALS

A. Formwork: Refer to Section 03100, “Concrete Formwork”, for requirements.

B. Joint Fillers and Sealers: Refer to Section 03100, “Concrete Formwork”, for requirements.

C. Waterstops: Refer to Section 03100, “Concrete Formwork”, for requirements.

D. Reinforcing Steel: Refer to Section 03200, “Concrete Reinforcement”, for requirements.

E. Portland Cement Concrete: Refer to Section 03305, “Portland Cement Concrete”, for mix designs and other requirements.

F. Epoxy Adhesive: ASTM C881, Type, Grade and Class as determined by project conditions and requirements.

1. For Concrete Repairs Exposed to Wet Conditions: Two-component compound, 100 percent solids, 100 percent reactive compound suitable for use on dry or damp surfaces.

   a. Acceptable manufacturers and product:

      1) “Shep Poxy Roads & Highways MV” by CMC Construction Services.
      2) “Sikadur 32 Hi-Mod LPL” by Sika Corporation.
      3) “Epobond” by L&M Construction Chemicals.

2. For Concrete Repairs and New Construction Not Exposed to Wet Conditions:

   a. Film-forming, freeze-thaw resistant material suitable for exterior or interior exposure.

   b. Acceptable manufacturers and product:

      1) “Everbond” by L&M Construction Chemicals.
      2) “Euco Weld” by Euclid Chemical
      3) “Weld-Crete” by Larson Products Corp.

3. For New or Repaired Construction Joints Exposed to Wet Conditions or where shown:

   a. High solids, acrylic polymer latex bonding agent conforming to ASTC C-1059-91 Type II (non-reemulsifiable).

   b. Acceptable manufacturers and product:

      1) Acrylic Bonding Agent J40 by Dayton Superior
      2) Acrylic Bonding Agent by White Cap Construction Supply
      3) Acry-Lok Bonding Agent by W.R. Meadows Co.

2.2 MECHANICAL COOLING SYSTEM FOR MASS CONCRETE

A. If the Contractor elects to use a mechanical cooling system, the mechanical cooling system shall be designed in conformance with the Thermal Control Plan and the following requirements:

1. The mechanical cooling system shall be embedded within mass concrete elements and surface connections to cooling pipes shall be removable to a depth of 4 inches from the surface.

2. Forms shall be designed so that removal of the forms shall not disrupt the cooling or temperature monitoring.

3. Cooling pipes shall not break and deform during mass concrete placement and shall be secured to prevent movement. Damaged Cooling pipes shall be removed and replaced immediately.

4. The mechanical cooling system shall be pressure tested at 30 psig for 30 minutes for leaking prior to mass concrete placement. Coolant circulation shall be in progress at the time that concrete placement begins.

5. After cooling is completed, cooling pipes shall be full grouted under pressure with a Structural Nonshrink Grout as specified in Section 03305, “Portland Cement Concrete”. The placement of structural nonshrink grout shall be in conformance with the manufacturer’s recommendations.

6. After surface connections to the cooling pipes are removed, the holes shall be reamed and filled with Portland Cement Grout as specified in Section 03305, “Portland Cement Concrete”.

DART Standard Specifications – July 2014

03300 - 3
CAST-IN-PLACE CONCRETE

PART 3 - EXECUTION

3.1 PREPARATION FOR CONCRETE PLACEMENT

A. Coordination:

1. In accordance with Section 01450, "Quality Control", and as directed during the program of work, notify Contracting Officer at least 24 hrs prior to the date and time concrete is scheduled to be placed and when the forms, reinforcement and embedded items will be ready for inspection by the Contracting Officer. Do not place concrete until the Contracting Officer's inspection is complete.

2. Notify all trades having work that will be embedded in the concrete unit being placed sufficiently in advance of the placement date to allow completion of their work prior to the Contracting Officer's inspection.

3. Schedule the presence of agencies, laboratories and manufacturers' representatives required to test sample or give direction during placement of concrete at least 5 days in advance of the concrete placement date.

4. Coordinate accessibility for concrete placement equipment with local traffic authorities and adjacent property owners.

B. Examination:

1. Prior to the Contracting Officer's inspection, inspect subgrades, adjacent concrete, work that will be covered by concrete formwork, reinforcement, and all required embedded items relevant to the concrete unit to be placed to verify their completeness and accuracy of location. Make corrections of all deficiencies prior to the start of the Contracting Officer's inspection.

2. The absence of the Contracting Officer's inspection does not relieve the Contractor of responsibility for the accuracy or completeness of the work.

C. Accessibility of Materials:

1. Have available at the site and ready to place in operation all materials and equipment in conjunction with hot or cold weather concreting requirements.

2. Verify that all curing materials are at the site and are in proper condition prior to concrete placement.

3. Initiate concrete placement only when all suitable materials, equipment, and personnel that are required for proper execution of concrete placement, finishing, curing, and protection are available at the site.

D. Installation of Embedded Items:

1. Set and build into work anchorage devices and other embedded items required for other work that is attached to, or supported by, cast-in-place concrete.

2. Use setting drawings, diagrams, instructions, and directions provided by suppliers of items.

3. Install miscellaneous steel and joint systems specified and shown.

4. Place and secure embedded items prior to concrete placement.

E. Joint Preparation:

1. Prepare surfaces of previously placed concrete against which fresh concrete will be placed as follows:
   a. Clean surfaces of all debris, curing compounds, scum, laitance, loose or defective concrete, standing water, ice, or other foreign matter.
   b. Where requirement for a "roughened joint" is specified or shown, verify that the hardened concrete has been finished rough or roughen any smooth surfaces by sandblasting or other approved methods. A rough surface is defined as having a textured amplitude of approximately 1/4 inch and that is free of loose particles and pockets that restrict concrete from flowing into the roughened concrete surfaces.
   c. Clean protruding waterstop surfaces of all laitance and hardened concrete material. Protect waterstops from damage during concrete cleaning and roughening operations.
   d. Apply appropriate bonding agent or cement slurry to joints only where shown or specified. If no bonding agent or cement slurry is specified, immediately prior to placing fresh concrete wet the joint surface and remove standing water.
   e. Allow at least 72 hours to elapse before continuing concrete placement at a construction joint. Approval for accelerating the minimum time elapsing between adjacent placements will be based on tests and methods which confirm that a minimum moisture loss at a
relatively constant temperature will be maintained for the period as necessary to control the heat of hydration and hardening of concrete, and to prevent shrinkage and thermal tracking.

f. Prior to mass concrete placement, Contractor’s Engineer or Technician under the supervision of the Contractor’s Engineer, shall inspect and test the temperature monitoring and recording system. The Contractor’s technician shall be present at the jobsite when the mass concrete operation is in progress and shall report to the Contracting Officer in writing on a daily basis the progress of the operation. A copy of the daily report shall be available at the jobsite.

g. Mechanical cooling systems may be used to control the internal temperature of mass concrete during curing.

2. Horizontal Construction Joints:
   a. Do not make horizontal construction joints within the top 18" of walls, piers, columns, or other vertical elements except where otherwise shown.
   b. Trowel the top surface of concrete within 1 inch of forms where joint will be exposed. Remove laitance from joint surfaces prior to placement of additional concrete.
   c. Construction joints shall be permitted only as shown in the plans and on shop drawings as approved by the Contracting Officer.

3. Supports for Conveying Equipment: Support concrete conveying equipment so supports and equipment will not travel or sit on reinforcement. Have all supports prefabricated, in place or readily accessible prior to concrete placement.

3.2 TRANSPORTING
   A. Concrete shall be central-mixed concrete from a central batch plant, transported to the jobsite in a truck mixer or shall be truck-mixed, both in accordance with the requirements specified in Section 03305, “Portland Cement Concrete”, and ASTM C94.
   B. Transport concrete to the jobsite in a manner that will assure efficient delivery of concrete to the point of placement without adversely altering specified properties with regard to water-cement ratio, slump, air entrainment, and homogeneity.

3.3 CONVEYING
   A. General Requirements:
      1. Provide equipment for conveying concrete in a continuous flow without segregation from point of Ready-Mix truck discharge to point of placement in the work. Equipment shall have sufficient capacity to provide a placement rate which will preclude cold joints and which shall deposit the concrete without segregation or loss of ingredients.
      2. Use pumps, pneumatic equipment, pipes, chutes, buggies, buckets, and troughs that have been thoroughly cleaned before use to convey concrete, and that are not constructed of aluminum.
   B. Chutes and Troughs: Where steep slopes are unavoidable, equip chutes or troughs with baffles to minimize segregation of aggregates.
   C. Adjustable Length Pipes (Elephant Trunks): Use pipes of ferrous metal, rubber or plastic, 6 inches minimum diameter so that concrete can be delivered in continuous flow to points not more than 5 feet horizontally and 5 feet vertically from final location. At no location shall free fall of concrete exceed 5 feet.
   D. Buggies: Operate buggies only on provided runways so they will not come into contact with concrete reinforcing steel.
   E. Pumping and Pneumatic Conveying Equipment:
      1. Use pumping and pneumatic conveying equipment designed to handle the types and volumes of concrete to be conveyed without segregation occurring.
      2. Operate pump or pneumatic equipment so that a continuous stream of concrete without air pockets is produced. Position discharge end of line as close as possible to final position of concrete, but in no case more than 5 feet away.

3.4 PLACEMENT
   A. General Requirements:
      1. Immediately prior to placing concrete, remove all debris and extraneous material from interior of forms.
      2. Place concrete continuously and as rapidly as possible after discharge from Ready-Mix
CAST-IN-PLACE CONCRETE

3. Place concrete in layers of such thickness that no concrete will be deposited on concrete which has hardened sufficiently to cause formation of seams or planes of weakness. Cover each layer of concrete with fresh concrete within 45 minutes. Do not use vibrators for shifting mass of fresh concrete.

4. Do not place concrete which has attained initial set or concrete which has contained mix water for more than 90 minutes; or does not meet specified requirements.

5. Remove temporary spreaders in forms when concrete has reached elevation which makes them unnecessary.

6. Place column concrete using adjustable pipes or elephant trunks. In monolithic placements, do not deposit concrete in supported elements such as beams, girders and slabs until concrete previously deposited in columns or walls has completed its settlement shrinkage, but not to the point at which concrete in supporting members will not permit vibrator to sink into concrete by its own weight.

7. Do not place concrete when sun, heat, wind and limitations of facilities will prevent finishing and curing. Rate of evaporation of surface moisture from the concrete shall be as calculated per ACI 305R.

8. Comply with ACI 305R Hot Weather Concreting when air temperatures exceed 80 degrees F during placing, finishing and curing. The temperature of the concrete mix shall not exceed 95 degrees F at the time of placement, except for bridge decks concrete which shall not exceed 85 degrees F. The Contractor shall select and implement a procedure from ACI 305R at no additional cost to the Authority to ensure that the concrete mix temperature at the time of placement remains below this maximum.

9. Comply with ACI 306.1 Cold Weather Concreting when air temperatures will be 40 degrees F or less during concrete placement, finishing and curing. The temperature of the concrete, when placed, shall not be less than 50 degrees F.

10. Prior to placing fresh concrete against rock or previously placed concrete, remove all foreign matter which would adversely affect bond. Prepare surface as specified in Paragraph 3.1.E of this Section.

11. Except for drilled piers, concrete is not to be dropped over 5 feet without the use of tremies or chutes to prevent the segregation of concrete during placement. Free fall of concrete shall not exceed 5 feet.

B. Pumping:

1. Concrete may be placed by pumping if the maximum slump can be maintained and if accepted in writing by the Contracting Officer for the location proposed.

2. Placing concrete by pumping methods shall conform to applicable requirements of ACI 304R and ACI 304.2R.

3. Equipment for pumping shall be of such size and design as to ensure a continuous flow of concrete at the delivery end without separation of materials. Concrete from end of hose shall have a free fall of less than 5 feet. Pump hoses shall be supported on horses or similar devices so that reinforcement or post-tensioning ducts or tendons are not moved from their original position.

4. The concrete mix shall be designed to the same requirements as specified in Section 03305, “Portland Cement Concrete”, and may be altered for placement purposes with the prior written approval of the Contracting Officer.

C. Underwater Concrete Placement:

1. Place concrete mix designated for underwater placement carefully and continuously in compact mass by means of tremie or underwater bottom dump bucket; do not disturb after depositing. Do not allow concrete to freely drop more than 1 foot through water. Maintain still water at point of deposit. Use tight forms. Place concrete to produce approximately horizontal surfaces.

2. Do not perform dewatering within area until concrete has set at least 48 hours.

3. Tremie:

a. Provide tremie consisting of watertight tube, 10 inch minimum diameter, with hopper at top. Equip tube with device to close discharge end and prevent water from entering tube while charging tube with concrete. Refer to ACI 304R.

b. Support tremie to permit free movement of discharge end over entire top surface of work and to permit rapid lowering when necessary to retard or stop flow of concrete.
c. Close discharge end at start of work to prevent water entering tube and maintain entirely sealed, except when concrete is being placed. Keep tremie tube full of concrete. When concrete is discharged, place the end of the tremie on the surface upon which concrete is to be deposited or slightly embedded in previously placed fresh concrete. Maintaining end of tremie embedded in the fresh concrete, raise end as necessary to allow adequate flow to achieve the thickness of the layer being placed.

d. Maintain continuous flow until work is complete and resulting concrete seal is monolithic and homogeneous. Control tremies so that concrete will be effectively compacted into horizontal layers not more than 12 inches thick.

e. Space tremies so as to avoid segregation.

4. Underwater bucket:
   a. Provide underwater buckets with open tops manufactured so that bottom doors open freely and outwardly when tripped.
   b. Fill bucket completely and lower slowly to avoid backwash until it rests on surface upon which concrete is to be deposited.
   c. Discharge concrete slowly. After discharge, raise bucket slowly until well above concrete.

5. For drilled shaft foundation piers, follow concrete placement methods stated in ACI 336.1 and other requirements specified in Section 02375, “Drilled Shaft Foundations”.

3.5 CONsolidation

A. Consolidate concrete thoroughly as it is placed in order to secure a dense mass. Work concrete well around reinforcement, embedded items and into the corners of forms. Consolidate concrete in accordance with ACI 309R.

B. Use internal vibrators unless external vibrators are approved by the Contracting Officer.

C. Use vibrators capable of generating frequencies of not less than 7,000 impulses per minute. Vibrate so as to visibly affect mass of concrete of 1 inch slump over radius of at least 18 inches. Prevent formation of laitance and accumulation of excessive water on surface of concrete as it is deposited. Remove excessive water by pumping or other approved means.

D. When consolidating concrete in haunches, girders, beams, or slabs, ensure that vibrator penetrates and re-vibrates previously placed concrete in top of supporting members.

E. Do not allow vibrators to penetrate previously placed layers more than 2 inches in order to consolidate and prevent over vibration of previously vibrated layer. Do not use vibrators where internal vibration might cause damage to embedded items; in such cases spading is required.

F. Vibrator(s) are to be inserted and withdrawn vertically except in slabs and similar shallow areas at uniform spacing over the entire area of the placement. Space the distance between insertions such that their sphere of influence overlaps.

G. Provide at least 1 standby vibrator for emergency use in addition to those required for placement.

H. Vibration shall be supplemented by hand spading or rodding where necessary to execute proper consolidation.

3.6 CONSTRUCTION JOINTS

A. Construction joints will be permitted only where indicated or approved by the Contracting Officer.

B. Provide and prepare construction joints and install waterstops in accordance with the applicable requirements of ACI 301 and ACI 304R, and as specified in Section 03100, “Concrete Formwork” and Paragraph 3.1.E, herein.

C. Make construction joints straight and as inconspicuous as possible, and in exact vertical and horizontal alignment with the structure, as the case may be.

D. Use approved key, at least 1-1/2 inches in depth, at joints unless otherwise indicated or approved by the Contracting Officer.

E. Thoroughly clean the surface of the concrete at construction joints and remove laitance, loose or defective concrete, coatings, sand, sealing compound and other foreign material. Prepare surfaces of joints by sandblasting or other approved methods to remove laitance and expose aggregate uniformly.

F. Immediately before new concrete is placed, wet the joint surfaces and remove standing water. To allow for shrinkage, do not place new concrete against the hardened concrete side of a construction joint for a minimum of 72 hours.

G. Locate joints which are not indicated so that the strength of the structure is not impaired. Joint types
and their locations are subject to prior approval of the Contracting Officer.

H. Ensure that reinforcement is continuous across construction joints.

I. Place waterstops in construction joints where indicated.

J. Where bonding of the joint is required, provide epoxy adhesive hereinbefore specified and apply in accordance with ACI 503.2.

K. Retighten forms and dampen concrete surfaces before concrete placing is continued, unless bonding agent is used.

L. Allow at least 72 hours to elapse before continuing concrete placement at a construction joint. Approval for accelerating the minimum time elapsing between adjacent placements will be based on tests and methods which confirm that a minimum moisture loss at a relatively constant temperature will be maintained for the period as necessary to control the heat of hydration and hardening of concrete, and to prevent shrinkage and thermal cracking.

3.7 CURING AND PROTECTING

A. Curing and protection of concrete shall be done in accordance with Section 03350 “Concrete Finishing”.

3.8 REPAIR OF MINOR SURFACE DEFECTS

A. Refer to Section 03350, “Concrete Finishing” and 03360 “Special Concrete Finishes” for requirements.

3.9 TEMPERATURE MONITORING AND RECORDING SYSTEM FOR MASS CONCRETE

A. The temperature monitoring and recording system for mass concrete shall consist of temperature sensors connected to a data acquisition system capable of printing, storing, and downloading data to a computer. Temperature sensors shall be located such that the maximum temperature difference within a mass concrete element can be monitored. As a minimum, concrete temperatures shall be monitored at the calculated hottest location and surface.

B. Temperature readings shall be automatically recorded on an hourly or more frequent basis. The hourly temperature recording may be discontinued when the maximum internal temperature is falling, the difference between the interior concrete temperature and the average daily air temperature is less than the allowable temperature difference for 3 consecutive days, and there are no mass concrete elements to be cast adjacent. Data shall be printed and submitted to the Contracting Officer as requested.

C. Methods of concrete consolidation shall prevent damage to the temperature monitoring and recording system. Wiring from temperature sensors cast into the concrete shall be protected to prevent movement. Wire runs shall be kept as short as possible. The ends of the temperature sensors shall not come into contact with either a support or concrete form, or bar reinforcing steel.

D. When any equipment used in the temperature control and monitoring and recording system fails during the mass concrete construction operation, the Contractor shall take immediate measures to correct the situation as specified in the Thermal Control Plan. Failure to conform to the temperature requirements will be cause for suspension of the mass concrete work and review and adjustment of the Thermal Control Plan by Contractor’s Engineer and evaluation of the deficient concrete for acceptance or rejection.

3.10 MASS CONCRETE ACCEPTANCE

A. Mass concrete shall conform to the concrete acceptance criteria and the following temperature requirements:

1. The maximum allowable temperature of mass concrete shall not exceed 160 degrees F.

2. The maximum temperature differential of mass concrete shall not exceed the requirement as determined in the Thermal Control Plan.

B. Failure to conform to any of the temperature requirements above will be cause for suspension of the mass concrete work and review and adjustment of the Thermal Control Plan by Contractor’s Engineer and evaluation of the deficient concrete for acceptance or rejection. The rejected mass concrete shall be removed at the Contractor’s expense. The Contractor shall modify the Thermal Control Plan and design calculations to correct the problem and resubmit the revised Thermal Control Plan.

C. The Contractor shall allow the Contracting Officer 2 weeks for review and approval of the revised Thermal Control Plan. Mass concrete placement shall not begin until the Contracting Officer has approved the revised Thermal Control Plan. No extension of time or compensation will be made for any rejected mass concrete element or revisions of the Thermal Control Plan.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Quantities of cast-in-place concrete of the various classifications and color which constitute the completed structure segments specified herein, will be measured and paid for by mix type and the cubic
yard, each, or square foot as follows from the approved shop drawings for the location indicated.

1. Structure elements such as abutment and pier structures shall be measured by the cubic yard, which will include footings, walls, columns, and pier caps for each respective bridge.

2. Retaining wall construction shall be measured by the square foot of exterior surface area for the full height above foundation slab.
   a. Subdrains or underdrains for the retaining wall will not be measured separately for payment, but shall be considered subsidiary to the construction of the retaining wall.
   b. Foundation slab is subsidiary to the wall and will not be measured.

3. Superstructure concrete complete shall include bridge deck, catenary and signal supports, diaphragms and drainage systems on above grade structures, parapet walls, and shall be measured by the cubic yard. Cast-in-place prestressed concrete is included for payment under this item.

4. Ballast wall construction shall be measured by the linear foot along the front face for the full wall length including the foundation, as measured in the field.
   a. Subdrains or underdrains for the ballast wall will not be measured separately for payment, but shall be considered subsidiary to the construction of the ballast wall.
   b. Leveling pad and other pertinent items will not be measured separately for payment, but shall be considered incidental to the construction of the ballast wall.

5. Approach slab and track slab shall be measured by the cubic yard.

B. Cast-in-place concrete for at-grade station platforms and concourse slabs will not be measured, but will be paid for at the lump sum price for each station.

C. Excavation and earthwork, including backfill, will not be measured separately for payment, but shall be considered subsidiary to the various bid items.

D. Formwork, reinforcing, joint filler, and other pertinent items will not be measured separately for payment, but shall be considered incidental to the various bid items.

END OF SECTION 03300
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes specifications for Portland cement concrete, including materials, mix designs, batching, mixing, delivering, inspection, and testing.

B. Portland cement concrete shall be composed of Portland cement with or without fly ash, fine aggregate, coarse aggregate, and water, with or without admixtures as approved by the Contracting Officer, proportioned and mixed as specified herein.

1.2 REFERENCED STANDARDS

A. American Concrete Institute (ACI):

1. ACI 116R - Cement and Concrete Terminology

2. ACI 117 - Standard Specification for Tolerances for Concrete Construction and Materials

3. ACI 211.1 - Standard Practice for Selecting Proportions for Normal, Heavyweight, and Mass Concrete

4. ACI 211.2 - Standard Practice for Selecting Proportions for Structural Lightweight Concrete

5. ACI 301 - Specifications for Structural Concrete

6. ACI 304R - Guide for Measuring, Mixing, Transporting, and Placing Concrete

1.3 SUBMITTALS

A. Testing Laboratory and Quality Control:

1. In accordance with Section 01450, “Quality Control”, for the testing laboratory requirements.

B. Concrete Mix Designs: Submit mix designs as herein specified in Article 2.4. Include laboratory test reports of trial strength tests.

C. NRMCA or TxDOT batch plant certification to the Contracting Officer 30 days before delivery of concrete to Worksite.

1. Mix design, laboratory test reports, and mill or manufacturer’s certificates attesting the conformance of ingredients with these Specifications. Use ingredients in design mix which are representative samples of materials used in Work. Provide one design mix for each class of concrete. Establish mix design through an accepted laboratory.

2. Certifications by concrete supplier of design mixes to specified requirements in respect to strength, unit weight, maximum size aggregate, air-entrainment, slump and water-cement ratio.

3. If source, brand or characteristic properties of ingredients need to be varied during term of Contract, submit revised laboratory mix reports and Certificate of Compliance to Contracting Officer.

D. Product Data: Submit manufacturer’s product data for proposed concrete admixtures.

E. Certifications:

1. Cement mill certificates.

2. Concrete Ingredients:

a. Submit with mix design reports, laboratory test reports and mill or manufacturer’s certificates verifying that ingredients conform to specified requirements. Use ingredients in design mix which are representative samples of materials to be used in the work. All test reports and certificates are to be dated within six months of submittal date.

b. In case the source, brand or characteristic properties of ingredients need to be varied during the term of the Contract, submit revised laboratory mix report in accordance with procedures specified for original mix design.

3. Concrete Batch Tickets: Before unloading concrete at the site, submit certification or delivery ticket from concrete supplier with each batch delivered to the site bearing the following information.

a. Name of supplier.

b. Name of batching plant and location.

c. Serial number of ticket.

d. Date.

e. Truck number.

f. Specific job designation: Contract number and location.

g. Volume of concrete in cubic yards.

h. Class and type of concrete.

i. Time loaded.

j. Type and brand of cement.

k. Weight of cementitious materials and individual materials (e.g. cement, fly ash, etc.) which make up the total cementitious material.

l. Maximum size of aggregates.

m. Weights of coarse and fine aggregates.
n. Maximum amount of water to be added and amount of water added at the site.

o. Kind and amount of admixtures.

p. DART concrete mix design designation.

F. Implementation Plans and Reports:

1. Mix Design Reports:

a. Thirty days prior to placing concrete, submit mix designs for each concrete mix, certifying that proposed concrete ingredients and proportions will result in concrete mixes meeting specified requirements and that ingredients are those that will be used in the work.

b. The Contractor may present for approval a concrete mix previously approved by the Contracting Officer provided such mix is made with proposed ingredients that meet requirements, and provided that concrete has complied with compressive strength requirements based on ACI 318 5.3 and 5.4. The compressive strength tests results for such mix designs shall be no more than 12 months old.

c. Submit manufacturers literature, including instructions for use, for admixtures, surface treatments, curing materials, grouts and bonding agents to be used on this project.

1.4 STORAGE AND HANDLING OF CONCRETE INGREDIENTS

A. Deliver packaged materials in manufacturers original, unopened containers bearing manufacturer’s name and brand.

B. Load, transport, handle, store, and batch concrete materials in a manner to ensure materials are not contaminated, unclean, segregated or affected in any way detrimental to the final product.

C. Aggregates:

1. Transport and stock pile aggregate separately according to sources and gradations. Handle as to prevent segregation, loss of fines and contamination by earth or other foreign materials.

2. If aggregates show segregation or if different grades become mixed, rescreen before placing in proportioning bins.

3. When conditions require the use of two (2) or more sizes of aggregates, the aggregates shall be separated to prevent intermixing. Where space is limited, stockpiles shall separated by physical barriers. Aggregate from different sources shall stored in difference stockpiles unless the aggregates are pre-blended as approved by the Contracting Officer prior to stockpiling.

4. Do not transfer aggregates directly from trucks or railroad cars to proportioning bins when moisture content is such that it will affect accurate proportioning of concrete mixture. In such cases, stockpile aggregate until excess moisture drains off.

D. Packaged Cement:

1. Deliver to project site in original sealed packages labeled with weight, name of manufacturer, brand and type.

2. Store packages in water-tight building.

3. Do not use cement which has been reclaimed by cleaning bags.

4. Do not use cement which has been exposed to moisture or contaminated.

5. Deliver packages conforming to weight specified.

6. Packaged cement will be subject to testing.

E. Bulk Cement:

1. Store bulk cement separately from other cement and protect to prevent exposure to moisture and contamination.

2. In ready-mix plant, provide facilities to maintain separation of specified cements.

3. Provide sampling facilities at cement manufacturer’s plant at weighing hopper or in feed line immediately before entering hopper.

F. Store admixtures to prevent contamination, evaporation or damage. Protect liquid admixtures from harmful temperature ranges.
PORTLAND CEMENT CONCRETE

1.5 QUALITY ASSURANCE

A. The Contractor shall select a qualified concrete supplier capable of meeting project requirements and the requirements of these Specifications. Furnish evidence of plants capacity to produce and deliver concrete conforming to specified requirements at required rate and which has laboratory capability to develop acceptable concrete mix designs and control quality of concrete production.

1. Batch plant: Semi automatic batching systems as described in NRMCA checklists for Certification of Ready Mix Concrete Production Facilities.

2. Certification: NRMCA currently and continually certified batch plant. In lieu of NRMCA certification, proper, current, and continuing certification by TxDOT will be considered adequate.

B. In conformance with applicable requirements of Section 01450, "Quality Control", the Contractor shall provide a quality control plan to assure control and uniformity of materials, conformance with accepted mix designs, and prompt and proper delivery of concrete to the jobsite in accordance with applicable requirements of ASTM C94. Include in the plan all tests the Contractor will perform to verify compliance with Specification requirements, and the independent laboratory the Contractor intends to engage to perform the tests.

C. Quality Control For Batch Plant:

1. Batch plant quality control inspection during batching operations: By an independent certified testing laboratory retained and paid for by Contractor, for performing tests in accordance with reference standards listed. Plant inspections shall be on periodic basic, at frequency to ensure consistent quality concrete production and in accordance with Contractor's Approved Quality Control Plan. Provide concrete from batching plant, reviewed and accepted by Contractor and meeting the following requirements:

   a. Arrangement:

      1) Provide separate bins or compartments for each size or classification of aggregate and for bulk Portland cement.

      2) Provide compartments of ample size and constructed to maintain materials separately under working conditions. Equip batching plant so flow of each material into batcher is stopped automatically when designated weight has been reached. Weigh aggregates in a separate scale in a separate weight batcher. Water may be measured by weight or by volume. If measured by weight, do not weigh cumulatively with other ingredients.

      3) Arrange plant to facilitate inspection of operations. Provide suitable facilities for obtaining representative samples of aggregate from each of the bins or compartments for test purposes. Provide delivery of materials from batching equipment to within accuracies specified in ASTM C94.

   b. Water Batcher and Dispensers for Admixtures

      1) Provide equipment for batching water and air entraining or other admixtures at batching plant except in cases where mixing is performed at Worksite in paving mixers or in truck mixers.

      2) Provide a suitable water measuring device capable of measuring mixing water within specified requirements for each batch. Provide a mechanism for delivering water to mixers so leakage will not occur when valves are closed. Interface filling and discharge valves for weighing batcher so discharge valve cannot be opened before filling valve is fully closed.

      3) Provide measuring devices for admixtures capable of ready adjustment that have at least three percent accuracy, to permit varying quantity of admixture...
4) Interface dispenser for admixtures with batching and discharging operations so batching and discharging of admixture will be automatic.

c. Moisture Control: Provide a plant capable of ready adjustment to compensate for varying moisture contents of aggregate and to change weights of materials being batched. Provide electric moisture meter acceptable to Contractor for measurement of moisture in fine aggregate and calibrate as often as required. Do not exceed 8 percent moisture content of fine aggregate. Arrange sensing element so measurement is made near batcher charging gate of sand bin or in sand batcher.

d. Scales: Provide adequate facilities for accurate measurement and control of each material entering each batch of concrete. Conform to applicable requirements of NIST Handbook 44 for accuracy of weighing equipment. Provide each weighing unit with a visual springless dial or electronic readout to indicate scale load at all stages of weighing operation or include a beam scale with beam balance indicator to show scale in balance at zero load and at any beam setting. Provide indicator having over and under travel equal to at least 5 percent of capacity of beam. Provide standard test weights and other auxiliary equipment for checking operating performance of each scale or other measuring device. Make periodic tests in presence of Contractor in a manner and at intervals as directed. Upon completion of each check test and before further use of indicating, recording or control devices, make adjustments, repairs and replacements as required to secure satisfactory performance.

e. Recorders:

1) Provide accurate graphical or digital printout record of scale readings, including initial readings, after each of the aggregates, water, cement and admixtures have been batched before delivery to mixer, using accurate recorder or recorders.

2) Record Data: Show on each printout, date and time of batching; identification number - identical to concrete ticket and codes for mix design and for Contract Section.

3) House each recorder in a secure location, assuring proper operations.

4) Clearly indicate different types of mixes used by stamped letters, numerals, colored ink or other suitable means on charts or tapes so that variations in batch weights of each type of mix can be readily observed.

a) Show on charts or tapes, date and time of day (stamped or preprinted) at intervals of not more than 15 minutes.

b) Provide recorders of a type that prints required information in duplicate. One copy of recorded batch weights for each load shall accompany each delivery ticket as supplied by producer. Verify that the identification number is identical to concrete delivery ticket. Deliver one copy with its
5) Place recorders in a position convenient for observation by plant operator and Contractor.

2. Protect weighing, indicating and control equipment against exposure to dust and weather and insulate against vibration or movement caused by operating equipment in plant.

1.6 PROJECT CONDITIONS

A. Environmental Conditions:

1. Hot Weather Concreting:
   a. Batching, mixing, and delivering of concrete in hot weather shall conform to the applicable requirements of ACI 305R.
   b. When ambient temperatures exceed 80 degrees F, or are forecast to exceed 80 degrees F within 12 hours of concrete placement, the Contractor shall prepare steps to keep the concrete temperature at time of placement below the maximum allowable, as shown below. The method(s) used shall be approved by the Contracting Officer. For bridge decks the maximum concrete temperature shall be 85 degrees F. For all other concrete, unless specified elsewhere, the maximum concrete temperature shall be 95 degrees F.

2. Cold Weather Concreting:
   a. Batching, mixing, and delivering of concrete in cold weather shall conform to the applicable requirements of ACI 306.1.
   b. When the ambient temperature drops below 35 degrees F, or is forecast to drop below 35 degrees F during hours of concrete placement, the temperature of the mix shall be heated by adding hot water, not exceeding 180 degrees F, or by steam heating the aggregates, or both. Other methods of heating aggregates will not be permitted. Steam heating the aggregates may require an adjustment in the mixing water. Even if accelerators are used to assist setting, the concrete shall maintain a minimum temperature of 50 degrees F.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Portland Cement: ASTM C150, Type I, II, I/II, and III.

B. Fly Ash: ASTM C618, Class F or Class C (Type B), meeting TxDOT Material Specification DMS 4610 and on the TxDOT approved fly ash source list.

C. Coarse and Fine Aggregates

1. Coarse aggregate: Use ASTM D75 for standard practice for sampling aggregates. Test coarse aggregate in accordance with ASTM C33, Section 11.

2. Deleterious substances: Do not allow the amount of deleterious substances present in coarse aggregate to exceed the following:

<table>
<thead>
<tr>
<th>Substance</th>
<th>Maximum Allowable Percentage by Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Soft Particles</td>
<td>5.0</td>
</tr>
<tr>
<td>Coal and Lignite Particles</td>
<td>0.2</td>
</tr>
<tr>
<td>Clay Lumps and Friable Particles</td>
<td>0.25</td>
</tr>
<tr>
<td>Material Passing Size 200 Sieve</td>
<td>1.0</td>
</tr>
<tr>
<td>Thin or Elongated Pieces</td>
<td>15.0</td>
</tr>
<tr>
<td>Other Local Deleterious Substances</td>
<td>1.0</td>
</tr>
</tbody>
</table>

a. Thin and elongated pieces: Defined as pieces having a length greater than five times the smallest dimensions of a circumscribing rectangular prism.

3. Wear: 45 percent maximum when tested in accordance with ASTM C131 and C535.

4. Weighted percentage of loss: 15 percent maximum by weight when subjected to 5 cycles of magnesium sulphate...
PORTLAND CEMENT CONCRETE soundness test in accordance with ASTM C88.

5. Gradation: In accordance with ASTM C33, Table 2, and represented by a smooth gradation curve within required limits.

6. Fine aggregate:
   a. Washed and natural sand or washed stone sand: Manufactured sand may be subject to special gradation requirements as directed.
   b. Gradation in accordance with ASTM C33: Minimum percentages of material passing Size 50 and Size 100 sieves may be reduced to 5 and zero respectively if aggregate is to be used in concrete with three percent minimum air-entrainment or in concrete containing more than 5.5 bags of cement per cubic yard.
   c. Weighted percentage of loss not more than 12 percent by weight when subjected to 5 cycles of magnesium sulphate soundness test in accordance with ASTM C88.
   d. Deleterious Substances: Do not allow following substances to be present individually in amounts exceeding the following:

<table>
<thead>
<tr>
<th>Substance</th>
<th>Maximum Allowable Percentage by Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clay Lumps and Friable Particles</td>
<td>1.0</td>
</tr>
<tr>
<td>Coal and Lignite</td>
<td>0.2</td>
</tr>
<tr>
<td>Material Passing the No. 200 Sieve</td>
<td>5.0</td>
</tr>
<tr>
<td>Other Deleterious Substances such as shale, alkali, mica, coated grains, soft and flaky particles</td>
<td>2.0</td>
</tr>
</tbody>
</table>

   e. Provide Fine aggregate free from injurious amounts of organic impurities as determined by ASTM C40. Should material fail to pass test for organic impurities in sand for concrete, retest in accordance with ASTM C87. If fine aggregate shows by calorimetric test a darker color than that of sample originally approved for the work, stop using such aggregate until approved tests have been made to determine whether change in color is indicative of injurious amount of deleterious substances.

7. Aggregates for Lightweight Structural Concrete:
   a. Coarse aggregate: ASTM C330, with the following additional requirements:
      1) Composition: Expanded shale, clay or slate, predominantly lightweight cellular, and granular.
      2) Percentage loss: Ten percent maximum by weight when subjected to 5 cycles of the magnesium sulphate soundness test in accordance with ASTM C88.
      3) Gradation: In accordance with ASTM C330, Table 1.
      4) Unit weight: In accordance with ASTM C330, Table 2, except unit weight of concrete shall not exceed 120 lb/ft³.
      5) Loss on ignition: 5 percent maximum in accordance with ASTM C142.
      6) Deleterious substances, clay lumps and friable particles: 2 percent maximum in accordance with ASTM C142.
      7) Wear: 40 percent maximum in accordance with ASTM C131 and C535.
      8) Staining: In accordance with ASTM C641.
   b. Fine aggregate: Same as fine aggregate for Normal Weight Concrete.
D. Water - Meet the following requirements:

1. Natural potable water with no pronounced taste or odor.

2. Containing no impurities, suspended particles, algae, or dissolved natural salts in quantities that will cause:
   a. Corrosion of reinforcing steel.
   b. Volume change that will increase shrinkage cracking.
   c. Efflorescence.
   d. Excessive air entraining.

3. pH: Not less than 5.

4. When tested in accordance with AASHTO T26, indication of unsoundness, change in setting time in excess of plus or minus 30 minutes, and reduction in strength in excess of 10 percent will be sufficient cause for rejection of the water under test.

5. Water from municipal supplies approved by the State Health Department will not require testing, but water from other sources shall be tested in accordance with this section prior to use in structural concrete.

6. Free from substance which would interfere with the chemical reaction by which concrete is formed, detract from concrete strength and durability, cause variations of concrete color, or cause a combination of such defects. Limit chloride concentrations in total mixing water to 500 ppm, and limit sulfate concentrations to 1500 ppm.

7. Wash aggregates with potable water, or water meeting the above requirements. Recycled wash water may be used in mixing concrete. Wash water, if used, shall conform to the acceptance criteria of ASTM C94, as modified above (paragraphs 2 through 6) and shall not exceed 25 percent of the total water used in a batch.

E. Admixtures:

1. Air-entraining admixtures: When shown in Table 03305-1 herein, or when required under other specification items or shown in the plans, air-entraining admixtures shall conform to ASTM C260. Air-entrainment will not be required for precast, prestressed concrete bridge members.

2. Chemical Admixtures: When shown under Paragraph 2.4.B.1 herein, chemical admixtures will be allowed upon approval. Other chemical admixtures may be allowed only if approved by the Contracting Officer. Calcium Chloride or admixtures containing more than 0.05 percent chloride are not permitted. Chemical admixtures shall conform to ASTM C494 of the Type specified as follows:
   a. Water-Reducing Admixtures: Type A.
   b. Water-Reducing and Retarding Admixtures: Type D.
   c. High Range Water Reducing Admixture Plant or Field Added: Type F.
   d. High Range Water Reducing and Retarding Admixture: Type G.
   e. Accelerators - conform to Type C.

2.2 GROUT

A. Portland Cement Grout:

1. Prepare grout composed of Portland cement, sand and water.

2. Do not use staining ingredients in grout exposed to view.

3. Formulation: 2 parts sand and 1 part cement measured by volume. Use blend of White Portland cement and regular Portland cement to produce grout of color to match surrounding concrete when grout and concrete are dry.

4. Mix grout with sufficient water to permit placing and packing within approximately 45 minutes prior to use.

B. Structural Nonshrink Grout: Premixed, prepackaged, pretested, nonmetallic, noncorrosive, nonstaining product containing selected silica sands, Portland cement, shrinkage compensating agents, and water-reducing agents.

1. 5000 psi minimum compressive strength at 7 days when tested by ASTM C109. Shrinkage limited to zero inches in plastic state when tested in accordance with ASTM C827 and in hardened state when tested in accordance with ASTM C1107.
2. Products:
   a. "Five Star Grout" by Five Star Products, Inc.
   b. "Masterflow 928" by ChemRex.
   c. "Crystex" by L&M Construction Chemicals.
   d. "NS" by the Euclid Chemical Company.

C. Flowable Grout:
   1. Use for grouting anchor bolts or dowels.
   2. Products:
      a. "NS" by the Euclid Chemical Company.
      b. "Masterflow 713 Plus" by ChemRex.

D. Epoxy Grout: Nonshrink, nonstaining, 100 percent solids, two-component, or three-component epoxy resin system that has a documented history of successful use for an equivalent applications.
   1. On horizontal applications: Self-leveling type.
   2. On vertical and overhead surface application: Non-sag type.
   3. Physical properties:

2.4 CONCRETE MIX DESIGNS

A. Design of concrete mixes, including recommended amounts of admixture and water to be used in the mixes, shall be obtained by the Contractor from a qualified independent testing laboratory or agency, or ready-mix plant, properly equipped to design concrete mixes. The design shall be performed and certified by a professional engineer currently licensed in the State of Texas. The laboratory, agency or ready-mix plant shall meet applicable requirements of ASTM E329, and shall be approved by the Contracting Officer. Costs of obtaining the mix designs shall be paid by the Contractor.

B. Proportioning:
   1. Using materials that will be used in the work, establish proportions of Portland cement, fly ash coarse and fine aggregates, water, and admixtures to produce the properties specified for each concrete mix type based on field experience or trial batch method described in ACI 318. Substantiate attainment of all specified properties by designated ASTM test methods. Provide concrete that has 28-day strengths that exceed the specified design strength in accordance with ACI 318. Selection of mix proportions shall conform to the applicable requirements of ACI 211.1 and ACI 211.2. Concrete shall comply with ACI 301 and ACI 318, as applicable. Acceptability of concrete strength will be based on requirements for ultimate strength design.
      a. Use admixtures in accordance with manufacturer's directions. Use amounts of water-reducing admixtures where required that will permit the use of 5 percent less water to produce the specified slump. The slumps
specified are the slumps obtained from tests conducted at the point of placement, unless otherwise noted in these specifications.

b. Where indicated, total cementitious material means the total amount of cement plus fly ash admixture. Fly ash shall be mandatory where indicated in the mix design.

c. Use Type I or Type I/II cement unless otherwise specified, except that Type III may be used for precast concrete.

2. Superplasticized Concrete Mixes: Proportion mixes that will contain superplasticizers by the ACI 318 Laboratory Trial Batch Method to meet the performance required for the specific mix type. Proportion the water-reducing admixture dosage rate to provide slumps no greater than 7 inches, unless otherwise specified. Follow manufacturer's recommendations for dosage rates, mixing time, and compatibility with other admixtures. Provide written observations of mix workability after superplasticizer is added.

a. Obtain instructions from the manufacturer of the water-reducing admixture relative to the quantity necessary to produce the specified slumps and adjustments in dosages to maintain desired slumps and setting times with varying air temperature, humidity, and concrete temperature.

b. When not specifically required in this section, water-reducing admixtures may be used in the specified mix types upon written approval from the Contracting Officer.

3. Design Mix Reports: Prepare written concrete mix reports suitable for ordering concrete from a ready-mix concrete supplier in accordance with ASTM C94 and that contain the following information for each type:

a. Aggregate source of supply, type rock, size, and gradation for coarse aggregate.

b. Tests of aggregates, or certificates demonstrating compliance with specified requirements of ASTM C33 for Normal Weight Aggregate; ASTM C330 for Lightweight Aggregate.

c. Brand and type of cement.

d. Dry weights of cement and SSD weights of sand, and coarse aggregate per cubic yard of concrete.

e. Amounts of each admixture and fly ash per cubic yard of concrete; include manufacturer's instructions and certificates of compatibility. Identify source of fly ash.

f. Water-cement ratio.

g. Slump: ASTM C143.

h. Mix consistency and workability.

i. Entrained air content: ASTM C173 for Lightweight Concrete; ASTM C231 for Normal Weight Concrete.

j. Equilibrium dry weight of concrete per cubic foot for Lightweight Concrete: ASTM C567.

k. The method of concrete placement for which the mix is proportioned.

l. Standard deviation in accordance with ACI 318 for concrete production facility and associated strength required greater than the design strength, f’c. Determine standard deviation from concrete produced and tested within the 12 months preceding first concrete placement.

m. For proportions established by laboratory trial batches, provide the curve establishing the relationship between water-cement ratio and compressive or flexural strength required by ACI 318 and compressive or flexural strengths developed at 7 days and 28 days from three compressive or flexural strength tests, made in accordance with ASTM C39 and ASTM C192, for each mix type.

n. For proportions established by field experience, provide for each mix type, compressive strengths developed at 7 and 28 days from thirty consecutive compressive
2.5 BATCHING, MIXING, AND TRANSPORTING

A. Batching, mixing, and transporting Portland-cement concrete shall conform to the applicable requirements of ACI 301 and ACI 304R.

B. Concrete shall be central-mixed concrete from a central batch plant, to be transported to the jobsite in a truck mixer or shall be truck-mixed, both in accordance with the requirements of ASTM C94. Equipment used in the manufacture of concrete shall be kept clean at all times. Use readymix concrete produced at facilities meeting certification requirements of the National Ready-Mix Concrete Association, and complying with requirements specified, and ASTM C94. Unless otherwise approved, use concrete materials from sources and manufacturers that are the same as those used to establish concrete proportions for each concrete mix type. Provide batch tickets which show the information listed in Paragraph 1.3.E.3 of this Section.

C. Mixers shall be equipped with operational automatic device for recording number of revolutions of drum prior to completion of mixing operation. Each transit mixer shall also be equipped with operational water measuring devices consisting of either accurately calibrated water tanks or water meters.

D. Concrete in truck mixer shall be mixed continuously until discharged. The discharge time for concrete after all ingredients have been added to the mixer shall not exceed 90 minutes or 300 revolutions of the drum, whichever comes first. Delivery tickets shall show departure time and drum revolutions count from plants.

E. Mixing shall begin immediately after all ingredients are in the mixer and continue for at least 70 revolutions of the drum as required to obtain uniformity of concrete as defined in ASTM C94. The introduction of additional water into transit type mixers after leaving the plant will not be permitted unless approved by the Contracting Officer at the site. If the introduction of additional water is approved, the drum shall be revolved not less than 30 revolutions after the water is added and before discharge is commenced. The total water in the mix, the sum of the amount added at the plant and the site, shall not result in the specified water-to-cement ratio being exceeded.

F. Adding Water-Reducing Admixtures: Comply with manufacturer’s printed recommendations. Add Type G Water-Reducing, High Range and Retarding at the batch plant. Type F may be added at the plant, unless directed otherwise by the Contracting Officer.

G. Adding Polypropylene Fibers: Add polypropylene fibers into concrete mixes after the mixing water has been blended well with cement and aggregates. Extend mixing time as recommended by manufacturer of fibers. Add fibers at batch plant, unless otherwise acceptable to the Contracting Officer.

2.6 EPOXY MORTAR AND LATEX EMULSIONS

A. Epoxy mortar used to cover the ends of the prestressed concrete beams as specified in the plans shall consist of an epoxy binder mixed with aggregate. The epoxy resin and hardener ratio shall be as specified by the manufacturer.
Siliceous aggregate is required unless otherwise approved by the Contracting Officer. Aggregate shall be clean and dry.

B. Latex emulsion used for latex based grout/mortar, latex adhesive grout/mortar or other purposes shall conform to TxDOT Materials Specification DMS-8110 “Coatings for Concrete”.

2.7 PNEUMATICALLY PLACED CONCRETE

A. Pneumatically placed concrete, where required to stabilize soil of drilled shaft retaining walls, shall conform to TxDOT Standard Specifications Item 431, “Pneumatically Placed Concrete”.

PART 3 - EXECUTION

3.1 CONCRETE TESTING AND QUALITY CONTROL

A. General:

1. This paragraph will complement Section 01450, “Quality Control”.

2. Allow the Authority’s testing agency and Contracting Officer free access to material stockpiles, facilities for batching, mixing and placing concrete and the work in progress.

3. Quality control is the Contractor’s responsibility. Results of any testing performed by the Contracting Officer’s testing agency will be made available to the Contractor and the Contractor may use such testing as part of the Contractor’s Quality Control program, but will not be in lieu of the Contractor’s testing requirements.

4. Furnish molds and concrete for all testing. Provide tools necessary for making test specimens, slump tests, and yield tests. Furnish labor and equipment for obtaining and handling all test samples. Provide proper curing location and supplies as required by ASTM C31.

5. At least 24 hours in advance of placing concrete in the structure, notify the Contracting Officer of the date, time, and location in the structure and quantity of concrete to be placed.

6. Each concrete mix type has specific performance requirements. Verify that requirements are met for each mix type by sampling and testing at least equal to that required herein.

7. Verify that batch tickets from ready-mix supplier properly describes the mix for the work being performed prior to permitting the discharge of concrete from the supplier’s truck.

8. Ensure that the ready-mix transport trucks are equipped with an operational drum revolution counter, and the drum turn rates are established prior to concrete placements with the approval of the Contracting Officer.

B. Sampling and Testing Fresh Concrete: Fresh concrete used in the work shall be sampled and tested by the testing laboratory using technicians certified by the American Concrete Institute to determine its acceptability as required by ACI 318 and to demonstrate general conformance with specified properties as follows:

1. Sampling Fresh Concrete: ASTM C172.

2. Slump: ASTM C143; one test for each set of compressive strength test specimens. Perform additional slump tests when requested by Contracting Officer.

   a. When superplasticizers are added at site, make slump tests before adding superplasticizers and after superplasticizers have been properly mixed into the fresh concrete.

   b. When liquid nitrogen is used to cool the concrete, make slump test before adding liquid nitrogen to the concrete mix.

3. Air Content: ASTM C173, volumetric method for lightweight concrete; ASTM C231 pressure method for normal weight concrete; one for each set of compressive strength specimens.

4. Concrete Temperature: ASTM C1064; test concrete hourly when air temperature is 40 degrees F and below, and when 80 degrees F and above; and when each set of compression test specimens is made.

5. Compressive Strength Specimens: ASTM C31; one set of four standard cylinders for each 100 cubic yards or fraction thereof, of each concrete type placed in any one day, or for each 5000 sq. ft. of surface area placed, unless otherwise directed. Mold and store cylinders for laboratory cured test specimens.

6. Compressive Strength Tests: ASTM C39; one specimen tested at 7 days, two
PORTLAND CEMENT CONCRETE

at 28 days, and one retained in reserve for later testing if required. When frequency of testing will provide less than five strength tests for a given mix of concrete, testing shall be conducted from at least five randomly selected batches or from each batch if fewer than five are used.

7. Flexural Strength Specimens: ASTM C31; When flexural strength is specified, one set of three beam molds for each 100 cubic yards or fraction thereof, of each concrete type placed in any one day or for each 5000 square foot of surface area placed, unless otherwise directed. Mold and store beams for laboratory cured test specimens.

8. Flexural Strength Tests: ASTM C78; Two specimens tested at 7 days. Retain one in reserve for later testing, if required.

9. The Contractor shall provide a protected area or container for storage of the concrete test specimens during the initial curing period (the first 16 to 48 hours after molding). Specimens shall be stored under conditions that maintain the temperature immediately adjacent to the specimens in the range of 60 to 80 degrees F and prevent loss of moisture from the specimens. Initial curing shall meet the requirements of ASTM C31.

C. Sampling and Testing Hardened Concrete:

1. Make additional tests of in-place concrete as required by the additional jurisdictional agencies, and as directed by Contracting Officer when test results indicate specified concrete strengths and other qualities have not been attained in the work. Conduct tests to determine adequacy of concrete by cored cylinders complying with ASTM C42, or by other methods acceptable to the Contracting Officer. Additional tests performed on concrete previously determined deficient shall be done at Contractor’s expense.

a. When laboratory test results indicate concrete to be more than 500 psi below the specified strength, or if there is a likelihood of low strength concrete, a significant reduction in load-carrying capacity, or absence of desired durability in the concrete, the Contracting Officer will require tests of cores to be drilled from the areas in question.

1) The cores shall be drilled no earlier than 28-days and no later than 56-days after pouring of the concrete in question.

2) A minimum of three cores shall be taken for each 100-cubic yards or fraction thereof, of concrete classified as deficient as a result of the cylinder tests. Not less than 1 set (3-cores) shall be taken for each set of cylinders, which had deficient test results.

3) Prior to coring reinforcing steel and other embedded items shall be located by suitable means in order to minimize the risk of damage.

b. Test cores shall be obtained from each member or area of suspect strength, from locations designated by the Contracting Officer, and test specimens shall be prepared by the Contractor in accordance with ASTM C42.

c. Concrete in the area represented by the core tests will be considered structurally adequate if the average of the three cores is equal to at least 85 percent of the specified design strength and no single core test is less than 75 percent of the specified design strength. Locations represented by erratic core strengths shall be retested at the direction of the Contracting Officer.

d. Should the first set of cores show deficient strength, the contractor will have the option, at his expense, of obtaining one additional set of cores for further testing. These additional cores shall not exceed the number drilled for the first set and shall be subject to the criteria above. However, the results from all cores will be used in determining the average strength.

e. The Contractor shall, at his expense, fill core holes in
accordance with the requirements of Section 03350, “Concrete Finishing”, for repair of surface details.

2. Make cores of slabs-on-grade of Bus and LRT maintenance facilities to verify proper subbase, location of reinforcement and proper penetration of sealer or hardener, as directed by the Contracting Officer, and/or as required by the Jurisdictional Authority. For every 1,000 square feet of slab area, two cores will be taken to determine compliance with these specifications. Area found deficient, will have an additional four cores taken and the average value will be used to determine compliance.

3. Prepare and test samples of hardened concrete each time a supplier is changed and each time a supplier changes material source, as follows, to determine soluble chloride ion content, on bridge decks.

   a. A standard 3 inch diameter by 6 inch long, 7 day cured concrete sample shall be ground and pulverized. One hundred percent of the resulting powder shall pass a number 20 sieve.

   b. Mix powder with an equal or greater amount of distilled or deionized water, by weight; boil for 5 minutes and soak for 24 hours at 70 degrees F to 72 degrees F.

   c. Test the water extract for soluble chloride ions in accordance with ASTM D512. Test for Chloride Ion in Water and Waste Water. Calculate soluble chloride ion content as a function of the powder/water concentration from 3b above.

   d. Soluble chloride ion content in hardened concrete shall not exceed 250 ppm (approximately 0.15 percent by weight of cement).

4. Rejection of Concrete, Repair and Replacement: The Contracting Officer shall have authority to reject concrete work, which does not meet specification requirements, and to require repair or replacement as necessary to complete the work.

5. Acceptance of Structure: Acceptance of the completed concrete work requires conformance with the dimensional tolerances, appearance, and strengths specified in these Specifications, in ACI 301, and in ACI 117.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

   A. Portland cement concrete will not be measured separately for payment. It will be measured in accordance with the Sections specifying construction requiring concrete.

   B. Portland cement concrete will be paid for as part of the indicated Contract unit prices or lump-sum prices for the associated concrete work as indicated in the Bid Schedule of the Bid Form.

   C. Grout will not be measured separately for payment.

   D. Concrete which fails to meet minimum strength requirements may be rejected or structural review may be made by the Contracting Officer. Such concrete which is proven structurally adequate may be accepted at adjusted price based on following formula:

   \[ A = 0.10Bp + 0.75(Sa/Ss)^2 \]

   a. \( A \) = Amount to be paid per unit of measurement

   b. \( Sa \) = Actual strength from beams or cores

   c. \( Ss \) = Minimum required strength (specified)

   d. \( Bp \) = Unit bid price

Fly Ash: Fly Ash, conforming to the TxDOT DMS 4610, shall be substituted for cement in mixes S-1, S-2, S-7, M-1, P-1 and P-2 at the rate of 15 to 30 percent by absolute weight. Fly Ash shall be optional for all other mix designs at a maximum rate of 30 percent by absolute weight.
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes specifications for the finishing and curing of formed and unformed concrete surfaces, including the repair of surface defects.

B. Concrete formwork is specified in Section 03100, "Concrete Formwork".

C. Cast-in-place concrete is specified in Section 03300, "Cast-In-Place Concrete".

D. Sandblasted and color concrete are specified in Section 03360, "Special Concrete Finishes".

E. Repair of concrete defects caused by spills, cracks, or delaminations are specified in Section 03905, "Concrete Repair and Restoration".

1.2 REFERENCED STANDARDS

A. American Association of State Highway and Transportation Officials (AASHTO):

1. AASHTO M182 - Standard Specification for Burlap Cloth Made from Jute or Kenaf

B. American Concrete Institute (ACI):

1. ACI 117 - Standard Specification for Tolerances for Concrete Construction and Materials
2. ACI 301 - Standard Specifications for Structural Concrete
3. ACI 308 - Standard Practice for Curing Concrete
4. ACI 503.2 - 503.4 - Three Epoxy Standards
   a. ACI 503.2 - Standard Specification for Bonding Plastic Concrete to Hardened Concrete with a Multi-Component Epoxy Adhesive
   b. ACI 503.3 - Specification for Producing a Skid-Resistant Surface on Concrete by the Use of Epoxy and Aggregate
   c. ACI 503.4 - Standard Specification for Repairing Concrete with Epoxy Mortars ACI 503.1 - 503.4 - Four Epoxy Standards

C. American Society for Testing and Materials (ASTM):

1. ASTM C33 - Standard Specification for Concrete Aggregates
2. ASTM C150 - Standard Specification for Portland Cement
3. ASTM C171 - Standard Specification for Sheet Materials for Curing Concrete
4. ASTM C309 - Standard Specification for Liquid Membrane-Forming Compounds for Curing Concrete
5. ASTM C881 - Standard Specification for Epoxy-Resin-Base Bonding Systems for Concrete

D. Texas Department of Transportation (TxDOT):

1. Standard Specifications for Construction and Maintenance of Highways, Streets, and Bridges

1.3 SUBMITTALS

A. Submittals involving exposed concrete finishes require approval of the Contracting Officer before they may be incorporated in the Work.

B. Shop Drawings: Submit drawings, or diagrams to scale, that indicate the location in plan and elevation of all concrete finishes.

C. Product Data: Submit manufacturers' product data for manufactured products.

D. Samples:

1. Submit 1/2-pint sample container of aluminum oxide and silicon carbide abrasive grit for review and acceptance where "non-slip finish" is indicated.
2. Submit samples not less than 12 inches by 12 inches in size of each type of sand blast finish, indicating materials and methods used to produce the sand blast finishes. Review by the Contracting Officer will be for color and texture only. Approved samples will become the Contracting Officer's control samples.
1.4 QUALITY ASSURANCE

A. Finishes:
   1. Finishing of formed concrete surfaces shall conform with applicable requirements of ACI 301.
   2. Finishes for slabs and flatwork shall conform with applicable requirements of ACI 301.

B. Bridge deck finishes shall conform with applicable requirements of TxDOT Standard Specification Item 420.19. Tolerances:
   1. Formed Surfaces: Conform with applicable requirements of ACI 117.
      a. Where elastomeric bearing pads are indicated, the level plane upon which bearing pads are placed shall not vary more than 1/16-inch from a 2-foot straightedge placed in any direction across the area and the area shall extend a minimum of 1 inch beyond the limits of the pads.
      b. Bearing surfaces of girders on a slope or girders with a camber shall be finished on a horizontal/level plane so that loads are uniformly distributed over the entire surface of the elastomeric bearing pads.
      c. Finished plane shall not vary more than 1/8-inch from the elevation indicated.
   2. Slabs and Flatwork: Conform with applicable classification requirements of ACI 117, as follows:
      a. Very Flat Tolerance: True plane with maximum variation of 1/8-inch in 10 feet when measured with a 10-foot straightedge placed anywhere on the slab in any direction.
      b. Flat Tolerance: True plane with maximum variation of 3/16-inch in 10 feet when measured with a 10-foot straightedge placed anywhere on the slab in any direction.
      c. Straightedge Tolerance: True plane with maximum variation of 5/16-inch in 10 feet when measured with a 10-foot straightedge placed anywhere on the slab in any direction.
      d. Bullfloated Tolerance: True plane with maximum variation of 1/2 inch in 10 feet when measured with a 10-foot straightedge placed anywhere on the slab in any direction.

C. Curing: Conform with requirements of ACI 301 and ACI 308, as applicable.

D. Site Mock-Ups: Provide site mock-ups, at least 3 feet by 4 feet in size, of finishes of formed surfaces in exposed locations and of exposed slab finishes for the Contracting Officer’s review and approval. Refer to Section 01454, “Field Samples and Mock-ups”, for requirements and procedures.

E. Site Mock-ups of Architectural Concrete: Provide site mock-ups of architectural concrete showing finish texture and pattern of exposed formed concrete surfaces.
   1. Size of mock-up shall be a minimum of 8 feet by 10 feet, unless otherwise approved by the Contracting Officer to be smaller.
   2. The number of mock-up panels required shall be the number necessary to obtain the Contracting Officer’s approval of pattern and texture of panel.
   3. Approved mock-up shall be used as the standard for the aesthetic quality of the surface finish of architectural concrete.

PART 2 - PRODUCTS

2.1 TOOLS AND EQUIPMENT

A. Contractor shall furnish all materials, tools, equipment, facilities, and services as required for performing the required concrete-finishing work.

2.2 REPAIR AND FINISHING MATERIALS

A. Portland Cement: ASTM C150, Type II, of same brand as used in the work. Furnish white portland cement where required to produce color matching color of surrounding concrete.

B. Aggregate:
   1. For Bonding Grout: ASTM C33, washed clean sand passing a No. 30 sieve.
   2. For Patching Mortar: ASTM C33, washed clean, graded fine aggregate of suitable size for areas to be repaired. Clean coarse aggregate up to Size No. 8 may be added for repair of larger pockets and voids.

C. Commercial Patching Mortar: A structural repair mortar may be furnished if appropriate for the use and approved by the Contracting Officer.

D. Epoxy Patching Mortar: As specified in ACI 503.4 for Epoxy Mortar.
2.3 CURING MATERIALS

A. Damp Curing Materials:

1. Waterproof Sheet Materials: ASTM C171, waterproof paper with white paper face, polyethylene film pigmented white, or white burlap-polyethylene sheeting.

2. Burlap: AASHTO M182, of class or weight suitable for the use and location. Do not use burlap where concrete is exposed to direct sunlight.

B. Curing Compound: ASTM C309, liquid membrane-forming curing compound, Type 1, Class A or B as appropriate for the use or location.

1. Where concrete surfaces will receive architectural finishes, such as paint, or membrane waterproofing, membrane-forming curing compound shall not leave a coating or residue which will impair bond of adhesives, paints, and coatings with concrete.

PART 3 - EXECUTION

3.1 REPAIR OF SURFACE DEFECTS

A. Repair Standards: Repair of surface defects shall conform with applicable requirements of ACI 301. Repair with epoxy mortar, conform with applicable requirements of ACI 503.4.

B. Surface Defects:

1. Repair of surface defects shall begin immediately after form removal. For repair with epoxy mortar, concrete shall be dry.

2. Surface defects are defined to include: form-tie holes, air voids or pockets, bug holes with a nominal diameter or depth greater than 1/4-inch, honeycombed areas, rock pockets, visible construction joints, fins and burrs.

3. Repair of surface defects shall be tightly bonded and shall result in concrete surfaces of uniform color and texture, matching adjacent surfaces, and free of shrinkage cracks.

C. Repair Work:

1. Remove honeycombed and other defective concrete including graffiti down to sound concrete. Saw-cut the edges perpendicular to the surface or slightly undercut. Feather-edges will not be permitted. Dampen the area to be patched and an area at least 6 inches wide surrounding it to prevent absorption of water from the patching mortar.

2. Where rock pockets or similar defects or voids expose steel reinforcement, cutout to solid surface behind the reinforcing steel to provide suitable key-lock for patching mortar. Patching mortar shall envelope the exposed reinforcing bar.

3. Bond patching mortar to concrete with bonding grout or epoxy adhesive. Bonding grout shall consist of 1 part Portland cement to 1 part No. 30 mesh sand, mixed to the consistency of a thick cream, and then well brushed onto the concrete. Bond commercial patching mortar to concrete in accordance with the manufacturer's instructions.

4. Make the patching mortar of the same materials and of approximately the same proportions as used for the concrete, except omit the coarse aggregate. Use not more than 1 part Portland cement to 2-1/2 parts sand by damp loose volume, and substitute white Portland cement for a portion of the regular gray Portland cement to produce patching mix matching the surrounding concrete in color when dry. Determine the proportion of white Portland cement by trial mixes and test areas, prior to repair of actual defective areas.

5. After surface water has evaporated from the area to be patched, brush the bond coat well into the surface. When the bond coat begins to lose the water sheen, apply the patching mortar. Compact the mortar into place and strike off so as to leave the patch slightly higher than the surrounding surface. To permit initial shrinkage, leave the patch undisturbed for at least 1 hour before being finally finished. Keep the patched area damp for 7 days.

6. Neatly finish patched surfaces to match adjacent surrounding surface texture of concrete. Grind or fill surfaces to produce level and plumb, true planes.

7. For walls exposed in the finish work, form tie holes shall be patched and finished flush with adjacent surface. For holes passing entirely through walls, a plunger type injection gun or other suitable device shall be used to completely fill the holes.
8. Patching of honeycombed areas or rock pockets which are too large and unsatisfactory for mortar patching shall be cut out to solid surface, keyed, and packed solid with matching concrete to produce firm bond and flush surface. Patching shall match texture of adjacent surfaces where exposed in the finished work.

9. Repair work in exposed locations which does not match the texture and color of surrounding adjacent surfaces or which was not well performed shall be removed and performed again until the repair work conforms with Specification requirements.

10. Surfaces to receive membrane waterproofing shall have fins and loose material removed, and voids and cracks patched flush with adjacent surfaces.

11. Completed repairs shall be cured as herein specified under Article 3.4, Curing.

### 3.2 FINISHING OF FORMED SURFACES

**A. Unexposed Surfaces:**

1. Concrete which will not be exposed in the completed structure shall be any form finish as specified in Section 03100, "Concrete Formwork", and ACI 301 for "rough form finish."

2. Concrete to receive membrane waterproofing shall receive a "smooth form finish" in accordance with ACI 301.

**B. Exposed Surfaces:** Unless indicated otherwise, concrete which will be exposed in the completed structure shall receive the following finishes as indicated:

1. Smooth Form Finish: Conform to ACI 301.

2. Smooth Rubbed Finish: Conform to ACI 301.

3. Grout Cleaned Finish: Conform to ACI 301.

4. Unspecified Finish: When finish is not indicated, provide "smooth form finish" as specified above.

### 3.3 SLABS AND FLATWORK

**A. Placement and Finishing Standards:** Slabs and flatwork shall be placed, consolidated, and finished in accordance with applicable requirements of ACI 301. Coordinate with Section 03300, "Cast-In-Place Concrete", as applicable.

**B. Placement:**

1. Slabs and flatwork shall be placed and finished monolithically. Strike off and screed slabs to true, plane surfaces at required elevations, and thoroughly consolidate concrete with vibrators, finish with straight edges and floats. Finish slab within four hours of concrete placement or as needed to provide specified finish.

2. Whether indicated or not, in areas where drains occur, slope finished slab to drains. Slope shall be a minimum of 1/8 inch per foot unless otherwise indicated.

**C. Slab Finishes:** Unless indicated otherwise, slabs and flatwork shall receive the following finishes as indicated:

1. Scratched Finish: Conform to ACI 301. Provide "scratched finish" for slab substrates to receive cementitious toppings or finishes, such as terrazzo or mortar setting bed for ceramic tile.

2. Floated Finish: Conform to ACI 301. Provide "floated finish" for track slabs and mud slabs and for slabs and flatwork to receive roofing and membrane waterproofing.

3. Troweled Finish: Conform to ACI 301. Provide "troweled finish" for interior slabs and flatwork to be exposed in the completed structure, for slabs to receive resilient floor coverings, and for flatwork to receive elastomeric bearing pads.

4. Broom Finish: Conform to ACI 301. Exact texture and coarseness of the broom finish shall match the approved site mock-up. Provide fine or medium-coarse "broom finish" as indicated for exterior sidewalks and paving, garage floors, exterior ramps, equipment and transformer pads, and subway invert slab.

5. Nonslip Finish: Conform to ACI 301. Nonslip materials shall be aluminum oxide and silicone carbide grit particles. Provide "nonslip finish" for interior pedestrian ramps, walkways, subway cross-passage floors, and other floor areas where indicated.

6. Unspecified Finish: When finish is not indicated or specified, provide finishes as specified in ACI 301.

**D. Surface Tolerances:** Conform with ACI 117, as follows:

1. Flat Tolerance: Slabs and flatwork with "troweled finish" and with "nonslip finish."
2. **Straightedge Tolerance:** Slabs and flatwork with fine "broom finish" or medium-coarse "broom finish."

3. **Bullfloated Tolerance:** Slabs and flatwork with "scratched finish," with "floated finish," and with coarse "broom finish."

E. **Joints:**

1. Construction, expansion, isolation, and contraction joints shall be located as indicated. Construction joints shall act as contraction joints. Where additional contraction joints are required to prevent shrinkage cracks, saw-cut such joints. All joints shall be straight and true to line.

2. Expansion joints materials shall cover full depth of concrete.

3. Mark-off lines or edges at formed construction and expansion joints shall be finished with 1/4 inch radius curved edging tool, neat and true to line, uniform throughout.

### 3.4 CURING AND PROTECTING

**A. General Requirements:**

1. Protect freshly placed concrete from excessively hot or cold temperatures, rapid temperature changes and physical damage including graffiti. Maintain without drying for period of time necessary for hydration of cement and proper hardening of concrete. Curing shall conform with the applicable requirements of ACI 301 and ACI 308, except as modified herein.

2. Unless otherwise specified or directed, cure newly placed concrete continuously for seven days at ambient temperature in excess of 55 degrees F. Initiate curing methods as soon as free water has disappeared from concrete surface after finishing but not later than 1 hour following the completion of final finishing procedures. Avoid rapid drying at end of curing period.

3. Where water is used with a curing method, only use specified potable water.

**B. Curing Methods: Use the following methods where specified:**

1. **Method A:** Water ponded on horizontal surfaces keeping surface continuously submerged for required curing period.

2. **Method B:** Water applied by continuous sprinkling with nozzle or nozzles which, during first 24 hours, atomize flow of water providing a mist and not a spray. Do not apply moisture under pressure directly upon concrete; avoid flowing or washing on surfaces while susceptible to erosion.

3. **Method C:** Cover entire surface of concrete with double thickness burlap sheet, laid directly on concrete and kept continuously wet with water. Maintain in good condition.

4. **Method D:** Immediately cover with waterproof curing sheet, free from holes or tears. Hold in position so that entire surface of concrete is fully and continuously covered. Weight down the sheets and overlapped edges enough to resist moderate winds. Maintain sheet free of holes during curing period.

5. **Method E:** Membrane forming curing compound applied to concrete surfaces by methods and at coverage rates recommended by the manufacturer within two hours after final finishing operations.
   
   a. Use Type 1 compound, except where surfaces are subject to sunlight, use Type 2 compound.

   b. Do not apply curing compounds to surfaces requiring bond to additional concrete or where bonded surface coating such as paint, tile, damp-proofing, waterproofing or roofing is to be applied, or to floors to be chemically sealed.

   c. Apply curing compound in two coats. Apply first coat immediately after stripping of forms and acceptance of concrete finish.

   d. If surface is dry, thoroughly wet concrete with water and apply curing compound just as surface film of water disappears. Apply second coat after first coat has set.

   e. Protect coating against damage for at least 10 days after application. If damage occurs, apply additional coating.

   f. If use of curing compound results in streaked or blotchy appearance, cease operations and use other methods of curing until cause of defective appearance is corrected.

**C. Application of Curing Methods:**

1. **Curing Interior Building Slabs Supported On Grade:** Use curing Method D for a period of 7 days.
2. Curing Exterior Building Slabs Supported On Grade: Use curing Methods A through D for a period of 7 days. Method E may be used if not prohibited by Sec. 3.4.B.5.b.

4. Curing Formed Surfaces: Cure formed concrete surfaces, including undersides of beams, supported slabs, walls and other similar surfaces, by keeping forms in place or by Method E. Shade forms exposed to sun when air temperature exceeds 80 degrees F or keep forms cooled by continuous wetting. If forms are removed prior to full length of curing period, continue curing by Method E.

5. Curing Roadway Paving: Use curing Methods C, D, or E for minimum period of 72 hours.

6. Curing Bridge Concrete: Use curing Methods for bridge decks as specified for water and membrane curing in Section 420.20 of the TxDOT Standard Specifications.

D. Floor Treatment Curing: Cure in accordance with recommendations of manufacturer of floor hardener.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Repair of surface defects, finishing, and curing of concrete will not be measured separately for payment.

B. Repair of surface defects, finishing, and curing of concrete will be paid for as part of the indicated Contract unit price for the associated concrete work as indicated in the Bid Schedule of the Bid Form.

END OF SECTION 03350
PART 1 - GENERAL

1.1 DESCRIPTION
A. This Section includes specifications for sandblasted and integrally colored concrete finishes.
B. Standard concrete finishes are specified in Section 03350, “Concrete Finishing”.
C. Concrete formwork is specified in Section 03100, “Concrete Formwork”.
D. Cast-in-place concrete is specified in Section 03300, “Cast-In-Place Concrete”.

1.2 REFERENCED STANDARDS
A. American Association of State Highway and Transportation Officials (AASHTO):
   1. AASHTO M182 - Standard Specification for Burlap Cloth Made from Jute or Kenaf
B. American Concrete Institute (ACI):
   1. ACI 117 - Standard Specification for Tolerances for Concrete Construction and Materials
   2. ACI 301 - Specifications for Structural Concrete
   3. ACI 308 - Standard Practice for Curing Concrete
   4. ACI 503.1 - 503.4 - Four Epoxy Standards
C. American Society for Testing and Materials (ASTM):
   1. ASTM C33 - Standard Specification for Concrete Aggregates
   2. ASTM C150 - Standard Specifications for Portland Cement
   3. ASTM C171 - Standard Specifications for Sheet Materials for Curing Concrete
   4. ASTM C309 - Standard Specification for Liquid Membrane-Forming Compounds for Curing Concrete
   5. ASTM C881 - Standard Specification for Epoxy-Resin-Base Bonding Systems for Concrete
   6. ASTM C979 - Standard Specification for Pigments for Integrally Colored Concrete

1.3 SUBMITTALS
A. Submittals involving exposed concrete finishes require approval of the Contracting Officer before they may be incorporated in the Work.
B. Product Data: Submit manufacturers' product data for manufactured products.
C. Samples:
   1. Submit samples not less than 12 inches by 12 inches in size of each color of integrally colored concrete, indicating materials and methods used to produce colors. Review by the Contracting Officer will be for color and texture only. Approved samples will become the Contracting Officer's control samples.
   2. Submit samples not less than 12 inches by 12 inches in size of each type of sand blast finish, indicating materials and methods used to produce the sand blast finishes. Review by the Contracting Officer will be for color and texture only. Approved samples will become the Contracting Officer's control samples.

1.4 QUALITY ASSURANCE
A. Finishes:
   1. Finishing of formed concrete surfaces shall conform with applicable requirements of ACI 301.
   2. Finishes for slabs and flatwork shall conform with applicable requirements of ACI 301.
   3. Special architectural finishes for formed concrete surfaces shall conform with applicable requirements of ACI 301.
B. Colored Concrete Work:
   1. Finisher must have a minimum of 5 years experience with colored concrete work.
   2. The only approved concrete finishers for colored concrete flat work are:
      b. Texas Unique Concrete Technologies (972) 669-9442.
c. North Texas Bomanite (972) 484.8465.

C. Tolerances:

1. Formed Surfaces: Conform with applicable requirements of ACI 117.
   a. Where elastomeric bearing pads are indicated, the level plane upon which bearing pads are placed shall not vary more than 1/16 inch from a 2 foot straightedge placed in any direction across the area and the area shall extend a minimum of 1 inch beyond the limits of the pads.
   b. Bearing surfaces of girders on a slope or girders with a camber shall be finished on a horizontal/level plane so that loads are uniformly distributed over the entire surface of the elastomeric bearing pads.
   c. The finished plane shall not vary more than 1/8 inch from the elevation indicated.

2. Slabs and Flatwork: Conform with applicable classification requirements of ACI 117, as follows:
   a. Very Flat Tolerance: True plane with maximum variation of 1/8 inch in 10 feet when measured with a 10 foot straightedge placed anywhere on the slab in any direction.
   b. Flat Tolerance: True plane with maximum variation of 3/16 inch in 10 feet when measured with a 10 foot straightedge placed anywhere on the slab in any direction.
   c. Straightedge Tolerance: True plane with maximum variation of 5/16 inch in 10 feet when measured with a 10 foot straightedge placed anywhere on the slab in any direction.
   d. Bullfloated Tolerance: True plane with maximum variation of 1/2 inch in 10 feet when measured with a 10 foot straightedge placed anywhere on the slab in any direction.

D. Curing: Conform with requirements of ACI 301 and ACI 308, as applicable.

E. Site Mock-Ups: Provide site mock-ups, at least 4 feet by 4 feet in size, of finishes of formed surfaces in exposed locations and of exposed slab finishes for the Contracting Officer's review and approval. Refer to Section 01454, "Field Samples and Mock-ups", for requirements and procedures.

F. Site Mock-ups of Architectural Concrete: Provide site mock-ups of architectural concrete showing finish texture and pattern of exposed formed concrete surfaces.

1. Size of mock-up shall be a minimum of 8 feet by 10 feet, unless otherwise approved by the Contracting Officer to be smaller.

2. The number of mock-up panels required shall be the number necessary to obtain the Contracting Officer's approval of pattern and texture of panel.

3. Approved mock-up shall be used as the standard for the aesthetic quality of the surface finish of architectural concrete.

4. Approved mock-ups may become part of the completed Work if undisturbed at time of Final Completion.

G. Requirements of Regulatory Agencies: Comply with air pollution regulations of governing authorities for sand-blasting activities and operations.

PART 2 - PRODUCTS

2.1 INTEGRALLY COLORED CONCRETE MATERIALS

A. Coloring Admixture: ASTM C979, synthetic mineral-oxide pigments or colored water-reducing admixtures, free of carbon black; color stable, nonfading, and resistant to lime and other alkalis.

2.2 REPAIR AND FINISHING MATERIALS

A. Portland Cement: ASTM C150, Type II, of same brand as used in the work. Furnish white Portland cement where required to produce color matching color of surrounding concrete.

B. Aggregate:

1. For Bonding Grout: ASTM C33, washed clean sand passing a No. 30 sieve.

2. For Patching Mortar: ASTM C33, washed clean, graded fine aggregate of suitable size for areas to be repaired. Clean coarse aggregate up to Size No. 8 may be added for repair of larger pockets and voids.

C. Commercial Patching Mortar: A structural repair mortar may be furnished if appropriate for the use and approved by the Contracting Officer.

D. Epoxy Patching Mortar: As specified in ACI 503.4 for Epoxy Mortar.
SPECIAL CONCRETE FINISHES

2.3 CURING MATERIALS

A. Damp Curing Materials:
   1. Waterproof Sheet Materials: ASTM C171, waterproof paper with white paper face, polyethylene film pigmented white, or white burlap-polyethylene sheeting.
   2. Burlap: AASHTO M182, of class or weight suitable for the use and location. Do not use burlap where concrete is exposed to direct sunlight.

B. Curing Compound: ASTM C309, liquid membrane-forming curing compound, Type 1, Class A or B as appropriate for the use or location.
   1. Where concrete surfaces will receive architectural finishes, such as resilient floor coverings or paint, or membrane waterproofing, membrane-forming curing compound shall not leave a coating or residue which will impair bond of adhesives, paints, and coatings with concrete.

2.4 CONCRETE MIXES

A. In addition to requirements of Section 03305, “Portland Cement Concrete”:
   2. Obtain written approval of color pigment manufacturer of admixtures proposed for use in integrally colored concrete.
   3. Coloring Admixture: Add coloring admixture to architectural concrete mix according to manufacturer’s written instructions.
   4. To help maintain consistent color of integrally colored and sandblasted concrete, use same brand of cement and same concrete aggregates throughout and maintain consistency of water content and slump.

PART 3 - EXECUTION

3.1 REPAIR OF SURFACE DEFECTS

A. Repair Standards: Repair of surface defects shall conform with applicable requirements of ACI 301. When using epoxy mortar, conform with applicable requirements of ACI 503.4.

B. Surface Defects:
   1. Repair of surface defects shall begin immediately after form removal. For repair with epoxy mortar, concrete shall be dry.
   2. Surface defects are defined to include: form-tie holes, air voids or pockets, bug holes with a nominal diameter or depth greater than 1/4-inch, honeycombed areas, rock pockets, visible construction joints, fins and burrs.
   3. Repair of surface defects shall be tightly bonded and shall result in concrete surfaces of uniform color and texture, matching adjacent surfaces, and free of shrinkage cracks.

C. Repair Work:
   1. Remove honeycombed and other defective concrete down to sound concrete. Saw-cut the edges perpendicular to the surface or slightly undercut. Feather-edges will not be permitted. Dampen the area to be patched and an area at least 6 inches wide surrounding it to prevent absorption of water from the patching mortar.
   2. Where rock pockets or similar defects or voids expose steel reinforcement, cutout to solid surface behind the reinforcing steel to provide suitable key-lock for patching mortar. Patching mortar shall envelope the exposed reinforcing bar.
   3. Bond patching mortar to concrete with bonding grout or epoxy adhesive. Bonding grout shall consist of 1 part Portland cement to 1 part No. 30 mesh sand, mixed to the consistency of a thick cream, and then well brushed onto the concrete. Bond commercial patching mortar to concrete in accordance with the manufacturer’s instructions.
   4. Make the patching mortar of the same materials and of approximately the same proportions as used for the concrete, except omit the coarse aggregate. Use not more than 1 part Portland cement to 2-1/2 parts sand by damp loose volume, and substitute white Portland cement for a portion of the regular gray Portland cement to produce patching mix matching the surrounding concrete in color when dry. Determine the proportion of white Portland cement by trial mixes and test areas, prior to repair of actual defective areas.
   5. After surface water has evaporated from the area to be patched, brush the bond coat well into the surface. When the bond coat begins to lose the water sheen, apply the patching mortar. Compact the mortar into
place and strike off so as to leave the patch slightly higher than the surrounding surface. To permit initial shrinkage, leave the patch undisturbed for at least 1 hour before being finally finished. Keep the patched area damp for 7 days.

6. Neatly finish patched surfaces to match adjacent surrounding surface texture of concrete. Grind or fill surfaces to produce level and plumb, true planes.

7. For walls exposed in the finish work, form tie holes shall be patched and finished flush with adjacent surface. For holes passing entirely through walls, a plunger type injection gun or other suitable device shall be used to completely fill the holes.

8. Patching of honeycombed areas or rock pockets which are too large and unsatisfactory for mortar patching shall be cut out to solid surface, keyed, and packed solid with matching concrete to produce firm bond and flush surface. Patching shall match texture of adjacent surfaces where exposed in the finished work.

9. Repair work in exposed locations which does not match the texture and color of surrounding adjacent surfaces or which was not well performed shall be removed and performed again until the repair work conforms with Specification requirements.

10. Surfaces to receive membrane waterproofing shall have fins and loose material removed, and voids and cracks patched flush with adjacent surfaces.

11. Completed repairs shall be cured as herein specified under Article 3.4, Curing.

3.2 FINISHING OF FORMED-surfaces

A. Sand Blast Finish:

1. Blasting Operations and Requirements:
   a. Apply sandblasted finish to exposed concrete surfaces where indicated.
   b. Perform sand blasting at least 72 hours after placement of concrete. Coordinate with formwork construction, concrete placement schedule, and formwork removal to ensure that surfaces to be blast finished are blasted at the same age for uniform results.
   c. Determine type of nozzle, nozzle pressure, and blasting techniques required to match the Contracting Officer’s control samples.
   d. Abrasive blast corners and edge of patterns carefully, using back-up boards, to maintain uniform corner or edge line.

2. Depths of Cut: Use an abrasive grit of proper type and gradation to expose aggregate and surrounding matrix surface to match the Contracting Officer’s control samples as follows:
   a. Brush Sand Blast Finish: Remove cement matrix to expose face of fine aggregate; no reveal.
   b. Light Sand Blast Finish: Expose fine aggregate with occasional exposure of coarse aggregate; maximum 1/16-inch reveal.
   c. Medium Sand Blast Finish: Generally expose coarse aggregate; 3/16-inch to 1/4-inch reveal.

3. Surface Continuity: Perform sand blast finishing in as continuous an operation as possible, utilizing the same work crew to maintain continuity of finish on each surface or area of work. Maintain patterns of variances in depths of cuts as indicated.

4. Construction Joints: Use technique acceptable to the Contracting Officer to achieve uniform treatment of construction joints.

5. Protection and Repair:
   a. Protect adjacent materials and finishes from dust, dirt, and other surface or physical damage during abrasive blast finishing operations. Provide protection as required and remove from site at completion of the work.
   b. Repair or replace other work damaged by finishing operations.

6. Clean-up: Maintain control of concrete chips, dust, and debris in each area of the work. Clean up and remove such material at the completion of each day of operation. Prevent migration of airborne materials by use of tarpaulins, wind breaks, and similar containing devices.

3.3 SLABS AND FLATWORK

A. Placement and Finishing Standards: Slabs and flatwork shall be placed, consolidated, and finished in accordance with applicable requirements of ACI 301. Coordinate with Section 03300, “Cast-In-Place Concrete”, as applicable.
B. Placement:

1. Slabs and flatwork shall be placed and finished monolithically. Strike off and screed slabs to true, plane surfaces at required elevations, and thoroughly consolidate concrete with vibrators, finish with straight edges and floats. Finish slab within four hours of concrete placement, or as needed to provide specified finish.

2. Whether indicated or not, in areas where drains occur, slope finished slab to drains. Slope shall be a minimum of 1/8 inch per foot unless otherwise indicated.

C. Slab Finishes: Unless indicated otherwise, slabs and flatwork shall receive the following finishes:

1. Broom Finish: Conform to ACI 301. Exact texture and coarseness of the broom finish shall match the approved site mock-up. Provide fine or medium-coarse "broom finish" as indicated for exterior sidewalks and paving, garage floors, exterior ramps, equipment and transformer pads, and subway invert slab.

D. Surface Tolerances: Conform with ACI 117, as follows:

1. Straightedge Tolerance: Slabs and flatwork with fine "broom finish" or medium-coarse "broom finish."

E. Joints:

1. Construction, expansion, isolation, and contraction joints shall be located as indicated. Construction joints shall act as contraction joints. Where additional contraction joints are required to prevent shrinkage cracks, saw-cut such joints. All joints shall be straight and true to line.

2. Mark-off lines or edges at formed construction and expansion joints shall be finished with 1/4-inch radius curved edging tool, neat and true to line, uniform throughout.

3.4 CURING

A. Curing Standards: Curing of concrete shall conform with applicable requirements of ACI 301 and ACI 308, except that the duration of the curing period shall be ten days. Curing with earth, sand, sawdust, straw, and hay will not be permitted.

B. Curing Requirements:

1. Concrete shall be cured with waterproof sheet materials, damp burlap, or curing compounds.

2. Curing compounds shall not be used on surfaces when their use may be detrimental to bonding of concrete, mortar, membrane waterproofing, calking and sealants, adhesives, plaster, paint, or the specified surface finish or coating.

C. Damp Curing:

1. Vertical surfaces shall be cured by keeping the forms wet at all times and by leaving the forms in place as long as possible as specified in Section 03100, Concrete Formwork. After removal of forms, concrete shall be kept continuously damp by fog spraying or otherwise washing down the concrete in an accepted manner until ten days after placing. Protect exposed surfaces by covering with sheet materials or burlap kept continuously moist.

2. Horizontal surfaces shall be cured and protected by covering the finished surfaces with waterproof sheet materials or damp burlap, left in place for a minimum of ten days and kept continuously moist.

3. Fog spray freshly placed slabs until finishing operations commence. Do not allow slabs to become dry until finishing operations are complete.

D. Curing Compound: Application of curing compound shall conform to applicable requirements of ACI 308.

3.5 PROTECTION

A. Protect exposed concrete surfaces, including flatwork, as required to prevent damage from impact or strains.

B. Protect fresh concrete from drying winds, rain, damage, or soiling.

C. Refer to Section 03300, "Cast-In-Place Concrete", for additional requirements.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Sandblasted concrete described in this section will be measured and paid for at the unit price per square foot, installed.

B. Integrially colored concrete described in this section will not be measured or paid for separately but will be considered as incidental to the various bid items for concrete with integral color.
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies prestressed concrete work including the requirements for determining, providing, and installing prestressing reinforcement for concrete members, where prestressing reinforcement tendons are tensioned as follows:

1. Pretensioning, in which the tendons are tensioned prior to concrete placement and curing; and the tension is released and transferred from the anchorages to the concrete after the development of the specified concrete strength.

2. Post-tensioning, in which the tendons are installed in ducts or voids in the concrete structure and are tensioned and anchored when the specified concrete strength has developed.

B. This section specifies requirements for providing and installing prestressing accessories which include sheaths, ducts, or voids for bonded and unbonded prestressing systems; tendon anchoring and splicing systems; and grouting for bonded tendon installations.

C. This section specifies the requirements for determining non-prestressed deformed reinforcement that may be required at anchorages and splices and provided and installed under Section 03200, "Concrete Reinforcement".

1.2 REFERENCED STANDARDS

A. American Concrete Institute (ACI):

1. ACI 301 - Specifications for Structural Concrete
2. ACI 318/318R - Building Code Requirements for Structural Concrete (ACI 318) and Commentary (ACI 318R)

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM A416/A416M - Standard Specification for Steel Strand, Uncoated Seven-Wire for Prestressed Concrete.
2. ASTM A421/A421M - Standard Specification for Uncoated Stress-Relieved Steel Wire for Prestressed Concrete.
3. ASTM A722/A722M - Standard Specification for Uncoated High-Strength Steel Bars for Prestressing Concrete.

7. ASTM C827 - Standard Test Method for Change in Height at Early Ages of Cylindrical Specimens from Cementitious Mixtures.
8. ASTM D1248 - Standard Specification for Polyethylene Plastics Extrusion Materials for Wire and Cable

C. Precast/Prestressed Concrete Institute (PCI):

1. PCI/CONCRT MNL 116 - Manual for Quality Control for Plants and Production of Precast and Prestressed Concrete Products
2. PCI/CONCRT MNL 120 - Design Handbook - Precast and Prestressed Concrete

D. Post-Tensioning Institute (PTI):

1. PTI/POST A - Post-Tensioning Manual

E. Corps of Engineers (COE):

1. COE CRD-C 79-94 - Handbook for Concrete and Cement Standard Specification for Pigments for Integrally Colored Concrete

F. Texas State Department of Highways and Public Transportation:

1.3 SUBMITTALS

A. Shop Drawings: Have drawings and calculations for prestressed products certified by a Professional Engineer licensed in the State of Texas. Include, at a minimum, the following:

1. Description of equipment to be used and procedure for installing and stressing
prestressing tendons. Unless otherwise shown on the plans, the Contractor has the option of furnishing any type of post-tensioning system which meets the requirements of these specifications. The system selected shall provide the magnitude and distribution of prestressing force and ultimate strength required by the plans without exceeding allowable temporary stresses.

2. Ductwork and method of holding ducts and tendons in position, tendon or bar sizes, splicing of bars, unit weights, materials and stress grade, jack clearances and procedures, stressing sequence, initial tensioning forces, pressure gauge or load cell for determining loads, calculated friction and elastic shortening losses and tendon or bar elongation, anchorage details and anchorage slippage losses, bonding and grouting procedures, mild steel requirements, and clearances.

3. Complete details and substantiating calculations of method and materials proposed for use in prestressing operations, both pretensioning and post-tensioning, including any required additions or rearrangement of reinforcing steel from that shown on the plans. Calculate, detail and show individual tendon and anchorage arrangement to satisfy design requirements and to avoid interferences. Coordinate with embedded items. Changes or rearrangement of details shown permitted only with approval of Structural Engineer of Record. Ensure that spacing of tendon is sufficient for full encasement of each tendon in concrete. Plan sequence of installation to minimize fitting problem of various components embedded in prestressed member.

4. Stress/strain curve of tendons and bars. Show amount of slip normally expected in seating anchorage devices as opposed to that assumed in design calculations. Show friction wobble coefficient and friction curvature coefficient expected from tendons and bars and duct material. Show complete stress diagram for each tendon.

5. Bills of materials, erection diagrams and details of connections to other work.

6. Details and design calculations for size and thickness of anchor plates and corresponding reinforcement necessary for each system to provide safe transfer of forces into end block. Show amount, size and arrangement of such reinforcement to be installed at anchorage zones to prevent bursting and splitting concrete members when subjected to prestressing forces.

B. Submit the following samples of materials and tendons, selected by the Contracting Officer from prestressing steel at plant or job site:

1. For wire, strand, or bars: One sample of each size from each heat or reel.

2. If prestressing tendon is to be prefabricated, one completely fabricated prestressing tendon 5 feet in length for each size of tendon, including anchorage assemblies. If the prestressing tendon is to be assembled at job site, sufficient wire or strand and end fittings to make up one complete prestressing tendon 5 feet length for each size of tendon, including anchorage assemblies.

3. If prestressed tendon is a bar, one 5 feet length complete with one end anchorage; if couplers are to be used with the bar, two 4 feet lengths of bar equipped with one coupler and fabricated to fit coupler.

C. Grout for Ducts:

1. Furnish results of tests performed by the Authority’s testing laboratory or by an independent laboratory approved by the Contracting Officer demonstrating that proposed grout mixture meets the specified requirements.

2. Furnish a graph from said laboratory relating compressive strength of the grout to age covering a span from 24 hours to 28 days.

D. Working Drawings: Have working drawings and design calculations for falsework and formwork certified by a Professional Engineer licensed in the State of Texas. Include, at a minimum, the following:

1. Complete working drawings and all necessary calculations for formwork and falsework when constructing cast-in-place prestressed units.

2. Complete working drawings and all necessary calculations for any falsework required for constructing precast concrete members.

3. Include in calculations compensation for deflections, consider all loads, forces and stresses to be imposed during casting and tensioning in order to construct the structure to proper lines and grades shown on the plans.

4. Include structural grade requirements for formwork and falsework materials.

E. Samples: As previously specified.
F. Certification:

1. Tendons:
   a. Certificates for each five reels or coils or fraction thereof.
   b. Applicable certificates to accompany each shipment of tendons.
   c. For each size of strand to be used in the work, submit test certificates showing physical, chemical and stress/strain test properties including modulus of elasticity and stating guaranteed minimum ultimate tensile and yield strength.
   d. With each sample of prestressing steel wires, bars or strands furnished for testing, submit certificate stating manufacturer’s minimum guaranteed ultimate tensile strength of sample furnished. Prior to installation submit certified test results from each manufacturer for each type of low-relaxation steel.

2. Hydraulic jacks: Certified calibration curves for each hydraulic jack.

G. Documentation:

1. Specified calculations.
2. Records of tendon elongation promptly upon completion of post-tensioning of each member.

1.4 QUALITY ASSURANCE

A. Qualifications:

1. Precast work to be performed by a PCI certified plant regularly engaged in design and construction or structural precast, prestressed concrete members with a minimum of 5 years experience.

2. Submit name, qualifications and evidence of 5 years experience on work comparable to that specified.

3. Fabricators of post-tensioning systems are to be members of the Post-Tensioning Institute (PTI) and are to have PTI certified facilities.

4. Do not commence work until Prestressor has been approved.

B. Sampling and Testing of Tendons:

1. Furnish samples for testing from each size and each heat of prestressing bars, from each manufactured reel of prestressing steel strand, from each coil of prestressing steel wire and from each lot of anchorage assemblies and tendon couplers to be used.

2. Test tendons, anchorage assembly and coupler samples using approved ASTM test methods and other appropriate test methods required to demonstrate the values of properties specified.

3. Assign individual lot number to bars of each size from each mill heat, wire from each coil, and strand from each manufactured reel to be shipped to site and tag so that each lot can be accurately identified at job site. Identify each lot of anchorage assemblies and tendon couplers to be installed.

4. Unidentified prestressing steel, anchorage assemblies or bar couplers received at site will be rejected.

5. For prefabricated tendons, notify the Contracting Officer at least 10 working days prior to commencing installation of end fittings or heading of wires. The Contracting Officer will inspect end fitting installations and wire headings while such fabrication is in progress at the plant and will arrange for testing of material shipped to the site.

6. Do not ship pre-fabricated tendons to the site until they are released by the Contracting Officer. Tag each tendon before shipment as specified.

7. Material released by the Contracting Officer will be rejected if subsequently damaged or found defective.

C. Testing Laboratory and Quality Control: In accordance with Section 01450, “Quality Control”, and Section 03300, “Cast-In-Place Concrete”.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Protect prestressing steel against physical damage and rust or other results of corrosion at all times from manufacture to grouting or encasing in concrete. Physically damaged prestressing steel will be rejected. Rust or other corrosion will be cause for rejection. Any reel containing broken wires will be rejected.

B. Package prestressing steel in containers or shipping forms for protection against physical damage and corrosion during shipping and storage. Place corrosion inhibitor and rust preventive in package or form or use corrosion-inhibiting carrier-type packaging material. If approved, apply corrosion inhibitor directly to steel.

C. For tendons that will be in direct contact with concrete, use corrosion inhibitor which has no
deleterious effect on steel, concrete or bond strength of steel to concrete.

D. Replace or restore to original condition damaged packaging or forms.

E. Clearly mark shipping package or form with statement that package contains high-strength prestressing steel, and caution that care be used in handling. Show type, kind, amount, and placement date of corrosion inhibitor used. Include safety recommendations and instructions for use.

F. Store strand in a weatherproof enclosure. Mark each coil with order number, coil number, and heat number.

G. Provide strand that will lay straight with maximum deviation not exceeding 3 inch offset from theoretical centerline in any 5 feet in length.

H. Replace strand with sharp kinks or short radius bends.

I. When prestressing steel for post-tensioning is installed in members prior to placing and curing concrete, provide protection against rust or other corrosion, until grouted, by means of corrosion inhibitor placed in ducts or applied to steel in duct.

J. Protect prefabricated post-tensioning elements from moisture by taping or wrapping the ends and all openings in the conduit or by other acceptable means.

PART 2 - PRODUCTS

2.1 CONCRETE

A. In accordance with Section 03300, "Cast-In-Place Concrete", and Section 03305, "Portland Cement Concrete". Concrete mix design shall be S-3 with \( f'c = 5,000 \text{ psi} \) unless noted otherwise on the plans.

2.2 FORMWORK

A. In accordance with Section 03430, "Structural Precast Concrete".

2.3 TENDON GROUT

A. Material for tendon grout: Cementitious grout, compatible and non-corrosive to steel, free from calcium chloride.

   2. Sand: ASTM C144
   3. Water: Potable, clean, limits of injurious substances not to exceed:
      a. Nitrates: 13 parts per million.
      b. Sulfides: 00 parts per million.
      c. Sulfates: 15 parts per million.
      d. Chlorides: 20 parts per million.
   4. Expanding Admixtures: Provide 2 percent to 4 percent expansion.
   5. Water Content: Minimum necessary but not to exceed the water-cement ratio of 0.45, or approximately 5 gallons per 94 pound sack of cement.
   6. Pumpability: Determine in accordance with COE CRD-C 79-94. Efflux time of grout sample immediately after mixing not to be less than 11 seconds.
   7. Other use of pozzolans not permitted.

B. Alternate Material: Commercial cement-based grout mixture meeting the requirements of this specification, properly certified, subject to approval.

2.4 REINFORCEMENT

A. In accordance with Section 03200, "Concrete Reinforcement".

2.5 TENDONS, ANCHORAGE, COUPLERS, AND DUCTS

A. Tendons are defined as follows:

   1. For post-tensioned units, a tendon is each bar, each group of wires or each group of strands having common end anchorage.
   2. For pre-tensioned units, a tendon shall be each individual strand.

B. Pretensioning tendons:

   1. Steel strand: ASTM A416, Grade 270, regular or low-relaxation.
   2. Steel wire: ASTM A421.

C. Post-tensioning tendons:

   1. Strand as specified or shown for pretensioning either in single-strand units or in multiple-parallel-strand units, with wedge-type anchorages.

   2. Button heads to be cold formed symmetrically about axes of wires so that button develops minimum guaranteed ultimate tensile strength of wire. Use of cold-forming process that causes indentations in wire is prohibited.
3. Prestressing bars:
   a. Fabricated and processed in accordance with ASTM A722 and as specified.
   b. High-tensile-strength hot-rolled alloy steel, individually cold stretched and thermally stress-relieved to ensure uniform stress/strain characteristics and to obtain yield strength not less than 85 percent of required minimum guaranteed ultimate tensile strength.
   c. In accordance with the following minimum requirements:

<table>
<thead>
<tr>
<th></th>
<th>Regular Grade</th>
<th>Special Grade</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ultimate tensile strength</td>
<td>150,000psi</td>
<td>160,000 psi</td>
</tr>
<tr>
<td>Modulus of elasticity at 70% of manufacturer's minimum guaranteed ultimate strength</td>
<td>$29 \times 10^6$ psi</td>
<td>$30 \times 10^6$ psi</td>
</tr>
</tbody>
</table>

D. Anchorages and couplers:
   1. Steel anchorages and couplers compatible with particular installation. Anchorage devices to hold prestressing steel at load producing stress of not less than 95 percent of specified minimum ultimate tensile strength of prestressing steel. Anchorages with cut threads or notches are prohibited on prestressing steel. Fabricate stressing anchorages to provide adjustable seating loss. Ensure that each anchorage is capable of lift-off, detensioning and retensioning tendon at any time prior to grouting.

E. Ducts:
   1. Galvanized ferrous metal.
   2. Spiral corrugated plastic duct. ASTM F405 and made of high density polyethylene conforming to ASTM D3350 with cell classification PE 335433C or ASTM D1248, Type 3, Grade P34, Category 5.
   3. Strong enough to retain shape and resist damage during construction.
   5. Incapable of causing electrolytic action or deterioration in concrete.

6. Ensure that inside area of duct is at least two times the area of the enclosed prestressing steel.
7. Ensure capability of ducts to accommodate the anchorage system.
8. Equip ducts with fittings for injection of the grout, ports for venting, and drain holes at low points for draped tendons.
9. Pipes for grouting and for vent holes of 1/2 inch diameter metal or plastic. Fit pipes with positive mechanical shut-off valves capable of withstanding grouting pressures. Connect pipe to duct with structural fasteners, either metal or plastic. Tape connections with waterproof tape.
10. Ensure that couplers provide mortar-tight connection.

**PART 3 - EXECUTION**

3.1 GENERAL

A. The general requirements of Section 03300, "Cast-In-Place Concrete", govern for cast-in-place concrete box girder construction. Forms for cast-in-place concrete box girder construction shall conform to the requirements of this section and Section 03430, "Structural Precast Concrete".

3.2 JACKS

A. Furnish suitable jacks for stressing the tendons.
B. Equip each jack used to stress tendons with pressure gauge or load cell to determine jacking stress.
C. If pressure gauge is used, provide accurate, easily readable dial at least 6 inches in diameter. Calibrate each jack and its gauge as a unit with cylinder extension in approximate position in which it will be at final jacking force. Provide certified calibration chart as specified from an approved independent testing laboratory.
D. If inconsistencies occur between measured elongation and jack gauge reading, recalibrate gauge. If further discrepancies occur, determine cause and report to the Contracting Officer. Agreement within 5 percent will be satisfactory.
E. If load cell is used, calibrate and provide with indicator by means of which prestressing force in tendon may be determined. Ensure that range of load cell is such that lower 10 percent of manufacturer's rated capacity will not be used in determining jacking stress.
F. Provide independent system from which elongation can be measured to the nearest 1/16 inch.
3.3 INSTALLATION OF TENDONS AND DUCTS

A. Prior to stringing tendons and installing ducts, inspect bottom of forms for cleanliness and accuracy of alignment.

B. Accurately place and hold securely in place prestressing strand for pretensioned members and ducts for post-tensioned members during placing concrete.

C. String tendons singly or in multiples.

D. Splicing of wires or strands is prohibited.

E. Place tendons and ducts within tolerance of plus or minus 1/4 inch from locations shown on plans.

F. Cut length of each tendon between tendon vise and coil or reel.

G. Do not string tendons incorporating points previously gripped by tendon vises or wedges within lengths to be stressed. Do not use notched, nicked, pitted, rusted or otherwise damaged tendons.

3.4 PRETENSIONING

A. Provide tendon vises or wedges capable of anchoring stressing loads positively with a minimum of differential slippage. Have vises or wedges cleaned, lubricated and inspected between each use.

B. Discard grips which become visibly worn or distorted or which allow excessive slippage. Furnish full set of cleaned and inspected tendon vises or wedges before commencing each stressing operation. Ensure that vises and wedges are free of rust and physical damage.

C. After straight wire tendons have been positioned, apply initial force to each tendon to eliminate slack and to provide uniform initial stress condition in all tendons prior to final stressing. Initial force may be applied only by pressure jacks equipped with proper gauging system for measuring initial force.

D. The initial force shall be within 50 pounds or 2 percent of that required.

E. Strands shall be stressed as a group (multiple strand stressing) shall be brought to a uniform initial tension prior to full pretensioning.

F. Maintain records of elongation of each tendon and tension applied to each tendon.

G. Use load cells to calibrate load measuring devices and to check initial force on at least 10 percent of tendons.

H. Do not use elongation measurements as measure of initial stress. The initial force shall be measured by a dynamometer or other approved method, so that it can be used as a check against elongation as computed and measured.

I. Draped tendons shall be held in their draped positions by means of rollers, pins or other approved methods during jacking. Approved low-friction devices shall be used at points of change of slope of draped tendons.

J. Perform final stressing as shown on approved shop drawings.

K. When tendons have been final stressed, and approved, concrete shall be placed. Tendon stress shall be maintained between anchorages until concrete has reached the compressive strength of shown on the plans for release.

3.5 POST-TENSIONING

A. Post-tensioning forces shall not be applied until the concrete has attained the specified compressive strength shown on the plans as the required minimum concrete strength at post-tensioning.

B. Perform sequence and staging of post-tensioning in accordance with approved shop drawings.

C. Stress post-tensioned prestressing steel by means of hydraulic jacks equipped with accurately calibrated, easily readable hydraulic pressure gauges or load cells to permit reading stress in prestressing steel throughout stressing operation.

D. Anchor prestressing steel at initial stresses (transfer) calculated to result in final force shown. Initial stress not to exceed 70 percent of minimum ultimate tensile strength of prestressing steel at any point of tendon.

E. During jacking of prestressing steel, do not exceed 80 percent of the minimum guaranteed ultimate tensile strength of tendon.

F. Permanent force and permanent stress will be considered as the force and stress remaining in the prestressing steel after all losses, including creep and shrinkage of concrete, elastic shortening of concrete, relaxation of steel, thermal effects, losses in post-tension prestressing steel due to sequence of stressing, friction and take-up of anchorages, and all other losses peculiar to method or system of prestressing, have taken place or have been provide for.

G. Keep records of tension and elongation of each tendon at all stages and submit records as specified. Make readings of elongations to within plus or minus 1/32 inch when dial indicators are used, reading accuracy to be accordingly higher.

H. At the time of stressing first member of each type, check stresses in individual tendons and verify...
calculated frictional losses and seating losses to establish post-tensioning procedure and ensure uniform results.

I. Recheck may be directed, if it appears that stress shown is not being obtained.

J. Use approved tendon cutting tools for cutting prestressing steel after tensioning. Obtain written approval before capping post-tensioned anchorage.

K. Make accurate measurements of anchorage slippage losses at time of anchoring first tendon of each type of member and compare with assumed slippage losses. In case of deviation, detension tendon; repeat tensioning in accordance with special approved procedure or by shimming as necessary for particular system.

L. When necessary and approved, make adjustments to post-tensioning procedure to obtain required stresses.

M. Submit for approval proposed remedy for inconsistencies which occur between measured elongation and jack-gauge readings and which cannot be corrected by specified recalibration of gauge nor by lubrication of tendons. Replace tendon, if necessary.

N. Immediately after concreting, check ducts for obstructions by drawing cleaning device through them, by blowing through or by movement of tendon. Immediately prior to installation of tendons in ducts, demonstrate that ducts are free of water, debris, and other obstructions.

3.6 GROUTING

A. Immediately prior to grouting, remove the plug, clean ducts of foreign materials and remove any corrosion inhibitor by thoroughly flushing duct with water and dry by blowing.

1. After post-tensioning and anchoring of a tendon has been completed and accepted, the annular space between the prestressing steel and the duct shall be grouted.

2. Immediately after post-tensioning, a plug shall be inserted in each end to prevent entry of air and water until grouted.

3. Tendons shall be grouted within 48 hours after completion of post-tensioning.

B. Placing Grout:

1. Start grouting at the lowest injection point with all vent holes open.

2. Maintain pumping pressure through the pipe until grout is continuously wasted at the next vent hole, and until no visible slugs or other evidence of water or air are ejected, and the grout being ejected has the same consistency as the grout being injected.

3. Close vent, hold the pumping pressure for a number of seconds and then close injection port.

4. In the event one-way flow of grout cannot be maintained, or in the event of blockage or interruption of grouting, remove grout immediately from the duct by flushing with water.

5. Do not open shut-off valves serving as injection ports or vent ports until grout has taken its final set.

6. If temperature is anticipated to fall below 32 degrees F, prevent water from being entrapped in ungrouted ducts.

7. No grouting may be done when temperature of grout is below 45 degrees F.

8. Maintain the temperature of the concrete or surrounding air at 35 degrees F or higher from the time the grout is placed until the compressive strength of the grout, as determined from tests on 2 inch cubes cured under the same site conditions, exceeds 800 psi.

9. Do not grout when temperature of grout reaches or exceeds 90 degrees F. If necessary, mixing water may be chilled.

C. Mixing Grout: Mix grout as recommended by manufacturer, as tested and approved or for 1-1/2 minutes in high-speed mechanical mixer; pass through strainer into pumping equipment which has provision for recirculation. Begin pumping grout as soon as possible after mixing. Pumping may be continued as long as grout retains proper consistency.

1. When approved, finely ground aluminum powder or other gas evolving material which is well dispersed throughout the mixture, may be used to obtain a maximum of 4 percent unrestrained expansion of the grout.

2. Base proportions of materials on results of tests made on grout to achieve the following:

a. Water content: Minimum necessary for proper placement with a maximum 0.45 water-cement ratio, measured by weight.

b. Minimum 7-day compressive strength: 5,000 psi (average of 3 cubes) for 2 inch cubes molded, cured and tested in accordance with ASTM C109.
3. Grout shall be placed within 30 minutes of mixing.

4. Grout may not be retempered by adding water to modify consistency after the initial mixing procedure has been completed.

3.7 PROTECTION OF PRESTRESS ANCHORAGES

A. Within 14 days after tensioning and grouting is completed, exposed end anchorages, strands, and other metal accessories shall be cleaned of rust, misplaced mortar, grout, and other materials.

B. Coat the entire surface of the anchorage recess (all metal and concrete) with a uniform coating of an approved epoxy bonding compound.

C. Immediately following application of the epoxy bonding compound, tight-fitting forms shall be installed while epoxy is 'tacky' and the anchorage recess shall be filled with a non-shrink cement based grout.

D. The grout shall exhibit 0 percent shrinkage when tested in accordance with ASTM C827, and shall contain no aluminum powder, iron particles, chlorides, sulphides, fluorides or nitrates.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Precast Work: Structural precast and architectural precast members either pretensioned, post-tensioned, or combined pretensioned and post-tensioned are not measured for payment under this section. Measurement and payment will be under Section 03430, "Structural Precast Concrete", and Section 03450, "Architectural Precast Concrete".

B. Cast-in-place Prestressed Concrete:

1. Cast-in-place prestressed concrete members will not be measured for payment under this item, but will be measured by the cubic yard in accordance with Section 03300, "Cast-In-Place Concrete".

2. Prestressing steel for cast-in-place concrete will not be measured, but will be paid for at the lump sum price for "Prestressing Steel", for each bridge or structure, including wires, strands, and bars.

C. Ducts, grout fittings, grouting of ducts, anchorage, bearing plates, dowels, joint fillers, sealers, and stressing wires, strands, and bars will not be measured separately, but will be paid for under the various bid items for architectural precast concrete, structural precast prestressed concrete, and prestressing steel for cast-in-place concrete.

END OF SECTION 03365
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies the requirements for the construction and erection of precast prestressed concrete bridge members in accordance with the plans. Structural precast concrete members shall include the following:

1. AASHTO Beams.
2. Double Tee Girders.
3. Single or Double Cell Box Girders.

1.2 REFERENCED STANDARDS

A. American Association of State Highway and Transportation Officials (AASHTO):

1. AASHTO HB-17 - Standard Specification for Highway Bridges

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

5. ASTM A709/A709M - Standard Specification for Carbon and High-Strength Low-Alloy Structural Steel Shapes, Plates, and Bars and Quenched-and-Tempered Alloy Structural Steel Plates for Bridges

C. Precast/Prestressed Concrete Institute (PCI):

1. PCI/CONCRT MNL 116 - Manual of Quality Control for Plants and Production of Precast and Prestressed Concrete Products

D. Texas Department of Transportation (TxDOT):

1. TxDOT Standard Specifications for Construction and Maintenance of Highways, Streets and Bridges.

1.3 SUBMITTALS

A. Shop Drawings: Have drawings and calculations for structural precast, prestressed members certified by a Professional Engineer licensed in the State of Texas. Include as a minimum, the following:

1. Location and layout of precaster's casting site for the precast members.
2. Details of form fabrication, profiles, reinforcing steel, inserts, lifting devices. Include adjustment capabilities of the forms and procedures for checking control points prior to start of casting.
4. Schedule of casting and curing sequence and method of handling and storing members and segments prior to shipping and erection.
5. Details for erection procedures for precast units sequence of erection and required handling equipment.
6. Design mix: Determine the mix proportions which shall conform to the strengths required. Perform work and tests required to substantiate the mix design. Include mix reports, material certificates and laboratory test reports.

B. Samples: As specified.

C. Certification: Certificates from concrete supplier as specified in Section 03300, "Cast-In-Place Concrete".

D. Certificates, required back up information, and testing data shall be dated within 6 months of submittal date.

1.4 QUALITY ASSURANCE

A. Qualifications:

1. Precast work to be performed by a PCI certified plant regularly engaged in design and construction or structural precast, prestressed concrete members with a minimum of 5 years experience.
2. Submit name, qualifications and evidence of 5 years experience on work comparable to that specified.
3. Do not commence work until fabricator (precastor) has been approved.
B. Sampling and Testing of Concrete:

1. Perform sampling, testing and frequency of testing in accordance with Section 03300, "Cast-In-Place Concrete", except as otherwise specified.

2. Mold three sets of at least two cylinders for each casting bed each day or for each 100 cubic yards of concrete or fraction thereof for each prestressed concrete structure. In any case, have at least six cylinders cast for each group of members cast from each batch.

3. Cure cylinders for stress transfer in same environment as members or structures they represent.

4. Test one set of cylinders for compressive strength at stress transfer, and one set of each on day 28.

5. The Contracting Officer may require testing of the concrete at any time during the fabrication operations.

C. Testing Laboratory and Quality Control: In accordance with Section 01450, "Quality Control", and Section 03300, "Cast-In-Place Concrete".

D. Comply with the requirements for mass concrete in Section 03300, "Cast-in-Place Concrete", for all structural precast concrete members except that the maximum allowable temperature of mass concrete shall not exceed 170 degrees F instead of 160 degrees F.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Store and handle basic materials in accordance with Section 03300, "Cast-In-Place Concrete".

B. Avoid damaging surfaces, edges, and corners and creating stresses within units.

C. Handle and store precast structural members in upright position with points of support in approximately the same position as designated for final position in the structure.

D. Lift member with lifting devices as approved on shop drawings or by other methods approved by the Contracting Officer in writing.

E. Do not lift nor transport member until concrete has attained proper compression strength shown on the plans.

F. Mark all structural precast members with correct erection mark corresponding to that shown on the approved erection drawings.

G. Store precast prestressed members with adequate blocking so that warpage or cracking will not occur. Support fully across their width on battens not less than 4 inches wide.

H. Stack members in storage only with approval of Contracting Officer.

I. Keep precast units under cover and protected until installed.

PART 2 - PRODUCTS

2.1 CONCRETE

A. In accordance with Section 03300, "Cast-In-Place Concrete", and Section 03305, "Portland Cement Concrete". Concrete mix design shall be S-3, unless noted otherwise on the plans.

2.2 FORMWORK

A. Construct side and bottom forms for all structural precast prestressed concrete members with steel of sufficient thickness and adequate bracing and stiffeners to withstand forces due to placement and vibration of concrete.

B. Use wood for inside forms.

C. Forms shall be capable of accommodating block outs, openings and protrusions for post-tensioning. Forming system shall be capable of adjusting to changes in geometry and for correcting previous casting errors to prevent accumulation.

D. Treat forms with approved form oil or other bond breaking coating prior to placing concrete to facilitate stripping without damage to concrete. Material used shall not react or stain the concrete.

E. Forms shall be thoroughly cleaned prior to each casting operation, and shall be free from rust, grease, and other foreign materials.

2.3 REINFORCEMENT

A. In accordance with Section 03200, "Concrete Reinforcement".

2.4 TENDONS, ANCHORAGES, COUPLERS, AND DUCTS

A. In accordance with Section 03365, "Prestressed Concrete".

2.5 MISCELLANEOUS STEEL

A. Steel Plates and Shapes: Steel, ASTM A709, Grade as indicated on drawings.

B. Welded Headed Studs: ASTM A108, Grade 1015 or 1020, cold finished carbon steel headed studs.

D. Finish of Steel: Exposed galvanized per ASTM A153.

E. Bearing: In accordance with items 434 and 435 of the TxDOT Standard Specifications for Construction of Highways, Streets, and Bridges.

F. Dowels: As shown.

2.6 BIRD REPELLENT SYSTEM

A. Bird repellent system shall be Bird Spike 2000 manufactured by Bird-B-Gone, or as approved by the Authority. Repellent system shall be attached to interior sloping surfaces of AASHTO beams, prior to painting, using exterior grade construction adhesive (no mechanical fasteners) as recommended by the manufacturer. Limits of repellent system to be centered over sidewalks and path where shown on the drawings, 30 feet in length.

PART 3 - EXECUTION

3.1 FABRICATION

A. Forms:

1. Ensure that joints are smooth and tight to prevent leakage of mortar. Maintain accurate alignment of forms during casting operations. Check form alignment and grade for each casting.

2. Make provisions in form anchorage system for anticipated differential movements of beds and forms during casting and curing operations. In providing forms, ties, inserts, bulkheads and other accessories, use details of forms and anchor them so as to avoid any differential movement or loosening, but to enable movement without damage to members or forms. Ensure that bearing devices supporting prestressed members are free to rotate and that expansion bearings are free to translate during post-tension operation.

3. Clean beds and forms thoroughly before casting. Do not allow coatings for bond breakers to accumulate in bottoms of forms. For members to be cured by artificial heat, provide for ventilation of void forms.

4. In areas subject to freezing and thawing, make provisions for draining voids.

5. Treat surfaces in contact with concrete with effective bond breaker.

6. Prevent contamination of tendons by bond breaker, mud, grease or other detrimental substances.

7. Provide bolting fittings and welding plates for embedment in prestressed members to allow later attachment of conduits, pipes, boxes, and similar items.

B. Concrete:

1. Mixing and Placing: Mix concrete in accordance with the requirements of Section 03305, “Portland Cement Concrete”, with the following additional requirements:

   a. Do not use admixtures containing chlorides, fluorides, or nitrates.

   b. Use more than one admixture only if compatible with each other. If used, add separately during batching sequence.

   c. Placement of concrete: Section 03300, “Cast-In-Place Concrete”.

2. Sampling and Testing: Perform sampling and testing as specified.

3. Concrete Protection for Reinforcement: Section 03200, “Concrete Reinforcement”.

4. Consolidation of Concrete:

   a. Consolidate concrete by means of internal, external, or surface vibrators as approved and as follows:

      1) Use internal vibrators on sections that are sufficiently large to admit them.

      2) Use external vibrators on smaller sections produced by extrusion or slip-form method.

      3) Surface or screed vibrators may be used for flat slabs.

   b. Use vibrators having operating frequencies of at least 7,000 impulses per minute and higher frequencies if approved. Use vibrators only for consolidating, not for moving concrete along forms.

5. General Patching: Thoroughly clean and hammerpack holes left by tie rods, strand hold-down devices or other temporary inserts with stiff dry mortar made with same type of sand and cement used in concrete. In areas of tensile stress, bond hole patches with approved epoxy resin.

C. Curing: Keep structural precast members continuously wet until conclusion of curing period. Cure by covering with burlap or jute mats kept
continuously wet, by moist air, by live steam, or combination.

1. **Wet Mat Method**: Secure mats, sheets, or blankets to provide continuous contact with all concrete surfaces.
   a. Enclose surfaces not in direct contact with mats, adequately anchored, so that outside air cannot enter the enclosure.
   b. Keep mats wet and air inside enclosure sufficiently moist to maintain all the surfaces wet for the required curing time.

2. **Water Spray Method**: Use overlapping spray or sprinkles to keep concrete surfaces continuously wet.

3. **Steam Method**: Do not commence steam curing for a minimum present time of 3 hours after placing concrete, except if ambient temperature is below 50 degrees F, whereby apply steam at a rate sufficient to keep surrounding air at temperature between 50 degrees F and 70 degrees F.
   a. Provide an unobstructed air space of not less than six inches between concrete surfaces and the steam jacket.
   b. After preset time, apply steam at a rate not to increase temperature of air surrounding the member more than 40 degrees F per hour.
   c. Do not exceed maximum curing temperature of 160 degrees F. Concrete exposed to temperatures exceeding 180 degrees F will be cause for rejection.
   d. Do not fluctuate temperatures within enclosure or at adjacent locations within enclosure by more than 30 degrees F.
   e. Furnish and have available two portable recording thermometers, capable of automatically producing a temperature record during entire curing period. Record temperatures at every 15 minutes.
   f. Steam outlets shall not impinge directly against the concrete surfaces.
   g. Continue curing until required strength for transfer of load as shown on plans, have been developed and until detensioning has been performed.
   h. Reduce temperature inside chamber, after expiration of curing period, at a reduction rate of not more than 40 degrees F per hour until temperature is within 20 degrees F of air outside enclosure.

D. **Finishes**: Surface finish in accordance with Section 03300, "Cast-In-Place Concrete", except as modified herein.
   1. Do not repair cracks in members scheduled for post-tensioning prior to final post-tensioning.
   2. Screed or rough float top surfaces of prestressed concrete girders, if scheduled for embedment into cast-in-place concrete. At the approximate time of initial set, the surface shall be roughened by brushing, brooming or other approved methods.

E. Fabricate units in number and sizes shown and specified. Prestress as required in accordance with Section 03365, "Prestressed Concrete".

F. Deliver units to site in compliance with erection schedule.

G. Fabricate structural precast, prestressed units within the dimensional tolerances and levels of workmanship specified in Item 424 of the TxDOT Standard Specifications for Construction of Highways, Streets and Bridges.

3.2 **DEFECTIVE AND DAMAGED CONCRETE UNITS**

A. Diagonal cracks indicating torsion damage, longitudinal cracks following stressing tendons, cracks extending to plane of reinforcement, spalls, concrete breakage, and honeycombs are subject to structural review by the Contracting Officer prior to acceptance.

B. Any defects, damage, cracks, breakage or spalls in any fabricated precast unit shall be subject to review by the Contracting Officer as to repairability and shall be cause for rejection if so deemed by the Contracting Officer.

C. Repair of concrete units shall be in conformance with Section 03905 “Concrete Repair and Restoration”.

3.3 **HANDLING, STORING, HAULING, AND ERECTION**

A. Handle, lift, support, and erect structural precast members with utmost care so as to prevent damage or overstressing.

B. Handle members in accordance with details, and at points, as shown on the approved shop drawings and erection plan.
C. Move no member from casting yard until all requirements for tensioning (when specified), curing and strength requirements have been attained.

D. Erect and position members in structure properly leveled, aligned and braced as required until diaphragms are in place for lateral stability.

E. Fill erection holes with mortar made flush with surrounding concrete.

F. For requirements related to post-tensioning, if required, refer to Section 03365, “Prestressed Concrete”.

**PART 4 - MEASUREMENT AND PAYMENT**

**4.1 MEASUREMENT**

A. Structural precast prestressed concrete girders, double tee girders, and box girders described in this section will be measured and paid for at the unit price per linear foot per type specified.

B. The unit prices for precast prestressed concrete girders, double tee girders and box girders will include full compensation for manufacturing the members; furnishing and tensioning the prestressing steel (pretensioning and post-tensioning, as required); furnishing and placing reinforcing steel and structural concrete; bearing plates and pads; grouting of holes and repairs as required; temporary work; and transporting and erecting the bridge or structure, complete-in-place.

C. Cast-In-place post-tensioned concrete units including box girders, etc., will not be measured under this section. Refer to Sections 03365, “Prestressed Concrete”, and 03300, “Cast-In-Place Concrete”. Miscellaneous incidentals such as those mentioned in Section 03365, “Prestressed Concrete”, Part 4, will not be measured for payment.

END OF SECTION 03430
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies the fabrication and installation of precast concrete for building walls, sound barriers, wall panels, and other precast concrete building elements designated as Architectural Precast Concrete.

1.2 REFERENCE STANDARDS

A. American Concrete Institute (ACI):

1. ACI SP-66 - ACI Detailing Manual
2. ACI 308.1 - Standard Specification for Curing Concrete
3. ACI 318/318R - Building Code Requirements for Structural Concrete (ACI 318) and Commentary (ACI 318R)

B. American Welding Society (AWS):

1. AWS D1.1/D1.1M - Structural Welding Code - Steel
2. AWS D1.4 - Structural Welding Code - Reinforcing Steel

C. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

5. ASTM A193/A193M - Standard Specification for Alloy-Steel and Stainless Steel Bolting Materials for High-Temperature Service
7. ASTM A666 - Standard Specification for Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar

D. Concrete Reinforcing Steel Institute (CRSI):

1. CRSI DA4 - Manual of Standard Practice

E. Precast/Prestressed Concrete Institute (PCI):

1. PCI/CONCRT MNL-116 - Manual for Quality Control for Plants and Production of Precast and Prestressed Concrete Products
2. PCI/CONCRT MNL-117 - Manual for Quality Control for Plants and Production of Architectural Precast Concrete Products
3. PCI/CONCRT MNL-119 - Drafting Handbook - Precast and Prestressed Concrete
4. PCI/CONCRT MNL-122 - Architectural Precast Concrete

1.3 SUBMITTALS

A. Shop Drawings:

1. Prepare drawings in accordance with PCI/CONCRT MNL-119, ACI SP66 and CRSI DA4. Take and include field verified dimensions, details of form fabrication, profiles, joints, reinforcing steel, clips, anchors, inserts, reglets, lifting devices, openings, electrical and structural embedded items, connection to other work and placement, and erection sequence. Shop drawings shall be prepared, sealed and signed by a Professional Engineer.

8. ASTM A884/A884M - Standard Specification for Epoxy-Coated Steel Wire and Welded Wire Fabric for Reinforcement
9. ASTM C33 - Standard Specification for Concrete Aggregates
10. ASTM C94 - Standard Specification for Ready-Mixed Concrete
11. ASTM C260 - Standard Specification for Air-Entraining Admixtures for Concrete
12. ASTM C494/C494M - Standard Specification for Chemical Admixtures for Concrete
13. ASTM C618 - Standard Specification for Coal Fly Ash and Raw or Calcined Natural Pozzolan for Use in Concrete
14. ASTM C979 - Standard Specification for Pigments for Integrally Colored Concrete
2. Prior to installation of units, submit schedule indicating sequence of installation, joints, support and bracing systems, and anchoring system.

3. Design Calculations: Submit complete calculations for the design of precast units and precast connections 60 days prior to start of precast fabrication. Do not proceed with fabrication of units until notified in writing that the Contracting Officer has completed review of calculations and approved the submittal.

4. Design mix: Submit concrete mix to comply with product requirement of this section: Part 2 - PRODUCTS.

B. Product Data: Submit manufacturer’s product data and specifications, with application and installation instructions for manufactured materials and products. Include concrete mix reports, material certificates and laboratory test reports as specified in Section 03300, “Cast-In-Place Concrete”.

C. Samples:
   1. Panels representing color, texture and general finish of test units and production panels, each 12 inches square by 1-1/2 inches thick: Submit two samples prior to fabrication.
   2. Gasket and flashing materials proposed for use: Submit two, each 12 inches long.

D. Job Mock-Up: After acceptance of material samples, construct full-size sample of each required architectural precast concrete unit for Contracting Officer’s inspection at production plant or on site prior to start of installation work. Include representative items encountered in work, per Contracting Officer’s directive. Cast, finish, cure, and erect job mock-up panel in same manner as will be employed in work. Acceptable full-size samples may be incorporated in job installation.

1.4 QUALITY ASSURANCE

A. Qualifications:
   1. Fabricator Qualifications: Firms which have a minimum of 5 years successful experience in the fabrication of Architectural Precast Concrete units, similar to units required for this project, will be acceptable. Fabricator must have sufficient production capacity to produce, transport, and deliver required units without causing delay in the work.

2. Qualifications of Erector: Firms which have a minimum of 2 years successful experience in the erection of Architectural Precast Concrete units, similar to units required for this project, will be acceptable.

B. Certifications:
   1. Fire-Resistance Rated Precast Units: Where precast concrete units are shown or scheduled as requiring fire-resistance classification, provide units tested and listed by UL in “Fire Resistance Directory”, or with each unit bearing UL label and marking.
   2. Certificate of Conformance: Provide written certification that all material, shipped or used and shown on invoices for this project, including chemical test results for mills, meets the contract requirements.
   3. Concrete Testing: Requirements for testing laboratories, and sampling and testing to demonstrate compliance with specified properties, are as specified in Section 03300, “Cast-In-Place Concrete”, and Section 01450, “Quality Control”.
   4. Precast Unit Design: The precast units have been proportioned to resist in-place service loading conditions only. Using the services of a Professional Engineer, licensed in the State of Texas and experienced in providing engineering services that resulted in successful installation of precast concrete units similar in material, design and extent as required by this Project, analyze the units for stresses resulting from fabrication, handling, shipping, storage, erection, connection to the supporting structure and temperature changes, and select concrete strength, reinforcement, and lifting devices and procedures necessary to provide precast units conforming to requirements shown and specified. Maintain general design concept shown without increasing or decreasing sizes of members or altering profiles and alignment shown. Provide complete design calculations and drawings prepared, sealed and signed by the Professional Engineer.
   5. Precast Connections: Design Modifications to connection configurations shown may be made only as necessary to meet field conditions and to ensure proper fitting of the work, and only as acceptable to Contracting Officer. Precast connections have been shown on the drawings indicate general types acceptable and locations of connections. Using the services of a Professional Engineer, licensed in the State of Texas, analyze and design the
connections and anchorage for dead load, service load and temperature stresses. Where possible, provide mechanical fasteners to minimize field welding; where field welding is necessary, conform to the AWS D1.1/D1.1M qualification requirements. Provide complete design calculations and drawings prepared, sealed and signed by the Professional Engineer.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Store and handle basic materials in accordance with Section 03300, "Cast-In-Place Concrete".

B. Avoid damaging surfaces, edges, and corners and creating of stresses within units.

C. Keep units under cover and protected until installed.

D. Lift and support units only at designated lifting or supporting points as shown on final shop drawings. Verify that sealers used to protect precast concrete units prior to erection are compatible with caulking and painting requirements.

E. Deliver anchorage items, which are to be embedded in other construction before the start of such work. Provide setting diagrams, templates, instructions and directions as required for installation.

PART 2 - PRODUCTS

2.1 CONCRETE

A. In accordance with Section 03300, "Cast-In-Place Concrete", except as modified in this section.

B. Mix Designs: Establish mix designs to produce specified appearances and that have qualities as follows:

1. $f'c = 5000$ psi; minimum; normal weight aggregates; coarse aggregates size to meet requirements of ACI 318/318R and specified appearance; air entrainment must be in accordance with ACI 318/318R.

2. Portland Cement:
   a. ASTM C150, Type I, II or III.
   b. Use only one brand, type, and source of supply of cement throughout production, unless noted otherwise.
   c. Use white Portland cement with concrete pigment for concrete mix as necessary to match Contracting Officer approved sample.

3. Aggregates:
   a. Sand to conform with ASTM C144 passing through No. 16. sieve of washed and dried silica or other acceptable material with successful use in production.
   b. Aggregate used in precast concrete units shall conform to ASTM C33 and match in size (not to exceed 5/8 inch), color, texture, and aggregate exposure to that used in the Contracting Officer approved sample.

5. Admixtures: Conform to ASTM C260 for air entrainment, ASTM C494/C494M for chemical admixtures, or ASTM C618 for fly ash or natural pozzolan admixtures; at manufacturer's option. Do not use admixtures that contain more than 0.1 percent chloride ions.

6. Coloring Agent:
   a. Conform to ASTM C979; ultraviolet and alkali resistant; high-temperature stable; harmless to concrete set or strength.
   b. Match color to that of Contracting Officer's control sample.
   c. The amount of coloring agent shall not exceed 10 percent of the cement weight.

C. Batching and Mixing:

1. In accordance with PCI/CONCRTMNL-117.

2. Use ready-mix concrete in accordance with ASTM C94 unless otherwise approved in writing by the Contracting Officer.

2.2 FORMWORK

A. Materials and construction to conform with PCI/CONCRTMNL-117.
ARCHITECTURAL PRECAST CONCRETE

B. Unless otherwise approved in writing, use one of the following form facing materials.
   1. Fibrous-glass-reinforced plastic.
   2. Steel.
C. Use forms which produce units without visible joint marks.
D. Use form liners as required to produce patterns or textures shown and specified.

2.3 REINFORCEMENT
A. In accordance with Section 03200, "Concrete Reinforcement"; welded wire fabric ASTM A884/A884M, epoxy coated.
B. Conform to requirements in Section 03365, "Prestressed Concrete", for prestressed concrete.

2.4 BEARING PADS AND SHIMS
A. Elastomeric Bearing Pads:
   1. Preformed resilient pads of specified uniform thickness (plus 15 percent) composed of a homogeneous blend of rubber elastomer and high-strength random synthetic fiber cords cured together to form a durable material with uniform behavior in all directions and suitable to support structural loads. Provide pads with required dimensions for proper load transfer and of enough thickness to accommodate not less than 0.01 radians rotation of support member. Increase pad plan dimensions when necessary in order to withstand anticipated loads without exceeding a compressive strain of 30 percent.
   2. Provide finished pads which have a Shore A Durometer hardness of 75 (plus 5), a shear modulus of 265 (plus 80) psi, an ultimate compressive strength of 8000 psi minimum, an initial tensile strength of 900 psi minimum and an initial tear strength of 400 lbs./inch minimum.
B. Bearing Shims: Multipolymer plastic; chemically inert, weatherproof, non-staining, 2500 psi minimum allowable bearing pressure; sized for dead and live loads prior to grouting.

2.5 MISCELLANEOUS STEEL
A. Anchors, Dowels, Shims, and Accessories Cast Into Precast Units: Steel, ASTM A36/A36M, hot-dip galvanized, ASTM A153/A153M.
B. Welded Headed Studs: ASTM A108, Grade 1015 or 1020 Cold finished carbon steel headed studs.

2.6 JOINT CONNECTIONS
A. Stainless Steel, ASTM A666, where subject to uncontrolled environment or weather.
B. ASTM A36/A36M where connection is totally within an interior environment controlled for human comfort.
C. Bolts: Stainless steel, ASTM A193/A193M where connections are stainless steel and ASTM A307 bolts where ASTM A36/A36M steel is used.

2.7 STRUCTURAL NON-SHRINK GROUT
A. As specified in Section 03300, "Cast-In-Place Concrete".

2.8 FLASHING REGLETS
A. Stainless steel ASTM A167, Type 302, soft temper minimum 0.011 inch thick; open type having continuous groove not less than 1-1/8 inch deep by 3/16 inch wide opening and sloped upwards at 45 degrees, unless otherwise shown. Furnish with easily removable filler strip.

2.9 FABRICATION
A. Formwork:
   1. Accurately construct forms, mortar-tight, and of sufficient strength to withstand pressures due to concrete placing operations, temperature changes, and prestressed pretensioning and detensioning operations. Maintain formwork to provide completed precast concrete units of shapes, lines and dimensions indicated, within specified fabrication tolerances.
   2. Unless forms for prestressed concrete units are stripped prior to detensioning, design forms so that stresses are not induced in precast units due to deformation of concrete under prestress or to movement during detensioning.
B. Built-In Items: Provide reglets, slots, holes, and other accessories in units to receive windows, dowels, reglets, waterstops, flashings, and other similar work as indicated. Cast in structural inserts, bolts, and plates as shown. Cast in electrical embeds specified and shown. At all lifting and handling
embeds, provide hairpin reinforcing as required by analysis.

C. Anchorages: Provide loose steel plates, clip angles, seat angles, anchors, dowels, hangers, and other miscellaneous steel shapes not provided by other trades, necessary for securing precast units to supporting and adjacent members.

D. Pretensioning: Pretensioning of tendons for prestressed concrete may be accomplished either by single-strand tensioning method or multiple-strand tensioning method. Comply with PCI/CONCRT MNL-116 requirements and Section 03365, "Prestressed Concrete".

E. Fabricate Units complying with manufacturing procedures and dimensional tolerances of PCI/CONCRT MNL-117. Provide number and finished sizes of units shown and specified to match approved sample units. Precast units that are warped, cracked, broken, spalled, stained, or otherwise defective will not be accepted.

F. Surface Finishes: Provide exposed surface finishes for precast units as shown or specified:
   1. Abrasive Blast Finish: Use abrasive grit, equipment, application techniques and cleaning to expose aggregate and surrounding matrix surfaces, to match approved control samples designated as light, medium or heavy.
   2. Exposed Aggregate Brush Finish: Use washing and brushing procedures to match approved control sample.
   3. Smooth Surface Finish: Finish free of pockets, sand streaks, and honeycomb, with uniform color and texture to match approved control sample.
   4. Textured Surface Finish: Finish imparted by form liners or inserts. Provide surfaces free of pockets, streaks and honeycomb, with uniform color and texture to match approved control sample.
   5. Formed or float finish for unexposed surfaces.

G. Curing: Do not apply liquid membrane curing compounds to surfaces which will be sealed or painted. Follow specifications in ACI 308.1 and recommendations in PCI/CONCRT MNL-117.

2.10 QUALITY CONTROL

A. Fabricate precast units complying with manufacturing and testing procedures, quality control recommendations, and following dimensional tolerances, unless otherwise indicated.

B. Accurately construct forms mortar-tight of rigid materials that will result in finished units conforming to profiles, lines, and dimensional tolerances indicated, within specified fabrication tolerances.

C. Dimensional Tolerances of Finished Units: Overall height and width measured at face adjacent to mold at time of casting:
   1. Length, width, and height of unit: Plus or minus 1/16 inch.
   2. Angular deviation of plane of mold: 1/16 inch total.
   3. Out of Square (difference in length of two diagonal measurements): 1/8 inch.
   4. Skin Thickness: Plus 1/4 inch or minus 0.
   5. Architectural Facing Thickness, if required: Plus 1/16 inch or minus 0, plus domes.
   6. Tolerances of other dimensions not otherwise indicated: Plus or minus 1/16 inch.

D. Fabricate units straight, smooth, and true to size and shape, with exposed edges and corners precise and square unless otherwise indicated.

E. Units that are warped, cracked, broken, spalled, stained, or otherwise defective will not be acceptable.

F. Fabricate units and provide exposed surface finishes to match the Contracting Officer's control sample.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine the areas and conditions under which precast work is to be installed, and make provisions for the proper and timely completion of work. Do not proceed with the work until unsatisfactory conditions have been corrected.

3.2 DEFECTIVE AND DAMAGED CONCRETE UNITS

A. Do not install units with surface imperfections such as air bubbles, joint lines, stains, uneven matrix plane, and uneven exposure of aggregate.

B. Do not install units which are warped, cracked, broken, spalled, stained, or otherwise defective.
3.3 INSTALLATION

A. General: Deliver anchorage items which are to be embedded in other construction before start of such work. Provide setting diagrams, templates, instructions, and directions as required for installation.

1. Do not install precast units until concrete has attained its design compressive strength.

2. Install precast concrete members plumb, level, and in alignment within PCI/CONCRT MNL-117 standard tolerances. Provide temporary supports and bracing as required to maintain position, stability, and alignment until members are permanently connected. Maintain horizontal and vertical joint alignment and uniform joint width as erection progresses.

3. Install precast concrete units so that the joints between units meet the following:
   a. Face width of joints: plus or minus 1/16 inch.
   b. Joint taper: 1/16 inch maximum.
   c. Jog in alignment of finished surfaces: 1/16 inch maximum.
   d. Variation from level: run plus or minus 1/4 inch in any 20 feet.
   e. Variation from plumb: plus or minus 3/8 inch in 20 feet.

B. Accessories: Install clips, hangers, and other accessories required for erection of precast units to supporting members and back-up materials.

C. Connections:

1. Anchor units in final position by bolting, welding, grouting, or as otherwise indicated. Remove temporary shims, wedges, and spacers as soon as possible after anchoring is completed.
   a. At bolted connections, use lock washers or other acceptable means to prevent loosening of nuts.
   b. At welded connections, apply rust-inhibitive coating on damaged areas, same as shop-applied material. Use galvanizing repair coating on damaged galvanized surfaces.
   c. All welds shall be of sound construction; free from porosity slag inclusions, undercutting and other defects shall be of clean and regular appearance.

2. After precast concrete units are in place, remove all temporary lifting and handling devices cast into the concrete unless protectively treated and acceptable to the Contracting Officer. Do not torch cut connected anchors and clips. Patch holes with cement and sand mortar which will blend with the finished surface in texture and color.

D. Cleaning: Clean exposed facings to remove dirt and stains which may be on units after erection and completion of joint treatments. Wash and rinse in accordance with precast manufacturer's recommendations. Protect other work from damage due to cleaning operations. Do not use cleaning materials or processes which could change the character of exposed concrete finishes or joint sealants.

3.4 PERFORMANCE REQUIREMENTS

A. Conduct inspections and make repairs or replace unsatisfactory precast units as required.

1. Develop procedures and techniques for repair and corrective work to precast concrete units during the early steps of production.

2. Modify concrete proportions and blends of cement or ratio of aggregate to cement to provide an appearance of repair area that matches the remaining surfaces of the precast concrete units. Do not implement repair methods until approved by the Contracting Officer.

3. Limitations as to amount of repairs which will be permitted is subject to acceptance of Contracting Officer.

4. Make repairs to match texture and color of adjacent finished surfaces to the satisfaction of the Contracting Officer.

5. Cure and finish repair area in accordance with approved procedures.

B. In-place Precast units may be rejected for any one of the following:

1. Do not match job mock-up.

2. Exceeding specified installation tolerances.
3. Damaged during construction operations.

4. Exposed-to-view surfaces which develop surface finish deficiencies.

5. Other defects as listed in PCI/CONCRTMNL-117.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Architectural Precast Concrete described in this section will be paid for on a lump sum basis wherein no measurement will be made.

END OF SECTION 03450
THIS PAGE INTENTIONALLY LEFT BLANK
SECTION 03462
GLASS FIBER REINFORCED CONCRETE WARNING STRIPS

PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies the procurement, handling and installation of glass fiber reinforced concrete (GFRC) warning strips.

B. The precast glass fiber reinforced concrete warning strip shall consist of glass fibers, aggregate, Portland cement, embedded hardware, and other miscellaneous anchors and accessories necessary for complete installation field modifications or additional materials.

1.2 REFERENCE STANDARDS

A. Americans with Disabilities Act Accessibility Guidelines (ADAAG).

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM A666 - Standard Specification for Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar

2. ASTM C33 - Standard Specification for Concrete Aggregates

3. ASTM C39 - Standard Specification for Compressive Strength of Face Mix

4. ASTM C136 - Standard Sieve Analysis of Sand for Backing

5. ASTM C138 - Standard Specification for Slurry Unit Weight

8. ASTM C260 - Standard Specification for Air-Entraining Admixtures for Concrete

9. ASTM C494/C494M - Standard Specification for Chemical Admixtures for Concrete

10. ASTM C618 - Standard Specification for Coal Fly Ash and Raw or Calcined Natural Pozzolan for Use in Concrete

11. ASTM C947 - Standard Test Method for Flexural Properties of Thin-Section Glass-Fiber-Reinforced Concrete (Using Simple Beam with Third-Point Loading)

12. ASTM C1028 - Standard Test Method for Determining the Static Coefficient of Friction of Ceramic Tile and Other Like Surfaces by the Horizontal Dynamometer Pull-Meter Method

C. Precast/Prestressed Concrete Institute (PCI):

1. PCI/CONCRT MNL-117 - Manual for Quality Control for Plants and Production of Architectural Precast Concrete Products

2. PCI/CONCRT MNL-128 - Recommended Practice for Glass Fiber Reinforced Concrete Panels

D. Texas Accessibility Standards (TAS).

1.3 SUBMITTALS

A. Product Data:

1. Submit manufacturer's product data and specifications, with application and installation instructions for manufactured materials and products. Include concrete mix reports, material certificates and laboratory test reports as specified in Section 01450, "Quality Control".

2. Include water absorption test reports.

B. Shop Drawings:

1. Submit shop drawings prepared by or under supervision of a Professional Engineer licensed in the State of Texas showing complete information for fabrication of glass fiber reinforced concrete warning strip units. Indicate unit dimensions and cross-sections, fabrication tolerances, location, size, and type of reinforcement, including any special reinforcement and lifting devices necessary for handling.

2. Shop drawings are to be sealed and signed by the Professional Engineer.

3. Detail inserts, connections, and joints, including accessories and construction at openings in glass fiber reinforced concrete units.

4. Show location and details of anchorage devices to be embedded in or connected to other construction.

5. Submit design mix for approval prior to fabrication of samples.
C. Samples: Submit three samples, approximately 12 inches by 12 inches to illustrate typical range of color, pattern, and texture and of appropriate thickness; these are to be submitted prior to fabrication of project glass fiber reinforced concrete warning strip units.

D. Mock Ups: Submit two units 2 feet wide by 2 feet 6 inches long for use as a field performance mock-up. Provided the product meets the testing criteria outlined in Paragraph 1.2 of this specification section, units will be installed in a location to be determined by the Contracting Officer.

1.4 QUALITY ASSURANCE

A. Engineer Qualifications: The engineering work for this specification section shall be done by or under the supervision of a Professional Engineer registered to practice in the State of Texas, and experienced in providing engineering services that have resulted in successful installation of glass fiber reinforced concrete units similar in material, design, and extent as required for this Project. Comply with procedures in PCI/CONCRT MNL-117.

B. Manufacturer Qualifications: Firms which have a minimum of 5 years successful uninterrupted production experience in the fabrication of glass fiber reinforced concrete units, similar to units required for this Project, will be acceptable. Manufacturer must have sufficient production capacity to produce, transport, and deliver required units without causing delay in the work. The GFRC Manufacturing plant shall be certified by the Prestressed Concrete Institute's Plant Certification Program, prior to bid date.

C. Testing Laboratory and Quality Control: In accordance with Section 01450, "Quality Control". Testing shall be in accordance with ASTM C94 - as modified by PCI/CONCRT MNL-128.

D. The following testing shall be required in accordance with ASTM C241, C947 and C1028 and PCI/CONCRT MNL-128 and MNL-117:

1. Flexural yield strength.
2. Flexural ultimate strength.
3. Slurry unit weight test.
4. Slurry slump test.
5. Aggregate gradation testing.

E. Tolerances: Manufacture GFRC panels so that tolerances for dimensions and appearance shall be as indicated in PCI/CONCRT MNL-128 and PCI/CONCRT MNL-117.

F. Records: Keep quality control records available for two years after final acceptance.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Deliver glass fiber reinforced concrete warning strip units to Worksite in such quantities and at such times to assure continuity of installation. Handle and transport units in a position consistent with their shape and design in order to avoid excessive stresses or damage.

B. Store units at Worksite to prevent cracking, distorting, warping, staining, or other physical damage and so that markings are visible. Lift and support units only at designated lifting or supporting points as shown on final shop drawings.

C. Keep units under cover and protected until installed.

D. Deliver anchorages items which are to be embedded in other construction before the start of such work. Provide setting diagrams, templates, and directions as required for installation.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Following manufacturers listed are "acceptable" only if manufacturer can evidence product compliance with requirements of Contract Documents.

1. GFRC Cladding Systems, Inc.
2. GFRC Specialties
3. Hand and Spirit, Inc.

2.2 GLASS FIBER REINFORCED CONCRETE (GFRC) MATERIALS

A. Portland Cement:

1. ASTM C150, Type I.
2. Use only one brand, type, and source of supply of cement throughout GFRC production, unless noted otherwise.
3. Use colored Portland cement with concrete pigment for concrete mix as necessary to match Contracting Officer's GFRC concrete warning strip control sample.

B. Aggregates:

1. Sand to conform with ASTM C144 passing through No. 16. sieve of washed and dried
GLASS FIBER REINFORCED CONCRETE WARNING STRIPS

2. Aggregate used in GFRC units shall conform to ASTM C33 and match in size (not to exceed 1/2 inch), color, texture, and aggregate exposure to that used in the Contracting Officer's GFRC warning strip control sample.

C. Water: Drinkable, free from foreign materials in amounts harmful to concrete and embedded steel.

D. Admixtures: Conform to ASTM C260 for air entrainment, ASTM C494/C494M for chemical admixtures, or ASTM C618 for fly ash or natural pozzolan admixtures at manufacturer's option. Do not use admixtures that contain more than 0.1 percent chloride ions.

E. Coloring Agent:
   1. Conform to ASTM C979; ultraviolet and alkali resistant; high-temperature stable; harmless to concrete set or strength.
   2. Match color to that of Contracting Officer's GFRC warning strip control sample.
   3. The amount of coloring agent shall not exceed 10 percent of the cement weight.

F. Glass Fiber: Specifically designed for compatibility with aggressive alkaline environment of Portland cement-based composites, complying with PCI/CONCRTMNL-117 and PCI/CONCRTMNL-128.

G. Forms: Provide forms consisting of a form-facing material of metal, plastic, rubber, high density wood, or other acceptable material that is non-reactive with concrete and will produce required finish surfaces. Use forms that do not require a release agent to prevent reaction with sealants.

H. Anchors and Subsystems:
   1. Stainless steel anchors and other attachment and connection materials: AISI Type 302/304, ASTM A666.
   2. Each GFRC unit is to be attached to the supporting concrete with a minimum of two anchors in the top horizontal plane (one anchor for every 2.5 SF of surface) and at uniform spacing.
   3. Weepholes Tubes: In accordance with Section 04100, "Mortar, Grout and Masonry Accessories".

2.3 FABRICATION

A. Fabricate GFRC warning strip units complying with manufacturing and testing procedures, quality control recommendations, and following dimensional tolerances, unless otherwise indicated.

B. Accurately construct forms mortar-tight of rigid materials that will result in finished GFRC warning strip units conforming to profiles, lines, and dimensional tolerances indicated, within specified fabrication tolerances.

C. Dimensional Tolerances of Finished Units: Overall height and width measured at face adjacent to mold at time of casting:
   1. Length and width of unit: Plus or minus 1/16 inch.
   2. Angular deviation of plane of mold: 1/16 inch total.
   3. Out of Square (difference in length of two diagonal measurements): 1/16 inch.
   4. Skin Thickness: Plus 1/4 inch or minus 0.
   5. Architectural Facing Thickness: Plus 1/8 inch or minus 0.
   6. Tolerances of other dimensions not otherwise indicated: Plus or minus 1/16 inch.

D. Fabricate units straight, smooth, and true to size and shape, with exposed edges and corners precise and square unless otherwise indicated.

E. GFRC concrete warning strip units that are warped, cracked, broken, spalled, stained, or otherwise defective will not be acceptable.

F. Provide loose stainless steel pins, anchors, and other miscellaneous anchors not provided by other trades, necessary for securing GFRC warning strip units to supporting and adjacent members.

G. Fabricate GFRC warning strip units and provide exposed surface finishes to match the Contracting Officer's control sample.

H. Curing: Ensure sufficient strength for removing units from form.
   1. After initial curing, remove panel from form and place in a controlled curing environment. Keep panels continuously moist for minimum 7 days in accordance with manufacturer's standard curing practice. Maintain temperature between 60 deg. F and 120 deg. F during this period.
2. Acrylic thermoplastic copolymer dispersion may be used as a curing admixture in lieu of moist curing. Use only copolymers shown to eliminate need for moist curing through published independent laboratory test data and in accordance with specifications in Appendix F of PCI/CONCRT MNL-128. Verify compatibility of alternate curing agent with sealant.

I. Mark each GFRC warning strip unit to correspond to identification mark on shop drawings. Mark each panel with casting date.

J. Source Quality Control: Establish a quality control program for manufacturing GFRC panels to monitor glass content, spray rate, unit rate of slurry, product physical properties, and shear strengths, curing period and conditions, flexural yield strength, and flexural ultimate strength in accordance with PCI/CONCRT MNL-117.

K. The GFRC panels shall meet or exceed the following requirements when dry tested:

<table>
<thead>
<tr>
<th>Property</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flexural Ultimate Strength</td>
<td>2500 psi</td>
</tr>
<tr>
<td>Flexural Yield Strength</td>
<td>1500 psi</td>
</tr>
<tr>
<td>Tensile Ultimate Strength</td>
<td>1300 psi</td>
</tr>
<tr>
<td>Ultimate Compressive Strength</td>
<td>9000 psi</td>
</tr>
<tr>
<td>Glass Fiber Content</td>
<td>4.5 - 6% by weight</td>
</tr>
</tbody>
</table>

L. GFRC Skin: In no case shall the panel skin be less than 1 inch thick. Backup mixes shall have the same proportion of pigments as face mixes to eliminate the possibility of bleeding through a different colored backup.

M. Provide detectable warning pattern on walking surface of units to comply with ADAAG and TAS. Match Contracting Officer’s sample for color and pattern.

N. Architectural facing, if required, shall be no less than 1 1/8 inches thick, excluding detectable warning dome.

2.4 MORTAR SETTING BED

A. General: The GFRC manufacturer shall verify the compatibility of the mortar bed with the composition of the GFRC design mix. A three part mortar setting bed shall be used to adhere the GFRC warning strip units to the concrete grade beams.

C. Expansion Control: Provide expansion (sealant) joints between GFRC units as recommended by the mortar setting bed requirements at intervals not to exceed 20 feet on center. Joint design shall conform to Tile Council of America (TCA) Detail EJ 171.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Examine the areas and conditions under which GFRC units are to be installed, and make provisions for the proper and timely completion of work. Do not proceed with the work until unsatisfactory conditions have been corrected.

B. Provide and check setting diagrams, templates, instructions, and directions of embedded anchors as required for installation. Drill holes in the platform surface in which the GFRC will be installed at the proper template location. Check location of holes prior to drilling on each panel. Drilled holes shall be 1/2 inch larger than anchor diameter.

C. Do not install glass fiber reinforced concrete warning strip units until supporting concrete has attained minimum allowable design compressive strength.

D. Install GFRC warning strip units at true plane per contract drawings, and in alignment within PCI/CONCRT MNL-117 and specified limits of installation tolerances. Provide temporary supports, spacers, and bracing as required to maintain position, stability, and alignment as units are being permanently installed.
E. Maintain a perpendicular joint alignment, unless otherwise shown on drawings, and uniform joint width as erection progresses.

F. Install weepholes where shown.

G. Anchor units in final position by grouting setting bed and all joints, or as otherwise indicated. Remove temporary shims, wedges, and spacers as soon as possible after anchoring and grouting are completed.

H. Clean exposed facing to remove dirt and stains on units after installation and completion of joint treatments. Wash and rinse in accordance with GFRC manufacturer’s recommendations. Do not use cleaning materials or processes that could change the character of GFRC finishes.

I. Surface of each unit will be at designated elevation, tactile domes will extend above finished elevations shown on drawings.

3.2 INSTALLATION TOLERANCES

A. Install precast concrete warning strips so that the joints between units meet the following:

1. Face width of joints: plus or minus 1/16 inch.
2. Joint taper: 1/16 inch maximum in 3 feet.
4. Variation from true plane: run plus or minus 1/4 inch in 30 feet.
5. Variation from plumb: plus or minus 1/16 inch maximum in 3 feet.

B. Warning strips shall be placed within plus 1/4 inch of horizontal and vertical line and grade.

3.3 DEFECTIVE AND DAMAGED GFRC UNITS

A. Do not install units with surface imperfections such as air bubbles, joint lines, warpage, stains, and damages to any exposed sides or corners.

3.4 PERFORMANCE REQUIREMENTS

A. General:

1. Conduct inspections, perform testing, and make repairs or replace unsatisfactory GFRC warning strip units as required.

2. Develop procedures and techniques for corrective work to GFRC warning strip units during the early stages of production.

B. Limitations as to amount of corrective work which will be permitted is subject to acceptance of the Contracting Officer.

C. In-place GFRC warning strip units may be rejected for any one of the following:

1. Does not match mock-up.
2. Exceeding specified fabrication or installation tolerances.
3. Damage during construction operations.
4. Surface finish deficiencies and irregularities in exposed-to-view surfaces.
5. Visible stains on panel surface.
6. Visible differences between panel and approved sample.
7. Visible nonuniformity of textures or color.
8. Visible areas of backup concrete bleeding through the facing concrete.
9. Visible foreign material embedded in the face.
10. Visible repairs or cracks.
11. Visible reinforcement shadow lines.

3.5 INSPECTION

A. Materials furnished in this Contract shall be presented for inspection at the place of manufacture. The Contractor shall provide the Contracting Officer all necessary facilities to examine the work during its progress as well as the finished product to verify that the materials comply with these Specifications.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Glass fiber reinforced concrete warning strip units will not be measured but will be paid for at the lump sum price.
SECTION 03490
GLASS-FIBER-REINFORCED PRECAST CONCRETE

PART 1 - GENERAL

1.1 SUMMARY

A. Work required for this section includes plant-cast, glass-fiber reinforced concrete (GFRC) column covers, including embedded hardware, loose connection hardware and supplementary items necessary to complete their installation.

B. Elastomeric sealants and backings for sealing joints between panels is specified in Section 07900, "Joint Sealants".

1.2 REFERENCED STANDARDS

A. American Welding Society (AWS):

1. AWS D1.1/D1.1M - Structural Welding Code - Steel

2. AWS D1.3 - Structural Welding Code - Sheet Steel

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

2. ASTM A108 - Standard Specification for Steel Bar, Carbon and Alloy, Cold-Finished

4. ASTM A153/A153M - Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware

5. ASTM A283/A283M - Standard Specification for Low and Intermediate Tensile Strength Carbon Steel Plates

6. ASTM A307 - Standard Specification for Carbon Steel Bolts and Studs, 60 000 psi Tensile Strength

7. ASTM A325 - Standard Specification for Structural Bolts, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength

8. ASTM A780 - Standard Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings

9. ASTM C144 - Standard Specification for Aggregate for Masonry Mortar

11. ASTM C231 - Standard Test Method for Air Content of Freshly Mixed Concrete by the Pressure Method

12. ASTM C260 - Standard Specification for Air-Entraining Admixtures for Concrete

13. ASTM C494/C494M - Standard Specification for Chemical Admixtures for Concrete

14. ASTM C947 - Standard Test Method for Flexural Properties of Thin-Section Glass-Fiber-Reinforced Concrete (Using Simple Beam with Third-Point Loading)

15. ASTM C948 - Standard Test Method for Dry and Wet Bulk Density, Water Absorption, and Apparent Porosity of Thin Sections of Glass-Fiber Reinforced Concrete

C. Precast/Prestressed Concrete Institute (PCI):

1. PCI/CONCRT MNL-117 - Manual for Quality Control for Plants and Production of Architectural Precast Concrete Products

2. PCI/CONCRT MNL-128 - Recommended Practice for Glass Fiber Reinforced Concrete Panels

3. PCI/CONCRT MNL-130 - Manual for Quality Control for Plants and Production of Glass Fiber Reinforced Concrete Products.

1.3 PERFORMANCE REQUIREMENTS

A. Structural Performance: Provide GFRC panels, panel frames and anchors capable of withstanding gravity, wind, seismic, and erection design loads as well as the effects of thermal- and moisture-induced volume changes, according to load factors and combinations established in PCI/CONCRT MNL-128.

1. Design Loads: As indicated on drawings in "Building Summary" schedule.

2. Design framing systems to withstand design loads with lateral deflections no greater than 1/360 of the panel height.

B. Design panel framing to provide for movement of framing members without damage or over stressing, connection failure, undue strain on fasteners and anchors, or other detrimental effects when subject to a maximum ambient
1.4 SUBMITTALS

A. Product Data: For each type of product indicated. Include GFRC design mixes.

B. Shop Drawings: Detail fabrication and installation of GFRC panels, including the following:
   1. Signed and sealed by the qualified professional engineer responsible for its preparation and engineering.
   2. Panel elevations, sections, and dimensions.
   3. Thickness of facing, GFRC backing, and bonding pads.
   4. Finishes.
   5. Joint and connection details.
   7. Cold-formed metal framing layout and details.
   8. Location and details of connection hardware attached to structure.
   9. Size, location, and details of flex, gravity, and seismic anchors.
  10. Other items sprayed into panels.
  11. Sequence of erection for special conditions.
  12. Relationship to adjacent materials.
  13. Description of loose, cast-in, and field hardware.

C. Samples: Representative of finished exposed face of GFRC showing the full range of colors and textures expected, 12 by 12 inches and of appropriate thickness.

D. Welding Certificates: Copies of certificates for welding procedures and personnel.

E. Qualification Data: For manufacturing firms specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: An experienced installer who has completed GFRC panels similar in material, design, and extent to that indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.

B. Manufacturer Qualifications: A firm that complies with the following requirements and is experienced in manufacturing GFRC panels similar to those indicated for this Project and with a record of successful in-service performance.
   1. Assumes responsibility for engineering GFRC panels to comply with performance requirements. This responsibility includes preparation of Shop Drawings and comprehensive engineering analysis by a qualified professional engineer.

B. Professional Engineer Qualifications: A professional engineer who is legally qualified to practice in State of Texas and who is experienced in providing engineering services of the kind indicated. Engineering services are defined as those performed for installations of GFRC panels that are similar to those indicated for this Project in material, design, and extent.
   1. Participates in PCI's Plant Certification Program and is designated a PCI-Certified Plant for Group G, Glass Fiber Reinforced Concrete.
   2. Has sufficient production capacity to produce required units without delaying the Work.

C. Welding: Qualify procedures and personnel according to AWS D1.1/D1.1M and AWS D1.3.

D. PCI Manuals: Comply with requirements and recommendations in PCI/CONCRT MNL-128 and PCI/CONCRT MNL-130, unless more stringent requirements are indicated:

E. Mockups: Before installing GFRC, build mockups for each form of construction and finish required to verify selections made under sample Submittals and to demonstrate aesthetic effects and qualities of materials and execution. Build mockups to comply with the following requirements, using materials indicated for the completed Work:
   1. Build mockups in the location and of the size indicated or, if not indicated, as directed by Contracting Officer.
F. Include sealant-filled GFRC joints complying with requirements in Section 07900, “Joint Sealants.”

1. Notify Contracting Officer seven days in advance of dates and times when mockups will be constructed.
2. Demonstrate the proposed range of aesthetic effects and workmanship.
3. In presence of Contracting Officer, damage part of an exposed-face surface and demonstrate materials and methods proposed for repair of surface blemishes.
4. Obtain Contracting Officer's approval of mockups before starting installation.
5. Maintain mockups during installation in an undisturbed condition as a standard for judging the completed Work.
6. Demolish and remove mockups when directed.

1.6 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Handle and transport units to avoid excessive stresses or damage.

B. Store units to protect from contact with soil, staining, and physical damage.

PART 2 - PRODUCTS

2.1 MOLD MATERIALS

A. Molds: Rigid, dimensionally stable, nonabsorptive material, warp and buckle free, that will provide continuous and true GFRC surfaces; nonreactive with GFRC and capable of producing required finish surfaces.

1. Mold-Release Agent: Commercially produced liquid-release agent that will not bond with, stain, or adversely affect GFRC surfaces and will not impair subsequent surface treatments of GFRC.

B. Form Liners: Units of face design, texture, arrangement, and configuration to match approved sample. Provide solid backing and form supports to ensure that form liners remain in place during concreting. Furnish with manufacturer's recommended liquid-release agent that will not bond with, stain, or adversely affect GFRC surfaces and will not impair subsequent surface treatments of GFRC.

2.2 GFRC MATERIALS

A. Portland Cement: ASTM C150, Type I, color as required to match approved sample.

1. For surfaces exposed to view in finished structure, use of same type, brand, and source throughout GFRC production.

B. Glass Fibers: Alkali resistant, with a minimum zirconia content of 16 percent, 1 to 2 inches long, specifically produced for use in GFRC, and complying with PCI MNL 130.

C. Sand: Washed and dried silica, successfully used in GFRC production, complying with composition requirements of ASTM C144; passing No. 20 sieve with a maximum of 2 percent retained on No. 140 sieve.

D. Water: Potable; free from deleterious material that may affect color stability, setting, or strength of GFRC and complying with chemical limits of PCI MNL 130.

E. Curing Admixture: Acrylic thermoplastic copolymer dispersion complying with PCI MNL 130.

F. Air-Entraining Admixture: ASTM C260, containing not more than 0.1 percent chloride ions.

G. Chemical Admixtures: ASTM C494/C494M, containing not more than 0.1 percent chloride ions.

2.3 ANCHORS AND SUBSYSTEMS

A. Carbon-Steel Shapes and Plates: ASTM A36/A36M.

C. Carbon-Steel Plate: ASTM A283/A283M.

D. Bolts: ASTM A307 or ASTM A325.

E. Finish: Zinc coated by hot-dip process according to ASTM A123/A123M, after fabrication, and ASTM A153, as applicable.

2.4 GFRC MIXES

A. GFRC Mix: Proportion backing mix of portland cement, glass fibers, sand, and selected admixtures to comply with design requirements, and as follows. Provide nominal glass-fiber content of not less than 5 percent.

1. Flexural Properties: Average yield strength of 900 psi, and average ultimate strength of 2200 psi at 28 days; ASTM C947.
2. Maximum Water-Cementitious Ratio: 0.35.

3. Curing Admixture: 4 to 5 percent of total mix volume.

5. Air Content: 3 to 10 percent; ASTM C231.

2.5 MOLD FABRICATION

A. Construct molds that will result in finished GFRC complying with profiles, dimensions, and tolerances indicated, without restraining shrinkage or damaging GFRC during stripping. Construct molds to prevent water leakage and loss of cement paste. Coat contact surfaces of molds with form-release agent.

B. Place form liners accurately to provide finished surface texture indicated. Provide solid backing and supports to maintain stability of liners during GFRC application. Coat form liner with form-release agent.

2.6 GFRC FABRICATION

A. Proportioning and Mixing: For backing mix, meter sand/cement slurry and glass fibers to spray head at rates to achieve desired mix proportion and glass content according to PCI MNL 130 procedures.

B. Spray Application: Comply with general procedures as follows:

1. Spray mist coat or face mix of matrix without glass fibers over molds to a thickness not exceeding 1/8 inch.

2. Proceed with spraying up backing mix skin before mist coat or face mix has set, using procedures that produce a uniform thickness and even distribution of glass fibers and matrix.

3. Consolidate backing mix by rolling or use another technique to achieve complete encapsulation of glass fibers and compaction.

4. Measure thickness with a pin gage or another acceptable method at least once for each 5 sq. ft. of panel surface. Take not less than six measurements per panel.

C. Hand form intricate details, incorporate formers or infill materials, and over spray before material reaches initial set to ensure complete bonding.

D. Attach panel frame to GFRC before initial set of GFRC backing, maintaining a minimum clearance of 1/2 inch from GFRC backing, and without anchors protruding into GFRC backing.

E. Build up homogeneous GFRC bonding pads over anchor legs, maintaining a minimum thickness of 1/2 inch over top of anchor foot, before initial set of GFRC backing.

F. Inserts and Embedments: Build up homogeneous GFRC bosses or bonding pads over inserts and embedments to provide sufficient anchorage and embedment to comply with design requirements.

G. Curing: Employ initial curing method that will ensure sufficient strength for removing units from mold.

1. After initial curing, remove panel from mold and place in a controlled curing environment.

2. Keep panels continuously moist for a minimum of seven days. Maintain temperature between 60 and 120 deg F during this period.

3. An acrylic thermoplastic copolymer dispersion may be used as a curing compound in lieu of moist curing. Use only copolymers shown, in published independent laboratory test data, to eliminate the need for moist curing of GFRC.

H. Panel Identification: Mark each GFRC panel to correspond with identification mark on Shop Drawings. Mark each panel with its casting date.

2.7 FABRICATION TOLERANCES

A. Manufacturing Tolerances: Manufacture GFRC units so each finished panel complies with the following basic dimensional tolerances. For additional dimensional tolerances not listed below, comply with PCI MNL 130.

1. Overall Height and Width of Units, Measured at the Face Adjacent to Mold:

   B. 10 feet or under, plus or minus 1/8 inch.

   C. More than 10 feet, plus or minus 1/8 inch per 10 feet; 1/4 inch maximum.

   1. Edge Return Thickness: Plus 1/2 inch, minus 0 inch.

4. Local Smoothness: 1/4 inch per 10 feet.

5. Bowing: Not to exceed L/240 unless unit meets erection tolerances using connection adjustments.

6. Length and Width of Block Outs and Openings within One Unit: Plus or minus 1/4 inch.

7. Location of Window Opening within Panel: Plus or minus 1/4 inch.

8. Maximum Permissible Warpage of One Corner out of the Plane of the Other Three: 1/16 inch per 12 inches of distance from nearest adjacent corner.

2.8 FINISHES

A. Finish exposed-face surfaces of GFRC units as follows to match design reference sample. Panel faces shall be free of joint marks, grain, or other obvious defects.

1. Typical: Smooth-Surface Finish: Provide free of pockets, sand streaks, and honeycombs, with uniform color and texture.

2. Where indicated: Abrasive-Blast Finish: Use abrasive grit, equipment, application techniques, and cleaning procedures to expose aggregate and surrounding matrix surfaces.

2.9 SOURCE QUALITY CONTROL

A. Quality-Control Testing: Establish and maintain a quality-control program for manufacturing GFRC panels according to PCI MNL 130.

1. Test and inspect GFRC production. Include material acceptance testing, preproduction testing, aggregate production testing, wet production testing, and production testing after curing.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrate surfaces to receive GFRC units and associated work and conditions under which work will be installed. Do not proceed with work until unsatisfactory conditions have been corrected in a manner acceptable to installer. Starting work within a particular area will be construed as applicator's acceptance of installation conditions.

3.2 ERECTION

A. Install clips, hangers, and other accessories required for connecting GFRC units to supporting members and backup materials.

B. Lift GFRC units at lifting points established by manufacturer and install without damaging units.

C. Install GFRC units level, plumb, square, and in alignment. Provide temporary supports and bracing as required to maintain position, stability, and alignment of units until permanent connections are completed.

1. Maintain horizontal and vertical joint alignment and uniform joint width.

2. Remove projecting hoisting devices.

D. Anchor GFRC units in position by bolting or welding, or both, as indicated on Shop Drawings. Remove temporary shims, wedges, and spacers as soon as possible after anchoring is completed.

E. Welding: Comply with AWS D1.1/D1.1M and AWS D1.3 requirements and procedures for welding, appearance and quality of welds, and methods used in correcting welding work.

1. Protect GFRC units from damage by field welding or cutting operations, and provide noncombustible shields as required.

F. At bolted connections, use lock washers or other acceptable means to prevent loosening of nuts.

3.3 ERECTION TOLERANCES

A. Plan Location from Building Grid Datum: Plus or minus 1/2 inch.

B. Top Elevation from Nominal Top Elevation: As follows:

1. Exposed Individual Panel: Plus or minus 1/4 inch.

2. Nonexposed Individual Panel: Plus or minus 1/2 inch.

3. Exposed Panel relative to Adjacent Panel: 1/4 inch.

4. Nonexposed Panel relative to Adjacent Panel: 1/2 inch.

C. Support Elevation from Nominal Elevation:

1. Maximum Low: 1/2 inch.

GLASS-FIBER-REINFORCED PRECAST CONCRETE

D. Maximum Plumb Variation over the Lesser of Height of Structure or 100 Feet: 1 inch.

E. Plumb in Any 10 Feet (3 m) of Element Height: 1/4 inch.

F. Maximum Jog in Alignment of Matching Edges: 1/4 inch.

G. Maximum Jog in Alignment of Matching Faces: 1/4 inch.

H. Face Width of Joint: (governs over joint taper):
   1. Panel Dimension 20 Feet or Less: Plus or minus 1/4 inch.

J. Joint Taper in 10 Feet: 1/4 inch.

K. Differential Bowing, as Erected, between Adjacent Members of Same Design: 1/4 inch.

3.4 REPAIRS

A. Repairs will be permitted provided structural adequacy of GFRC unit and appearance are not impaired, as approved by Contracting Officer.

B. Blend and mix patching materials and repair GFRC so cured patches match color, texture, and uniformity of adjacent exposed surfaces.

C. Prepare and repair damaged galvanized coatings on metal framing, anchors, and subsystems with galvanizing repair paint according to ASTM A780.

D. Remove and replace damaged GFRC units when repairs do not comply with requirements.

3.5 CLEANING AND PROTECTION

A. Perform cleaning procedures according to GFRC manufacturer’s written instructions. Clean soiled GFRC surfaces with detergent and water, using soft fiber brushes and sponges, and rinse with clean water. Prevent damage to GFRC surfaces and to adjacent materials.

B. Provide final protection and maintain conditions that ensure GFRC is without damage or deterioration at time of Substantial Completion.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will be paid for on a lump sum basis for glass-fiber-reinforced precast concrete (GFRC) per location indicated wherein no measurement will be made.

END OF SECTION 03490
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies the materials and procedures to repair concrete defects caused by spills, cracks, or delaminations. In no case does the inclusion of this specification imply that substandard work is acceptable and can be repaired to conform to contract drawings by the use of the materials and procedures included herein. The Authority reserves the right to reject any substandard or deficient product and require the Contractor to remove and replace the nonconforming product with one that conforms to the Contract Documents at no cost to the Authority.

B. The type of concrete repair specified herein include the following:

1. Minor Surface Repair
2. Surface Repair
3. Crack Repair

C. Repairs required beyond these described here may require a specialty contractor and a separate repair procedure and plan for each case.

1.2 REFERENCE STANDARDS

A. American Concrete Institute (ACI):

1. ACI 224.1R - Causes, Evaluation and Repair of Cracks in Concrete Structures
2. ACI 503.2 - 503.4 - Three Epoxy Standards
   a. ACI 503.2 - Standard Specification for Bonding Plastic Concrete to Hardened Concrete with a Multi-Component Epoxy Adhesive
   b. ACI 503.3 – Specification for Producing a Skid-Resistant Surface on Concrete by the Use of Epoxy and Aggregate
   c. ACI 503-4 – Standard Specification for Repairing Concrete with Epoxy Mortars

1.3 SUBMITTALS

A. Contractor shall submit the proposed repair procedure for each repair not covered under “Minor Surface Repair”. With the approval of the Contracting Officer’s inspector, repairs agreed to that qualify as “Minor Surface Repair” will not require a submitted procedure. Other repairs will require a repair procedure be submitted for approval, identifying, products, tools and procedures to be used and dimensional extents of repair.

B. Defective concrete, which by its extent, type, or location exceeds the repair procedures enclosed, herein, as determined by the Contracting Officer, will require a submittal detailing repair procedure, specialty contractors to be employed, materials to be used, tools to be used, location of repair and dimensions of said repair.

1.4 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Delivery, storage and handling of products shall conform to each manufacturer’s recommendations.

B. Packages opened prior to its day of intended use shall be discarded and not used.

C. Do not exceed the shelf life of a product.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Concrete: Conform to Section 03305 “Portland Cement Concrete”.

B. Epoxy: Low viscosity epoxy adhesive conforming to TxDOT Material Specification DMS-6100, Type IX.

C. Grout: Conform to Section 03305 “Portland Cement Concrete”.

PART 3 - EXECUTION

3.1 MINOR SURFACE REPAIR

A. A minor repair is defined as a spall or small area of section loss that does not expose any reinforcing and has a maximum of 1-1/2 inch depth of defective concrete.

B. Remove loose, delaminated, or honeycombed concrete to sound material. Feathered edges shall be eliminated by saw cutting or chiseling a vertical edge around the repair perimeter, a minimum of 1/4 inch, or as recommended by the material supplier.

C. If upon removing defective concrete, reinforcing is exposed, further preparations, as defined in article 3.2 Surface Repair, may be necessary, at the discretion of the Contracting Officer.

D. Once defective concrete is removed, and no reinforcing is exposed or cracks visible, the surface is to be cleaned by wire brush, oil-free air hose, or...
SURFACE REPAIR

A. Surface Repair: A surface repair is defined as an area of deficient concrete larger than the defined minor repair and/or exposes reinforcing steel. The Contracting Officer is to be notified immediately if an area of defective concrete will require a Surface Repair. The procedure for a surface repair is as follows:

B. Remove loose delaminated concrete to sound concrete. Feathered edges shall be eliminated by saw cutting around the repair perimeter a minimum of 1/4 inch. Care shall be taken not to damage any reinforcing during the concrete removal process. Where one-half of a reinforcing bar’s circumference is exposed, concrete, whether sound or delaminated, shall be sufficiently removed to provide a 1 inch clearance beyond the exposed reinforcing.

C. If after removing delaminated concrete, no reinforcing is visible, yet the removed concrete exceeds 1-1/2 inch in depth, anchors shall be drilled and epoxied into the sound concrete, extending into the patch material. Embedment into sound concrete shall be at least 3 inches and cover from the finished patch surface shall be at least 1/2 inch. Spacing of anchors shall not exceed 6 inch. Supplemental reinforcing consisting of reinforcing bars, welded wire fabric or other approved material may be required as directed by the Contracting Officer.

D. If after removing delaminated concrete visible cracks remain, they shall be epoxy injected per Article 3.3 of this specification, as directed by the Contracting Officer.

E. The surface of the area to be patched shall be cleaned by wire brush or other approved means, to remove loose particles, dirt, deteriorated concrete or other substance that would impede the bond of the patch material. Final cleaning shall be by an oil-free, high pressure, air blast.

F. Concrete surface to be patched shall then be saturated or coated with an approved bonding agent. If a proprietary patch material is used, preparation shall be in compliance with the manufacturer’s recommendations.

G. Concrete, similar to the damaged base material shall be used for the patch material. A proprietary patch material may be used in lieu of concrete, if approved by the Contracting Officer. Forming, if required, casting and curing shall be performed in compliance with these specifications for the intended use of the damaged element.

H. Verification of the bonding shall be done by sounding the patch and surrounding area with an inspector’s hammer. Areas sounding hollow shall be removed and repaired per this specification.

3.3 EPOXY INJECTION OF CRACKS

A. Epoxy Injection of Cracks: Cracks larger than 0.002 inch but less than 3/32 inch wide shall be injected with epoxy if approved by the Contracting Officer. Cracks greater than 3/32 inch will have to be reviewed by the Contracting Officer on a case-by-case basis. The sealing material shall be an epoxy adhesive capable of bonding to wet or dry surfaces and shall be gray in color. It shall have adequate strength and adhesion to confine the injection material in the cracks being injected until the injection material has cured.

B. Epoxy used for injection shall be a two-component epoxy conforming to TxDOT Materials Specification DMS 6100, Type IX or other material as approved by the Contracting Officer. The viscosity of the epoxy shall be adjusted as necessary to obtain penetration and retention into the cracks. Where there is considerable variation in crack widths, it may be necessary to use more than one epoxy formulation. The epoxy shall contain no solvents and no solvents shall be added at any time. The mixing ratio of the components in terms of volume and weight shall be clearly stated. Proprietary crack injection systems may be used subject to approval by the Contracting Officer.

C. Unless otherwise approved by the Contracting Officer, injection will not be permitted unless the concrete temperature is above 50 degrees F and the air temperature is above 50 degrees F and forecasted to remain above 50 degrees F for the duration of the application period.

D. Top surface of cracks to be injected shall be cleaned free of dust, dirt, oil, grease or other material that would interfere with the bond of the surface sealer. The interior of the cracks should also be cleaned as much as possible with compressed air prior to sealing. Entry ports for epoxy injection shall be provided, spaced far enough apart to assure that when the epoxy shows at the adjacent port, it has completely filled the crack to its full depth. Entry ports may be either surface mounted or drilled into the cracks.
shall be placed along cracks a maximum of 12 inches on center and usually determined by the tightness of the crack and the depth of penetration. Spacing is generally between 4 inches and 10 inches. When drilling cracks for port installation, care should be used to avoid over drilling the crack. There should be no evidence of any dust or debris remaining in the drilled holes, which would be detrimental to the injection process. The injection ports shall be epoxied in place with the surface seal epoxy being careful not to seal the ports from resin flow.

E. Epoxy shall be injected with automatic two-component proportioning and mixing equipment. The two components shall be mixed by the machine just prior to injection. The machine must be capable of proportioning the materials to within plus or minus 5 percent of the ratio stated by the epoxy supplier. The mixing head must be designed so that an intimate mix of the two components will be obtained. Dwell time in the mixing head shall not exceed 10 seconds.

F. Injection of the epoxy into a given crack shall, unless permitted by the Contracting Officer begin first at the lowest entry port and progress upward as the epoxy begins to flow out of the adjacent ports. Injection pressure shall be kept as low as possible and shall not exceed 30 psi. After injection at a given port has been completed, this port shall be sealed and injection started at the next adjacent port.

G. Before beginning injection, and at selected intervals during the injection work, a small sample of the mixed epoxy will be taken from the injection gun. Should these samples show any evidence of improper proportioning or mixing, injection work shall be suspended until the equipment or procedures are corrected.

H. Surface of the crack herein treated shall be finished flush with the adjacent concrete surfaces and show no indentations or evidence of port fittings.

3.4 QUALITY OF WORK

A. Overall quality of the work will be judged by the Contractor’s ability to achieve a repair with no voids remaining in the structure and full epoxy penetration into cracks.

B. In case of question as to the quality of the work, the Contracting Officer may have core samples taken from the completed work and assess the completeness of the patch and/or crack injection. The cores will be taken at locations determined by the Contracting Officer. The expense of taking and testing core samples will be borne by the Contractor.

C. In general, core samples indicating 90 percent or more epoxy penetration into the crack will signify acceptable work. Work not considered acceptable will not be paid for unless satisfactorily corrected by the Contractor. In evaluating core samples for compliance, the Contracting Officer will take into account the presence of foreign matter that was not amendable to removal by usual crack cleaning processes required herein.

D. Finishing of the surface shall match the surrounding concrete in color and texture. The final surface shall be as shown on the contract drawings.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Work described in this section will not be measured or paid for separately if the work is being performed on concrete constructed as part of this Contract.

B. If the work specified under this section is being performed on preexisting structures then the work will be measured by and paid for at the following unit prices: Per square foot of surface for “minor surface repair” and for “surface repair” and per linear foot of crack for “epoxy injection”.

END OF SECTION 03905
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies furnishing mortar and accessories for unit masonry work, including brick masonry, concrete masonry units and stone. The installation of such material is specified in the various masonry sections.

1.2 REFERENCED STANDARDS

A. American Concrete Institute (ACI):
   1. ACI 530.1/ASCE 6/TMS 602 - Specification for Masonry Structures and Commentary

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A36/A36M - Standard Specification for Carbon Structural Steel
   2. ASTM A82 - Standard Specification for Steel Wire, Plain, for Concrete Reinforcement
   3. ASTM A153/A153M - Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware
   4. ASTM A666 - Standard Specification for Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar
   5. ASTM A 1008/A1008M - Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability
   8. ASTM C144 - Standard Specification for Aggregate for Masonry Mortar
   11. ASTM C270 - Standard Specification for Mortar for Unit Masonry
   12. ASTM C476 - Standard Specification for Grout for Masonry
   13. ASTM C780 - Standard Test Method for Preconstruction and Construction Evaluation of Mortars for Plain and Reinforced Unit Masonry
   14. ASTM C954 - Standard Specification for Steel Drill Screws for the Application of Gypsum Panel Products or Metal Plaster Bases to Steel Studs From 0.033 in. (0.84 mm) to 0.112 in. (2.84 mm) in Thickness
   16. ASTM D2000 - Standard Classification System for Rubber Products in Automotive Applications

C. Brick Institute of America (BIA):
   1. BIA - Technical Notes on Brick Construction.

1.3 SUBMITTALS

A. Product Data: Manufacturer's data: Recommendations for use of materials, preparation of substrate, limitations and special instructions for materials necessary to the work.

B. Samples: Three of each type of the following products used in the work:
   1. Mortars: Cured samples showing color of each type.
   2. Accessories: Representative samples of each type.

1.4 QUALITY ASSURANCE

A. Fire-rated Masonry: Wherever a fire - resistance classification is shown or scheduled for unit masonry construction (4-hour, 3-hour and similar designations), provide mortar as UL-listed for the particular construction.

B. Qualification: Do not change source and brands of masonry mortar materials during the course of the work.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Deliver products to Worksite in their original unopened containers clearly labeled with manufacturer's name and brand designation, referenced specification number, type, and class as applicable.
MORTAR, GROUT AND MASONRY ACCESSORIES

B. Store products so as to prevent water intrusion, dampness, and deterioration. Store loose materials, sand, and aggregates, so as to prevent intrusion of foreign materials.

C. Handle products so as to prevent breakage of containers and damage to products.

1.6 JOB CONDITIONS

A. Environmental Requirements:

1. Do not use materials or aggregates that are covered with frost. Do not mix mortar when the temperature is below that specified for the related masonry work.

2. Provide protective covering and heat for cold weather work as specified for masonry work.

3. Perform work under environmental conditions consistent with manufacturer's recommendations for materials being used in the work.

4. Perform hot weather mortar work in accordance with requirements of ACI 530.1/ASCE 6/TMS 602.

4. Colored Pigmented Mortar: Comply with the requirements for brick masonry mortar specified herein, and proportion pigments with other ingredients to achieve required mortar color as follows:

1. Mix to match color as directed.

2. Cement and pigments, as applicable to produce required mortar color, factory proportioned, dry blended and packaged. Site proportioning and blending not permitted.

3. Pigment to cement ratio by weight and water to cement ratio of colored mortar mixes to be consistent and in compliance with instructions of the pigment manufacturer for required mortar color and with the requirements of this section. Do not exceed pigment to cement ratio of 1:7, except limit carbon black to ratio of 1:35.

C. Mortar Mixes for Concrete Masonry Unit: As specified for brick masonry, except color pigment not required unless otherwise noted.

D. Grout for Masonry Lintels and Other Reinforced Masonry: Comply with ASTM C476. Use non-shrink grout of consistency indicated or if not otherwise indicated, of consistency (fine or coarse) at time of placement which will completely fill all cells and spaces intended to receive grout, and fully surrounding the reinforcement. Use concrete fill specified in Section 04220, "Concrete Masonry Units", in lieu of grout where shown.

E. Grout: For setting steel lintels and similar items: Portland cement, clean sand and lime putty added to obtain quick set; proportioned as required to provide a 28 day minimum compressive strength of 3000 psi when tested in accordance with ASTM C109.

2.3 EMBEDDED FLASHING MATERIALS

A. Sheet Metal Flashing: Fabricate from following metal complying with requirements specified in Section 07600, "Flashings and Sheet Metal" and below:
1. Stainless Steel: ASTM A666, Type 302/304, 2D annealed finish, soft, 0.0156 inch (28 gage) thick.

2. Fabricate metal expansion joint strips from sheet metal indicated above, formed to shape indicated.

3. Application: Use where flashing is fully or partly concealed in masonry wall.

4. Provide end dams at flashing termination and back-up plates at control joints.

B. Sealant: Low modulus silicone sealant complying with requirements for joint sealants specified in Section 07900, “Seals and Sealants”.

2.4 JOINT REINFORCEMENT

A. Continuous horizontal wall reinforcement:

1. Prefabricated continuous reinforcing tie system of truss design fabricated of 9 gauge side and cross wire rods conforming to ASTM A82; flush welded diagonal rods.

2. Hot-dip galvanized after fabrication in accordance with ASTM A153/A153M, Class B2, 1.50 ounces for side and diagonal rods.

3. Provide for out to out dimension of side rods 2 inches less than nominal thickness of wall.

4. Intersecting wall reinforcement: Factory-prefabricated units for corners and butting and intersecting walls.

5. Cavity wall reinforcement: Provide 4 wire ladder design continuous reinforcing for cavity wall construction.

2.5 VENEER ANCHORS AND TIES

A. General: Provide two-piece assemblies that allow vertical or horizontal adjustment but resist tension and compression forces perpendicular to plane of wall; for attachment over sheathing to metal studs; and with the following characteristics:

2. Steel Sheet, Galvanized after Fabrication: ASTM A 1008/A1008M cold-rolled, carbon-steel sheet hot-dip galvanized after fabrication to comply with ASTM A153/A153M.

3. Structural Performance Characteristics: Capable of withstanding a 100 lbf. load in both tension or compression without deforming, or developing play in excess of, 0.05 inch.

B. Anchor System: Heckman Building Products, Inc., POS-I-TIE Masonry Veneer Anchor System with 5 gage steel wire ties, hot-dipped galvanized per ASTM A153/A153M, Class B3, size as required to provide maximum bond.

1. Provide screw types for steel studs, concrete or masonry and structural steel.

2. Corrugated ties not allowed.

C. Veneer Wall Tie: Minimum 14 gage screw attached anchor plate with 3/16 inch wire ties, hot-dipped galvanized per ASTM A153/A153M, Class B2, size as required to provide 2 inch minimum bond.

1. Anchor Section: Sheet metal plate with screw holes top and bottom and with raised rib-stiffened strap stamped into center to provide a slot between strap and plate for connection of wire tie.

   a. Plate 1-1/4 inches wide by 6 inches long with strap 5/8 inch wide by 3-5/8 inches long; slot clearance formed between face of plate and back of strap shall not exceed diameter of wire tie by more than 1/32 inch.

2. Wire Tie Section: Triangular-shaped wire tie sized to extend at least halfway through veneer but with at least 5/8 inch cover on outside face.

   a. Corrugated ties not allowed.

3. Steel Drill Screws for Steel Studs: ASTM C954 except manufactured with hex washer head and neoprene washer, No. 10 diameter by length required to penetrate steel stud flange by not less than 3 exposed threads. Corrosion protective organic polymer coating with salt-spray resistance to red rust of more than 800 hours per ASTM B117.

4. Neoprene Gaskets: Anchor manufacturer’s standard closed cell neoprene gaskets manufactured to fit behind anchor plate and to prevent moisture from penetrating through screw holes to steel studs behind sheathing.

5. Acceptable Manufacturers and Products:

   a. Dur-O-Wal, Inc.: “D/A 210”

   b. Hohmann & Barnard, Inc., “DW-10HS”

   c. Masonry Reinforcing Corp. of America, “1004, Type III”

   d. Heckman Building Products, Inc., “315D”

   e. Or approved equal.
D. Dovetail anchors:

1. Flexible, adjustable dovetail anchors of 3/16 inch zinc alloy or mild steel galvanized after fabrication in accordance with ASTM A153/A153M, Class B3. To be installed every 16 inches vertically and at 36 inches on centers horizontally, maximum (unless shown otherwise).

2. Dovetail anchor slots: 22 gauge electro-galvanized steel with removable filler.

3. Section 03100, "Concrete Formwork".

E. Wall Plugs: Galvanized, corrugated metal, approximately 3 inches long and of standard manufacture, where necessary for attaching other work. Galvanize after fabrication, ASTM A153/A153M, Grade B3.

F. Z-type rigid steel anchors: Steel, ASTM A36/A36M, 1/4 inch thick by 1-1/4 inches wide by length as required, galvanized; with one 2 inch opposing 90-degree bend at each end. Galvanizing ASTM A153/A153M, Class B3.

2.6 ACCESSORIES

A. Weep holes for brickwork: Provide one of following:

1. Aluminum Weep Hole/Vent: One-piece, L-shaped units made from sheet aluminum, designed to fit into a head joint and consisting of a vertical channel with louvers stamped in web and with a top flap to keep mortar out of the head joint; painted to comply with Section 09970, "Coatings for Steel" before installation, in color approved by Architect to match that of mortar.

2. Plastic Weep Hole/Vent: One-piece, flexible extrusion made from UV-resistant polypropylene copolymer, designed to fill head joint with outside face held back 1/8 inch from exterior face of masonry, in color selected from manufacturer's standard.

3. Vinyl Weep Hole/Vent: One-piece, offset, T-shaped units made from flexible, injection-molded PVC, designed to fit into a head joint and consisting of a louvered vertical leg, flexible wings to seal against ends of masonry units, and a top flap to keep mortar out of the head joint; in color approved by Contracting Officer to match that of mortar.

B. Weep holes for stonework: 1/4 inch OD, nonstaining plastic tubes of lengths ensuring complete panel penetration.

C. Cavity Drainage Material:

1. Description: Proprietary product composed of either reticulated, nonabsorbent mesh made from polyethylene strands, or, polymer core geomatrix composed of woven nylon strands, molded and shaped in open weave configuration to maintain drainage at weep holes without being clogged by mortar droppings, size as required to extend across entire width of cavity.

2. Acceptable Manufacturers and Products:
   a. Advanced Building Products, Inc., "Mortar Maze".
   b. Mortar Net USA, Ltd., "Mortar Net Green".
   c. Polytite Manufacturing Corp., "Mortarstop".
   d. Or approved equal.

D. Rubberized Asphalt Flexible Flashing:

1. Polyethylene-sheet-backed rubberized asphalt membrane, 40 mils thick. Provide primer (VOC compliant) when recommended by membrane manufacturer.

2. Acceptable Manufacturers and Products:
   a. Carlisle Coatings and Waterproofing Inc., "CCW-705-TWF"
   b. W.R. Grace & Co., "Perm-A-Barrier" Wall Flashing,
   c. Hohman & Barnard, "TEXTROFLASH"
   d. Polyken Technologies, "Polyken 640 Underlayment Membrane"
e. Polyguard Products, Inc., “400 Membrane”

f. Protecto Wrap Co., “Thru Wall Flashing”

g. Or approved equal.

E. Bolts, straps, bars, rods, and angles of the type and size indicated, fabricated from not less than 16 gauge galvanized sheet metal or 3/8 inch diameter rod stock.

G. Masonry Flashing: Install flashings where shown.

H. Control Joint Filler: Rubber, factory-extruded solid key-section 60 to 80 “Shore A durometer” hardness, ASTM D2000, 2AA805, minimum shear strength 540 psi; Rapid Control Joint, “Dur-O-Wall” Incorporated, or approved equal.

I. Loose granular Insulation and preformed foam inserts for CMU cells as shown on Drawings (See Section 07210, “Building Insulation”).

PART 3 - EXECUTION

3.1 MIXING OF MORTAR

A. Mix mortar materials in a clean mechanical mixer, the drum of which is free from dirt and dried mortar, for at least three minutes.

B. Mortar which has stiffened beyond workability because of evaporation of water may be retempered by adding water as needed to restore necessary consistency. Use mortar within 2 hours of initial mixing. Do not use mortar which has begun to set.

C. Use clearly identifiable graduated containers for measuring materials for mortar that will control and accurately maintain specified proportions throughout the work. Shovel measure is prohibited. Measure sand in damp loose condition.

3.2 INSTALLATION OF ACCESSORIES

A. Install accessories as shown and in conformance with manufacturers installation recommendations.

B. Place anchors every 16 inches in height of wall at intersections of masonry walls and concrete, and for masonry furring of concrete. Dovetail slots are to be embedded in concrete vertically not more than 24 inches apart over centers.

3.3 TESTING

A. Mortar composition and properties shall be evaluated per ASTM C780.

B. Grout shall be sampled and tested for compressive strength per ASTM C1019.

C. Refer to Section 01450, "Quality Control", for further information and compliance.

D. Testing Frequency: Tests and evaluations listed in this article shall be performed during construction for each 5000 sq. ft. of wall area or portion thereof.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. No separate measurement will be made for the work specified in this section.

B. No separate payment will be made for the work specified in this section, but it shall be included under relevant sections of the Specifications in the cost of furnishing and installing the related work such as brick masonry, concrete masonry, stone, etc. for which the work described in this section will be required.

END OF SECTION 04100
THIS PAGE INTENTIONALLY LEFT BLANK
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies providing brick masonry, as applicable and as shown.

1.2 REFERENCE STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM C62 - Standard Specification for Building Brick (Solid Masonry Units Made from Clay or Shale)

2. ASTM C216 - Standard Specification for Facing Brick (Solid Masonry Units Made from Clay or Shale)

3. ASTM C780 - Standard Test Method for Preconstruction and Construction Evaluation of Mortars for Plain and Reinforced Unit Masonry

B. Brick Institute of America (BIA):

1. BIA - Technical Notes on Brick Construction.

1.3 SUBMITTALS

A. Product Data:

1. Submit manufacturer’s data for each material to be used in the work, showing compliance with the specified requirements. Include instructions for handling, storage, installation, and protection of each material.

2. Tests: Submit independent laboratory test reports and certificates on materials to show compliance of materials with specified requirements.

B. Samples:

1. Submit three units of each kind of brick (nine units if they range in color), with indication of locations for their use. Acceptance of color range is at the sole discretion of the Contracting Officer.

2. Review will be for size, color, and texture only.

C. Shop Drawings: Show reinforcement, anchors, flashing and accessories details where required.

D. Masonry Mock-up:

1. Construct a mock-up masonry panel of exposed brick masonry, for each type required, of size not less than 4 feet x 3 feet incorporating corner edge, stone base (if any), reinforcement, flashing, face brick and backup units.

2. Construct sample panels on Worksite, as required to demonstrate the construction required for the work.

3. If necessary to produce an acceptable standard of appearance and workmanship, construct additional panels until approved.

4. Use types of material, color, mortar, bond, thickness, and tooling of joints, method of laying and workmanship typical and standard for the installation. Clean sample panel as specified for finished work.

5. Maintain panels in good condition and protect from moisture penetration until completion of masonry work and removal is directed.

1.4 QUALITY ASSURANCE

A. Preparatory: Before constructing sample panels, meet with the affected trades and the Contracting Officer to review new work installation procedures, precautions, and coordination with other work. Discuss in detail the color matching requirements for restoration work; the testing of salvaged units; the mixing and application of mortar; and the setting and pointing of brick units.

B. Source Quality Control: Brick used in the work shall be from the same run, unless quantity of brick for the project requires more than one run production.

C. Certification: Submit signed certification that materials conform with specified requirements.

D. Construction Tolerances:

1. Variation from Plumb: For lines and surfaces of walls and arises do not exceed 1/4 inch in 10 feet, or 3/8 inch in a story height or 20 feet maximum, nor 1/2 inch in more than 40 feet. Except for external corners, expansion joints and other conspicuous lines, do not exceed 1/4 inch in any story or 20 feet maximum, nor 1/2 inch in more than 40 feet.
2. Variation from Level: For lines of exposed lintels, sills, parapets, horizontal grooves and other conspicuous lines, do not exceed 1/4 inch in any bay or 20 feet maximum, nor 3/4 inch in more than 40 feet.

3. Variation of Linear Building Line: For position shown in plan and related portion of columns, walls and partitions, do not exceed 1/2 inch in any bay or 20 feet maximum, nor 3/4 inch in more than 40 feet.

4. Variation in Cross-Sectional Dimensions: For thickness of walls, from dimensions shown, do not exceed minus 1/4 inch nor plus 1/2 inch.

5. Variation in Face of Masonry: 1/16 inch from face of adjacent masonry unit.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Deliver products to the Worksite in good condition.

B. Keep products dry, protect from rain, snow, and ice, do not allow to become wet or damp, prevent contact with soil.

C. Handle products to prevent chipping and breaking.

1.6 JOB CONDITIONS

A. Environmental Requirements: The following are prohibited:

1. Use of products that are covered with frost.

2. Erection of masonry when temperature is below 40 deg. F or tending to fall below 40 deg. F, unless suitable fireproof protective covering and heat are provided to maintain work and materials above 40 deg. F.

PART 2 - PRODUCTS

2.1 FACE BRICK

A. Provide brick as follows:

1. ASTM C216, Grade SW.

2. Size 2-1/4 inches by 3-5/8 inches by 7-5/8 inches, unless shown otherwise.

3. Color and finish: As scheduled on drawings.

B. Special Shapes: 100 percent solid for the following locations, as applicable:

1. Flat header wall caps.

2. End units on rowlock header wall caps.

3. Comers of soldier courses.

5. Pierced screen walls.

6. Where construction would result in exposed cores.

7. Where shown.

2.2 COMMON BRICK (BACKING BRICK)

A. ASTM C62, Grade SW, wire-cut.

B. First quality, hard grade, same vertical dimensions as face brick.

2.3 MORTAR AND GROUT

A. Specified in Section 04100, "Mortar, Grout and Masonry Accessories".

2.4 CLEANING SOLUTION

A. Formulated for cleaning brick work, containing no acid.

B. Type which will not stain, discolor or otherwise adversely affect surfaces with which it comes into contact.

2.5 SEALANT AND BACKER ROD

A. Polyurethane based sealant and backer rod, as specified in Section 07900, "Seals and Sealants".

2.6 CONTROL JOINT FILLER

A. Section 04100, "Mortar, Grout and Masonry Accessories".

2.7 OTHER ACCESSORIES

A. Specified in Section 04100, "Mortar, Grout and Masonry Accessories".

PART 3 - EXECUTION

3.1 PREPARATION

A. Remove dirt, debris, oil, grease, and other foreign matter from surfaces to receive brick masonry, in accordance with BIA instructions.
B. Follow manufacturers’ instructions regarding the proper preparation and use of materials.

C. Protection: Protect areas around and below work areas from mortar droppings.

D. Built-In Work:
   1. Verify locations of chases and openings for pipes, conduit, ducts, and locations of flashing and weep holes.
   2. Establish layout lines and verify proper setting of bucks and frames.

3.2 **ERECITION**

A. Erect masonry to conform to approved sample panels. Place units plumb, true to line, and with level courses.

B. Erect adjoining walls simultaneously. Do not erect walls more than 5 feet above adjoining walls. Tooothing is prohibited. Cover and protect tops of unfinished walls whenever work on wall is not in progress.

C. Plumb piers and walls. Level brick courses using uniform joint thickness. Use power driven, masonry saws for cutting material. Build external corners square, unless otherwise shown.

D. Provide structural and pattern bonding as shown.

E. Unless otherwise shown, provide common Flemish header courses in every sixth brick course when using concrete masonry backing.

F. Place reinforcement and build in openings for pipes, conduits, ducts, chases and other work as shown.

G. Grout and set in place steel lintels furnished by other trades for openings in masonry walls.

H. Install flashing and weep holes over brick shelf angles, lintels and where shown. Lap joints in flashing 4 inches minimum and bond with mastic. Install through-wall flashing from inside and outside faces of walls. Set flashing in full bed of mortar and trowel full bed of mortar to ensure complete contact. If not otherwise shown, install weep holes not more than 2 feet on centers, immediately above flashing, but end recessed from face of wall. Keep weep holes free of mortar with sash cord, removing cord, and rodding before mortar hardens.

I. When more than one run of brick is required, select face brick from various stock piles so that they may be mixed to prevent segregating color ranges. Use same color mortar proportions throughout work.

J. Prior to laying face brick, lay out work so that bond and design are maintained plumb and level and joints are of uniform width throughout the work.

K. Do not use segments of bricks less than one-half in size at corners and openings. Use same sizes of bricks or same sizes of brick segments in same course at each side of jambs of openings and piers.

L. Thoroughly soak brick with water just before laying; and allow water to soak in so there is no standing water on the bricks.

M. Cover brick uniformly with mortar, firmly lay into place, with no voids in wall joints, at window frames or at door frames.

N. Place units with full mortar coverage on head and bed joints. Provide sufficient mortar on ends of units to fill head joints. Butter faces of brick. Do not slush joints.

O. Where necessary to secure more accurate dimensions in the field, size brick by grinding or cutting with a diamond-tipped blade.

P. Adjust units to final location while mortar is soft and plastic. If units are displaced after mortar has stiffened, remove, clean joints and units of mortar and relay with fresh mortar.

Q. Do not drop excessive mortar in cavity space to ensure the function of the weep hole system.

R. Where dovetail anchors are required, provide anchors vertically at each slot, maximum 16 inches on center vertically and 36 inches on center maximum (unless otherwise shown) horizontally and solidly fill in joints against concrete with mortar. Ensure that joints at anchors and bond courses are filled.

S. Unless otherwise shown, use 3/8-inch concave joints, carefully tooled to form smooth dense surface. Avoid burns at intersections and mortar discoloration.

T. Lay face brick from exterior with bed joints, head joints and collar joints full and level, faces plumb, joints uniform, and bonds accurate.

U. Place continuous wall reinforcement in courses maximum 16 inches on center except as otherwise shown. Use specially fabricated sections at corners and intersections.
V. Masonry anchors and wall reinforcements: In accordance with Sections 04100, "Mortar, Grout and Masonry Accessories", and 04220, "Concrete Masonry Units".

W. As the work progresses, clean masonry with stiff brush before mortar sets.

3.3 CONTROL JOINTS AND EXPANSION JOINT

A. Provide control joints where shown.

B. Wherever control joints are placed, insert Control Joint Filler (Section 04100), pack with a backer rod and joint filler, and fill with sealant as specified in Section 07900, "Seals and Sealants".

C. Provide expansion and control joints in masonry walls as shown. Ensure that joints are straight and of the thickness shown. Ensure that clear joints are free of water, mortar and other obstructions. Leave continuous open joint for caulking and sealing in accordance with Section 07900, "Seals and Sealants".

3.4 REPAIR, POINTING, AND CLEANING

A. Repair and Pointing Procedure:

1. Remove and replace masonry units which are loose, chipped broken, stained, or otherwise damaged, or if units do not match adjoining units as intended. Provide new units to match adjoining units and install in fresh mortar or grout, pointed to eliminate evidence of replacement taking care not to discolor or damage mortar or brick.

2. Pointing: During the tooling of joints, enlarge any voids or holes, except weep holes, and completely fill with mortar. Point up all joints including comers, openings, and adjacent work to provide a neat, uniform appearance.

B. Cleaning:

1. Wet exposed brick masonry surfaces and clean with soap-and-water solution applied with stiff fiber brushes leaving masonry clean, free of mortar daubs and with tight mortar joints throughout. The use of acid is prohibited.

2. Allow masonry walls to cure at least three weeks in summer four weeks in spring and fall, and five weeks in winter before final cleaning.

3. Begin cleaning at top and work down.

4. Remove as much mortar from brick as is possible with scraper or wire brushes taking care not to discolor mortar or brick.

5. Dampen walls thoroughly with water to prevent loose materials from being drawn into pores of dry brick below and to prevent build-up of dry detergents.

6. Clean surfaces thoroughly with cleaning solution. Rinse and flush with clean water immediately after cleaning.

7. Leave work in uniformly clean condition, free from mortar stain or other defacement.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Brick masonry described in this section will be paid for on a lump sum basis per location indicated wherein no measurement will be made.

END OF SECTION 04210
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies providing, and the installation of, concrete masonry units (CMU), and includes installation of glazed structural tile, and structural clay tile.

1.2 REFERENCED STANDARDS

A. American Concrete Institute (ACI):
   1. ACI 530.1/ASCE 6/TMS 602 - Specification for Masonry Structures

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A82 – Standard Specification for Steel Wire, Plain, for Concrete Reinforcement
   2. ASTM 153 – Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware
   3. ASTM A615 - Standard Specification for Deformed and Plain Carbon Steel Bars for Concrete Reinforcement
   4. ASTM C33 - Standard Specification for Concrete Aggregates
   5. ASTM C55 - Standard Specification for Concrete Brick
   6. ASTM C90 - Standard Specification for Loadbearing Concrete Masonry Units
   7. ASTM C140 - Standard Test Methods for Sampling and Testing Concrete Masonry Units and Related Units
   9. ASTM C331 - Standard Specification for Lightweight Aggregates for Concrete Masonry Units

C. National Concrete Masonry Association (NCMA)
   1. Specifications for the Design and Construction of Concrete Masonry

D. Portland Cement Association (PCA)
   1. Concrete Masonry Handbook

1.3 SUBMITTALS

A. Product Data:
   1. General: Submit manufacturer's data for each type of concrete masonry unit required, including certified copies of laboratory test reports and other data as may be required to show compliance with the specified requirements.
   2. Fire-rated assemblies: Submit complete information on each fire-rated assembly to be used in the work. Include the assembly identification number or designation and all construction requirements and details; include certified test reports where applicable and the qualifications of the testing laboratory. Submit all components of the assembly in one, coordinated submittal.

B. Samples:
   1. Submit samples of each type of concrete block to be used. Select units to show the range of color and texture which will be used in the finished work for the Contracting Officer’s inspection and approval.
   2. Submit three of each type of the following products which will be used in the work:
      a. Concrete masonry units (CMU):
         1) Hollow.
         2) Solid.
         3) Special shapes.
      b. Precast lintels.
      c. CMU lintels.

C. Shop Drawings: Show reinforcement, anchors, flashing and accessories details where required. Take and indicate field-verified dimension and elevations. Show existing and new units at restoration locations and how restored areas are bonded to existing.
D. Masonry Sample Panel(s):

1. Construct sample panel(s) for exposed work only. Build panels not less than 4 feet square by 8 inches thick incorporating reinforcement and concrete masonry units. If sample panel is not constructed in accordance with specifications and drawings, and is not approved by the Contracting Officer, rebuild as necessary until approval is obtained.

2. Masonry Mock-up(s): Construct a Mock-up masonry panel of exposed CMU, for each type required, of size not less than 4 feet by 3 feet, incorporating corner edge, cast stone base (if any), reinforcement, flashing and backup structure if required.

3. Use types of material, color, mortar, bond, tooling of joints, method of laying and workmanship shown or specified.

4. Maintain panels in good condition and protect from moisture penetration until completion of masonry work and removal is directed.

E. Certification: Provide certification that UL fire rated units comply with requirements for ratings indicated.

1.4 QUALITY ASSURANCE

A. Concrete Unit Masonry Standard: Comply with recommendations of Portland Cement Association’s “Concrete Masonry Handbook”.

B. Source Limitations for Masonry Units: Obtain exposed masonry units of a uniform texture and color, or a uniform blend within the ranges accepted for these characteristics, through one source from a single manufacturer for each product required.

C. Preconstruction Testing Service: Engage a qualified independent testing agency to perform following preconstruction testing:

1. Concrete Masonry Unit Test: For each concrete masonry unit indicated, per ASTM C 140.

2. Prism Test: For each type of wall construction indicated, per ASTM C 1314.

3. Test results or certificates of conformance already on file with supplier may be used.

D. Fire-Resistance Ratings: Where indicated, provide materials and construction identical to those of assemblies with fire-resistance ratings determined per ASTM E 119 by a testing and inspecting agency, by equivalent concrete masonry thickness, or by another means, as acceptable to authorities having jurisdiction. Proof of tests may be procured from manufacturer and submitted as certificate of conformance; specific jobsite testing is not required.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Store masonry units on elevated platforms, under cover, and in a dry location to prevent their deterioration or damage due to moisture, temperature changes, contaminants, corrosion, and other causes. If units become wet, do not install until they are in air-dried condition.

B. Store cementitious materials on elevated platforms, under cover, and in dry location.

C. Store aggregates where grading and other required characteristics can be maintained and contamination avoided.

D. Store masonry accessories including metal items to prevent corrosion and accumulation of dirt and oil.

1.6 PROJECT CONDITIONS

A. Protection of Masonry: During construction, cover tops of walls, projections, and sills with waterproof sheeting at end of each day’s work. Cover partially completed masonry when construction is not in progress.

B. Stain Prevention: Prevent grout, mortar, and soil from staining face of masonry to be left exposed or painted. Immediately remove grout, mortar, and soil that come in contact with masonry.

1. Protect base of walls from rain-splashed mud and mortar splatter using coverings spread on ground and over wall surface.

2. Protect sills, ledges, and projections from mortar droppings.

3. Protect surfaces of window and door frames, as well as similar products with painted and integral finishes from mortar droppings.

C. Hot and Cold-Weather Requirements: Comply with referenced concrete unit masonry standard.

PART 2 - PRODUCTS

2.1 CONCRETE MASONRY UNITS

A. Use products of a single manufacturer.

B. Nominal dimensions:

2. Thickness: As shown.
CONCRETE MASONRY UNITS

C. Color and Finish: Manufacturer's standard color with standard aggregate and ground finish unless shown otherwise.

D. For exposed work, provide units of uniform medium texture, free from defects and of uniform dimensions. Furnish special units as necessary.

E. Units having UL fire resistance ratings to achieve fire ratings for walls as required by local building codes and as shown.

F. Units free from iron and other substances that will stain plaster or paint.

G. Hollow and Solid Load Bearing Units: ASTM C90, normal weight, aggregate complying with ASTM C33 and dry net weight of not more than 125 pounds per cubic foot.

H. Curing: Cure units by autoclave treatment at a minimum temperature of 350 degrees F, and a minimum pressure of 125 psi. Limit moisture absorption to 25 percent of saturation during delivery and until time of installation.

2.2 CONCRETE FILL FOR MASONRY

A. Concrete fill for unit masonry bond beams and reinforced masonry unit cells: Class 3500; (3500 psi compressive strength) maximum aggregate size, 3/4 inch.

2.3 ANCHORS AND REINFORCEMENT

A. Anchoring Devices - Provide bolts, straps, bars, rods and angles, of the type and size indicated, but fabricated from not less than 16 gauge sheet metal zinc coated, conforming to ASTM A153, Class B2.

B. Reinforcing Bars - Steel reinforcing bars, complying with ASTM A615, Grade 60, size as indicated, joint reinforcement conforming to ASTM A82, free from mill scale and excess or loose rust deposits.

2.4 WALL CONTROL JOINT FILLER

A. Section 04100, "Mortar, Grout and Masonry Accessories".

2.5 ACCESSORIES

A. Section 04100, "Mortar, Grout and Masonry Accessories".

2.6 CLEANING SOLUTION

A. Mild household detergent (wash powder), in quantities recommended by manufacturer.

PART 3 - EXECUTION

3.1 PREPARATION

A. Clean foreign substances which would affect bond of mortar from surfaces to receive unit masonry.

B. Built-In Work:

1. Verify locations of chases and openings for pipes, conduits and ducts.

2. Establish locations for walls and partitions; verify that door frames and other built-in work provided by others are or can be properly located.

3.2 ERECTION

A. Erect exposed unit masonry work to conform to approved sample panel.

B. Erect adjoining walls simultaneously. Do not erect walls more than 5 feet above adjoining walls. Tooothing is prohibited. Cover and protect the tops of unfinished walls.

C. Plumb piers, walls and partitions. Level courses using uniform joint thickness for interior work. Build external corners with square or bull nose units as indicated.

D. Place reinforcement and build in openings for pipes, conduits, ducts, chases, frames, and other work as shown.

E. Grout and set in place miscellaneous steel lintels furnished by other trades for openings in masonry walls.

F. As the work progresses, keep masonry clean by stiff brushing.

G. Do not wet units before laying up. Unless otherwise shown, lay units in running bond, with full mortar coverage of bottom and ends, tooled to tight concave joints.

H. Prevent smearing mortar on surface of exposed units. If mortar smears occur, remove while soft.

I. Carefully cut faces of units for electrical or other outlets and cut out backs for conduit and other piping. Where possible, use full size units. Do not use portions of units shorter than 4 inches. Perform cutting with power-driven masonry saws.

J. Build partitions plumb and true to lines and heights shown on contract drawings. Anchor partitions at junctions with masonry exterior walls using Z-type steel anchors, rigid or corrugated, Z-bar anchors vertically 24 inches on center maximum unless otherwise shown. Use dovetail anchors spaced not over 16 inches on vertical centers where partitions abut concrete walls or concrete columns and steel.
framing anchors where partitions abut steel columns.

K. Use unit masonry or precast lintels except where steel lintels are shown. Use precast lintels for 4 inch masonry partitions. For other masonry partitions and walls, use lintels fabricated at plant or at job site from masonry lintel units.

L. Fill cells of masonry with mortar adjacent to openings and around built-in and embedded items.

M. Place prefabricated continuous wall reinforcement in alternate horizontal joints above grade and each horizontal joint below grade. Terminate each side of expansion joints. Use specially fabricated sections at corners and intersections.

N. Fill cells solid with grout where vertical reinforcement is installed within unit masonry walls.
   1. Fill cells with granular insulation where shown on drawings.
   2. Fill heads and jambs of hollow metal frames solid with mortar, as laying of units progresses.

O. Installation of Masonry Accessories:
   1. Wall anchors:
      a. Space Z-type rigid steel anchors at intersections of load-bearing masonry walls and at control joints.
      b. Space corrugated steel anchors 16 inches on centers vertically at control joints located not more than 2 feet from intersections of masonry walls.
   2. Steel framing anchors: Install anchors to attach masonry walls to structural steel building frame at 16 inches on centers vertically and 36 inches horizontally (unless shown otherwise). Weld anchors to structural steel so as to achieve full strength of anchor system.
   3. Soldier course anchors: Install corrugated steel anchors in horizontal mortar joints of soldier coursing, except where continuous wall reinforcement is used. Space anchors 24 inches on centers horizontally.
   4. Flashing: Install flashing to provide positive keying to mortar.
   5. Weep holes: Install at 2 feet 8 inches on centers at terminations of through-wall flashing.

P. Bond Beams:
   1. Provide bond beams in walls where shown.
   2. Construct similar to unit masonry lintels, except beams to be continuous, except at control joints, and full bearing.

Q. Chases: Build chases and recesses as indicated and as may be required for work of other trades.

R. Construction Openings: Leave openings for equipment as indicated or required to be installed at later date. Complete masonry work after equipment is in place using materials identical with those immediately adjacent to opening.

S. Construction Joints: Step back unfinished work for joining with new work; toothing will not be permitted. Before new work is started, clean exposed surfaces of set masonry, and remove loose masonry units and mortar prior to laying fresh masonry.

T. Cutting Masonry Units: Use motor driven saw designed to cut masonry units with clean sharp corners. Cut units as required to provide pattern indicated and to fit adjoining work neatly. Use full units without cutting wherever possible. Avoid the use of less than half size units at corners, jambs and wherever possible at other locations. Do not use chipped or broken units for exposed work.

3.3 CONSTRUCTION TOLERANCES

A. Comply with tolerances in ACI 530.1/ASCE 6/TMS 602 and the following:

1. Variation from Plumb: For Lines and surfaces of walls and arises do not exceed 1/4 inch in 10 feet, or 3/8 inch in a story height or 20 feet maximum, nor 1/2 inch maximum. Except for external corners, expansion joints and other conspicuous lines, do not exceed 1/4 inch in any story or 20 feet maximum, nor 1/2 inch maximum.

2. Variation from Level: For lines of exposed lintels, sills, parapets, horizontal grooves and other conspicuous lines, do not exceed 1/4 inch in any bay or 20 feet maximum, nor 1/2 inch maximum.

3. Variation of Linear Building Line: For position shown in plan and related portion of columns, walls and partitions, do not exceed 1/2 inch in any bay or 20 feet maximum, nor 3/4 inch maximum. Variation in Cross-Sectional Dimensions: For thickness of walls, from dimensions shown, do not exceed minus 1/4 inch nor plus 1/2 inch.

4. Variation of Face of Masonry. 1/16 inch from face of adjacent masonry unit.

3.4 LAYING MASONRY WALLS AND PARTITIONS

A. Mortar Types General: Refer to Section 04100, "Mortar, Grout and Masonry Accessories" for masonry types and applications.
B. Bond: Use running bond for single-wythe masonry walls unless otherwise indicated.

C. Laying Procedure for Walls:
1. Shove masonry units into place with a full bed of mortar in both horizontal and vertical joints.
2. Lay-up walls plumb and true with courses level and accurately spaced and coordinated with other work.
3. Build bearing plates, masonry anchors, flashings, sleeves, door frames and other miscellaneous items into masonry as work progresses. Fill-in solid with masonry around built-in items. Fill hollow metal frames adjoining masonry work solidly with mortar.
4. Provide anchoring devices of the type indicated.
5. Do not grout between top of non-bearing walls and structural beams or slabs above. Provide firestopping material. At the top of the fire partitions also, seal through fireproofing all the gaps around penetration of ducts, conduits, pipes, cables, etc. (See Section 07840, “Firestopping”).

D. Joints:
1. Maintain uniform joint widths except for minor variations to maintain bond alignment.
2. Cut joints flush for masonry walls which are concealed or to be covered with other materials.
3. Tool exposed wall joints slightly concave, unless otherwise indicated.

E. Reinforcing:
1. At openings of more than 1 foot width, provide joint reinforcement both immediately above the lintel and immediately below the sill. Extend the reinforcing a minimum of 2 feet beyond the opening.

F. Grouting, General:
1. Use fine grout for filling spaces less than 4 inches in both horizontal directions.
2. Use coarse grout for filling spaces 4 inches or larger in both horizontal directions.

G. Grouting, low-lift techniques subject to the following requirements:
1. Place vertical reinforcing before grouting. Place reinforcement before or after laying masonry units, as required by job conditions. Support vertical reinforcing at intervals indicated. Where individual bars are placed after laying masonry, place wire loops extending into cells as masonry is laid and loosen before mortar sets. After insertion of reinforcing bar, pull loops and bar to proper position and tie free ends.
2. Prior to grouting, clean, and inspect grout spaces and close cleanout holes. Remove dust, dirt, mortar droppings, loose pieces of masonry, and other foreign materials from grout spaces. Clean reinforcing and adjust to proper positioning as required. Clean top surface of structural members supporting masonry to ensure bond. After final cleaning and inspection, close cleanout holes and brace closures as required to resist grout pressures.
3. Do not place grout until entire height of masonry to be grouted has attained sufficient strength to resist displacement of masonry units and breaking of mortar bond. Install shores and bracing, if required, before starting grouting operations.
4. Limit grout pours to sections which can be completed in one working day with not more than one hour interruptions of pouring operations. Place pour in lifts which do not exceed 4 feet. Allow not less than 30 minutes, nor more than one hour between lifts of a given pour. Rod or vibrate each grout lift during pouring operation.
5. When more than one pour is required to complete a given section of masonry, extend reinforcing beyond masonry as required for splicing. Pour grout to within 1-1/2 inches of top course of first pour. After grouted masonry is cured, lay masonry units and place reinforcing for second pour section before grouting. Repeat sequence if more pours are required.
6. Extend vertical reinforcing above elevation of maximum pour height as required to allow for splicing.
7. Lay masonry units to maximum pour height. Do not exceed 4 feet.
8. Pour grout using container with spout or chute. Rod or vibrate grout during pour.

3.5 LINTELS

A. Provide masonry lintels where openings of more than 12 inches are shown without structural steel or other supporting lintels. Provide either precast or formed-in-place masonry lintels as follows:
1. Provide precast lintels made from concrete matching concrete masonry units in color,
2. Provide prefabricated or built-in-place masonry lintels. Use specially formed bond beam units with reinforcing bars placed and filled with coarse grout. Cure precast lintels before handling and installing. Temporarily support built-in-place lintels until cured.

3. Unless otherwise indicated, provide one reinforcing bar for each 4 inch thickness of wall, and use bars of a size number not less than the number of feet of opening width.

B. Provide minimum bearing of 8 inches at each jamb, unless otherwise indicated.

C. Steel: Install steel lintels and loose lintels of other materials where indicated.

3.6 CONTROL JOINTS / EXPANSION JOINTS

A. General: Install control/expansion joints in masonry walls where indicated. Rake out mortar in preparation for application of sealant.

B. Spacing: If control joint locations are not indicated, place joints vertically, spaced at each structural column, or joint between bays but in no case spaced more than 30 feet on center. Also, place vertical joints at points of natural weakness in the masonry work, including the following locations:

1. Above and below major openings, at one side of the jamb if opening is less than 6 feet wide and at both jambs if opening is over 6 feet wide. Joint should be located away from the opening, at least 2 feet beyond the end of the lintel beam.

2. At expansion or control joints in supporting structure.

3. Where end of masonry wall abuts supporting structure.

3.7 POINTING, CURING, AND CLEANING

A. Pointing: When approved by the Contracting Officer, enlarge and point holes in joints of exposed unit masonry surfaces by completely filling with pointing mortar (Section 04100, "Mortar, Grout and Masonry Accessories").

B. Curing: Allow masonry walls to cure at least three weeks in summer, four weeks in spring and fall, and five weeks in winter before final cleaning.

C. Cleaning:

1. After pointing, wet and clean exposed unit masonry surfaces with mild household detergent-and-water solution, applied with stiff fiber brushes leaving masonry clean, free of mortar daubs and with tight mortar joints throughout. The use of acid is prohibited.

2. Begin cleaning at top and work down.

3. Remove as much mortar from masonry as is possible with scraper or wire brushes taking care not to deface masonry units.

4. Clean surfaces thoroughly and carefully with cleaning solution.

5. Rinse and flush with clean water immediately after cleaning.

6. Leave work in clean condition, free from mortar stain or other defacement.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Concrete masonry described in this section will be paid for on a lump sum basis per location indicated, wherein no measurement will be made. Unless designated in the contract as separate pay items, no separate measurement will be made for bond beams, unit cores, lintel beams, anchors and reinforcement as specified.

END OF SECTION 04220
PART 1 - GENERAL

1.1 DESCRIPTION

A. The extent of stonework (pavers and wall units) is shown on the drawings.

1.2 REFERENCED STANDARDS

A. American National Standards Institute (ANSI):
   1. ANSI A108.1 - Installation of Ceramic Tile
   2. ANSI A118.1 – Specifications for Dry-Set Portland Cement Mortar
   3. ANSI A118.4 – Specifications for Latex-Portland Cement Mortar
   4. ANSIA A118.6 – Specifications for Ceramic Tile Grouts

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM C144 - Standard Specification for Aggregate for Masonry Mortar
   2. ASTM C150 - Standard Specification for Portland Cement
   3. ASTM A153/A153M - Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware
   4. ASTM A185 - Standard Specification for Steel Welded Wire Reinforcement, Plain, for Concrete
   5. ASTM A307 – Standard Specification for Carbon Steel Bolts, Studs, and Threaded Rod 60,000 PSI Tensile Strength
   6. ASTM C97 – Standard Test Methods for Absorption and Bulk Specific Gravity of Dimension Stone
   10. ASTM C270 - Standard Specification for Mortar for Unit Masonry

C. The Society for Protective Coatings (Formerly known as Steel Structures Painting Council) (SSPC):
   1. SSPC Paint 12 - Cold-Applied Asphalt Mastic (Extra Thick Film)

D. Tile Council of America (TCA):
   1. TCA Handbook for Ceramic Tile Installation

1.3 SUBMITTALS

A. Product Data: Submit manufacturer’s data for each material required and proposed for use in the work, showing compliance with the specified requirements. Include mortar, grout, and stone test results performed by testing laboratories, independent of the manufacturer, and instructions for handling, storage, installation, and protection of each material. For tests of mortars and grouts, use the prescribed mixes to achieve the specified properties.

B. Samples: Submit 3 sets of samples not less than 12 inches by 12 inches in size of each different color, grade, and finish of stonework required. Include in each set the full range of exposed color and texture to be expected in the completed work. Contracting Officer’s will review for color and texture only.

C. Shop Drawings: Submit cutting and setting drawings showing sizes, dimensions, sections, and profiles of stonework units; the arrangement and provisions for jointing; required anchoring and fastening supports and other necessary details for lifting devices and reception of other work. Indicate location of each stonework unit on the setting drawings with number designation corresponding to number marked on each unit.

1. Show location of inserts (for stone anchors and supports) which are to be built into concrete or masonry.
2. Locate lifting devices only on concealed surfaces.
3. Show large scale details of decorative surfaces and inscriptions.

1.4 QUALITY ASSURANCE

A. Source Quality Control:

1. Provide stone which complies with recommendations of the following, as applicable:
   a. Limestone: Indiana Limestone Institute.
   c. Marble: Marble Institute of America.

2. Obtain each type or color of stone from one quarry, with consistent color range and texture throughout the work, matching Contracting Officer's samples for the project.

3. Fabricator: Ensure that fabricator (manufacturer) of stonework is an individual or firm experienced in the fabrication of stonework of the type and quality shown and specified and who can provide required quantities. The fabricator and the quarry company are required to be one and the same firm, unless accepted otherwise by the Contracting Officer.

B. Stone Quality: Unacceptable defects in stone units and installations are as follows:

1. Irregular edges.
2. Exposed surfaces which have finish deficiencies.
3. Damaged surfaces.
4. Exceeding specified tolerances.

C. Allowable Tolerances: As recommended by the applicable stone association, unless more strict requirements are specified in sections relating to each type of stonework.

D. Sample Panel Installation: See requirements in sections relating to each type of stonework.

E. Pre-Construction Meeting: Before constructing sample panel installations, meet with affected trades and the Contracting Officers to review installation procedures, precautions, and coordination with other work. Discuss in detail the mixing and application of mortars and grouts, and the setting of stone.

F. Latex Admixture Manufacturer Qualification: Ensure that latex manufacturer has proven experience in formulating and manufacturing latex admixtures for stonework.

G. Workmanship: Use only journeymen stonecutters and journeymen stonesetters under the direction of a competent foreman to perform stonework.

H. Sample Panel:

1. Prior to installation of stonework, provide sample panels of stonework indicated with proposed range of color, texture, and workmanship to be expected in the completed work. Use stone, anchors and jointing, as shown and specified in accordance with final shop drawings.

2. Obtain Contracting Officer's acceptance of visual qualities of sample panels before start of stonework. Replace unsatisfactory sample panel work, as directed, until acceptable to the Contracting Officer.

3. If sealant primers, sealants, resin-adhesives, sealers, water repellents, and other compounds are required in the finished work, build sample panel and apply compounds in sufficient time to allow for final examination for staining or other deleterious effects from such applications.

4. Sample Panels will be used to approve procedures, the finished appearance of installations, and the qualification of installation personnel.

5. Initial Testing of Paver Installation Sample Panels (if any stone pavers):
   a. After at least 40 hours bond coat curing time, and before grouting pavers, test sample panel in presence of Contracting Officer. Test each paver by tapping with a 3/8 inch diameter steel rod, 36 inches long; and gently pry each paver sideways or upward.
   b. Mark with bright crayon or paint for immediate removal, pavers which are not firmly bedded, or which exhibit a hollow sound when tapped, or which are broken.
   c. Remove marked pavers, chip out bond coat, and set new paver in place of the removed unit, fully aligned with adjacent pavers.
d. Adjust setting technique to prevent probable causes of discovered failures.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Protect stone during storage and construction against wetting, soiling, staining and damage.

B. Handle stone to prevent chipping, breakage, soiling or other damage. Do not use pinch or wrecking bars without protecting edges of stone with wood or other rigid materials. Lift with wide-belt type slings wherever possible; do not use wire rope or ropes containing tar or other substances which might cause staining. If required, use wood rollers and provide cushion at end of wood slides.

C. Store stone on wood skids or pallets, covered with non-staining, waterproof membrane. Place and stack skids and stones to distribute weight evenly and to prevent breakage or cracking of stones. Protect stored stone from weather with waterproof, non-staining covers or enclosures, but allow air to circulate around stones.

D. Protect mortar materials and stonework accessories from weather, moisture, and contamination with earth and other foreign materials.

1.6 JOB CONDITIONS

A. Maintain a temperature of not less than 50 degrees F during stonework installation and for 7 days after completion.

B. Keep sand dry, so that mixes are not diluted with water.

C. During all seasons, protect partially completed stonework against inclement weather when work is not in progress. Cover top of walls with strong, waterproof, non-staining membrane extending at least 2 feet down both sides of walls and anchor securely in place.

D. Do not proceed with installation of sealants when ambient and substrate temperatures are outside the limits permitted by sealant manufacturer or below 40 degrees F., or when joint substrates are wet due to rain, frost, condensation or other causes.

E. Cold Weather Precautions:

1. Do not use frozen materials or materials mixed or coated with ice or frost. Do not use salt to thaw ice in anchor holes or slots. Do not lower the freezing point of mixes by use of admixtures or anti-freeze agents, and do not use calcium chloride in mixes.

2. Do not build on frozen work. Remove ice or snow formed on substrate surfaces, carefully applying heat until top surface is dry to the touch.

3. Remove and replace stonework which is frozen or damaged by frost or freezing condition.

1.7 EXTRA MATERIALS

A. Deliver extra materials to Owner at a location and time that is at Owner's convenience. Furnish extra materials matching products installed, packaged with protective covering for storage and identified with labels clearly describing contents.

1. Stone Cladding Units: Furnish quantity of full-size units for each shape and thickness equal to 2 percent of amount installed.

PART 2 - PRODUCTS

2.1 MARBLE

A. Pavers: ASTM C503, except as follows:

1. Water absorption: (0.06) percent by weight after 48 hours immersion, ASTM C97.

2. Compressive strength: 8,700 psi, ASTM C170.

3. Abrasive hardness: Coefficient of 15.0 or better, ASTM C241.

B. Trim Units and Wall Units: ASTM C503.

2.2 GRANITE

A. ASTM C615, architectural grade, free from starts, cracks, or seams which might impair its structural integrity or appearance.

B. Finish Classifications: Finishes for granite are defined as follows:

1. Split-face finish: Finish face mechanically split along a line parallel to the grain. Stones with exposed tooling or tool marks are not acceptable.

2. Saw-cut finish: Relatively plain surface with texture ranging from wire sawn, a close approximation of smooth lusterless rubbed finish, to shot sawn, with scorings 3/32 inch in depth.

3. Thermal finish: Plane sawn surfaces with flame finish applied by mechanically controlled means to ensure uniformity. Surface coarseness may vary depending upon grain structure. Stone on which the thermal pattern is directional is unacceptable.
4. Honed: Dull sheen, without reflections, approximate 80 to 100 grit finish.

5. Polished: Mirror gloss, with sharp reflections.

6. Shot-ground: Plane surface with pronounced circular markings or trails having no regular pattern.

7. Lewis Holes: Where stone thickness permits, provide Lewis holes for lifting stones weighing over 100 pounds. Do not provide Lewis holes closer than 2 inches from finished face of stone nor in exposed portions of stone.

2.3 LIMESTONE

A. Pavers: ASTM C568, Category III (high density).

B. Trim Units and Wall Units: ASTM C568, Category II (medium density) or Category III (high density).

2.4 SLATE

A. ASTM C629, Classification I (Exterior); hard, non-absorbing, non-fading, sound stock.

B. Finish Classifications:
   1. Natural Cleft (pronounced texture).
   2. Semi-Rubbed (partly rubbed to produce a level surface, but showing some of the natural cleft face).
   3. Sand-Rubbed (perfectly smooth, straight face).
   4. Honed (smoother than sand-rubbed, having some sheen).

2.5 BOND ADHESIVE

A. Two component epoxy resin designed specifically for bonding together units of stone or for bonding stone units to a substrate as recommended by manufacturer for intended use.

2.6 BITUMINOUS PAINT

A. Cold applied asphaltic mastic complying with SSPC Paint 12, formulated for 30 mils dry film thickness per coat and compatible with adjacent damproofing.

2.7 JOINT FILLER

A. Closed cell polyethylene or neoprene foam, not less than 3 psi for 25 percent compression resistance, free of tar, asphalt, or creosote, and highly resistant to petroleum oils and solvents. Provide filler of dimensions in width as required to compress firmly into joints; in any case not less than 1/4 inch greater than the width of joints. Refer to Section 07900, “Seals and Sealants” for installation.

2.8 SEALANT

A. Multi-component polyurethane sealant, as applicable, complying with Section 07900, “Seals and Sealants”.

2.9 BACKER ROD

A. See Section 07900, “Seal and Sealants”.

2.10 MORTAR AND GROUT MATERIALS

A. Cement: Provide Portland cement, ASTM C150, white, non-staining and non-air-entraining. Use Type I, except Type III may be used for setting stonework in cold weather. Do not use masonry cement.

B. Hydrated Lime: ASTM C207, Type S.

C. Sand: Measure and use sand in dry, loose consistency so that mixes are not diluted with water, and will have the specified properties, except as otherwise allowed in writing by the latex manufacturer and proven by the submitted test results.

   1. Mortar Sand: ASTM C144, except graded with 100 percent passing the No. 16 sieve and of white or colored aggregate as required to match Contracting Officer’s sample.
      a. White mortar aggregate: Natural white sand or ground white stone meeting the specified requirements.
      b. Colored mortar aggregate: Marble, granite, or other sound stone, meeting the specified requirements.

   2. Setting bed sand (course sand): ASTM C144, 100 percent passing the No. 8 sieve.

   3. Bond coat sand (fine sand): ASTM C144, bagged silica sand, with no particles larger than No. 30 sieve and no particles smaller than No. 60 sieve.

D. Grout: Prepackaged, factory colored, acid-resistant, sanded grout mix, without additives that would alter the properties of the latex admixture.

E. Pigment: Where required for use to match approved sample, provide commercial finely ground, integral coloring pigment of iron oxide, manganese dioxide, ultramarine blue, chromium oxide or carbon black which are fade proof, alkali-resistant; and compounded for use in mortar mixes and matching Contracting Officer’s sample. Do not exceed pigment-to-cement ratio (by weight) of 1-to-35 for carbon black and 1 to 7 for other pigments.
F. Stearate Additive for Back-Parging: Ammonium stearate, aluminum tristearate or calcium stearate.

G. Water: Clear and free of deleterious materials which would impair the work.

H. Latex Admixtures: Styrene butadiene latex, formulated to improve the adhesive, cohesive, compressive, and water resistant properties of the mortars, bond coats, and grouts to which they are added. Do not use acrylic latex, vinylidene chloride latex, or polyvinyl acetate latex. Mix properties are specified under Article 2.12, herein. Conform to the requirements of ANSI A118.1, A118.4, A118.6 and the TCA: Handbook for Ceramic Tile Installation, as applicable.

2.11 STONEWORK ACCESSORIES

A. Adjustable Inserts: Stainless steel, AISI Type 302/304, of the configuration and size shown or, if not shown, as required to support loading involved.

B. Dovetail Slots: Fabricate from not less than 24-gauge galvanized steel, unless otherwise indicated. Provide with filler strips. Supply dovetail slots to concrete installer.

C. Expansion Anchors: Type, size, and load capacity shown or, if not shown, as required to support loading involved.
   1. For anchoring into concrete, fabricate from hot-dipped galvanized A153 Class B3 steel.
   2. For anchoring into stone, fabricate from AISI Type 302/304 stainless steel.

D. Anchor Bolts, Nuts and Washers: Fabricate from AISI Type 302/304 stainless steel if in contact with stone; otherwise, provide regular low carbon steel bolts and nuts (ASTM A307, Grade A) hot-dip galvanized; complying with ASTM A153.

E. Stone Anchors: Type and size shown or, if not shown, as required to securely anchor and fasten stonework in place. Fabricate anchors and dowels from Type 302/304 stainless steel.

F. Setting Buttons: High-density, high-impact polyurethane of the thickness required for the joint size indicated, and of the size required to maintain uniform joint width.

G. Stonework Flashing: Provide concealed flashing, shown to be built into stonework, of AISI Type 302/304 stainless steel, 2D finish, fully annealed or dead-soft temper, in thicknesses indicated but not less than 0.0156 inch thick.

H. Cleavage Membrane: Minimum 4 mils thick polyethylene film, for use only where shown.

I. Setting Bed Reinforcement: 2 inch by 2 inch, 16/16 gauge welded wire mesh; ASTM A185, galvanized after fabrication. Use flat mats, not rolls. Cut mats to stop 1 inch short of control joint locations.

J. Metal Lath: 3.4 pounds per square yard expanded, self-furring, zinc coated metal lath; anchored by galvanized nails and 1/2 inch stainless steel washers 6 inches on center. Place metal lath in all vertical cement mortar (mud set) setting beds. Cut lath to stop at control joints.

K. Water Repellents for Limestone: Penetrating water repellent for vertical application. A monomeric compound containing approximately 20 percent alkyltrialkoxysilanes and meeting VOC/AIM regulations containing 3.3 lb./gal. VOCs or less.

2.12 MIXES

A. General: Use the following mixes for mortar and grout, as applicable, unless otherwise specified in sections relating to each type of stonework.

B. Setting Bed Mortar (Traffic Surfaces): Mixture of 1 part Portland cement to 3 parts setting bed sand by volume and liquid latex for mortar mixed complying with instructions of liquid latex manufacturer. Mixture consistency which will stick together on being molded into a ball by a slight pressure of the hands, will not exude liquid latex, but will leave hands damp, and when placed, be at the point of becoming plastic. Water or diluted liquid latex is not acceptable, except as otherwise instructed by liquid latex manufacturer. Provide weather resistant, frost resistant, shock resistant cured mortar, with the following physical properties:
   1. Compressive Strength: Minimum 5000 psi at 28 days.
   2. Water Absorption: Maximum 4 percent.
   3. Bond Strength: Minimum 500 psi.
   4. Ozone Resistant: No loss of strength after 200 hrs. exposure at 200 ppm.

C. Veneer Setting Mortar (Walls): Mixture of Portland cement, hydrated lime, mortar sand and liquid latex for mortar in-place of water complying with ASTM C270. Type S, except as otherwise indicated, mixed complying with instruction of liquid latex manufacturer. Provide mixture of workable consistency for the application. Water or diluted liquid latex is not acceptable, except as otherwise instructed by liquid latex manufacturer. Provide weather resistant, frost resistant, shock resistant cured mortar, with the following physical properties:
   1. Compressive Strength: Minimum 3000 psi at 28 days.
   2. Water Absorption: Maximum 4 percent.
   3. Bond Strength: Minimum 500 psi.

D. Bond Coat: Mixture of 1 part Portland cement to 1 part bond coat sand by volume and liquid latex for bond coat, mixed complying with instructions of liquid latex manufacturer. Provide mixture of a thick, creamy consistency. Water or diluted liquid latex is not acceptable, except as otherwise instructed by liquid latex manufacturer. Provide weather resistant, frost resistant, shock resistant, non-staining cured bond coat with the following physical properties:

1. Compressive Strength: Minimum 5000 psi at 28 days.
2. Water Absorption: Maximum 4 percent.
3. Bond Strength: Minimum 500 psi.
4. Ozone Resistance: No loss of strength after 200 hours exposure at 200 ppm.

E. Floor Grout: Mixture of proprietary floor grout pre-mixture and liquid for grout, mixed complying with instructions of manufacturers. Provide mixture of workable toothpaste consistency, which permits filling joints their full depth, without voids. Water or diluted liquid latex is not acceptable, except as otherwise instructed by liquid latex manufacturer. Provide weather resistant, frost resistant, shock resistant, resistant to promoting bacteria growth, non-shrink, non-staining cured grout, with acceptable color consistency between batches and the following physical properties:

1. Compressive Strength: Minimum 5000 psi at 28 days.
2. Water Absorption: Maximum 4 percent.
3. Bond Strength: Minimum 500 psi.
4. Ozone Resistance: No loss of strength after 200 hrs. exposure at 200 ppm.

F. Color Pigmented Veneer Setting Mortar: Comply with the requirements for veneer setting mortar specified herein, and proportion pigments with other ingredients to achieve required mortar color as follows:

1. Mix to match final sample.
2. Cement, and pigments, as applicable to produce required mortar color; factory proportioned, dry blended and packaged. Site proportioning and blending not permitted.
3. Pigment to cement ratio by weight and water to cement ratio of colored mortar mixes to be consistent and in compliance with instructions of the pigment manufacturer for required mortar color and with the requirements of this section. Do not exceed specified pigment to cement ratio.

2.13 FABRICATION

A. General: Fabricate as shown and as detailed on final shop drawings and in compliance with the recommendations of the applicable stone association. Provide holes and sinkages cut or drilled for anchors, fasteners, supports and lifting devices, as shown and as necessary to secure stone work in place. Cut and back-check as required for proper fit and clearance. Shape beds to fit supports.

B. Contiguous Work: Provide chases, reveals, reglets, openings, and similar spaces and features as required for contiguous work. Coordinate with drawings and approved shop drawings showing contiguous work.

C. Cut accurately to shape and dimensions shown on approved shop drawings, maintaining fabrication tolerances specified under Quality Assurance.

1. Dress joints (bed and vertical) straight and at 90 degree angle to face, unless otherwise indicated.
2. Provide quirk-mitered corner, unless otherwise shown or specified. Provide for cramp anchorage in top and bottom bed joints of corner units, unless otherwise shown or required to assure concealment of the anchorage.
3. Joint Width: Cut to provide joint widths as shown or specified; or, if not shown or specified, cut to allow for uniform 1/2 inch wide joints.
4. Remove rust and iron particles for sawn backs of stone units.

D. Thickness: Provide stone of the thickness shown or specified. Saw-cut back surfaces which will be fully concealed in the finished work.

E. Provide not less than 1 inch clearance between back face of units and structure framing (or fireproofing, if any).

F. Fabricate molded work to profiles shown, with arrises sharp and true and matched at joints between units.

G. Carve and cut decorative surfaces and inscriptions in accordance with the final shop drawings.

H. Cut flashing reglets, 5/8 inch wide by 3/4 inch deep, unless otherwise indicated.
I. Cut gasket reglets in edges of panels where gasketed joints are shown. Coordinate with profile of gaskets to be used in the work.

J. Fabricate saddles and thresholds to profiles and dimensions shown.

K. Fabricate saddles and thresholds of same width as jamb openings and 7/8 inch thick if flush, or 1-1/4 inch thick with rounded corners, if raised. Cope ends to fit profile of metal jambs and stops; extend ends under stops of wood jambs.

PART 3 - EXECUTION

3.1 INSPECTION

A. Require Installer (stonecutter and stonesetter) to examine supporting structure and all conditions under which the stonework is to be performed, to verify all critical dimensions, and to notify the Contracting Officer in writing of any conditions detrimental to proper installation or performance of the work.

B. Do not proceed with the work until unsatisfactory conditions have been corrected in a manner acceptable to the Installer.

C. Where indicated, dampproof concrete and masonry surfaces associated with or to be in direct contact with stone units prior to installation of stonework.

D. Do not use stone units with chips, cracks, voids, stains, discoloration, or other defects which might be visible or cause bad appearance in the finished work.

3.2 PREPARATION

A. Coordinate placement of inserts and flashing reglets which are to be used for anchoring and supporting and flashing of stonework. Furnish to installers of other adjacent work drawings or templates showing location of inserts for stone anchors and supports.

B. Remove debris, material droppings, and all other foreign matter from substrate surfaces before starting installation of stonework.

C. Clean stone before setting by thoroughly scrubbing with fiber brushes followed by a thorough drenching with clear water. Use only mild cleaning compounds that contain no caustic or harsh fillers or abrasives. If not thoroughly wet at time of setting, drench or sponge stone. Do not wet expansion or control joint surfaces.

3.3 INSTALLATION - GENERAL

A. Execute stonework by skilled stone cutters and stone setters at the site to do necessary field cutting as stone is set.
L. **Flashing:** Provide concealed flashing built into stonework where indicated. Prepare substrate surfaces smooth and free from projections and other items which might damage flashing. Seal flashing penetrations with sealant before covering.

1. Terminate flashing 1/2 inch from outside face of stonework, unless otherwise indicated.

2. Extend flashings beyond interior edge of lintels and sills at least 4 inches and turn up edge on sides to form pan to direct moisture to exterior.

3. Interlock end joints of flashing units by overlapping not less than 3 inches and seal lap with sealant.

M. **Expansion and Control Joints:** Provide expansion and control joints where indicated, but in no case less frequent than at abutting surfaces and directly over joints in substrate. Provide joint filler of applicable type for installation condition installed in continuous strips complying with Section 07900, “Seals and Sealants”. Do not fill joint space with mortar or grout. Ensure joint filler extends full width and depth of joint, including bedding material. Install joint filler to allow for installation of sealant and backer rod complying with Section 07900, “Seals and Sealants”.

3.4 **WALLS**

A. Erect walls plumb and true with joints uniform in width and accurately aligned. Set in full bed of mortar, unless otherwise indicated. Provide setting buttons as required to prevent extrusion of mortar. Do not set units above until mortar in courses below is set sufficiently to maintain alignment and prevent extrusion.

B. **Cavity Construction:** Where open space between back of stone units and back-up or framing is shown, keep cavity open; do not fill with mortar or grout. Ensure joint filler extends full width and depth of joint, including bedding material. Install joint filler to allow for installation of sealant and backer rod complying with Section 07900, “Seals and Sealants”.

3.5 **TRAFFIC SURFACES (FLOORS)**

A. Clean subbase to remove dirt, dust, debris, and loose particles.

B. Moisten concrete subbase with clean water about three hours before placing setting bed, until absorption from water-suction stops. About 1 hour prior to placing setting bed, remove all remaining surface water, allowing surface to dry. Omit water-moistening or modify procedure if so recommended by latex admixture manufacturer.

C. **Layout:** As indicated, or if not indicated, center paver field, both directions, in each major area to provide a symmetrical pattern which minimizes pavers less than half-size and cutting of pavers.

1. Set pavers with stone grain running all in the same direction, unless otherwise shown.

2. **Texture:** Locate pavers with shallow textures together, gradually making transition to pavers with deeper textures so the transition is imperceptible.

D. **Joint Width:** As indicated, or if not indicated, provide joints 1/2 inch wide, except as detailed for expansion joints.

E. **Bed Bond Coat:** Where setting bed mortar is to be placed directly on a concrete substrate, apply bond coat to substrate at approximately 1/16 inch thickness by trowel about 15 minutes prior to placing setting bed mortar. Limit area of bond coat application to avoid drying out prior to placement of mortar.

F. **Setting Bed:** Place setting bed mortar over prepared substrate, and spread, compact and screed to uniform thickness indicated, except for variations necessary to provide a true surface level in plane or uniformly sloped for drainage and to the required tolerances. Place only the amount of mortar which can be covered with pavers prior to
initial set of mortar. Replace setting bed mortar which has reached initial set prior to placing of paver.

1. About 15 minutes after placing bed bond coat, and before it takes its initial set, place half of the mortar bed.

2. Dry mix the mortar bed ingredients in a concrete mixer for at least three minutes. Then mix dry ingredients with latex additive, as approved, to form a stiff cohesive mortar.

3. Screed the mortar which has been placed in the setting bed to a level which is 3/4 of the required setting bed thickness and compact it to 1/2 the required setting bed thickness by rolling or by tamping with a hand tamper.

4. Place the welded wire reinforcement flat on the mortar, half-bed lapping the joints 4 inches and tie with galvanized wire for convenience. Cut reinforcement 1 inch back from control joints.

5. Screed the remainder of the mortar over the welded wire reinforcement and compact by roller or tamper until the required overall mortar bed thickness and slope is attained and the completed mortar bed;
   a. Shows a slight glaze of moisture when worked with a steel trowel.
   b. Is firm enough to support a person’s weight without showing the outline of footprints.

6. Set pavers before initial set of setting bed mortar.

G. Setting Units:

1. Apply the paver bond coat to the setting bed mortar with the flat edge of the trowel and work into the surface of the mortar bed. Then, comb the bond coat with coarsely notched trowel, leaving ample mortar standing up in ridges.

2. Apply paver bond coat to the back surface of pavers sufficient to fully cover the surface and to fill all recesses.

3. Total thickness of the paver bond coat mortar: 1/16 inch to 1/8 inch as needed to make up for variations in the level and trueness of the mortar setting bed. Place the paver before bond coat takes its initial set.

4. Level pavers to required elevation. Install entire bottom surface of pavers in contact with setting bed. Set and level each paver immediately. Do not set large areas of pavers and later level.

H. Cleavage Membrane: Where cleavage membrane is shown, install membrane flat, lapping edges three inches and taping to hold membrane secure and flat during placement of setting bed.

I. Grout: Grout joint spaces as indicated. Install grout after initial set of setting mortar and pavers are firm and securely in place.

1. Remove debris, dust, and spacers from joint spaces.

2. Force grout into grout spaces full width and depth. Place in layers as necessary and compact with the side of a rod-shaped tool to assure there are no voids down to bottom of joint.

3. Strike joints flush with surface of pavers and tool slightly concave (maximum 1/32 inch).

4. Remove grout spillage from faces of pavers as work progresses.

5. Cure grout complying with instructions of grout latex admixture manufacturer.

J. Control Joints (Sealant Joints):

1. Rake out joint down to substrate of bed before mortar is set.

2. Fill joint with filler, keeping filler recessed just far enough to allow for backer rod and sealant. Therefore, there will be more filler material at thicker parts of setting bed, and less filler material at thinner parts of bed.

3. Install backer rod and sealant. See Section 07900, “Seals and Sealants”.

K. Projection:

1. Do not permit traffic on pavers during setting and for at least 24 hours after grouting or pointing of joints.

2. Protect installation from precipitation for 2 days.

L. Testing:

1. Permit normal pedestrian and light, soft-wheeled cart traffic over installation after grouting has cured at least 1 week in order to reveal the presence of any unsound or improperly set pavers.

2. Test entire installation in the presence of the Contracting Officer. Test each paver by tapping with a 3/8 inch diameter steel rod, 36 inches long.
3. Mark with bright crayon or paint for removal, pavers which exhibit a hollow sound when tapped, or which are broken or discolored.

4. Remove marked pavers, chip out grout and bond coat, and set new paver grout and sealer in place of removed material, fully level, align, and color match to adjacent work.

3.6 ADJUSTMENTS AND CLEAN-UP

A. Remove and replace stone units which are broken, chipped, stained or otherwise damaged. Where directed, remove and replace units which do not match adjoining stonework. Provide new matching units, install as specified and point-up joints to eliminate evidence of replacement. Repoint defective and unsatisfactory joints as required to provide a neat, uniform appearance.

B. Clean stonework not less than 6 days after completion of work, using clean water, a mild household detergent, and stiff-bristle brushes. Do not use wire brushes, acid type cleaning agents or other cleaning compounds with caustic or harsh fillers.

C. Protect the stonework from collapse, deterioration, discoloration, or damage during subsequent construction and until acceptance of the work.

3.7 ALLOWABLE TOLERANCES FOR FINISHED INSTALLATIONS

A. General: Meet the following tolerances unless otherwise specified in sections relating to each type of stonework.

B. Walls:
   1. Variation from plumb: 1/4 inch maximum in 10 feet.
   2. Variation from level: 1/4 inch maximum in any bay or 20 feet.
   3. Variation from linear building line: 1/2 inch maximum in any bay or 20 feet.
   4. Variation in cross-sectional dimensions: For thickness of walls, minus 1/4 inch and plus 1/2 inch.

C. Face of Stone: 1/16 inch offset from adjacent stone.

D. Floors and Other Horizontal Surfaces:
   1. Horizontal surface: Maximum of 1/8 inch deviation in 10 feet, taken at any location and in any direction.
   2. Elevation: Within 1/8 inch of elevation shown.

E. Joint Widths:
   1. 1/4 inch joints: Plus or minus 1/16 inch.
   2. 3/8 inch joints: Plus or minus 1/16 inch.
   3. 1/2 inch joints: Plus or minus 1/8 inch.

F. Maximum Out-of-Square: 1/4 inch in 10 feet, measured diagonally.

3.8 WATER REPELLENTS FOR LIMESTONE

A. Examination:
   1. Examine substrates surfaces to receive water repellents and associated work and conditions under which work will be installed. Do not proceed with installation until unsatisfactory conditions have been corrected in a manner acceptable to Installer. Starting work within a particular area will be construed as applicator’s acceptance of surface conditions.

B. Preparation:
   1. Clean substrate of substances that might interfere with penetration or performance of water repellents. Test for moisture content, according to repellent manufacturer’s written instructions, to ensure surface is sufficiently dry.
   2. Test for pH level, according to water repellent manufacturer’s written instructions, to ensure chemical bond to silicate minerals.
   3. Protect adjoining work, including sealant bond surfaces from spillage or blow-over of water repellent. Cover adjoining and nearby surfaces of aluminum and glass if there is the possibility of water repellent being deposited on surfaces. Cover live plants and grass.
   4. Coordination with Sealants: Do not apply water repellent until sealants for joints adjacent to surfaces receiving water-repellent treatment have been installed and cured.
      a. Water-repellent work may precede sealant application only if sealant adhesion and compatibility have been tested and verified using substrate, water repellent, and sealant materials identical to those used in the work.
   5. Test Application: Before performing water-repellent work, including bulk purchase and
delivery of products, prepare a small application in an unobtrusive location and in a manner approved by Contracting Officer to demonstrate the final effect (visual, physical, and chemical) of planned application. Proceed with work only after Contracting Officer approves test application or as otherwise directed.

C. Application:

1. Apply a heavy-saturation spray coating of water repellent on surfaces indicated for treatment using low-pressure spray equipment. Comply with manufacturer’s written instructions for using airless spraying procedure, unless otherwise indicated.

2. Apply a second saturation spray coating, repeating first application. Comply with manufacturer’s written instructions for limitations on drying time between coats and after rainstorm wetting of surfaces between coats. Consult manufacturer’s technical representative if written instructions are not applicable to Project conditions.

D. Field Quality Control:

1. Manufacturer’s Field Service: Provide services of a factory-authorized technical service representative to inspect and approve the substrate before application and to instruct the applicator on the product and application method to be used.

E. Cleaning:

1. Protective Coverings: Remove protective coverings from adjacent surfaces and other protected areas.

2. Immediately clean water repellent from adjoining surfaces and surfaces soiled or damaged by water-repellent application as work progresses. Repair damage caused by water-repellent application. Comply with manufacturer’s written cleaning instructions.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will be paid for on a lump sum basis per location indicated wherein no measurement will be made.

END OF SECTION 04400
SECTION 04720
CAST STONE

PART 1 - GENERAL

1.1 SUMMARY

A. Work required for this section includes cast stone masonry and supplementary items necessary to complete their installation.

B. Precast concrete units are specified in Section 03450, “Architectural Precast Concrete”.

1.2 REFERENCE STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM A276 - Standard Specification for Stainless Steel Bars and Shapes
2. ASTM A615/A615M - Standard Specification for Deformed and Plain Carbon Steel Bars for Concrete Reinforcement
3. ASTM A666 - Standard Specification for Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar
4. ASTM A767/A767M - Standard Specification for Zinc-Coated (Galvanized) Steel Bars for Concrete Reinforcement
5. ASTM A775/A775M - Standard Specification for Epoxy-Coated Steel Reinforcing Bars
6. ASTM C33 - Standard Specification for Concrete Aggregates
7. ASTM C114 - Standard Test Methods for Chemical Analysis of Hydraulic Cement
10. ASTM C666 - Standard Test Method for Resistance of Concrete to Rapid Freezing and Thawing
11. ASTM C979 - Standard Specification for Pigments for Integrally Colored Concrete

B. Brick Institute of America (BIA):

1. BIA - Technical Notes on Brick Construction.

1.3 DEFINITIONS

A. Cast Stone: Highly refined architectural precast concrete building stone manufactured from mixture of Portland cement and coarse and fine aggregates, to simulate natural stone and generally used as masonry product, as an architectural feature, trim, ornament, or facing for buildings and other structures.

1.4 SUBMITTALS

A. Product Data: Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for cast stone units.

B. Shop Drawings: Show fabrication and installation details for cast stone units. Include dimensions; details of reinforcement and anchorages, if any; and indication of finished faces.

1. Include building elevations showing layout of units and locations of joints and anchors.

C. Stone Samples: For each color and texture of cast stone required, 10 inches square in size.

D. Full-Size Samples: For each type of cast stone unit required. Make available for Architect’s review at Project site before installing cast stone. Approved Samples may be installed in the Work.

E. Test Reports: From a qualified testing agency indicating and interpreting test results for compliance of cast stone with requirements indicated.

1. Certificates: In lieu of agency test reports, submit certificates signed by manufacturer certifying that cast stone complies with requirements specified.

1.5 QUALITY ASSURANCE

A. Standards: Comply with provisions of Cast Stone Institute standard specification and technical bulletins.

B. Manufacturer Qualifications: A firm experienced in manufacturing cast stone units similar to those indicated for this Project and with a record of successful in-service performance, as well as sufficient production capacity to manufacture required units.

C. Source Limitations for Cast Stone: Obtain cast stone units through one source from a single manufacturer.
1.6 DELIVERY, STORAGE, AND HANDLING

A. Pack, handle, and ship cast stone units in suitable packs or pallets.
   1. Lift with wide-belt slings; do not use wire rope or ropes that might cause staining. Move cast stone units, if required, using dollies with wood supports.
   2. Store cast stone units on wood skids or pallets with nonstaining, waterproof covers. Arrange to distribute weight evenly and to prevent damage to units. Ventilate under covers to prevent condensation.

PART 2 - PRODUCTS

2.1 CAST STONE MATERIALS

A. General: Comply with ASTM C1364 and the following:
   B. Portland Cement: ASTM C150, Type I, containing not more than 0.60 percent total alkali when tested according to ASTM C114. Color as required to produce finish specified.
   C. Coarse Aggregates: Granite, quartz, or limestone complying with ASTM C33; gradation and color as needed to produce required textures and finish.
   D. Fine Aggregates: Manufactured or natural sands complying with ASTM C33, gradation and color as needed to produce required textures and finish.
   E. Air-Entraining Admixture: ASTM C260, certified by the manufacturer to be compatible with other admixtures used.
       1. Add to mixes for units exposed to the exterior at manufacturer’s prescribed rate to result in an air content of 5 to 7 percent.
   F. Reinforcement: Deformed steel bars complying with ASTM A615, Grade 60.
   G. Embedded Anchors and Other Inserts: Fabricated from stainless steel complying with ASTM A276 or ASTM A666, Type 304.
   H. Color Pigments: ASTM C979, Inorganic (natural or synthetic) iron oxide pigments excluding use of carbon black pigment, and guaranteed by pigment manufacturer to be lime-proof. Amount of pigment shall not exceed 5 percent by weight of cement used.

2.2 CAST STONE UNITS

A. Provide cast stone units complying with ASTM C1364.
   1. Provide units that are resistant to freezing and thawing as determined by laboratory testing according to ASTM C666, Procedure A, as modified by ASTM C1364.
   B. Reinforce units as indicated and as required by ASTM C1364. Use galvanized or epoxy-coated reinforcement when covered with less than 1-1/2 inches of material.
   C. Fabricate units with sharp arris and details accurately reproduced with indicated texture on exposed surfaces, unless otherwise indicated.
       1. Slope exposed horizontal surfaces at least 1:12, unless otherwise indicated.
       2. Provide raised fillets at backs of sills and at ends indicated to be built into jambs.
       3. Provide drips on projecting elements, unless otherwise indicated.
   D. Cure and finish units as follows:
       1. Cure units in totally enclosed curing room under dense fog and water spray at 95 percent relative humidity for 24 hours.
       2. Yard cure units until the sum of the mean daily temperatures for each day equals or exceeds 350 deg F.
       3. Acid etch units to remove cement film from surfaces indicated to be finished.
   E. Color and Texture: Provide units with fine-grained texture and buff color resembling Indiana limestone.

2.3 MORTAR MATERIALS

A. Provide mortar materials that comply with Section 04100, “Mortar, Grout and Masonry Accessories”.

2.4 ACCESSORIES

A. Anchors: Type quantity and size required to support cast stone cladding and to sustain imposed loads, fabricated from stainless steel complying with ASTM A276 or ASTM A666, Type 304.
   B. Dowels: Round stainless steel bars complying with ASTM A276, Type 304, 1/2-inch diameter.
2.5 MORTAR MIXES

A. Comply with requirements in Section 04100, "Mortar, Grout and Masonry Accessories" for mortar mixes.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrate surfaces to receive cast stone and associated work and conditions under which stone will be installed. Do not proceed with installation until unsatisfactory conditions have been corrected in a manner acceptable to installer. Starting work within a particular area will be construed as applicator's acceptance of installation conditions.

3.2 INSTALLATION

A. Install cast stone units to comply with requirements specified in other Division 4 Unit Masonry Sections for installing stone units in walls with other masonry units.

B. Install anchors, supports, fasteners, and other attachments necessary to secure units in place. Set units accurately in locations indicated with edges and faces aligned according to established relationships with other masonry units and indicated tolerances.

C. Drench units with clear water just before setting.

D. Set units in full bed of mortar with full head joints, unless otherwise indicated. Build anchors and ties into mortar joints as units are set.
   1. Fill dowel holes and anchor slots with mortar.
   2. Fill collar joint solid as units are set.
   3. Build concealed flashing into mortar joints as units are set in accordance with other Division 4 Unit Masonry Sections.
   4. Leave head joints open in coping and other units with exposed horizontal surfaces. Keep joints clear of mortar, and rake out to receive sealant.

E. Rake out joints for pointing with mortar to depths of not less than 3/4 inch. Rake joints to uniform depths with square bottoms and clean sides. Scrub faces of units to remove excess mortar as joints are raked.
