F. Point mortar joints by placing and compacting mortar in layers not greater than 3/8 inch. Compact each layer thoroughly and allow to become thumbprint hard before applying next layer.

G. Tool exposed joints slightly concave when thumbprint hard, using a jointer larger than joint thickness, unless otherwise indicated.

H. Provide expansion, control, and pressure-relieving joints of widths and at locations indicated.
   1. Sealing joints is specified in Section 07900, "Seal and Sealants".
   2. Keep joints free of mortar and other rigid materials.

3.3 INSTALLATION TOLERANCES

A. Variation from Plumb: Do not exceed 1/8 inch in 10 feet or 1/4 inch in 20 feet or more.

B. Variation from Level: Do not exceed 1/8 inch in 10 feet, 1/4 inch in 20 feet, or 3/8 inch maximum.

C. Variation in Joint Width: Do not vary joint thickness more than 1/8 inch in 36 inches or one-fourth of nominal joint width, whichever is less.

D. Variation in Plane between Adjacent Surfaces (Lipping): Do not exceed 1/16-inch difference between planes of adjacent units or adjacent surfaces indicated to be flush with units.

3.4 ADJUSTING AND CLEANING

A. Remove and replace stained and otherwise damaged units and units not matching approved Samples. Cast stone may be repaired if methods and results are approved by Contracting Officer.

B. Replace units in a manner that results in cast stone matching approved Samples, complying with other requirements, and showing no evidence of replacement.

C. In-Progress Cleaning: Clean cast stone as work progresses. Remove mortar fins and smears before tooling joints.

D. Final Cleaning: After mortar is thoroughly set and cured, clean exposed cast stone as follows:
   1. Remove large mortar particles by hand with wooden paddles and nonmetallic scrape hoes or chisels.
2. Clean cast stone by bucket and brush hand-cleaning method described in BIA Technical Notes No. 20 Revised II, using job-mixed detergent solution.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work specified in this section will be paid for on a lump sum basis per location indicated wherein no measurement will be made. No separate measurement will be made for mortar and grout, and any other equipment or accessories specified for the work, as they are considered incidental to and integral part of the finished work.

END OF SECTION 04720
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies structural steel work for bridges and includes shop coating of steel.

1.2 REFERENCE STANDARDS

A. American Association of State Highway and Transportation Officials (AASHTO):

1. AASHTO HB-17 - Standard Specification for Highway Bridges

2. AASHTO/AWS D1.5M/D1.5 - Bridge Welding Code

B. American Institute of Steel Construction (AISC):

1. AISC 303 - Code of Standard Practice for Steel Buildings and Bridges

2. AISC 348 - Specification for Structural Joints Using ASTM A325 or A490 Bolts

C. American Railway Engineering Association (AREMA):

1. AREMA Chapter 15 - Steel Structures Volume 2/Structures (Manual for Railway Engineering - Fixed Properties, Vol. 2)

D. American Welding Society (AWS):

1. AWS D1.1/D1.1M - Structural Welding Code - Steel

E. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM A6/A6M - Standard Specification for General Requirements for Rolled Structural Steel Bars, Plates, Shapes, and Sheet Piling

2. ASTM A27/A27M - Standard Specification for Steel Castings, Carbon, for General Application

3. ASTM A36/A36M - Standard Specification for Carbon Structural Steel

4. ASTM A108 - Standard Specification for Steel Bar, Carbon and Alloy, Cold-Finished

5. ASTM A109/A109M - Standard Specification for Steel, Strip, Carbon (0.25 Maximum Percent), Cold-Rolled

8. ASTM A153/A153M - Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware

9. ASTM A242/A242M - Standard Specification for High-Strength Low-Alloy Structural Steel

10. ASTM A307 - Standard Specification for Carbon Steel Bolts and Studs, 60,000 psi Tensile Strength

11. ASTM A325 - Standard Specification for Structural Bolts, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength

12. ASTM A370 - Standard Test Methods and Definitions for Mechanical Testing of Steel Products

13. ASTM A449 - Standard Specification for Quenched and Tempered Steel Bolts and Studs

15. ASTM A563 - Standard Specification for Carbon and Alloy Steel Nuts

16. ASTM A572/A572M - Standard Specification for High-Strength Low-Alloy Columbium-Vanadium Structural Steel

17. ASTM A588/A588M - Standard Specification for High-Strength Low-Alloy Structural Steel with 50 ksi (345 MPa) Minimum Yield Point to 4-in. (100-mm) Thick

18. ASTM A668/A688M - Standard Specification for Steel Forgings, Carbon and Alloy, for General Industrial Use

20. ASTM A709/A709M - Standard Specification for Carbon and High-Strength Low-Alloy Structural Steel Shapes, Plates, and Bars and Quenched-and-Tempered Alloy Structural Steel Plates for Bridges

22. ASTM F436 - Standard Specification for Hardened Steel Washers

23. ASTM F1554 - Standard Specification for Anchor Bolts, Steel, 36, 55, and 105-ksi Yield Strength

F. Military Specification (MIL):
1. MIL-P-21035 - Paint High Zinc Dust Content, Galvanizing Repair (Metric).
2. MIL-PRF-26915 - Primer Coating, for Steel Surfaces.

G. The Society for Protective Coatings (Formerly known as Steel Structures Painting Council) (SSPC):
1. SSPC Paint 20 - Zinc-Rich Primers (Type I, "Inorganic," and Type II, "Organic").
2. SSPC VIS 1 - Visual Standard for Abrasive Blast Cleaned Steel (Standard Reference Photographs)

1.3 SUBMITTALS

A. Shop Drawings:
1. General: Shop drawings shall not be the reproductions of the Contract drawings.
2. Structural details: Include the following:
   a. Bills of materials giving complete information for fabrication and erection of component parts of structures including material and finish information.
   b. Details of location, type, sizes of bolts, and welds and for welded structures details of welding as specified.
   c. Structural computations for designed work certified by a Professional Engineer licensed in the State of Texas.
3. Match marks: Provide diagram showing match marks for connecting structural parts assembled in shop for purpose of drilling or reaming holes in field connections.
4. Welding:
   a. Complete shop details of qualification test specimens.

B. Manufacturer's Data and Samples: Prior to the start of any shop painting work submit to the Contracting Officer for approval, the following:
1. Complete Data Sheets of the shop coating material to be used, identified by the manufacturer, brand name and product number, color, and batch number.
2. Written procedures for compliance with this specification, covering storage, handling, surface preparation, application, curing, repair, and inspection.

C. Certifications:
1. Certified mill test reports of structural steel at least 10 days prior to start of fabrication.
2. Certified quality assurance testing and inspection reports.
3. Submit certification verifying that welding personnel have been qualified in accordance with AASHTO/AWS D1.5M/D1.5, for the required positions and techniques utilized.
4. Manufacturer's certification that bolts meet approved testing.
5. Submit certifications for both the inspection and testing personnel who will inspect the welding showing they comply with requirements of AASHTO/AWS D1.5M/D1.5.

1.4 QUALITY ASSURANCE

A. Source Quality Control:

1. The Contracting Officer will have the authority to reject any material or work which does not meet the requirements of these specifications.

2. Testing and inspection:

a. Nondestructive test requirements for welded members: Perform the following:

1) Tension butt welds in fracture-critical non-redundant members and member components of structures subject to repetitive dynamic loading: 100 percent of welds inspected by radiographic examination and as specified in AASHTO/AWS D1.5M/D1.5.

2) Groove welds of flange material for compression and tension splices: 100 percent of welds inspected by radiographic examination.

3) Groove welds for web splices beginning at point of maximum stress: 40 percent of welds inspected by radiographic examination.

4) Fillet welds connecting web plates to flange plates: 25 percent of welds inspected by magnetic particle inspection.

5) For other fillet weld connections: 10 percent of welds inspected by magnetic particle inspection.

6) Visual inspection of welds for conformance to details shown on shop drawings and quality.

7) When testing, examination, and inspection as specified or scheduled herein reveals faulty welds, joints of the same type will be checked until the integrity of the welds is assured before resuming the specified schedule.

b. Mill Testing:

1) For identified stock materials provide three specimens from each heat number, one for tension test, one for bend test, and one for Charpy V-notch impact test.

2) Cut, machine and test specimens in accordance with ASTM A370.

3) Mill test reports shall reflect the following:

a) Specification to which material is provided.

b) Heat number of material.

c) Chemical and physical properties of material.

d) Impact test data when required.

4) Perform Charpy V-notch impact test on materials used for tension flanges and other tension components in accordance with ASTM A588, Zone 1 (Minimum service temperature, 0 degrees F and above). Sampling and testing procedures in accordance with ASTM A673 using the (H) frequency of heat testing.

5) Subject the fracture-critical members (FCM’s) to the further requirements set forth in the AASHTO/AWS D1.5M/D1.5.

a) FCM’s are defined as those tension members and components thereof whose failure would be expected to result in collapse of the bridge. Any component that is welded to a fracture critical member is considered part of that member and therefore, shall be
b) Fracture-critical members are specifically designated in the plans with the designation FCM.

c. Bolts: The Contracting Officer will randomly select at least five bolts for test purposes from each bin of bolts furnished. Not less than three bolt, nut and washer assemblies from each lot supplied shall be tested in a tension measuring device to demonstrate that the bolts and nuts, when used together, can develop the specified tension requirements.

d. Painting:

1) Inspect and test each phase of the shop prime painting work, and unacceptable conditions corrected and reinspected until approved, before transporting to job site.

2) Provide the following items to the Contracting Officer so that he may perform inspection and testing.

a) Air temperature thermometer 30 degrees F to 120 degrees F.

b) Surface temperature thermometer 0 degrees F to 250 degrees F.

c) Sling psychrometer 30 degrees F to 110 degrees F or continuous recording hygrometer.

d) Pictorial surface preparation standards SSPC VIS 1.

e) Surface profile measuring device Keane-Tator, Clemtex or Testex.

f) Wet film thickness gauge 0.5 to 20 mils.

g) Magnetic dry film thickness gauge Mikrotest 102/FIM or approved equal.

B. Qualification of Welding Personnel and Procedures:

1. Prior to qualifying welding personnel and welding procedures, submit and obtain approval from the Contracting Officer for procedural details, sequence of welding, handling of materials to be inspected, and approval of electrodes, wire, flux and other welding materials and equipment. Refer also to Section 01450, “Quality Control”, for further information and compliance.

2. Employ welding personnel whose qualification is certified in accordance with AASHTO/AWS D1.5M/D1.5. Such certification is to remain in force for the duration of the welding operations under this Contract.

3. Do not start fabrication until qualification has been successfully completed and procedures approved.

C. Qualification of Nondestructive Testing Personnel:

1. Conduct nondestructive testing of fracture-critical members, by personnel qualified as NDT Level II or Level III or ASNT-TC1A Level II or III, in accordance with AASHTO HB-17 Guide Specifications.

2. Supervise Level II technicians with Level III personnel.

3. Visual inspections will be performed by an AWS CW1.

D. Qualification of Fabrication Plants:

1. Fabricate members or member components in “Fracture Critical Members” (FCM) category by plants certified under AISC Quality Certification Program, Category III Major Steel Bridges.

2. Use experienced, knowledgeable personnel, procedures and equipment.

E. Stock Material:

1. For qualification of welding personnel and procedures and for quality assurance testing, use only stock materials which can be identified as having been rolled from a given heat and for which certified mill tests can be produced.

2. Material Identification:

a. Inform the Contracting Officer at least 10 days in advance of commencing fabrication to permit
sampling and testing. Select identified material from as few heats as possible.

b. Use stock material that can be identified by heat number and mill test report.

c. The Contractor’s system of assembly-marking individual pieces, and the issuance of cutting instructions to the shop shall be such as to maintain identity of the original piece.

d. Use a marking system (color codes, stencils, etc.) which will identify the source of structural steel by heat number. Loss of positive identification will require testing to establish acceptability. Testing shall be performed by a commercial agency at the Contractor’s expense.

e. Each approved type of steel shall be identified by a color code in accordance with ASTM A6. The color “white” shall be used for ASTM A36 steel.

F. Comply with AWS: D1.1/D1.1M, except as follows:

1. For welding of structural steel, AASHTO/AWS D1.5M/D1.5.

2. For welding of “Fracture Critical” members; AASHTO/AWS D1.5M/D1.5.

G. Welder’s Identification Mark:

1. Assign each welder and welding operator an identification mark to stamp on pieces he has welded.

2. Have welder or welding operator place his identification mark by metal die stamp in letters 3/8 inch high in position that identification of welder or operator will appear adjacent to each of his welds in finally assembled members for ready reference to radiographic films and for identification by the Contracting Officer.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. General:

1. Load, transport, unload, and store structural materials to keep them clean and free from damage.

2. Store material above ground on platforms, skids, or non-abrasive supports and ensure proper drainage and protection from corrosion or damage to the coating.

3. Use acceptable methods to lift materials to protect coatings.

B. Steelwork:

1. Handle and store girders and beams in upright position. Properly brace and support to prevent damage from torsional, vertical or lateral deflections.

2. Block projecting parts likely to be bent or damaged during handling with wood or other approved material.

3. Members suspected of damage during handling, transporting, or storing subject to non-destructive tests as directed by Contracting Officer.

4. Replace pieces bent or damaged unless repair is approved. Repair scraped or gouged pieces by grinding or filing.

5. Indicate weight on members weighing more than three tons by means of paint contrasting with shop coat.

6. Mark structural members in accordance with approved erection plans.

7. Store prime coated steel off the ground on nonabrasive supports and stacked on nonabrasive separators. Use acceptable methods to lift coated steel where the use of chains or steel cable would damage the coating.

C. Bolts and Nuts:

1. Ship small parts such as bolts, nuts, washers, pins, fillers and small connecting plates or angles in boxes, crates or barrels.

2. Pack separately bolts of each length and diameter and loose nuts or washers of each size.

3. List and describe contents of each box, crate, keg, or barrel on the outside of each package.

D. Coating Materials:

1. Receive and store coating materials in the manufacturer’s original, unopened containers bearing a legible product designation, batch number, and date of manufacture on the side of each container. Do not open containers except for immediate use.

2. Store coating materials according to the manufacturer’s latest printed instructions and protect from damage, moisture, direct
PART 2 - PRODUCTS

2.1 MATERIALS

A. General Requirements For Rolled Steel Plates, Shapes, And Bars: ASTM A6.

B. Structural Steel for Bridges: ASTM A709, grade as specified on design plans.

C. Low-Carbon Steel Bolts and Nuts: ASTM A307, Grade A or B for bolts. ASTM A563, Grade A for nuts.

D. High-Strength Bolts, Nuts, and Washers for Structural Joints: ASTM A325, Type as specified on plans for bolts. ASTM A563, Grade as recommended in Table X1.1, in ASTM A563, for nuts.

E. Circular, Clipped, and Beveled Washers:
   1. ASTM F436.
   2. Make beveled washers square, smooth and sloped to make contact surfaces of bolt head and nut parallel.
   3. Diameter of hole in square beveled and circular washers as follows:
      a. For bolts less than 1 inch diameter: 1/16 inch larger than bolt size.
      b. For bolts larger than 1 inch diameter: 1/8 inch larger than bolt size.

F. Carbon Steel Forgings: ASTM A668.

G. Alloy Steel Forgings: ASTM A668.

I. Carbon Steel Castings: ASTM A27

J. Shear Connectors:
   1. Cold-rolled carbon-steel strip.
   2. Stud welding fasteners with upset head developing tensile strength of 65,000 psi minimum and yield strength of 52,000 psi minimum.

3. Complying otherwise to the following: Cold-finished bars, Grade 1015, Grade 1018 or Grade 1020, semi-killed or fully killed: ASTM A108.

4. Stud welding conforming to AASHTO/AWS D1.5M/D1.5.

5. Sizes and shapes: As shown.

6. Lengths to be after-weld lengths.

7. Studs arc-welded to parent metal as shown.

8. Before welding, parent metal surface to be free from rust, oil, paint, plating, and other foreign matter.

9. Heat treat parent metal where needed to develop full weld strength.

2.2 MISCELLANEOUS STEEL

A. Steel Plates and Shapes: Steel, ASTM A709, grade as shown on drawings.

B. Welded Headed Studs: ASTM A108, Grade 1015 or 1020, cold finished carbon steel headed studs.

C. Anchor Bolts: ASTM F1554, Grade 55, unless noted otherwise on drawings. ASTM A563, Grade A for nuts. ASTM F436, Type 1 for washers.

D. Galvanized Steel: ASTM A153/A153M.

E. Bearing: In accordance with Items 434 and 435 of the TxDOT Standard Specifications for Construction of Highways, Streets, and Bridges.

F. Dowels: As shown.

2.3 GALVANIZING

A. Steel products specified as galvanized. Hot-dip galvanized after fabrication, in accordance with the following:

1. Zinc coating on products fabricated from rolled, dressed and forged steel shapes, plates, and strips: ASTM A123.

B. Galvanizing Repair Paint:
   1. For Concealed or Top Coated Surfaces:
      a. Organic zinc-rich coating containing at least 65 percent metallic zinc, by weight in dry film and meeting performance requirements of:
         1) ASTM A780.
2. For Surfaces to be Left Exposed:
   a. In addition to requirements for concealed and top coated surfaces, match aesthetic appearance of hot-dip galvanizing and meet performance requirements of:
      1) MIL-P-21035.
      2) MIL-PRF-26915.
   b. Basis-of-Design: Brite Products "Brite Zinc".

2.4 PAINT

A. Primer: As specified in Section 09970, "Coatings for Steel" Paint and Coating System No. 1. Use make as selected for finish coating.

B. The following removable rust preventatives are acceptable for coating machined surfaces:

<table>
<thead>
<tr>
<th>Manufacturer</th>
<th>Product</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ashland Petroleum Co.</td>
<td>Tectyl 890</td>
</tr>
<tr>
<td>Daubert Chemical Co.</td>
<td>Nox Rust 501 LS</td>
</tr>
<tr>
<td>Houghton Chemical Co.</td>
<td>Cosmoline 1062</td>
</tr>
<tr>
<td>Or approved equal</td>
<td></td>
</tr>
</tbody>
</table>

C. Products for erection marking shall be verified to be compatible with the selected painting system.

2.5 FABRICATION

A. Accomplish workmanship and finish to standards referenced in Section 01450, "Quality Control". For railroad structures, shop workmanship and fabrication procedures shall be accordance with Chapter 15 of the latest AREMA Specification.

B. Camber girders for dead load as shown on plans. Girders require shop assembly, reaming, and matchmarking of connections. The Contractor shall submit a detailed procedure to the Engineer for approval prior to heat curving or cambering any beam or girder.

C. Straightening Material:
   1. Use rolled material that, before being laid off or worked, is straight within tolerances specified in ASTM A6.
   2. Perform straightening where necessary by approved methods approved by the Contracting Officer which will not overstress material.

D. Tolerances are as follows:
   1. Flanges of completed girders shall not depart from straightness or the specified camber by more than 1/8 inch in any ten feet along the flange.
   2. The plane of bearing area of beams and girders shall be perpendicular to the vertical axis of the beam within 1/16 inch.
   3. The plane of the bearings supporting a box girder shall be perpendicular to the vertical axis of the girder within 1/16 inch and true to each other, in that plane, to 1/16 inch. Each bearing shall be true to 1/32 inch across its entire width in the short direction.
   4. The plane of the beam supports on box girders are bearing areas and shall be true to the box girder bearings to 1/16 inch in the short direction and true to the vertical axis of the nesting beams/girders to 1/16 inch.

E. Cutting:
   1. Flame cut edges of members subject to dynamic loading by mechanically guided torch or by hand, when approved. Remove nicks by grinding to depth not exceeding 1/4 inch.
   2. Shape re-entrant corners notch-free to radius of 3/4 inch minimum.
   3. Perform flame cutting so that metal does not carry stress during cutting operation.
   4. Direct flame so that remaining material is not damaged.
   5. Except as otherwise permitted on the plans, steel plates for main members shall be cut and fabricated so that primary direction of rolling is parallel to the direction of the main tensile and/or compressive stress.
   6. Edges of main members which are sheared or oxygen cut, and other exposed edges to be painted, shall be rounded or chamfered.
to an approximate 1/16 inch radius by grinding.

**F. Planing and Facing:**

1. Plane to depth of 1/4 inch sheared edges of plates more than 5/8 inch thick which will carry calculated stress.

2. Face and bring abutting joints to even bearing where shown.

3. Fabricate floor beams, stringers, and girders having end connection angles to length back to back of connection angles.

4. For compression joints depending on contact, prepare bearing surfaces to a common plane by milling, sawing, or other approved means.

5. Where end connections are faced, ensure that finished thickness of angle is not less than that shown.

6. The milled surface of bearing stiffeners shall meet ANSI surface roughness of 500, and provide an even bearing against the flange.

**G. Bolt Holes:**

1. Punch or drill holes for bolts.

2. Pitch and edge distance not shown on the plans shall be in accordance with the latest edition of the AASHTO HB-17.

3. Subpunch or subdrill and ream assemblies. Use a steel template for alignment of connections as necessary. Flame cutting is prohibited.

4. Subdrill or subpunch holes 3/16 inch less than nominal diameter of bolt; after assembly ream holes 1/16 inch greater than nominal diameter of bolt or drill from the solid to 1/16 inch greater than nominal diameter of bolt.

5. Holes in field splices of main box girders, continuous beams, and plate girders shall be subpunched (or subdrilled) and reamed assembled, or drilled full size assembled, to correct position in the finished structure due to grade, camber, or curvature. Layout shall be as shown on the shop drawings and shall be approved by the Contracting Officer before reaming or drilling is done by the fabricator.

6. Holes for floor beams and stringer end connections shall be subpunched and reamed to a steel template.

7. Holes for secondary members such as diaphragms and laterals may be punched full size.

**H. Connections:**

1. Except where welded or ASTM A307 bolted connections are shown, use ASTM A325 bolts for shop connections.

2. Unless otherwise shown, bolt field connections using ASTM A325 bolts in accordance with AISC Manual of Steel Construction.

3. Use of ASTM A490 bolts for dynamic or fluctuating loadings is prohibited.

**I. Plates:**

1. Bent plates: For load carrying cold-bent plates, use identified stock, and arrange direction of bending at right angles to direction of rolling. Ensure radius of bend, measured on concave face of metal, is not less and preferably more than the following:

<table>
<thead>
<tr>
<th>Plate Thickness</th>
<th>(t) Minimum Radius</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up to ½ inch</td>
<td>2.0t</td>
</tr>
<tr>
<td>Over ½ to 1 inch</td>
<td>2.5t</td>
</tr>
<tr>
<td>Over 1 to 1½ inches</td>
<td>3.0t</td>
</tr>
<tr>
<td>Over 1½ to 2½ inches</td>
<td>3.5t</td>
</tr>
<tr>
<td>Over 2½ to 4 inches</td>
<td>4.0t</td>
</tr>
</tbody>
</table>

J. Before bending, the corners of the plate shall be rounded to a minimum radius of 1/16 inch throughout the portion of the plate at which bending is to occur.

**K. Sheared plates:** For gusset plates or connection plates, use sheared plates designed to resist applied loads in more than one direction in plane of plate.

**2.6 SHOP WELDING**

**A.** Perform welding in accordance with AASHTO/AWS D1.5M/D1.5.

**B.** Perform procedure and sequence of welding so as to avoid needless distortion and to minimize stresses. Straighten transverse warpage of flanges, if necessary, by controlled heating along outside face.

**C.** Make allowance in shop for expected weld shrinkage in laying out and assembling members. Trim members to size when most or all of welding has been completed.

**D.** Complete butt welds in flange joints before flanges are assembled on web. Use extension blocks on such joints when making ends of butt welds
removing extension blocks only upon completion and cooling of weld. Ensure ends of welds are finished smooth and flush with edges of abutting parts. Use double-V- flange butt welds, unless otherwise shown.

E. Make welds in web plates where shown.

F. Fabricate built-up members by welding.

G. Prior to ultrasonic or radiographic testing of butt welds of flanges and webs, grind, or machine weld reinforcement of joint to remove irregularities of weld surface so that it merges smoothly with base surface; one side for ultrasonic testing and both sides for radiographic testing.

H. Ensure that welded joints which are to be radiographed are free of paint, scale, and grease. Grind off welded ripples and surface irregularities on both sides of joint. Grind perpendicular to length of weld and to such a degree that resulting radiographic contrast due to remaining irregularities cannot mask or be confused with that of objectionable defect and so that weld surface will merge smoothly into adjoining surface.

I. Repair defective welds by chipping or melting out such defects from one or both sides of joint removing no more weld metal than necessary to correct defect. Reweld and have weld retested radiographically.

J. Welded Structures Subjected to Dynamic Loads:

1. Do not use backup bars for fracture-critical non-redundant members or member components. Refer to AASHTO/AWS D1.5M/D1.5 for requirements for the construction of fracture critical members.

2. Avoid use of backup bars elsewhere, unless explicitly permitted by original design.

3. When use of backup bars is unavoidable because of practicality but not explicitly permitted by original design, remove backup bar after welding is completed and affected surfaces of weld metal and base metal is ground flush. Ensure roughness of ground surfaces are similar to that of surrounding unaffected plate surface.

4. Do not use gas shielded metal arc, flux cored arc, electroslag, or electrogas welding processes for fabrication of fracture critical members.

5. Fully automatic submerged arc welding is required for this project.

K. Do not field weld unless specifically indicated on the plans or approved by the Contracting Officer.

2.7 SHOP ASSEMBLY

A. Undertake complete or progressive shop assembly of continuous plate and box girders, before reaming is started. Obtain approval of progressive shop assembly procedure.

B. Assembly of main span girders and box girders prior to reaming or drilling shall include at least three sections and each assembly thereafter shall include at least one adjacent section which has been reamed with a previous assembly. Assemblies shall be set to correct geometric position prior to reaming or drilling.

C. Clean surfaces of metals in contact with each other before assembling.

D. Assemble parts to line and fit; drill or ream bolt holes while assembled. Hand reaming is prohibited unless approved.

E. Assemble beams and girders of short structures in line assembly with a minimum length assembled of one complete span, from bearing to bearing.

F. Show camber and curvature offsets on shop drawings at approximately 10 foot intervals, measured along girder.

G. Permissible variation in specified sweep for horizontally curved beams and girders, measured in inches: 1/8 inch by 0.1 by (the number of feet from the end bearing), but not to exceed 1/2 inch.

2.8 SHOP COATING OF STEEL

A. Shop prime steel surfaces, except the following:

1. Surfaces embedded in concrete or mortar. Extend priming of partially embedded members to a depth of 2 inches.

2. Surfaces to be field welded.

3. Surfaces to be high-strength bolted with slip-critical connections, if primer does not meet the specified AISC slip coefficient.

4. Items indicated to be galvanized.

B. Prepare steel surfaces and apply shop primer as specified in Section 09970, “Coatings for Steel” Paint and Coating System No. 1 and as specified below:

1. Use priming methods that result in full coverage of joints, corners, edges, and exposed surfaces.

2. Stripe paint corners, crevices, bolts, welds, and sharp edges.

3. Apply two coats of shop primer to surfaces that are inaccessible after assembly or
erection. Change color of second coat to distinguish it from first.

C. Machined Surfaces: Wipe machined surfaces clean with solvent, free of foreign matter before coating with rust preventative.

D. Field Coats: For finish coat of paint, see Section 09970, "Coatings for Steel" Paint and Coating System No. 1.

PART 3 - EXECUTION

3.1 ERECTION

A. Falsework:

1. Furnish, place, and upon completion of erection, remove any required staging, and/or falsework.

2. Use temporary bracing to support loads to which structure may be subjected including erection equipment, materials, and their operations. Remove bracing when no longer required.

B. Erection of Superstructure:

1. Follow methods, procedures, and sequences shown on the approved erection drawings. Report immediately to Contracting Officer errors in shop fabrication and, if any, damages resulting from handling or transportation.

2. Erect reamed connections, match-marked in the shop during shop assembly, in accordance with those match-marks. Do not interchange or revise reamed connections from those shown on erection diagrams.

3. Support plate girders, box girders, and continuous I-beams to maintain required camber.

4. Provide fit-up bolts of the same nominal diameter as the design connection bolts, and drift pins not less than 1/32 inch larger than the connection bolts to provide a driving fit.
   - a. Place fit-up bolts in a symmetrical pattern.
   - b. Do not use fit-up bolts in final construction.
   - c. Ensure that holes are not enlarged and that metal in vicinity of holes is not disturbed by drifting during assembly. Drift only as necessary to bring parts into correct alignment and position.

5. Enlargement of holes to accept bolts is prohibited unless approved by the Contracting Officer. If approved, enlarge by reaming; burning is prohibited. Avoid hand reaming.

6. Field welding is prohibited, unless specifically shown on plans or if directed by the Contracting Officer. When field welding is directed, submit in advance the work and safety plan for approval and implement the approved measures during field welding. Welding and inspecting/testing personnel must submit proper certification prior to commencing their work.

7. Install anchor bolts accurately in positions shown on the plans.

8. If anchor bolts are set during construction of substructure units, ensure that the bolts are accurately located and held firmly in a rigid template elevated to span the concrete surface with sufficient clearance to permit proper finishing of concrete surface. Remove template only after concrete has set.

9. If anchor bolts are set in preformed holes or in drilled holes, the following requirements apply:
   - a. Drill in exact location, to required depth, perpendicular to the plane of the bridge seat, just prior to time of setting anchors.
   - b. Do not drill holes smaller in diameter than the diameter of the holes in the steel base plate.
   - c. Grout with structural non-shrink grout as specified in Section 03305, “Portland Cement Concrete”.

10. Bearing assemblies shall be placed upon lead plates or preformed fabric pads which shall be approximately 1/8 inch thick and 1/2 inch greater in length and width than the bottom bearing (masonry) plate under which they are placed.
   - a. Lead plates shall weigh approximately 8 pounds per square foot.
   - b. Fabric pads shall consist of fabric and rubber body made from new unvulcanized rubber and unused fabric fibers in proper proportion to maintain strength and stability. Type A shore durometer surface hardness of the vulcanized and cured pad shall be 70 - 90 and shall be capable of withstanding compressive loads of
not less than 7000 pounds per square inch.

c. Shop drawings are not required for lead plates or fabric pads.

3.2 FIELD BOLTING

A. Provide connections using high-strength steel bolts in accordance with AASHTO HB-17 Division I and Division II using ASTM A325 bolts.

B. Assemble high-strength bolted parts so that they fit solidly together when assembled. Do not use gaskets or other compressible materials. Use of lubricants on friction threaded bolts and nuts is prohibited.

C. Remove scale, dirt, burrs, and other defects likely to prevent proper seating when assembling joint surfaces, including those adjacent to washers.

D. Remove oil, paint, lacquer, and galvanizing from contact surfaces of friction joints.

E. Tightening Bolts:

1. Tighten A325 bolts to bolt tension not less than proof load given in AASHTO HB-17 Division II, Section 11.

2. Tighten by means of properly calibrated torque wrenches or turn-of-nut method. Alternatively tension indicating washers may be used to determine tension.

3. When tightening, place hardened washer under turned element (nut or bolt head), depending on which element is turned in tightening operation.

4. Calibrate torque wrenches by tightening bolt assembly in device capable of indicating actual bolt tension.

a. Set wrenches such as to induce a bolt tension 5 percent to 10 percent in excess of the specified value.

b. Recalibrate wrenches at least once each day by tightening, in a device capable of indicating actual bolt tension, not less than three bolts of each diameter from the bolts to be installed.

5. Measure torque when nuts or bolts are in tightening motion.

6. Adjust power wrenches, if used, to cut out or stall at required tension.

7. When tightening, do not allow rotation of the part not being turned by the wrench.

F. Arrange bolts so that heads show in areas exposed to public view.

3.3 ADJUSTING AND CLEANING

A. Galvanized Surfaces:

1. Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A780.

2. For surfaces to be left exposed, apply galvanizing repair paint in at least two coats.

B. Touchup Painting: Cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint shall be completed to blend with the adjacent surfaces. Such touch up work shall be done in accordance with manufacturer’s instructions as specified in Section 09970, “Coatings for Steel”.

3.4 QUALITY CONTROL

A. In accordance with Section 01450, “Quality Control”.

B. Inspection: Contracting Officer shall be notified and given the opportunity to observe installation and tightening of bolts to determine that the selected tightening procedure is properly used and that bolts are tightened, including shop and field bolts, tested in place.

1. When the calibrated wrench method of tightening is used, the Contracting Officer shall be given full opportunity to witness the calibration tests prescribed in a. herein.

2. The Contractor, in the presence of the Contracting Officer, shall use an inspected wrench that can be accurately adjusted in accordance with the requirements of a. herein.

3. When the inspection wrench is a torque wrench, each calibration test bolt shall be tightened in the calibration device to the minimum tension specified for its size in 3. herein. The inspecting wrench shall then be applied to the tightened bolt, and the torque necessary to turn the nut or bolt head 5 degrees (approximately 1 inch at 12 inch radius) in the tightening direction shall be determined. The average torque measured in the tests of three bolts shall be taken as the job-inspecting torque.

4. When the inspecting wrench is a power wrench, it shall be adjusted so that it will tighten each calibration test bolt to a tension of at least 5 but not more than 10 percent greater than the minimum tension specified for its size in 3. herein. This setting of the wrench shall be taken as the job-inspecting torque.
5. Bolts represented by the sample prescribed in a. herein that have been tightened in the structure shall be inspected in the presence of the Contracting Officer by applying, in the tightening direction, the inspecting wrench and its job-inspecting torque to 10 percent of the bolts, but not fewer than two bolts, selected at a random in each connection. If no nut or bolt head is turned by this application of the job-inspecting torque, the connection will be accepted as properly tightened. If any nut or bolt head is turned by the application of the job-inspecting torque, the torque shall be applied to bolts in the connection. Bolts whose nut or head is turned by the job-inspecting torque shall be tightened and reinspected, or the bolts in the connection may be retightened and the connection resubmitted for the specified inspection.

6. Inspection of installations using tension-indicating washers will normally be accomplished by checking the residual gap with a metal feeler gage. Installations will be considered satisfactory if the average gap per bolt installation does not exceed 0.015 inch for a tension-indicating washer installed under the bolt head, or 0.010 inch for a tension-indicating washer installed in conjunction with a hardened, flat washer, or if the gap has been reduced to zero at any point around the indicator.

7. The Contracting Officer may verify, by calibrated wrench, that the work conforms to the specified tightening requirements regardless of the method of installation.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

A. Structural steel shall be measured for payment in units of pounds by class such as carbon steel, low alloy steel, etc., and based upon computed weights from approved shop drawings. No allowance is made for erection bolts, excess field rivets or similar items, or the weight of paint, galvanizing, or weld material.

B. Increases in size or weights of members made at the Contractor’s convenience, even though approved by the Contracting Officer, will not be measured for payment, but measurement will be based upon approved Shop Drawings.

C. Deductions will be made for cuts, copes, perforations, and holes except bolt and rivet holes.

D. Weights of steel bolts are included for payment on the basis of the following weights per 100 bolts:

- 3/4 inch diameter - 65 pounds.
- 7/8 inch diameter - 95 pounds.
SECTION 05124
OVERHEAD CONTACT SYSTEM STEEL POLES – WIDE FLANGE

PART 1 - GENERAL

1.1 DESCRIPTION

A. The Work specified in this Section includes providing and delivering new wide flange steel poles and installation by the Contractor, as part of the Overhead Contact System (OCS) shown on the Contract Drawings and specified herein.

1.2 REFERENCE STANDARDS

A. American Society of Mechanical Engineers International (ASME)

B. American Institute of Steel Construction, Inc. (AISC)

G. Federal, State and Local Authorities
   1. All applicable codes and regulations

H. Corps of Engineers Publications
   1. CRD-C588 Non-shrink Grout

1.3 SUBMITTALS

A. Refer to these Specifications for submittal procedures.

B. Within 45 days of commencing Work, the Contractor shall submit shop drawings for review giving complete information required for fabrication of the poles. The shop drawings shall be to scale and shall indicate all
fitting, holes and accessories, and the locations, sizes and types of all welds.

C. Shop drawings shall be prepared under the signature and seal of a Licensed Texas Professional Engineer.

D. Within 45 days of commencing welding Work, the Contractor shall submit for acceptance:

1. Specifications for welding procedures in accordance with AWS D1.1.

2. Certificates of qualifications of welders, welding operators and tackers in accordance with AWS W1 CH12.

3. Certificate of qualification of welding inspectors in accordance with AWS W1 CH12.

E. Before commencing fabrication, the Contractor shall submit for review the manufacturer's certificates of compliance, or certified laboratory test reports demonstrating the compliance of all raw materials and fabricated products with paragraph 2.2, "Fabrication," of this Section. Included shall be a listing of the ASTM standards designated by the manufacturer, as indicated.

F. Six copies of certified laboratory test reports shall be submitted prior to delivery of poles.

1.4 QUALITY ASSURANCE

A. The Contractor shall perform the Work included in this Section in strict accordance with the requirements of the Authority approved Contractor Quality Control Program.

B. The Contractor shall comply with the requirements of these Specifications and the codes and regulations of jurisdictional authorities.

C. The Contractor’s Quality Control Program shall include the following requirements:

1. Material qualification testing and certification for acceptance of materials, components and assemblies.

2. Job control testing of in-progress work being performed in shops, factories and on-site.

3. On-site inspection of specified work elements.

1.5 POLE TESTING AND INSPECTION

A. Material Testing

1. The chemical compositions and required mechanical properties of all materials used shall be determined, either by obtaining manufacturer's certificates of compliance or by laboratory testing at a facility acceptable to the Authority.

B. Embrittlement

1. Fabrication shall conform to ASTM A143 to prevent embrittlement of the steel.

C. Weld Testing

1. The services of an AWS Certified Welding Inspector shall be provided by the pole fabricator:

   a. Inspect Fabrication Operations

   b. Inspect Welding Procedures

   c. Inspect Welding Personnel Qualifications

   d. Perform Ultrasonic and Magnetic Particle Testing

2. A visual inspection of all welds shall be performed in conformance with the AWS Code.

3. Weld testing shall be performed on a sample number of each type of pole, selected at random by the Authority, comprising five percent of the total number of poles. All poles selected for testing shall be tested by the ultrasonic and magnetic particle methods.

4. Equipment, procedures and personnel for weld testing, and test reports, shall conform to the requirements of AWS D1.1, Section 6 - Inspection.

5. Weld testing shall consist of:

   a. Ultrasonic testing conforming to the AWS D1.1, Section 6 requirements.

   b. Magnetic particle testing conforming to the ASTM E709 requirements.

6. Ultrasonic testing shall be performed on the complete penetration welds between the pole shaft and base.

7. For each tested pole that is found to be unacceptable, weld testing shall be performed on a further sample of two poles, selected at random by the Authority from the remaining untested pole population.

8. Results of weld testing shall be deemed acceptable or unacceptable in accordance with AWS D1.1, Sections 8, 9, or 10.

9. Welds found to be unacceptable shall be repaired in accordance with AWS D1.1, Section 3, and retested.

D. Galvanizing Testing
1. All galvanized items shall be inspected for conformance with the requirements of the following ASTM Specifications, as applicable:
   a. Galvanizing Compliance: A123 or A153
   b. Embrittlement: A143
   c. Distortion: A384

E. Impact testing:

1. Structural steel materials for base plates and pole shafts shall be tested for impact toughness in accordance with the Charpy V-notch test as specified in ASTM A370. The minimum energy value shall be 15 feet-pounds at 0 degrees F.

F. Inspection

1. Provisions shall be made for inspection of the fabrication and testing by the Authority. The Contractor shall provide two weeks advance notice for the Authority inspection. Inspection by the Authority at the point of manufacture shall not constitute acceptance of the work as specified.

1.6 PRODUCT DELIVERY, STORAGE AND HANDLING

A. During fabrication and delivery, the poles shall be handled and transported in a manner to preclude damage to either the structural steel or the zinc coating.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Wide Flange Poles

1. Wide Flange Pole shaft and components (base plates, stiffeners, bracket arms) shall be fabricated using ASTM A992 steel. The pole shaft shall be fabricated from one piece (no splicing).

B. Weld Filler

1. Weld filler metal shall be selected in compliance with the welding procedures of AWS D1.1.

C. Zinc

1. Zinc used for hot-galvanized coating shall be Prime Western Grade, or approved equal, conforming to ASTM B6.

D. Zinc rich paint shall conform to Federal Specification TT-P-641, Type II; and shall be Tnemec-Zinc Series 90-93 as manufactured by Tnemec Co., Inc.; Carbo-

Zinc SP81 as manufactured by Carbole; or approved equal.

E. Galvanizing repair compound shall conform to Federal Specification No. DOD-P-21035A, Galvalloy by Metalloy Products Co., Hardhat 2165 by Rust-Oleum, ZRC by ZRC Chemical Products, or approved equal.

2.2 FABRICATION

A. Poles, fittings, and accessories shall be fabricated to the dimensions shown on the Contract Drawings.

B. Methods and Tolerances

1. Poles, fittings, and accessories shall be fabricated by methods and within tolerances conforming to the AISC Specifications, except as specified herein.

C. Wide Flange base plates tolerances:

1. Bolt Circle +/- 1/16 inch.
2. Hole Diameter + 1/16, - 0 inch
3. Location of Holes + 1/16 inch in each direction.

D. Welding Procedures

1. Welding procedures, welders, welding operations and tackers shall conform to the provisions of AWS D1.1, Section 2, Design of Welded Connections; Section 3, Workmanship; Section 4, Technique; and Sections 8, 9, and 10.

E. Weld Repair

1. Welds found to be unacceptable shall be repaired in conformance with the provisions of AWS D1.1, Section 3, Workmanship.

F. Surface Grinding

1. Before galvanizing, all penetration welds shall be ground flush with base metal to eliminate surface cracks. All other welds and cut edges shall be ground to eliminate sharp edges and burrs.

G. Pole Straightening

1. Before galvanizing, the poles shall be straightened as required to conform to the specified requirements. Straightening methods shall not require heating of the poles.

H. Galvanizing

1. After fabrication, the poles, fittings and accessories shall be hot-dip galvanized inside
and out, in conformance with ASTM A123 or ASTM A153, as required. All pole fabrications shall be galvanized for their entire length, at one time, in a single hot-dip galvanizing bath. Galvanizing by successive dippings of partial pole lengths shall not be permitted.

I. Pole Identification Plate

1. A stainless steel pole identification plate shall be attached to each pole at 24 inches above the base plate. The plate shall show the pole type, structure number, and the manufacturer's name and date of manufacture. The identification plate shall be 4 inches by 1.5 inches and embossed with 0.75 inch high letters and numbers. The plate design, style of lettering and method of attachment shall be Authority approved.

J. Pole Type Assembly Mark

1. Pole type assembly number shall be hard marked with a minimum height of 3/4 inch and a minimum indentation of 1/16 inch. The hard mark shall be stamped on the top of the base plate and shall be visible after painting.

PART 3 - EXECUTION

3.1 DELIVERY AND STORAGE

A. Poles shall be delivered complete with associated fittings and accessories, properly packed and protected against damage and loss of parts. Poles shall be protected from damage during storage and handling, and during moving from the storage facility to the installation sites.

3.2 FIELD QUALITY CONTROL

A. Delivered poles, fittings, and accessories shall be inspected for conformance with requirements of this Section. Poles not acceptable will be removed and replaced at no additional expense to the Authority.

3.3 POLE SETTINGS

A. General

1. Wide flange steel poles shall be installed where shown on the Contract Drawings. Anchor bolts, nuts, and washers shown as cast-in-place will be provided and installed by the Contractor. Additional provisions prior to installation of the poles are as follows:

a. The Contractor shall inspect each OCS pole foundation for suitability of installing the designed pole. Any deficiencies with the OCS foundation shall be corrected by the Contractor at no additional cost to the Authority.

b. Perform any preparatory work required to install the pole such as chipping of concrete and cleaning of bolt threads. Cleaning of the bolt threads will generally require the use of the required chaser. Caution shall be exercised to prevent damage to the anchor bolts.

1) The Contractor shall repair the damage incurred at no extra cost to the Authority.

c. Straighten bent anchor bolts and or replace damaged ones as directed by the Authority. The Contractor shall be required to straighten or replace all bent or broken OCS foundation anchor bolts at no additional cost to the Authority.

d. The Contractor shall submit for Authority approval a procedure for straightening or replacing bent anchor bolts. The Contractor shall obtain Authority approval prior to commencing Work.

B. Pole Installation

1. All catenary poles shall be raked and/or adjusted to a plumb condition to compensate for the static load deflection induced by the wire and equipment. The final erected pole plumb (perpendicular) position shall not exceed one in 50 of true vertical with the pole fully loaded as measured within eight feet of its base and corrected for taper where applicable. Any pole lean shall be against the direction of the static loads.

2. The poles shall be raked in the unloaded position by adjusting the double nuts provided with the foundation. A minimum of two full threads shall protrude above the nut. The bottom nut shall clear the top of concrete a minimum of 3/4 inch and a maximum of 2-1/2 inches. All nuts shall be tightened by applying the required torque with a wrench.

C. Pole Fittings

1. The Contractor shall provide and install all fittings required for the specific installation, including, but not limited to, the following items:

a. Counterweight Holes

b. Brackets for Down Guys

D. Feeder Poles (Wide Flange Poles)

1. Wide flange feeder poles shall be fitted with cable support clamps as shown on the Contract Drawings. The Contractor shall
verify that any stiffener plates used on the feeder poles are installed in such a manner to allow correct routing of the feeder conduit risers.

E. Bracket Arms

1. Bracket arms shall be installed at the locations shown on the Contract Drawings. Installation shall conform to the following requirements:
   a. OCS support bracket arms shall be mounted and adjusted so that the contact wire can be installed at the wire heights, and within the tolerance limits, specified in this Specification.
   b. Bracket arm installation shall allow for pole rake and deflection caused by applied dead loads and wire tension loads. After overhead contact systems are installed and fully adjusted to the specified tensions, bracket arms and mountings shall be inspected, and readjusted as required.

F. Grounding and Bonding

1. All steel poles installed by the Contractor shall be electrically bonded to the foundation ground, or as shown on the Contract Drawings. Damage to the steel pole base plate galvanized coating shall be repaired in accordance with Paragraph 3.4, “Touch-Up,” of this Section.

G. Additional Requirements

1. If original foundations are replaced before poles are set, the poles shall be set not less than seven days after foundations are installed, and loaded to design requirements either not less than twenty-eight days after foundations are installed or until required concrete strength verified by test has been attained.

2. The Contractor shall exercise care during erection of poles to prevent damage and disfigurement. Nylon slings and chokers or other non-marking material shall be used for handling of poles. All imperfections on the steel poles shall be repaired as required to restore poles to a condition acceptable to the Authority. Damage to galvanized coatings shall be touched up as specified in Paragraph 3.4.

3. Caution is advised during steel pole erection to prevent contact with other overhead, and possibly energized, utilities.

3.4 TOUCH-UP

A. Areas of damaged galvanizing shall be coated with a compound such as Galvalloy by Metalloy Products Co., Hardhat 2185 by Rust-Oleum, ZRC by ZRC Chemical Products, or Authority approved equal.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this Section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith will be considered incidental to the Work specified under Section 16371 “Overhead Contact System.”

END OF SECTION 05124
PART 1 - GENERAL

1.1 DESCRIPTION

A. The Work specified in this Section includes the following:

1. Design, fabrication and installation of metal fabrications for pole attachments, tunnel roof supports and over bridge supports required to secure the Overhead Contact System (OCS), as shown on the Contract Drawings and specified herein.

2. The fabricated items specified herein consist of steel and iron shapes, plates, bars, pipes, tubes, casting and roll-formed shapes, hot-dip galvanized after fabrication, which are not a part of an overall system specified in other sections of these Specifications.

3. Pole attachments and over bridge supports shall be fabricated as complete units, and hot-dip or electro-galvanized after fabrication in order to avoid the need for field painting, or for any finishing at the work site except for touch-up of damaged surfaces. Each unit shall be delivered complete with anchorage devices, ready for installation as specified in these Specifications, without requiring cutting or drilling at the work site. Units shall be protected against damage during shipment and handling.

1.3 SUBMITTALS
A. Refer to these Specifications, for submittal procedures.
B. Within 45 days of commencing Work, submit Shop Drawings for the fabrication and erection of assemblies of metal work that are not completely shown by manufacturer's data sheets. Include plan elevations at not less than 1 inch to 1-foot scale, and include details of sections and connections at not less than 3-inch to 1-foot scale. Show anchorage and accessory items.
C. Shop drawings shall be prepared under the signature and seal of a Licensed Texas Professional Engineer.
D. Within 45 days of commencing Work, submit manufacturer's product data, load tables, dimension diagrams, and anchor details indicating compliance with the Contract Specifications and Drawings requirements, and for products installation instructions to be used in the metal work fabrication, including paint products.
E. Within 45 days of commencing Work, submit welder certifications and qualifications, as required by AWS W1 CH12.

1.4 QUALITY CONTROL
A. The Contractor shall perform the Work included in this Specification in strict accordance with the requirements of the Contractor's Quality Control Program as Authority approved. The Contractor shall comply with the requirements of these Specifications.
B. The Contractor shall perform the following in accordance with these Specifications:
1. Material qualification testing and certification for acceptance of materials, components and assemblies.
2. Job control testing of in-progress work being performed in shops, factories and work site.
3. On-site inspection of specified work elements.
C. Qualifications: Provide major items of work fabricated by a firm that has been specializing in custom type metal fabrication for a minimum of five years on work of similar scope. Employ experienced workers for both fabrication and installation, who are capable of producing work of the highest standards of quality in the industry.
D. Inspection and Tests:
1. Inspections, tests, and samples shall conform to listed ASTM Specifications and Standards.
2. Inspection rights and privileges, procedures, and acceptance or rejection of galvanized steel materials shall conform to ASTM A123.
3. Inspection and tests include the following:
   a. Visual examination of samples and finished products.
   b. Tests to determine weight or mass of zinc coating per square foot of steel surface.
   c. Tests to determine distribution and uniformity of zinc coating.
   d. Tests to determine thread fittings of units, washers to bolts.

1.5 PRODUCT DELIVERY, STORAGE AND HANDLING
A. Packaging
1. Shall be of the type to prevent damage to galvanized surfaces and distortion of steel materials and components.
B. Handling and Storage:
1. Conform to ASTM A123.
2. Protect galvanized materials from damage to zinc coating.

3. To avoid humid storage stain, space surfaces of galvanized materials to permit free circulation of air.

C. Damaged Materials:
1. Repair material showing evidence of damage to zinc coating.
2. If not repairable, material with damaged coating will be subject to rejection.

PART 2 - PRODUCTS

2.1 FASTENERS AND ANCHORAGE MATERIALS

A. Fasteners shall be stainless steel or epoxy-coated to prevent rusting or staining.

B. Items listed below are indicated for minimum general conditions, and may be superseded by Section 2.2 A.

3. Expansion Anchor Bolts: Toothed steel or lead shield expansion devices to the type and size indicated, with galvanized bolts, except do not use lead shield type anchor bolts for overhead anchorage.
4. Lag Bolts: FS FF-B-561, type and grade as required.
5. Through Bolts or Eye Bolts, ASTM A193, Grade B7.
7. Washers: Carbon steel; plain, round complying with FS FF-W-92; locking, helical spring complying with FS FF-W-84, all galvanized.
8. Concrete Inserts: Unit-type inserts of the type and size indicated, of hot-dip zinc-coated steel.
9. Non-shrink, Nonferrous Grout: POR-ROK Anchoring Cement, Lehn & Fink Industrial Products, Division of Sterling Drug, or Authority approved equal.

2.2 FABRICATION, GENERAL

A. For the fabrication of metal work which will be exposed to view, use only materials which are smooth and free of surface blemishes including pitting, seam marks, roller marks, grinding, or by welding and grinding, prior to cleaning, treating and application of finishes including zinc coatings.

B. Use materials of the size and thicknesses indicated, or if not indicated, of the required sizes and thickness to produce adequate strength and durability in the finished product for the intended use. Work to the dimensions shown or accepted on shop drawings, using proven details of fabrication and support. Use the type of materials indicated or specified for the various components of work.

C. Form exposed work true to line and level with accurate angles and surfaces and straight sharp edges. Ease exposed edges to a radius of approximately 1/32 inch unless otherwise indicated. Form bent-metal corners to the smallest radius possible without causing grain separation or otherwise impairing the Work.

D. Verify dimensions by accurate field measurement before fabrication, wherever work adjoins other work that precedes it in construction. However, do not delay job progress; allow for trimming and fitting of metal work wherever the taking of field measurements before fabrication might delay the work. On shop drawings, note which dimensions have been verified by field measurement.

E. Weld corners and seams continuously and in accordance with the recommendations of AWS D1.1. Grind exposed welds smooth and flush to match and blend with adjoining surfaces.

F. Form exposed connections with hairline joints that are flush and smooth, using concealed fasteners wherever possible. Use exposed fasteners of the type indicated, or if not indicated, use Phillips flathead (countersunk) screws or bolts.

G. Pre-drill bolt holes and tapped holes for screws as indicated as required for attachment of metal work and for the attachment of adjacent materials.

H. Provide inserts and anchoring devices that must be set in concrete for the installation of metal work. Coordinate delivery of such devices with other work to avoid delay.

I. Provide for anchorage of the type indicated. Fabricate and space anchoring devices as indicated and as required to provide adequate support for the intended use of the work.

J. Cut, reinforce, drill and tap metal work as may be required to receive finish hardware and similar items of work.

K. Use hot-rolled steel bar for work fabricated from bar stock, unless work is indicated or specified to be fabricated from cold-finished or cold-rolled stock.

L. Pre-assemble work at shop to the greatest extent possible to minimize field splicing assembly of units at
OVERHEAD CONTACT SYSTEM FABRICATED METAL SUPPORTS

the work site. Disassemble units to the extent required to comply with shipping limitations. Mark all units clearly for reassembly and proper installation.

M. Where indicated as galvanized, complete the shop fabrication prior to application of the coating. Remove mill scale and rust, clean and pickle the units as required for coating. Apply hot-dip zinc coating of 2 ounces in accordance with ASTM A123.

2.3 GALVANIZING

A. Steel members, fabrication, and assemblies shall be galvanized after fabrication:

1. Method: Hot-dip process in accordance with ASTM A123.

2. Weight of zinc coating to conform to requirements specified under "Weight of Coating" in ASTM A123, as applicable.

B. Safeguard against steel embrittlement in conformance with ASTM A143.

C. Safeguard against warpage or distortion of steel members to conform to ASTM A384. Notify the Authority of potential warpage problems that may require modification in design before proceeding with steel fabrications.

D. Finish and uniformity of zinc coating and adherence of coating shall conform to ASTM A153.

E. Passivating: Galvanizing materials subject to extended periods of storage in open, exterior locations shall be given passivating treatment or light oiling to prevent humid storage stain; treatment, solution and process shall be subject to review and acceptance by the Authority.

F. Preservative Oils: Do not treat freshly galvanized or passivated surfaces with oils, grease, or chemicals that might interfere with adhesions of subsequent paint primers and coatings.

G. Field Inspection: Visually inspect galvanized materials, fabrications, and assemblies for conformity with applicable requirements of AHDGA, Inspection Manual for Hot-Dip Galvanized Products.

1. Steel for timber screw spikes shall be heat-treated to a minimum of 150,000 psi tensile strength.

2. Timber screw spike head shall be square headed or match equal drive sockets for installation.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Set metalwork accurately in location, alignment and elevation, plumb, level, true and free of rack, measured from established lines and levels. Temporarily embrace or anchor in formwork where Work is to be built into concrete.

B. Fit exposed connections accurately together to form tight, hairline joints. Weld connections that are not to be left as exposed joints, but cannot be shop welded because of shipping size limitations. Grind joints smooth, and touch-up shop paint coat. Do not weld, cut or abrade the surfaces of exterior units which have been hot-dip galvanized after fabrication, and are intended for bolted or screwed field connections.

C. Anchor securely as shown or as required for the intended use, using concealed anchors wherever possible.

D. Grout with non-shrinking, nonferrous cement grout, or pack with lead wool and caulk where pipe sleeves are used to support metal Work. Provide galvanized steel pipe on pipe sleeves not less than 6 inches long and having an inside diameter not less than 1/2 inch greater than outside diameter of insert.

E. Install insulating devices or butyl tapes in between dissimilar metals.

3.2 TOUCH-UP

A. Immediately after erection, any areas of paint damaged by field installation, including field welding, shall be thoroughly cleaned to bare metal.

B. Paint those areas with the same material as used for shop coating.

C. Coat areas of damaged galvanizing with a compound such as Galvalloy by Metalloy Products Co., Hardhat 2185 by Rust-oleum, or ZRC by ZRC Chemical Products, or approved equal.

PART 4 – MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this Section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith will be considered incidental to the Work specified under Section 16371 “Overhead Contact System.”

END OF SECTION 05125
PART 1 - GENERAL

1.1 DESCRIPTION

A. The Work described in this Section includes providing and delivering new steel poles, and their installation by the Contractor as part of the Overhead Contact System (OCS) as shown on the Contract Drawings and as Specified herein.

1.2 REFERENCE STANDARDS

A. American Institute of Steel Construction, Inc. (AISC)
   1. Specifications for the Design, Fabrication and Erection of Structural Steel for Buildings
   2. Code of Standard Practice for Steel Buildings and Bridges

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM)
   1. ASTM A36/A36M - Standard Specification for Carbon Structural Steel
   2. ASTM A53/A53M REV A - Pipe, Steel, Black and Hot-Dipped, Zinc Coated, Welded and Seamless
   3. ASTM A123/A123M - Zinc Coating on products fabricated from rolled, pressed and forged steel shapes, plates, bars and strips
   4. ASTM 143/A143M - Safeguarding Against Embrittlement of Hot-Dip Galvanized Steel Products and Procedure
   5. ASTM A153/A153M - Zinc Coating (Hot Dip) on iron and steel hardware
   6. ASTM A283/A283M - Low and intermediate Tensile Strength Carbon Steel Plates
   7. ASTM A325 REV B - High Strength Bolts for Structural Steel joints, Including Suitable Nuts and Plain Hardened Washers
   8. ASTM A370 - Methods and Definitions for Mechanical Testing of Steel Products
   9. ASTM A384 - Safeguarding Against Warpage and Distortion During Hot-Dip Galvanizing of Steel Assemblies
   10. ASTM A572/ A572M - High-Strength, Low-Alloy Columbium-Vanadium Steels of Structural Quality
   11. ASTM A588/ A588M – High-Strength Low-Alloy Structural Steel
   12. ASTM A595 REV A - Steel Tubes, Low Carbon, Tapered for Structural Use
   13. ASTM E709 - Standard Guide for Magnetic Particle Examination
   15. ASTM F593 - Stainless Steel Bolts, Hex Cap Screws, and Studs

C. American Welding Society, Inc. (AWS)
   1. AWS D1.1/D1.1M - Structural Welding Code, Steel
   2. AWS W1 CH 12 - Qualifications of Welders and Welding Operators

1.3 SUBMITTALS

A. Shop Drawings: Within 45 days of commencing Work, submit shop drawings giving complete information required for the fabrication of the poles. The shop drawings shall be to scale and shall indicate all fittings, holes and accessories and all locations, types and sizes of all welds.
   1. Shop drawings shall be prepared under the seal of a Licensed Texas Professional Engineer.
   2. Indicate welded connections using standard AWS welding symbols, indicating net weld lengths.

B. Welding: Within 45 days of commencing Work, submit:
   1. Specifications for welding procedures in accordance with AWS D1.1/D1.1M.
   2. Certificates of qualifications of welders, welding operators and tackers in accordance with AWS W1 CH12.
   3. Certificates of qualifications of welding inspectors in accordance with AWS W1 CH12.

C. Certificates of compliance for components
   1. Before commencing fabrication provide a certification verifying that the material has been designed, manufactured, inspected and tested in accordance with the applicable portion of the referenced standards and these specifications.
   2. Test Reports: Provide copies of reports of all factory tests as required by these specifications and referenced standards.
D. Test Reports: Six copies of certified laboratory test reports shall be submitted within five days of each test, or series of tests.

E. Material and components manufactured to applicable foreign standards, including metric standards, are acceptable, provided that the Contractor submits written evidence in the English language, that they are equal or superior to those complying with the standards listed above, or after written approval is obtained from the Authority.

1.4 QUALITY ASSURANCE

A. The Contractor shall perform the work included in this Section in strict accordance with the requirements of the Contractor’s Quality Control Program as Authority approved.

B. The Contractor shall perform the following in accordance with these Specifications:
   1. Material qualification testing and certification for acceptance of materials, components and assemblies.
   2. Job control testing of in-progress work being performed in shops, factories and on-site.
   3. On-site inspection of specified work elements.

1.5 POLE TESTING AND INSPECTION

A. Material Testing:
   1. The chemical compositions and required mechanical properties of all materials used shall be determined, either by obtaining manufacturer’s certificates of compliance or by laboratory testing at a facility acceptable to the Authority.

B. Embrittlement:
   1. Fabrication shall conform to ASTM A143 to prevent embrittlement of the steel.

C. Weld Testing:
   1. The services of an AWS Certified Welding Inspector shall be provided by the pole manufacturer to:
      a. Inspect fabrication operations
      b. Inspect welding procedures
      c. Inspect welding personnel
      d. Perform ultrasonic and magnetic particle testing
   2. A visual inspection of all welds shall be performed in accordance with the AWS Code.
   3. Weld testing shall be performed on a sample number of each type of pole, selected at random by the Authority. All poles selected for testing shall be tested by the ultrasonic and magnetic particle methods.
   4. Equipment, procedures and personnel for weld testing, and test reports, shall conform to the requirements of AWS D1.1/D1.1M, Section 6 – Inspection.
   5. Weld testing shall consist of:
      a. Ultrasonic testing conforming to the requirements of AWS D1.1/D1.1M Section 6.
      b. Magnetic particle testing conforming to the requirements of ASTM E709.
   6. Ultrasonic or radiographic testing shall be performed on the complete penetration welds between the pole shaft and the pole base, and at any circumferential welds in the pole shaft at splice locations (if any), for each pole being tested. Magnetic particle testing shall be performed on all other welds including longitudinal seam welds at handholes.
   7. For each tested pole that is tested and found to be unacceptable, weld testing shall be performed on a further sample of two poles, selected at random by the Authority from the remaining untested pole population.
   8. Results of weld testing shall be deemed acceptable or unacceptable in accordance with AWS D1.1/D1.1M, Sections 8, 9, or 10.
   9. Welds found to be unacceptable shall be repaired in accordance with AWS D1.1/D1.1M, Section 3, and retested.

D. Galvanizing Testing:
   1. All galvanized items shall be inspected for conformance with the requirements of the following ASTM Specifications, as applicable:
      a. Galvanizing Compliance: A123 or A153
      b. Embrittlement: A143
      c. Distortion: A384

E. Impact testing:
   1. Structural steel materials for base plates and pole shafts shall be tested for impact toughness in accordance with the Charpy V-notch test as specified in ASTM A370. The minimum energy value shall be 15 foot-pounds at 0 degrees F.
OVERHEAD CONTACT SYSTEM STEEL TUBULAR POLES

F. Inspection:

1. Provisions shall be made for inspection of the fabrication and testing by the Authority or authorized representative. Contractor shall provide two weeks advance notice to the Authority. Inspection by the Authority or the authorized representative at the point of manufacture shall not constitute acceptance of the work as specified.

1.6 DELIVERY, STORAGE AND HANDLING

A. The Contractor shall ensure that all materials provided are suitably packaged and protected against damage during delivery and transportation.

B. The Contractor shall store all products in accordance with the manufacturer’s instructions, to ensure that all material is protected from damage. Poles shall not be stored directly on the soil or earth.

C. Poles shall be prepared and shipped in a manner to prevent damage to the painted surfaces.

D. Any damage to the material shall be the Contractor’s responsibility, and repairs and replacements shall be accomplished by the Contractor in accordance with the manufacturer’s instructions and at the Contractor’s expense.

PART 2 - PRODUCTS

2.1 MATERIALS

A. General

1. Tapered tubular poles shall be installed at locations as indicated in the plans.

B. Poles

1. Pole shafts shall be fabricated from one piece (no splicing) and from one structural steel material conforming to ASTM A595 REV A Grade A (55ksi FY).

2. Pole shafts shall be single ply.

3. Subject to Authority approval, other materials and fabrication methods may be used for the poles. Consideration shall not be given to press formed poles and wide flange poles will not be considered.

4. Taper tubular poles shall be designed for and selected so as not to exceed a maximum deflection due to operating loads of 2 inches at contact wire level (18 feet – 0 inches).

5. The maximum total deflection for the tubular poles, measured at the pole top shall not exceed 2.5 percent of the total pole length due to static and live loads combined. Poles shall not exhibit any permanent deflection or damage as a result of the defined system operating or non-operating loads.

C. Base plates shall be fabricated from structural steel conforming to the requirements of ASTM A572.

D. Handholes shall be fabricated from steel of the same type as the pole shafts specified.

E. Pole caps shall be fabricated from steel compatible with the pole shaft, fitted with a minimum of three stainless steel set screws.

F. Handhole cover screws shall be stainless hex, cap screws.

G. Feeder spouts shall be standard steel pipe conforming to ASTM A53/53M REV A, Type S, Grade A or B.

H. Weld filler metal shall conform to AWS D1.1/D1.1M.

I. Pole finish for painted poles and attachments shall be as specified in these Specifications. Color shall be as indicated on the Contract Drawings.

J. Poles that in the Contract Drawings are not indicated to be painted shall be hot dipped galvanized in accordance with ASTM A123/ A123M or A153/ A153M as required.

2.2 FABRICATION

A. General:

1. Poles, fittings, accessories and base plates shall be fabricated to the dimensions indicated in the approved shop drawings.

B. Methods and Tolerances:

1. Poles, fittings, accessories and base plates shall be fabricated by methods and within tolerances conforming to the AISC Specifications except as specified herein.

C. Tolerances:

1. Pole Diameter: Pole diameter shall be within +/- 1/8 inches of the design diameter. Round poles shall be within +/- 1/8 inches of perfect round.

2. Pole Wall Thickness: Pole wall thickness, exclusive of the weld area shall be within plus 10 percent or minus 2 percent of the design wall thickness.

3. Pole Taper: On taper tubular poles the pole taper shall be between 0.135 inches and 0.145 inches change in diameter per foot of length and constant for the length of the pole.
a. When pole length is over 32 feet, the pole taper rate may be between 0.075 inches and 0.145 inches change in diameter per foot.

4. Pole Straightness: Pole straightness shall be within 1/8 inch per 5 feet of length (1:480) and constant for the length of the pole.

5. Tolerances for Base Plate shall be as follows:
   a. Bolt Circle: +/- 1/16 inches
   b. Hole Diameter: + 1/16 inches, - zero inches
   c. Location of Holes: +/- 1/16 inches in each direction.

D. Welding Procedures:
   1. Welding procedures, welders, welding operations and tackers shall conform to the provisions of AWS D1.1/D1.1M, Section 2, Design of Welded Connections; Section 3, Workmanship; Section 4, Technique; and Sections 8, 9 or 10. All welds shall be ground smooth.

E. Weld Repairs:
   1. Welds found to be unacceptable shall be repaired in conformance with the provisions of AWS D1.1/D1.1M, Section 3, Workmanship.

F. Surface Grinding
   1. Before galvanizing, all penetration welds shall be ground flush with base metal to eliminate surface cracks. All other welds and cut edges shall be ground to eliminate sharp edges and burrs.

G. Pole Straightening
   1. Before galvanizing, the poles shall be straightened as required to conform to the specified requirements. Straightening methods shall not require heating of the poles.

H. Galvanizing
   1. After fabrication, the poles, fittings and accessories shall be hot-dip galvanized inside and out, in conformance with ASTM A123 or ASTM A153, as required. All pole fabrications shall be galvanized for their entire length, at one time, in a single hot-dip galvanizing bath. Galvanizing by successive dippings of partial pole lengths shall not be permitted.

I. Pole Identification Plate
   1. A stainless steel pole identification plate shall be attached to each pole at 24 inches above the base plate. The plate shall show the pole type, structure number, and the manufacturer's name and date of manufacture. The plate design, style of lettering and method of attachment shall be Authority approved.

J. Pole Type Assembly Mark:
   1. Pole type assembly number shall be hard marked with a minimum height of 3/4 inch and a minimum indentation of 1/16 inches. The hard mark shall be stamped on the top of the base plate and shall be visible after painting.

PART 3 - EXECUTION

3.1 DELIVERY
   A. Poles complete with base plates shall be delivered complete with associated fittings and accessories properly packed against damage and loss of parts.

3.2 INSTALLATION/ERECTION
   A. Erect structural steel in accordance with the AISC Specification for structural steel erection or in accordance with the manufacturer's recommended instructions.

   B. All catenary poles shall be raked and/or adjusted to a plumb condition to compensate for the static load deflection induced by the wire and equipment. The final erected pole plumb (perpendicular) position shall not exceed one in 50 of true vertical with the pole fully loaded measured within eight feet of its base corrected for taper where applicable. Any pole lean shall be against the direction of the static loads.

   C. Catenary Poles: Catenary poles shall be erected on foundations, using anchor bolts that have been cast into the concrete bases. The catenary pole erection crew shall maintain a quantity of leveling nuts and washers in the required sizes so that each pole erected will have the correct number of nuts and washers. Anchor bolts, nuts and washers are to be galvanized steel, and the Contractor shall take care to avoid damaging the galvanized surfaces. When poles have been erected to their final rake and alignment, the leveling nuts shall be in full contact with the base plate washers and shall be tightened to 50 foot-pounds torque. Two full threads shall protrude above the nut. The bottom nut shall clear the top of the concrete by 3/4 inch.

   D. Pole Fittings: The Contractor shall install all fittings required for the specific installation including, but not limited to the following items:
      1. Handholes
      2. Pole caps
      3. Feeder spouts
E. Grounding and Bonding: All steel poles installed by the Contractor shall be bonded to the foundation ground rod as shown on the Contract Drawings.

F. Additional Requirements:

1. Pole caps shall be installed on all poles prior to setting of the pole.

2. Contractor shall exercise care during erection of the poles to prevent subjection of the poles to abuse and damage. All imperfections on the steel poles shall be repaired by the Contractor as required to restore the pole to a condition acceptable to the Authority.

3. Caution is mandated during erection of the steel poles to prevent possible contact with overhead lines and other possible energized utilities.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this Section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith will be considered incidental to the Work specified under Section 16371 “Overhead Contact System.”

END OF SECTION 05126
SECTION 05130
STRUCTURAL STEEL - BUILDINGS

PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies structural steelwork for structures other than bridges and includes shop coating of steel.

B. For additional requirements for Architecturally Exposed Structural Steel (AESS), see Section 05135, "Architecturally Exposed Structural Steel".

1.2 REFERENCE STANDARDS

A. American Institute of Steel Construction (AISC):
   1. AISC 303 - Code of Standard Practice for Steel Buildings and Bridges
   2. AISC 348 - Specification for Structural Joints Using ASTM A325 or A490 Bolts

B. American Welding Society (AWS):
   1. AWS D1.1/D1.1M - Structural Welding Code - Steel

C. ASME International (ASME):
   1. ASME B18.2.2 - Square and Hex Nuts (Inch Series)

D. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A6/A6M - Standard Specification for General Requirements for Rolled Structural Steel Bars, Plates, Shapes, and Sheet Piling
   2. ASTM A36/A36M - Standard Specification for Carbon Structural Steel
   3. ASTM A53/A53M - Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless
   4. ASTM A108 - Standard Specification for Steel Bar, Carbon and Alloy, Cold-Finished
   5. ASTM A109/A109M - Standard Specification for Steel, Strip, Carbon (0.25 Maximum Percent), Cold-Rolled
   8. ASTM A153/A153M - Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware
   9. ASTM A194/A194M - Standard Specification for Carbon and Alloy Steel Nuts for Bolts for High Pressure or High Temperature Service, or Both
   10. ASTM A307 - Standard Specification for Carbon Steel Bolts and Studs, 60 000 psi Tensile Strength
   11. ASTM A325 - Standard Specification for Structural Bolts, Steel, Heat-Treated, 120/105 ksi Minimum Tensile Strength
   12. ASTM A435/A435M - Standard Specification for Straight-Beam Ultrasonic Examination of Steel Plates
   14. ASTM A500 - Standard Specification for Cold-Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes
   15. ASTM A501 - Standard Specification for Hot-Formed Welded and Seamless Carbon Steel Structural Tubing
   17. ASTM A572/A572M - Standard Specification for High-Strength Low-Alloy Columbium-Vanadium Structural Steel
   18. ASTM A668/A688M - Standard Specification for Steel Forgings, Carbon and Alloy, for General Industrial Use
22. ASTM A992/A992M - Standard Specification for Structural Steel Shapes

23. ASTM D610 - Standard Test Method for Evaluating Degree of Rusting on Painted Steel Surfaces

24. ASTM E164 - Standard Practice for Ultrasonic Contact Examination of Weldments

25. ASTM E709 - Standard Guide for Magnetic Particle Examination

26. ASTM F1554 - Standard Specification for Anchor Bolts, Steel, 36, 55, and 105-ksi Yield Strength

E. Military Specifications (MIL):

1. MIL-P-21035 - Paint High Zinc Dust Content, Galvanizing Repair (Metric).

2. MIL-PRF-26915 - Primer Coating, for Steel Surfaces

F. The Society for Protective Coatings (Formerly known as Steel Structures Painting Council) (SSPC):

1. SSPC Paint 20 - Zinc-Rich Primers (Type I, "Inorganic," and Type II, "Organic").

1.3 SUBMITTALS

A. Shop Drawings:

1. General: Shop drawings shall not be the reproductions of the Contract drawings. Provide shop drawings prepared under supervision of a licensed engineer to include complete layout of work. Take and incorporate field verified dimensions as required.

2. Structural details: Include the following:

   a. Bills of materials giving complete information for fabrication and erection of component parts of structures including material and finish information.

   b. Details of location, type, sizes of bolts, and welds and for welded structures details of welding as specified.

   c. Structural computations for designed work certified by a Professional Engineer licensed in the State of Texas.

3. Match marks: Provide diagram showing match marks for connecting structural parts assembled in shop for purpose of drilling or reaming holes in field connections.

4. Welding:

   a. Complete shop details of qualification test specimens.

   b. Include information on specimen identification, number of pieces, and welding procedure specification, type of material, sizes of pieces, and welds and other variables affecting detail or tests.

5. Erection.

6. Manufacturer’s test procedures for bolts: Details of methods of erection proposed to be used, including calculated stresses for proposed erection certified by a Professional Engineer registered in the State of Texas. Do not proceed until approval has been received.

B. Manufacturer’s Data and Samples: At least two weeks before start of any shop painting work submit to the Contracting Officer for approval the following:

1. Complete Data Sheets of the coating materials to be used, identified by the manufacturer, brand name, and product number.

2. Written procedures for compliance with this specification, covering storage, handling, surface preparation, application, curing, repair, and inspection.

3. Comply with paint manufacturer’s instruction for preparation of substrate. Submit procedure for review and approval. Submit 6 inch X 6 inch sample of prepared piece of metal if required by Contracting Officer.

C. Certifications:

1. Certified mill test reports of structural steel at least 10 days prior to start of fabrication.

2. Certified quality assurance testing and inspection reports.

3. Submit certification verifying that welding and inspection/testing personnel have been qualified in accordance with AWS D1.1/D1.1M.
4. Manufacturer's certification that bolts meet approved testing.

1.4 QUALITY ASSURANCE

A. Qualification of Welding Personnel and Procedures:
   1. Prior to qualifying welding personnel and welding procedures, submit and obtain approval from the Contracting Officer for procedural details, sequence of welding, handling of materials to be inspected, and approval of electrodes, wire, flux and other welding materials and equipment. See also Section 01450, "Quality Control".
   e. Each approved type of steel shall be identified by a color code in accordance with ASTM A6/A6M. The color “white” shall be used for ASTM A36/A36M steel.

2. Submit certifications for the welding and testing personnel in accordance with AWS D1.1/D1.1M within the previous 12 months prior to start of fabrication and erection. Such certification is to remain in force for the duration of the welding operations under this Contract.
   a. Do not start fabrication until qualification has been successfully completed and procedures approved.

B. Stock Material:
   1. For qualification of welding personnel and procedures and for quality assurance testing, use only stock materials which can be identified as having been rolled from a given heat and for which certified mill tests can be produced.

   2. Material Identification:
      a. When stock material is proposed, inform the Contracting Officer at least 10 days in advance of commencing fabrication to permit sampling and testing. Select identified material from as few heats as possible.
      c. The Contractor's system of assembly-marking individual pieces, and the issuance of cutting instructions to the shop shall be such as to maintain identity of the original piece.
      d. Use a marking system (color codes, stencils, etc.) which will identify the source of structural steel by heat number. Loss of positive identification will require testing to establish acceptability. Testing shall be performed by a commercial agency at the Contractor's expense.

   b. Use stock material that can be identified by heat number and mill test report.

   c. The Contractor's system of assembly-marking individual pieces, and the issuance of cutting instructions to the shop shall be such as to maintain identity of the original piece.

   1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. General:
   1. Load, transport, unload, and store structural materials to keep them clean and free from damage.

   2. Store material on platforms, skids, or other non-abrasive supports above the ground and ensure proper drainage and protection from corrosion.

B. Steelwork:
   1. When handling and shipping steelwork, prevent bending, scraping, or overstressing members.

   2. Block projecting parts likely to be bent or damaged during handling with wood or other approved material.

   3. Replace pieces bent, scraped, gouged, or damaged unless repair is approved.
4. Indicate weight on members weighing more than three tons by means of paint contrasting with shop coat.

5. Mark all structural members in accordance with approved erection plans.

C. Bolts and Nuts:
1. Ship small parts such as bolts, nuts, washers, pins, fillers, and small connecting plates or angles in boxes, crates, or barrels.

2. Pack separately bolts of each length and diameter and loose nuts or washers of each size.

D. Coating Materials:
1. Receive and store coating materials in the manufacturer’s original, unopened containers bearing a legible product designation, batch number, and date of manufacture on the side of each container. Do not open containers except for immediate use.

2. Store coating materials according to the manufacturer’s latest printed instructions and protect from damage, moisture, direct sunlight, and temperatures below 40 deg. F and above 105 deg. F.

3. Do not use coating materials that exceed the manufacturer’s shelf life without prior written permission from the Manufacturer. Do not use containers damaged to the point of jeopardizing the contents.

E. Coated Steel: Store coated steel off the ground on nonabrasive supports and stacked on nonabrasive separators. Use fabric slings or chokers to lift coated steel where the use of chains or steel cable would damage the coating.

1.6 SHOP CONDITIONS

A. Welding:
1. When welding during cold weather, avoid chilling weld metal within zone of welding influence and avoid restraining manual functions of welder or welding operator.

2. When temperature where steel is stored is more than 20 deg. F different from that of welding shop, move steel to be welded into shop sufficiently in advance of welding to allow it to attain shop temperature prior to welding.

3. Steel to be free of moisture. Dry as necessary by application of heat not exceeding 100 deg. F.

4. Do not weld when shop temperature is below 40 deg. F, unless otherwise required or permitted by AWS D1.1/D1.1M.

B. Painting:
1. Apply paint when temperature of steel and paint is within the temperatures recommended by the paint manufacturer and temperature is forecast to remain within that manufacturer’s recommendation until paint has dried.

2. Painting steel at a temperature which can cause blistering, porosity, or conditions otherwise detrimental to life of paint is prohibited. When paint is applied in hot weather or thinned in cold weather, ensure that specified thickness of paint coating is obtained.

3. Application of paint when steel surface temperature is below dew point is prohibited, unless otherwise approved. Follow manufacturer’s instruction for application temperature and allowable humidity level. If painting in damp or cold weather is unavoidable, provide protective covering and heat steel and surrounding air to 40 deg. F minimum. Maintain this temperature until weather conditions permit discontinuance.

PART 2 - PRODUCTS

2.1 MATERIALS

A. General Requirements for Rolled Steel Plates, Shapes, and Bars: ASTM A6/A6M.

B. Carbon Steel Plates, Shapes, and Bars: ASTM A36/A36M.

C. High-Strength Structural Steel Shapes, Plates, and Bars: ASTM A572.

D. High-Strength Structural Steel “W” Shapes: ASTM A992.

E. Low-Carbon Steel Bolts and Nuts:
1. ASTM A307, Grade A regular low-carbon steel bolts with hexagonal heads.

2. ASTM A563, Grade A hexagon nuts.
F. High-Strength Carbon-Steel Bolts, Nuts and Washers For Structural Joints:
   1. ASTM A325; Type 1, heavy hexagon structural bolts.
   2. ASTM A563, Grade DH or ASTM A194, Grade 2H hot formed heavy hexagon nuts.
   3. Washers having a hardness of Rockwell C26 to C45.

G. Round Washers Other Than Those In Contact With High-Strength Bolt Heads and Nuts: ASME B18.2.2.

H. Anchor Bolts, Nuts and Washers: ASTM F1554, Grade 55, unless noted otherwise on drawings. ASTM A563, Grade A for nuts. ASTM F436, Type 1 for washers. Galvanized per ASTM A153/A153M

I. Beveled Washers:
   1. Square, smooth and sloped to make contact surfaces of bolt head and nut parallel.
   2. Diameter of hole in square beveled washers, 1/16 inch larger than bolt size.

J. Structural Steel Tubing:
   1. ASTM A500, Grade B, 46,000 psi yield point, unless otherwise specified.
   2. ASTM A501, 36,000 psi yield point.

K. Steel Pipe: ASTM A53, Type E or S, Grade B; Black except where indicated to be galvanized.

L. Stud Connectors:
   1. Cold-finished bars, ASTM A108, Grade 1015, Grade 1018 or Grade 1020, semi-killed or fully killed, complying with AWSD1.1/D1.1M.
   2. Sizes and shapes: As shown.
   3. Lengths to be after-weld lengths.

M. Galvanizing: Steel products specified as galvanized. Hot-dip galvanized after fabrication, in accordance with the following:
   1. Zinc coating on products fabricated from rolled, dressed and forged steel shapes, plates and strips: ASTM A123/A123M.
   2. Zinc coating on iron and steel hardware: ASTM A153/A153M.

3. Galvanizing Repair Paint:
   a. For Concealed or Top Coated Surfaces:
      1) Organic zinc-rich coating containing at least 65 percent metallic zinc, by weight in dry film and meeting performance requirements of:
         a) ASTM A780.
         b) SSPC Paint 20.
   b. For Surfaces to be Left Exposed:
      1) In addition to requirements for concealed and top coated surfaces, match aesthetic appearance of hot-dip galvanizing and meet performance requirements of:
         a) MIL-P-21035.
         b) MIL-PRF-26915.
      2) Basis-of-Design: Brite Products “Brite Zinc”.

N. Paint:
   1. Primer: As specified in Section 09970, “Coatings for Steel” Paint and Coating System No. 2B. Use make as selected for finish coating.

2.2 FABRICATION

A. General: Accomplish workmanship and finish to standards referenced in Quality Control paragraph of these specifications.

B. Straightening Material:
   1. Use rolled material that, before being laid off or worked, is straight within tolerances specified in ASTM A6.
   2. Perform straightening where necessary by approved methods which will not overstress material.
   3. Achieve fabrication tolerances which will result in full bearing.
   4. In bearing assemblies, perform straightening and planing as necessary to provide full bearing assemblies and bearing areas.
5. Steel Wall Framing:
   a. Select members which are true and straight for fabrication of steel wall framing. Straighten as required to provide uniform, square and true members in completed wall framing.
   b. The as-fabricated straightness tolerances for the steel wall framing members are one-half the standard camber and sweep tolerances for rolled shape in ASTM A6.

C. Cutting:
   1. Shape re-entrant corners notch-free to radius of 1/2 inch minimum.
   2. Perform flame cutting so that metal does not carry stress during cutting operation.
   3. Direct flame so that remaining material is not damaged.
   4. Edges of main members which are sheared or oxygen cut, and all other exposed edges to be painted, shall be rounded or chamfered to an approximate 1/16 inch radius by grinding.

D. Planing and Facing:
   1. Face and bring abutting joints to even bearing where shown.
   2. For compression joints depending on contact, prepare bearing surfaces to a common plane by milling, sawing or other approved means.
   3. Plane to depth of 1/4 inch sheared edges of plates more than 5/8 inch thick which will carry calculated stress.

E. Bolt Holes:
   1. Punch or drill holes for bolts.
   2. Subpunch or subdrill and ream assemblies using steel template for alignment of connections as necessary. Flame cutting is prohibited. Subdrill or subpunch holes 3/16 inch less than nominal diameter of bolt; drill or ream holes 1/16 inch greater than nominal diameter of bolt.
   3. Drill or punch holes required to secure other work to structural steel.

F. Connections:
   1. Weld or bolt shop connections.
   2. Unless otherwise shown, bolt field connections.
   3. To minimize the amount of field welding, shop assembled components shall be the largest size possible commensurate with transportation and handling limitations. Shop connections may be bolted with high-strength bolts or welded.

G. Welding:
   1. Perform welding in accordance with AWS D1.1/D1.1M. Weld exposed joints continuously and grind smooth. Fillet welds are not required to be ground when a smooth appearance is provided.
   2. Perform procedure and sequence of welding so as to avoid needless distortion and to minimize stresses. Straighten transverse warpage of flanges, if necessary, by controlled heating along outside face.
   3. Make allowance in shop for expected weld shrinkage in laying out and assembling members. Trim members to size when most or all of welding has been completed.
   4. Complete butt welds in flange joints before flanges are assembled on web. Use extension blocks on such joints when making ends of butt welds removing extension blocks only upon completion and cooling of weld. Finish ends of welds smooth and flush with edges of abutting parts. Use prequalified welding procedures, unless otherwise shown.
   5. Make welds in web plates where shown.
   6. Prior to ultrasonic or radiographic testing of butt welds of flanges and webs, grind or machine weld reinforcement of joint to remove irregularities of weld surface so that it merges smoothly with base surface; one side for ultrasonic testing and both sides for radiographic testing.
   7. Ensure that welded joints which are to be radiographed are free of paint, scale, and grease. Grind off welded ripples and surface irregularities on both sides of joint. Grind perpendicular to length of weld and to such a degree that resulting radiographic contrast due to remaining irregularities cannot mask or be confused with that of...
objectionable defect and so that weld surface will merge smoothly into adjoining surface.

8. Repair defective welds by chipping or melting out such defects from one or both sides of joint removing no more weld metal than necessary to correct defect. Reweld and have weld retested radiographically.

9. Welded Construction Subjected to Dynamic Loads: Comply with AWS D1.1/D1.1M, Section 9, rules for dynamically loaded structures, when welding crane girders, elevator framing or frames for reciprocally loaded structures.

H. Bolting:

1. Provide connections using high-strength steel bolts in accordance with AISC Specifications for Structural Joints using ASTM A325 bolts and washers except where ASTM A307 bolts are shown or permitted.

2. Assemble high-strength bolted parts so that they fit solidly together when assembled. Do not use gaskets or other compressible materials.

3. Remove scale, dirt, burrs, and other items likely to prevent proper seating when assembling joint surfaces, including those adjacent to washers.

4. Tightening Bolts:

   a. Tighten A325 bolts to provide fully pretensioned connections unless otherwise approved in writing by the Contracting Officer.

   b. When tightening, place hardened washer under turned element (nut or bolt head), depending on which element is turned in tightening operation.

   c. Calibrate torque wrenches by tightening bolt assembly in device capable of indicating actual bolt tension.

   d. Test three bolts minimum from each lot.

   e. Measure torque when nuts or bolts are in tightening motion.

   f. Adjust power wrenches to cut out or stall at required tension.

5. Arrange bolts so that heads show in areas exposed to public view.

6. Unless noted otherwise, Bolted connections shall be made with minimum 3/4 inch diameter H.S. ASTM, A325 bolts in bearing type, with the threads included in the shear plane.

2.3 SHOP PAINTING

A. Shop prime steel surfaces, except the following:

1. Surfaces embedded in concrete or mortar. Extend priming of partially embedded members to a depth of 2 inches.

2. Surfaces to be field welded.

3. Surfaces to be high-strength bolted with slip-critical connections, if primer does not meet the specified AISC slip coefficient.

4. Items indicated to be galvanized.

5. Surfaces which are to receive sprayed-on fireproofing.

6. Top surface of crane rails.

B. Prepare steel surfaces and apply shop primer as specified in Section 09970, "Coatings for Steel" Paint and Coating System No. 1 and as specified below:

1. Use priming methods that result in full coverage of joints, corners, edges, and exposed surfaces.

2. Stripe paint corners, crevices, bolts, welds, and sharp edges.

3. Apply two coats of paint to surfaces which are inaccessible after assembly or erection. Change color of second coat to distinguish it from the first.

C. Shop painting requirements for Architecturally Exposed Structural Steel (AESS), see Section 05135, "Architecturally Exposed Structural Steel".

2.4 GALVANIZING

A. Hot-dip galvanize steel work and fasteners, where indicated, after fabrication. Conform to ASTM A123 and ASTM A153 as applicable. Plug vent holes with lead or silicone sealant after galvanizing.
2.5 **SOURCE QUALITY CONTROL**

**A.** Comply with quality control requirements specified in Paragraph 3.3 of this section and Section 01450, "Quality Control".

**B.** Materials and fabrication procedures are subject to inspection and tests in mill, shop, and field, conducted by a qualified inspection agency.

1. Such inspections and tests will not relieve Contractor of responsibility for providing materials and fabricated components in compliance with specified requirements.

2. Promptly remove and replace materials or fabricated components which do not comply.

PART 3 - EXECUTION

### 3.1 EXAMINATION

**A.** Verification of Conditions: Examine the areas and conditions under which structural steelwork is to be installed, and make provisions as necessary for the proper and timely completion of work. Do not proceed with the work until unsatisfactory conditions have been corrected. Modifications of structural materials must not proceed until accepted by the Contracting Officer.

### 3.2 ERECTION

**A.** General:

2. Immediately upon completion of erection of steel and prior to placing or applying all other materials, certify that the location of structural steel meets specified tolerances for plumbness, level and alignment. The Contracting Officer may verify placement prior to start of work by other trades. Immediately correct all deviations from specified requirements.

**B.** Surveys: Employ a Professional Engineer or Land Surveyor, licensed in the State of Texas, as required by Section 01722, "Field Engineering - Surveying", for accurate erection of structural steelwork. Check elevations of concrete and masonry bearing surfaces, and locations of anchor bolts and similar devices, before erection work proceeds. Report discrepancies to Contracting Officer. Do not proceed with erection until corrections have been made, or until compensating adjustments to structural steelwork have been agreed upon with the Contracting Officer.

**C.** Temporary Shoring and Bracing: Provide temporary shoring and bracing members with connections of sufficient strength to sustain imposed loads. Provide temporary guy lines to achieve proper alignment of structures as erection proceeds. Where floors and roofs are supported by steel framing, the framing should be considered to be unstable until floors and roofs are in place and properly secured. Remove temporary bracing members and connections when permanent members are in place and final connections are made. Do not use finish materials for erection or temporary purposes.

**D.** Temporary Connections: When the framing system requires connections with bolts common to several members, temporarily support all framing members affected by removal of bolts for installation of additional members.

**E.** Temporary Planking: Provide temporary planking and working platforms as necessary to effectively complete work.

**F.** Anchor Bolts: Furnish anchor bolts and other connectors required for securing structural steel to foundations and other in-place work. Furnish templates and other devices as necessary for presetting bolts and other anchors to maintain accurate locations during installation of concrete.

**G.** Setting Bases and Bearing Plates:

2. Set loose and attached base plates and bearing plates for structural members on steel shims, wedges or other adjusting devices.

3. Tighten anchor bolts after supported members have been positioned and plumbed. Do not remove wedges or shims but, if protruding, cut off flush with edge of base or bearing plate prior to packing with grout.

**H.** Grout beneath base plates using structural nonshrink grout as specified in Section 03305, "Portland Cement Concrete".

**I.** Bearing Devices: Install bearing devices in accordance with manufacturer's recommendations.
Field Assembly: Set structural frames accurately to lines and elevations indicated. Align and adjust various members forming part of complete frame or structure before permanently fastening. Clean bearing surfaces and other surfaces which will be in permanent contact before assembly. Perform necessary adjustments to compensate for discrepancies in elevations and alignment.

1. Level and plumb individual members of structure within specified AISC tolerances.
2. Establish required leveling and plumbing measurements on mean operating temperature of structure. Make allowances for difference between temperature at time of erection and mean temperature at which structures will be when completed and in service.
3. Plumb columns adjacent to elevator shafts to meet specified AISC tolerance at elevator shafts.
4. Splice members only where shown or specified.
5. Install high-strength threaded fasteners in accordance with AISC 348. Tension bolts with full pretension load.
6. On exposed welded construction, remove erection bolts, fill holes with plug welds and grind smooth at exposed surfaces.
7. Comply with AISC Specifications for bearing, adequacy of temporary connections, alignment, and removal of paint on surfaces adjacent to field welds.
8. Do not enlarge unfair holes in members by burning or by use of drift pins, except in secondary bracing members. Ream holes that must be enlarged to admit bolts.
9. Do not interchange parts which have been reamed or drilled in assembled position.
10. Handle material so that no parts will be bent, broken or otherwise damaged.

Crane Runways: Install runways complete with columns, girders, beams, bracing, rails, crane stops and other required items. Stagger joint locations in opposite rails to avoid crane girder joints. Provide flush joints at tip of crane rails. Set and adjust gauge alignment and elevation of crane rails and girders to tolerances as follows: gauge plus or minus 1/4 inch; horizontal alignment plus or minus 1/4 inch per 50’ length, 1/2 inch max. total; vertical alignment plus or minus 1/4 inch per 50’ length, 1/2 inch max. total; center of crane rail on girder web plus or minus 0.75 times the girder web thickness.

Stud Connectors:
1. Prepare steel surfaces as recommended by the manufacturer of the stud connectors. Weld only on clean, dry surfaces. Use automatic end welding of stud connectors in accordance with the manufacturer’s printed instructions.
2. Weld stud connectors, spaced as shown, to beams and girders through decking units. Do not weld through two layers (lapped ends) of decking units.

Field Cutting: Do not use gas cutting torches in field for correcting fabrication errors in structural framing.

ADJUSTING AND CLEANING

Touch-Up Painting: Immediately after erection, cleaning and touch-up painting of field welds, bolted connections, and abraded areas of shop paint shall be completed to blend with the adjacent surfaces. Such touch up work shall be done in accordance with manufacturer’s instructions as specified in Section 09970, “Coatings for Steel”.

Galvanized Surfaces:
1. Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A780.
2. For surfaces to be left exposed, apply galvanizing repair paint in at least two coats.

QUALITY CONTROL

Following provisions of this paragraph will complement Section 01450, "Quality Control".

Retain an independent testing and inspection agency approved by the Authority to inspect bolts and stud connectors, high-strength bolted connections, and welded connections, including stud welds, and perform tests and prepare test reports.

Testing Agency will conduct and interpret tests and state in each report whether test specimens comply with requirements, and specifically state any deviations therefrom.
D. Inspection of welded fabrication shall be done by AWS Certified Welding Inspectors with certification of Level II or III in accordance with the requirements of the American Society of Non-destructive Testing Certification SNT-TC-1A.

E. Provide access for Testing Agency to places where structural steelwork is being fabricated or produced so that required inspection and testing can be accomplished.

F. Correct deficiencies in structural steelwork which inspections and laboratory test reports have indicated as not in compliance with requirements. In accordance with Section 01450, "Quality Control", perform additional tests, at Contractor's expense, as may be necessary to reconfirm any non-compliance of original work, and as may be necessary to show compliance of corrected work.

G. Bolts: After receipt of bolts by the fabricator or erector, the Testing Agency shall test four bolts, selected at random, from each shipment to the fabricator or erector of a particular diameter and length using a bolt-tension calibrator. Bolts will be tested by being torqued to produce a tension of 105 percent of AISC 348 minimum fastener tension.

H. Bolted Connections:
   1. The Testing Agency shall visually inspect bolted connections to verify installation of specified bolt types and sizes in proper connections. Testing Agency will observe bolting installation and report conformance and non-conformance with AISC 348.
   2. When disagreement occurs relating to installation of bolts in connections requiring full pretensioning, arbitration inspection procedures conforming to AISC 348 will be used, except that a minimum of 25 percent of the bolts per connection will be checked.

I. Welded Connections: For each operator and each days work, the Testing Agency will perform nondestructive testing of field and shop welds, including stud welds, in accordance with provisions of the AWS Code and the following schedule:
   1. Partial Penetration Groove and Fillet Welds (Excluding Tubular Joints): Magnetic particle inspection in accordance with ASTM E709. Cracks or zones of incomplete fusion are not acceptable.
   2. Full Penetration Welds and Welds for Tubular Joints: Ultrasonic examination in accordance with ASTM E164, minimum quality level 2-2T.
      a. 1 out of 5 (full length) for thickness equal to or less than 3/4 inch welded in field.
      b. 1 out of 10 (full length) for thickness equal to or less than 3/4 inch welded in shop.
      c. 100 percent (full length) for thickness greater than 3/4 inch.
      d. 100 percent (full perimeter) for tubular butt welds of any thickness.
   3. Tubular "T", "K" and "Y" type connections:
      a. Verification of edge preparation: For 20 percent of joints of each type connection, verify that member ends are accurately cut to fit member joined and that edges are prepared in accordance with AWS D1.1/D1.1M to provide prequalified welds.
      b. Verification of weld integrity: Magnetic particle inspection in accordance with ASTM E709:
         1) 1 out of 5 joints for full perimeter when branch member thickness is 3/4 inch.
         2) 100 percent of joints for full perimeter when branch member thickness is greater than 3/4 inch.
   4. Weldments or Connections Subject to Lamellar Tearing: Ultrasonic inspection made 48 to 72 hours after welding at locations on weldments or connections subject to high restraint in order to check for lamellar tearing. The exact location of the areas to be inspected shall be determined by the Contractor and the Contracting Officer at the time of fabrication. This inspection shall be made according to the following schedule unless conditions of tearing indicate that more are required:
      a. 1 out of 10 for thickness equal to or less than 3/4 inch.
      b. 1 out of 5 for thickness greater than 3/4 inch and equal to or less than 1-1/4 inches.
c. 1 out of 2 for thickness greater than 1-1/4 inches.

d. If lamellar tearing should occur, modify material, procedures, or details to alleviate the problem before proceeding with further fabrication of like units.

e. For tubular "T", "K", and "Y" joints, inspect the continuous member for a distance of 2 feet each way beyond center of joint after the welding of all branch members.

5. Weldments Subjected to Ultrasonic Inspection: One or more radiographic examinations made as soon as possible after start of ultrasonic inspection as necessary to verify quality of ultrasonic inspection.

6. Stud Welds: Test studs in accordance with AWS requirements. In addition to the requirements of AWS D1.1/D1.1M, strike studs with a 15 pound hammer except, this requirement may be modified when approved in writing when temperatures below 50 deg. F are anticipated. Straighten studs after testing; except, on composite beams, studs bent toward mid-span need not be straightened. Replace studs that crack in the weld, base metal, or shank under testing or subsequent straightening.

7. Welds of any type, not tested by other means, shall be visually inspected and documented.

J. When testing, examination, and inspection as specified or scheduled herein reveals faulty welds, joints of the same type will be checked until the integrity of the welds is assured before resuming the specified schedule.

K. After faulty welds have been corrected or repaired, re-examine each in the manner specified for the original joint.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will be paid for on a lump sum basis for structural steel - buildings per location indicated wherein no measurement will be made.
THIS PAGE INTENTIONALLY LEFT BLANK
SECTION 05135
ARCHITECTURAL EXPOSED STRUCTURAL STEEL

PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section specifies requirements regarding the appearance and surface preparation of Architecturally Exposed Structural Steel (AESS). Refer to Section 05130, "Structural Steel - Buildings" for other requirements regarding steel work not included in this Section.

B. This section applies to members noted on Architectural and Structural drawings as AESS and in the areas defined as AESS below.

1.2 REFERENCE STANDARDS

A. American Institute of Steel Construction (AISC):
   1. AISC 303 - Code of Standard Practice for Steel Buildings and Bridges

B. American Welding Society (AWS):
   1. AWS D1.1/D1.1M - Structural Welding Code - Steel

1.3 DEFINITIONS

A. Architecturally Exposed Structural Steel (AESS): Structural steel that is exposed to view on or in completed structure or building and that requires special finishes to obtain specified architectural appearance.

PART 2 - PRODUCTS

2.1 MATERIALS

A. General: Comply with Section 05130, "Structural Steel - Buildings" as amended below.

2.2 PAINT

A. Primer as specified in Section 09970, "Coatings for Steel" Paint and Coating System No. 1. Use make as selected for finish coat.

2.3 FABRICATION

A. Fabricate and assemble AESS in the shop to the greatest extent possible. Locate field joints in AESS assemblies at concealed locations or as approved by the Contracting Officer. Detail AESS assemblies to minimize field handling and expedite erection.

B. Fabricate AESS with exposed surfaces smooth, square and of surface quality consistent with the approved mock up. Use special care in handling and shipping of AESS both before and after shop painting.

C. In addition to special care used to handle and fabricate AESS, employ the following fabrication techniques:

1. Fabrication Tolerance: Fabricate steel to one half the normal tolerance as specified in AISC 303 Section 10.

2. Welds ground smooth: Fabricator shall grind welds of AESS smooth. For groove welds, the weld shall be made flush to the surfaces each side and be within plus 1/16 inch, minus 0 inches of plate thickness.

3. Contouring and blending of welds: Where fillet welds are indicated to be ground contoured, or blended, oversize welds as required and grind to provide a smooth transition and match profile on approved mock-up.

4. Continuous Welds: Where welding is noted on the drawings, provide continuous welds of a uniform size and profile.

5. Minimize Weld Show Through: At locations where welding on the far side of an exposed connection occurs, grind distortion and marking of the steel to a smooth profile with adjacent material.

6. Coping and Blocking Tolerance: Maintain a uniform gap of 1/8 inch plus or minus 1/32 at copes and blocks.

7. Joint Gap Tolerance: Maintain a uniform gap of 1/8 inch plus or minus 1/32.

8. Piece Marks Hidden: Fabricate such that piece marks are fully hidden in the final structure or made with such media to permit full removal after erection.

9. Mill Mark Removal: Deliver steel with no mill marks (stenciled, stamped, raised etc) in exposed locations. Mill marks shall be omitted by cutting of mill material to appropriate lengths where possible. Where not possible, the fabricator may fill and/or grind to a surface finish consistent with the approved mock up.

10. Grinding of Sheared Edges: Grind edges of sheared, punched or flame cut steel to match approved mockup.
11. Rolled Members: Member specified to be rolled to a final curved shape shall be fully shaped in the shop and tied during shipping to prevent stress relieving. Distortion of the web or stem and of outstanding flanges or legs of angles shall be visibly acceptable to the Contracting Officer from a distance of 20 feet under any lighting condition determined by the Contracting Officer. Tolerances for the vertical and horizontal walls of rectangular HSS members after rolling shall be the specified dimension plus or minus 1/2 inch.

12. Seal Welds: Seal weld open ends of round and rectangular hollow structural section with 3/8 inch closure plates. Provide continuous, sealed welds at angle to gusset plate connections and similar locations where AESS is exposed to weather.

### 2.4 SHOP CONNECTIONS

A. Bolted Connections: Make in accordance with Section 05130, "Structural Steel - Buildings". Provide bolt type and finish as noted herein and align bolt heads as indicated on the approved shop erection drawings.

B. Weld Connections: Comply with AWS D1.1/D1.1M and Section 05130, "Structural Steel - Buildings". Appearance and quality of welds shall be consistent with the mock up. Assemble and weld built-up sections by methods that will maintain alignment of members without warp exceeding the tolerance of this section.

### 2.5 SHOP PRIMING

A. Shop prime steel surfaces, except the following:
   1. Surfaces embedded in concrete or mortar. Extend priming of partially embedded members to a depth of 2 inches.
   2. Surfaces to be field welded.
   3. Surfaces to be high-strength bolted with slip-critical connections, if primer does not meet the specified AISC slip coefficient.

B. Prepare steel surfaces and apply shop primer as specified in Section 09970, "Coatings for Steel" Paint and Coating System No. 1 and as specified below:
   1. Use priming methods that result in full coverage of joints, corners, edges, and exposed surfaces.
   2. Stripe paint corners, crevices, bolts, welds, and sharp edges.
   3. Apply two coats of shop primer to surfaces that are inaccessible after assembly or erection. Change color of second coat to distinguish it from first.

### 3.1 EXAMINATION

A. The erector shall check AESS members upon delivery for twist, kinks, gouges or other imperfections which may result in rejection of the appearance of the member. Coordinate remedial action with fabricator prior to erecting steel.

### 3.2 PREPARATION

A. Provide connections for temporary shoring, bracing and supports only where noted on the approved shop drawings. Temporary connections not shown shall be made at locations not exposed to view in the final structure or as approved by the Contracting Officer. Handle, lift and align pieces using padded slings and/or other protection required to maintain the appearance of the AESS through the process of erection.

### 3.3 ERECTION

A. Set AESS accurately in locations and to elevations indicated and according to AISC specifications referenced in this Section.

B. In addition to the special care used to handle and erect AESS, employ the following erection techniques:
   1. AESS Erection Tolerances: Erection Tolerances shall meet the requirements of Chapter 10 of the AISC 303.
   2. Welds ground smooth: Erector shall grind welds smooth in the connections of AESS members. For groove welds, the weld shall be made flush to the surfaces each side and be within plus 1/16 inch, minus 0 inches of plate thickness.
   3. Contouring and blending of welds: Where fillet welds are indicated to be ground contoured, or blended, oversize welds as required and grind to provide a smooth transition and match profile on approved mock-up.
   4. Continuous Welds: Where noted on the drawings, provide continuous welds of a uniform size and profile.
   5. Minimize Weld Show Through: At locations where welding on the far side of an exposed connection occurs, grind distortion...
and marking of the steel to a smooth profile with adjacent material.

6. Bolt Head Orientation: Bolt heads shall be oriented as indicated on the contract documents. Where bolt head alignment is specified, the orientation shall be noted for each connection on the erection drawings. Where not noted, the bolt heads in a given connection shall be oriented to one side.

7. Removal of field connection aids: Run out tabs, erection bolts and other steel members added to connections to allow for alignment, fit-up, and welding in the field shall be removed from the structure. Field groove welds shall be selected to eliminate the need for backing bars or to permit their removal after welding. Welds at run out tabs shall be removed to match adjacent surfaces and ground smooth. Holes for erection bolts shall be plug welded and ground smooth.

8. Filling of weld access holes: Where holes must be cut in the web at the intersection with flanges on W shapes and structural tees to permit field welding of the flanges, they shall be filled. Filling shall be executed with proper procedures to minimize restraint and address thermal stresses in group 4 and 5 shapes.

C. Field Welding: Weld profile, quality, and finish shall be consistent with mock-ups approved prior to fabrication.

D. Splice members only where indicated.

E. Obtain permission for any torch cutting or field fabrication from the Contracting Officer. Finish sections thermally cut during erection to a surface appearance consistent with the mock up.

F. Do not enlarge unfair holes in members by burning or by using drift pins. Ream holes that must be enlarged to admit bolts. Replace connection plates that are misaligned where holes cannot be aligned with acceptable final appearance.

3.4 FIELD CONNECTIONS

A. Bolted Connections: Install bolts of the specified type and finish in accordance with Section 05130, “Structural Steel - Buildings”.

B. Welded Connections: Comply with AWS D1.1/D1.1M for procedures, and appearance. Refer to Section 05130, "Structural Steel - Buildings" for other requirements.

1. Assemble and weld built-up sections by methods that will maintain true alignment of axes without warp. Verify that weld sizes, fabrication sequence, and equipment used for AESS will limit distortions to allowable tolerances.

2. Obtain Contracting Officer’s approval for appearance of welds in repaired or field modified work.

3.5 FIELD QUALITY CONTROL

A. Structural requirements: The Contractor shall engage an independent testing and inspecting agency to perform field inspections and tests and to prepare test reports. Refer to Section 05130, “Structural Steel - Buildings” for detailed bolt and weld testing requirements.

B. AESS acceptance: The Contracting Officer will observe the AESS steel in place and determine acceptability based on the mockup. The Testing Agency shall have no responsibility for enforcing the requirements of this section.

3.6 ADJUSTING AND CLEANING

A. Touchup Painting: Cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint shall be completed to blend with the adjacent surfaces of AESS. Such touch up work shall be done in accordance with manufacturer's instructions as specified in Section 09970, “Coatings for Steel”.

3.7 SCHEDULE OF ARCHITECTURALLY EXPOSED STRUCTURAL STEEL (AESS) ITEMS

A. Canopies

B. Other items indicated on Architectural or Structural drawings.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will be paid for on a lump sum basis for architecturally exposed structural steel per location indicated wherein no measurement will be made.
THIS PAGE INTENTIONALLY LEFT BLANK
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies structural metal roof decking.

B. Metal decking described in this section required for roof construction at crew room, light rail station, canopy, or any other building shall be included in the metal work.

1.2 REFERENCE STANDARDS

A. American Iron and Steel Institute (AISI):
   1. AISI SG02-1 - North American Specification for the Design of Cold-Formed Steel Structural Members

B. American Welding Society (AWS):
   1. AWS D1.3 - Structural Welding Code - Sheet Steel

C. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A653/A653M - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process
   2. ASTM A780 - Standard Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings
   3. ASTM A1008/A1008M - Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability
   4. ASTM A1011/A1011M - Standard Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability

D. Military Specification (MIL):
   1. MIL-P-21035 - Paint High Zinc Dust Content, Galvanizing Repair (Metric).
   2. MIL-PRF-26915 - Primer Coating, for Steel Surfaces

E. The Society for Protective Coatings (Formerly known as Steel Structures Painting Council) (SSPC):
   1. SSPC Paint 20 - Zinc-Rich Primers (Type I, "Inorganic," and Type II, "Organic").

F. Steel Deck Institute (SDI):
   1. SDI Specifications and Commentary for Steel Roof Deck.

1.3 PERFORMANCE REQUIREMENTS

A. Shear Diaphragm Loads: Roof deck units are part of the lateral load resisting system. Use deck configuration and fasteners which will provide the minimum pounds per linear foot diaphragm shear strength shown.

B. Uplift Loading: Proportion deck units and anchorage to resist, unless noted otherwise, gross uplift loading of 45 lbs. per sq. ft. at eaves overhang and 30 lbs. per sq. ft. for other roof areas.

1.4 SUBMITTALS

A. Shop Drawings:
   1. Provide drawing to show complete layout of work, under supervision of a licensed engineer, include details of fabrication and erection including materials, material thicknesses, dimensions, methods of joining, welding, accessories, fastenings, openings through decking, and protective coatings. Take and include any required field dimension(s).
   2. Include manufacturer's printed instructions.

B. Samples:
   1. Welding Sample: Prepare and submit three samples of each type of deck welding specified and shown. Resubmit samples not approved as required to provide an acceptable sample. Acceptable samples will be made available on-site as an example for welders to follow.

C. Certification: Certification that welding and inspection/testing personnel are qualified in accordance with AWS D1.3.

1.5 QUALITY ASSURANCE

A. Qualification of Welding Personnel: Employ welding and inspection/testing personnel whose qualification is certified in accordance with AWS D1.3.
D1.3. Such certification is to remain in force for the duration of the welding operations under this Contract. All inspection personnel shall be AWS CWI.

1.6 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Deliver products in good condition.
B. Store products to preclude corrosion, deterioration, and damage.
C. Handle products to prevent damage.

1.7 JOB CONDITIONS

A. Do not apply construction loads, such as roofing materials and aggregate, in excess of the live loads for which the deck is designed.

PART 2 - PRODUCTS

2.1 STEEL DECKING

A. Galvanized: ASTM A653/A653M, Grade A, Coating G60, gauge as shown, or to be designed by manufacturer.
B. Ungalvanized: ASTM A1011/A1011M or ASTM A1008/A1008M, gauge as shown, or to be designed by manufacturer coated with the manufacturer’s standard rust-inhibiting primer. Do not use asphalt or bitumastic paint based products. Certify that paint is compatible with insulation and roofing systems.
C. Types shown or necessary to complete installation, such as 14-gauge recessed sump pans for roof drains, cover plates where panels abut or change direction, and closure plates.
D. Same gauge and finish as decking, unless otherwise shown or specified.

2.2 PAINTING AT OPEN CANOPIES

A. Roof deck panels shall be shop-finished with manufacturer’s standard prime paint finish system (both sides).
B. Prime finish shall be a light color (such as beige, off-white, or light gray).
C. Metal decking finish shall be touched up in field after installation.

2.3 GALVANIZING REPAIR COMPOUND

A. Galvanizing Repair Paint:
1. For Concealed or Top Coated Surfaces:
   a. Organic zinc-rich coating containing at least 65 percent metallic zinc, by weight in dry film and meeting performance requirements of:
      1) ASTM A780.
      2) SSPC Paint 20.
2. For Surfaces to be Left Exposed:
   a. In addition to requirements for concealed and top coated surfaces, match aesthetic appearance of hot-dip galvanizing and meet performance requirements of:
      1) MIL-P-21035.
      2) MIL-PRF-26915.
   b. Basis-of-Design: Brite Products “Brite Zinc”.

2.4 FASTENERS

A. As shown on approved shop drawings.

2.5 FABRICATION

A. General: Fabricate deck units in lengths to span three or more supports, with telescoped or nested 2 inch end laps and nested side laps, and end laps staggered by at least one deck span length, unless otherwise indicated. Provide deck configurations complying with SDI “Specification” and as specified herein; and of gages and section modulus per foot width shown on Contract Drawings.
B. Wide Rib Metal Deck Units: Provide 1-1/2 inches approximate depth; 6 inches approximate rib spacing; 2-1/2 inches maximum width of rib opening at roof surface; 1-3/4 inches minimum width of rib at bottom surface. Metal deck units to be 36 inches wide times width of roof, wherever possible.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Erect steel decking and accessories in accordance with approved shop drawings and manufacturer’s recommendations.
B. Place decking units on the supporting member, align and adjust to final position before permanent fastening. Do not use metal deck area as storage or working platform until fastened.
C. If supporting beams are not in proper alignment or at correct elevation to provide bearing and alignment of deck units, do not place decking units in deficient areas until necessary corrections have been made.

D. Continue decking over three or more spans.

E. Welding and inspection of welds shall be done in accordance with AWS D1.3.

F. Use electric-arc welding to weld deck panels to end supports as shown on approved shop drawings. Where panel ends meet, provide minimum 2 inches overlap and continuous weld to fuse ends of units together. Stagger end laps by at least one deck span length unless otherwise approved. At the canopy, welds shall not be visible from below.

G. Mechanically anchor side laps of adjacent panels at intervals not exceeding 3 feet with self drilling, No. 10 or larger, screws. Screws to be aligned (not random) and through metal supports below. Remove any screws that are non-functioning or misplaced at the canopy. Screws must be cut after installation is complete.

H. Remove burrs and sharp edges.

I. Where welding occurs through deck, plug weld to ensure proper attachment. Use proper welding rods and power to produce sound, full size welds without excessive burning, or damage to supporting steel members. Use welding washers for metal thickness less than 0.0239 inches.

J. Cut bevels and perform other special cutting and fitting at Worksite.

K. Provide necessary support framing and reinforcement and openings for items penetrating deck panels.

L. Coordinate cutting of openings for work of other trades with trades involved. Repair or replace deck where non-usable holes have been made.

M. Do not hang mechanical equipment or other loads from steel deck.

N. Over welded areas, apply galvanizing repair compound at rate of 2 ounces per square foot.

O. Deck with burned holes must be repaired or replaced.

3.3 ADJUSTING AND CLEAN-UP

A. Clean up rubbish and debris caused by this work and remove from site.

B. Leave decks and areas surrounding work in broom-clean condition.

C. Galvanized Surfaces:
   1. Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A780.
   2. For surfaces to be left exposed, apply galvanizing repair paint in at least two coats.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Structural metal roof decking will not be measured under this section, but will be considered as subsidiary to Section 05130, “Structural Steel - Buildings”.

B. Structural metal roof decking, as described in this section, will be paid as subsidiary to Section 05130, “Structural Steel - Buildings”.

END OF SECTION 05300
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies the requirements for determining, providing, and installing permanent metal deck forms and accessories when used for the forming of bridge or any other elevated slab concrete.

1.2 REFERENCE STANDARDS

A. American Welding Society (AWS):
   1. AWS D1.3 - Structural Welding Code - Sheet Steel

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A653/A653M - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process

C. Military Specification (MIL):
   1. MIL-P-21035 - Paint High Zinc Dust Content, Galvanizing Repair (Metric).
   2. MIL-PRF-26915 – Primer Coating, for Steel Surfaces.

D. The Society for Protective Coatings (Formerly known as Steel Structures Painting Council) (SSPC):

1.3 PERFORMANCE REQUIREMENTS

A. Permanent Metal Deck Forms (P.M.D. Forms) shall be designed for the dead load of form, reinforcement, and concrete, plus 50 pounds per square foot for construction loads.

B. The following allowable stresses shall be used in the design:

<table>
<thead>
<tr>
<th>Grade</th>
<th>Yield (psi)</th>
<th>Allowable Stress (psi)</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>33,000</td>
<td>23,900</td>
</tr>
<tr>
<td>B</td>
<td>37,000</td>
<td>26,800</td>
</tr>
<tr>
<td>C</td>
<td>40,000</td>
<td>29,000</td>
</tr>
<tr>
<td>D</td>
<td>50,000</td>
<td>36,000</td>
</tr>
<tr>
<td>E</td>
<td>80,000</td>
<td>36,000</td>
</tr>
<tr>
<td>Weld Metal</td>
<td>12,400</td>
<td></td>
</tr>
</tbody>
</table>

C. The permissible form camber shall be limited to the actual dead load deflection of the form. Maximum deflection under the weight of forms, reinforcement, and concrete, or a minimum of 120 pounds per square foot shall not exceed 1/180 of the form span or 1/2 inch whichever is less.

D. Permanent metal deck forms shall not be used in panels where longitudinal deck construction joints are located between stringers.

E. Metal decks shall be grounded as shown on the drawings and in accordance with Section 16450, “Grounding and Bonding”.

1.4 SUBMITTALS

A. Shop Drawings:
   1. Include the layout, take and incorporate necessary field verified dimensions, details of fabrication and erection including materials, material thicknesses, dimensions, supports, form details, closures, methods of joining, fasteners, connectors, size and location of welds, accessories, openings through decking, special conditions, and protective coating data.

B. Design calculations covering all maximum stress conditions in forms and supports along with typical sketches of the system proposed and materials to be used will be required prior to fabrication or use of the forms. Calculations shall clearly indicate design spans, applied loads, loads on the support members, acceptable stresses or other evidence of the ability of the system to support the applied loads. Calculations shall be certified by a Professional Engineer licensed in the State of Texas.
Test results submitted as evidence of adequate strength shall be well documented and entirely conclusive that adequate strength is available. End closures, hangers, and connections differing from those shown on the plans will be considered if thoroughly detailed and documented.

C. Samples:
   1. Three of each type of the following products used in the work.
      a. Decking: 6 inches by width of material.
      b. Accessories.
      c. Fasteners.
   2. Welding Sample: Prepare and submit three samples of each type of deck welding specified and shown. Resubmit samples not approved as required to provide an acceptable sample. Acceptable samples will be made available on-site as an example for welders to follow.

D. Certification: Submit certification that welding personnel and inspection/testing personnel are qualified in accordance with AWS D1.3 and AWS CWI respectively.

1.5 QUALITY ASSURANCE

A. Qualification of Welding Personnel: Employ welding personnel whose qualification is certified in accordance with AWS D1.3. Such certification is to remain in force for the duration of the welding operations under this Contract. Inspection personnel shall be an AWS CWI.

1.6 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Deliver products in good condition.
B. Store products to preclude corrosion, deterioration, and damage.
C. Handle products to prevent damage.

1.7 JOB CONDITIONS

A. Do not apply construction loads in excess of the live loads for which the deck is designed.

2.1 STEEL DECKING

A. Permanent metal deck forms shall be fabricated from steel conforming to ASTM A653/A653M (Grades A through E) with a galvanized coating class G165.

2.2 ACCESSORIES

A. Types shown or necessary to complete installation, such as form supports and closure plates.
B. Same finish as decking, unless otherwise shown or specified.

2.3 GALVANIZING REPAIR COMPOUND

A. Galvanizing Repair Paint:
   1. For Concealed or Top Coated Surfaces:
      a. Organic zinc-rich coating containing at least 65 percent metallic zinc, by weight in dry film and meeting performance requirements of:
         1) ASTM A780.
         2) SSPC Paint 20.
   2. For Surfaces to be Left Exposed:
      a. In addition to requirements for concealed and top coated surfaces, match aesthetic appearance of hot-dip galvanizing and meet performance requirements of:
         1) MIL-P-21035.
         2) MIL-PRF-26915.
      b. Basis-of-Design: Brite Products “Brite Zinc”.

2.4 FASTENERS

A. As shown on approved shop drawings.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Erect permanent metal form decking and accessories in accordance with approved shop drawings and manufacturer’s recommendations.

B. Form sheets shall not be permitted to rest directly on the top of the stringer or floor beam flanges. Sheets shall be securely fastened to form supports and shall have a minimum bearing length of one inch at each end. Form supports shall be placed in direct contact with the flange of stringer or floor beam. Place decking units on the form supports,
align, and adjust to final position before permanently fastening. Do not use metal deck area as storage or working platform until fastened. 

C. If supporting beams are not in proper alignment or at correct elevation to provide bearing and alignment of deck units, do not place decking units in deficient areas until necessary corrections have been made.

D. Welding and inspection of welds shall be done in accordance with AWS D1.3.

E. Attachments shall be made by permissible welds, screws, bolts, clips, or other approved means. Only welds or bolts shall be used to support vertical loads. Use electric-arc welding to weld deck panels to form supports. Where welding occurs through deck, plug weld to ensure proper attachment. Use proper welding rods and power to produce sound, full size welds without excessive burning or damage to form supports. Mechanical anchor side laps of adjacent panels at intervals not exceeding 3 feet with self drilling, No. 10 or larger, screws. Screws to be aligned (not random).

F. Permanently exposed form metal, where the galvanized coating has been damaged, shall be thoroughly cleaned, wire brushed, and coated with galvanizing repair compound at a rate of 2 ounces per square foot.

G. Flutes shall line up uniformly across the entire span where main reinforcing steel is located in the flute.

H. Construction joints will not be permitted unless shown on the plans. The location of and forming details for any construction joint used, shall be shown on the erection drawings. Forms below a construction joint must be removed after curing of the slab.

I. The direction of concrete placement will be such that the upper layer of the form overlay receives load first.

J. Utilize method to provide uniform vibration of concrete during placement. Attention must be given to prevent damage to the forms, yet provide proper vibration to prevent voids or honeycomb in the flutes and at headers and/or construction joints.

3.2 ADJUSTING AND CLEAN-UP

A. Clean up rubbish and debris caused by this work and remove from site.

B. Leave decks and areas surrounding work in broom-clean condition.

C. Galvanized Surfaces:

1. Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A780.

2. For surfaces to be left exposed, apply galvanizing repair paint in at least two coats.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Permanent metal form deck used for slabs will not be measured directly under this section, but shall be considered subsidiary to Section 03300, “Cast-In-Place Concrete”.

B. Permanent metal form deck used for slabs will not be paid for directly under this section, but shall be considered subsidiary to Section 03300, “Cast-In-Place Concrete”.

END OF SECTION 053100
SECTION 05415
COLD-FORMED METAL FRAMING

PART 1 - GENERAL

1.1 SUMMARY
A. This section specifies cold-formed metal framing (screwable metal studs and joists, typically 16 or 18 gage) and supplementary items necessary to complete their installation.

B. For nonload-bearing metal-stud framing of 20, 22, and 25 gage metal studs and joists and ceiling-suspension assemblies refer to Section 09260, "Gypsum Board Assemblies".

1.2 DEFINITIONS
A. Minimum Uncoated Steel Thickness: Minimum uncoated thickness of cold-formed framing delivered to the Project site shall be not less than 95 percent of the thickness used in the cold-formed framing design. Lesser thicknesses shall be permitted at bends due to coldforming.

1.3 REFERENCE STANDARDS
A. American Iron and Steel Institute (AISI):
1. AISI SG03 - Cold-Formed Steel Design Manual
2. AISI SG-911/SG-912 - Load and Resistance Factor Design Specification and Commentary for Steel Structural Members

B. American Welding Society (AWS):
1. AWS D1.1/D1.1M - Structural Welding Code - Steel
2. AWS D1.3 - Structural Welding Code - Sheet Steel

C. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
1. ASTM A36/A36M - Standard Specification for Carbon Structural Steel
2. ASTM A123/A123M - Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products
3. ASTM A153/A153M - Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware
4. ASTM A653 - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process
5. ASTM A780 - Standard Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings
7. ASTM C955 - Standard Specification for Load-Bearing (Transverse and Axial) Steel Studs, Runners (Tracks), and Bracing for Screw Application of Gypsum Panel Products and Metal Plaster Bases
8. ASTM C1007 - Standard Specification for Installation of Load Bearing (Transverse and Axial) Steel Studs and Related Accessories
11. ASTM E488 - Standard Test Methods for Strength of Anchors in Concrete and Masonry Elements
12. ASTM E548 - Standard Guide for General Criteria Used for Evaluating Laboratory Competence
14. ASTM F1554 - Standard Specification for Anchor Bolts, Steel, 36, 55, and 105-ksi Yield Strength

D. Gypsum Association (GA):
1. GA 600 - Fire Resistance Design Manual

E. Military Specification (MIL):
1. MIL-P-21035 - Paint High Zinc Dust Content, Galvanizing Repair (Metric).
2. MIL-PRF-26915 - Primer Coating, for Steel Surfaces.
F. The Society for Protective Coatings (Formerly known as Steel Structures Painting Council) (SSPC):

   1. SSPC Paint 20 - Zinc-Rich Primers (Type I, "Inorganic," and Type II, "Organic").

1.4 SYSTEM DESCRIPTION

A. This is a performance specification and the cold-formed metal framing fabricator shall be responsible for structural design and engineering required to meet specified performance requirements within physical and aesthetic requirements established.

B. Contract Documents are an outline of criteria and performance requirements for the System. Requirements specified or indicated by details are intended to establish aesthetic design requirements and performance of exterior and interior finish materials.

C. Drawings do not necessarily indicate or describe total work required for completion of Work. Furnish and install all items required for complete installation.

D. Dimension and profile adjustments may be made in proposed structural design in interest of fabrication or erection methods or techniques, weatherability factor, or ability of design to satisfy design and performance requirements, provided that aesthetic design intent and intent of Contract Documents are maintained. Include modifications or additions required to meet specified requirements and maintain the visual design concept.

1.5 SYSTEM PERFORMANCE REQUIREMENTS

A. Structural Performance: Engineer, fabricate, and erect cold-formed metal framing to withstand design loads within limits and under conditions required.

   1. Design Loads: Design framing system to withstand design loads required by local building code.

   2. Deflection Limits: Design framing systems to withstand design loads without deflections greater than following:

      a. Exterior Typical Wall Framing: Horizontal deflection of 1/360 of wall height.

      b. Exterior Masonry Wall Framing: Horizontal deflection of 1/720 of wall height.

   c. Interior Typical Wall Framing: Horizontal deflection of 1/240 of wall height.

   3. Design framing systems to provide for movement of framing members without damage to interior and exterior finishes, sheathing failure, connection failure, undue strain on fasteners and anchors, or other detrimental effects when subject to a maximum ambient temperature change (range) of 120 deg F.

   4. Design framing system to maintain clearances at openings, to allow for construction tolerances, and to accommodate live load deflection of primary building structure of 1/2 inch upward and downward movement.

   5. System design shall maintain visual design concept and incorporate an expansion and contraction joint located above ceiling line to isolate movement between interior and exterior finishes.

   6. Stud depth and maximum spacing indicated is critical for performance of other materials and shall not change without consideration of performance of materials dependent upon indicated depth and spacing. Spacing where indicated shall be construed to imply maximum spacing.

B. Design exterior wall framing to accommodate lateral deflection without regard to contribution of sheathing materials.

C. Engineering Responsibility: Engage fabricator who assumes undivided responsibility for engineering cold-formed metal framing by employing a qualified professional engineer to prepare and seal design calculations, shop drawings, and other structural data.

1.6 SUBMITTALS

A. Product Data: For each type of cold-formed metal framing, accessory, and product specified.

B. Shop Drawings: Show layout, spacings, sizes, thicknesses, and types of cold-formed metal framing, fabrication, fastening and anchorage details, including mechanical fasteners. Show reinforcing channels, opening framing, supplemental framing, strapping, bracing, bridging, splices, accessories, connection details, and attachments to other units of Work.

   1. Include setting drawings, templates, and directions for the installation of anchor bolts.
and other anchorages installed as a unit of work under other sections.

2. If deviations are proposed indicate where and how the proposed system deviates from Contract Documents.

3. Shop drawings shall contain seal of a professional engineer currently registered in licensing jurisdiction of the project and a written statement that the wall system conforms to project requirements, applicable codes, and specified conditions.

4. Provide for information only, material properties and other information needed for structural analysis including computations, prepared, signed, and sealed by a professional engineer licensed to practice in the jurisdiction where the project is located.

C. Mill certificates signed by steel sheet producer or test reports from a qualified independent testing agency indicating steel sheet complies with requirements.

D. Certificates that welding and inspection/testing personnel are qualified in accordance with AWS D1.3.

E. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.

F. Product Test Reports: From a qualified testing agency indicating that each of the following complies with requirements, based on comprehensive testing of current products:

   1. Expansion anchors.
   3. Mechanical fasteners.
   4. Vertical deflection clips.
   5. Miscellaneous structural clips and accessories.

G. Research/Evaluation Reports: Evidence of cold-formed metal framing's compliance with building code in effect for Project, from a model code organization acceptable to authorities having jurisdiction.

1.7 QUALITY ASSURANCE

A. Installer Qualifications: An experienced installer who has completed cold-formed metal framing similar in material, design, and extent to that indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.

B. Engineering Responsibility: Engage a qualified professional engineer to prepare design calculations, Shop Drawings, and other structural data.

C. Professional Engineer Qualifications: A professional engineer who is licensed in the State of Texas and experienced in providing engineering services of the kind indicated. Engineering services are defined as those performed for installations of cold-formed metal framing that are similar to those indicated for this Project in material, design, and extent.

D. Mill certificates signed by steel sheet producer or test reports from a qualified independent testing agency indicating steel sheet complies with requirements, including uncoated steel thickness, yield strength, tensile strength, total elongation, chemical requirements, ductility, and galvanized-coating thickness.

E. Testing Agency Qualifications: An independent testing agency, acceptable to authorities having jurisdiction, qualified according to ASTM E329 to conduct the testing indicated.

G. Fire-Test-Response Characteristics: Where metal framing is part of a fire-resistance-rated assembly, provide framing identical to that of assemblies tested for fire resistance per ASTM E119 by a testing and inspecting agency acceptable to authorities having jurisdiction.

AISI Specifications: Comply with AISI SG03 and AISI SG-911/SG-912 and the following for calculating structural characteristics of cold-formed metal framing:

**PART 2 - PRODUCTS**

**2.1 MATERIALS**

A. Steel Sheet: ASTM A653 structural steel, zinc coated, of grade and coating as follows:

1. Grade: 33 for minimum uncoated steel thickness of 0.0428 inch and less; 50 for minimum uncoated steel thickness of 0.0538 inch and greater.

2. Coating: G90.

**2.2 WALL FRAMING**

A. Steel Studs: Manufacturer's standard C-shaped steel studs, of web depths indicated, punched, with stiffened flanges, complying with ASTM C955, and as follows:

1. Uncoated-Steel Thickness: 0.0428 inch minimum.

B. Steel Track: Manufacturer's standard galvanized U-shaped steel track, of web depths indicated, with straight flanges, and complying with ASTM C955 and the following:

1. Design Uncoated-Steel Thickness: Matching steel studs.

2. Flange Width: Manufacturer's standard deep flange (minimum 2 inches) at head of exterior walls where studs occur between structural floors, standard flange elsewhere.

3. Web: Bottom track punched with 1 inch diameter holes at 24 inches on center, over openings to prevent track from holding water, unpunched elsewhere.

**2.3 FRAMING ACCESSORIES**

A. Fabricate steel-framing accessories of the same material and finish used for framing members, with a minimum yield strength of 33,000 psi.

B. Provide accessories of manufacturer's standard thickness and configuration, unless otherwise indicated, as follows:

1. Supplementary framing.

2. Bracing, bridging, and solid blocking.

3. Web stiffeners.

4. Gusset plates and clips.

5. Deflection track.

7. Reinforcing and backer plates.

**2.4 ANCHORS, CLIPS, AND FASTENERS**

A. Steel Shapes and Clips: ASTM A36/A36M, zinc coated by the hot-dip process according to ASTM A123/A123M.

B. Anchor Bolts: ASTM F1554, threaded carbon-steel hex-headed bolts and carbon-steel nuts; and flat, hardened-steel washers; zinc coated by hot-dip process according to ASTM A153.

C. Expansion Anchors: Fabricated from corrosion-resistant materials, with capability to sustain, without failure, load equal to 5 times the design load, as determined by testing per ASTM E488 conducted by qualified independent testing agency.

D. Powder-Actuated Anchors: Fastener system of type suitable for application indicated, fabricated from corrosion-resistant materials, with capability to sustain, without failure, a load equal to 10 times the design load, as determined by testing per ASTM E1190 conducted by a qualified independent testing agency.

E. Mechanical Fasteners: Corrosion-resistant coated, self-drilling, self-threading steel drill screws with low-profile type head beneath sheathing, manufacturer's standard elsewhere.

F. Welding Electrodes: Comply with AWS standards.
2.5 MISCELLANEOUS MATERIALS

A. Galvanizing Repair Paint:

1. For Concealed or Top Coated Surfaces:
   a. Organic zinc-rich coating containing at least 65 percent metallic zinc, by weight in dry film and meeting performance requirements of:
      1) ASTM A780.
      2) SSPC Paint 20.

2. For Surfaces to be Left Exposed:
   a. In addition to requirements for concealed and top coated surfaces, match aesthetic appearance of hot-dip galvanizing and meet performance requirements of:
      1) MIL-P-21035.
      2) MIL-PRF-26915.

b. Basis-of-Design: Brite Products “Brite Zinc”.

B. Structural Nonshrink Grout: As specified in Section 03305, “Portland Cement Concrete”.

C. Thermal Insulation: For boxed-in sections, ASTM C665, Type I, unfaced mineral-fiber blankets produced by combining glass or slag fibers with thermosetting resins.

3. INSTALLATION, GENERAL

A. Cold-formed metal framing may be shop or field fabricated for installation, or it may be field assembled.

B. Install cold-formed metal framing according to ASTM C 1007, unless more stringent requirements are indicated or required by conditions.

C. Install cold-formed metal framing and accessories plumb, square, true to line, and with connections securely fastened, according to manufacturer's recommendations and requirements of this Section.

1. Space studs at 16 inches on center maximum unless otherwise indicated.

2. Cut framing members by sawing or shearing; do not torch cut.

3. Fasten cold-formed metal framing members by screw fastening. Wire tying of framing members is not permitted.
   a. Locate mechanical fasteners and install according to cold-framed metal framing manufacturer's instructions with screw penetrating joined members by not less than three exposed screw threads.

D. Install framing members in one-piece lengths, unless splice connections are indicated for track or tension members.

E. Install temporary bracing and supports to secure framing and support loads comparable in intensity to those for which structure was designed. Maintain braces and supports in place, undisturbed, until entire integrated supporting structure has been completed and permanent connections to framing are secured.

F. Do not bridge building expansion and control joints with cold-formed metal framing. Independently frame both sides of joints.

G. Install insulation in built-up exterior framing members, such as headers, sills, boxed joists, and multiple studs at openings that are inaccessible on completion of framing work.

H. Fasten reinforcement plate over web penetrations that exceed size of manufacturer's standard punched openings.

I. Erection Tolerances: Install cold-formed metal framing to a maximum allowable tolerance
variation from plumb, level, and true to line of 1/8 inch in 10 feet and as follows:

1. Space individual framing members no more than plus or minus 1/8 inch from plan location. Cumulative error shall not exceed minimum fastening requirements of sheathing or other finishing materials.

3.4 WALL FRAMING INSTALLATION

A. Install continuous top and bottom tracks sized to match studs. Align tracks accurately and securely anchor to supporting structure and at spacings recommended by manufacturer, but not greater than 24 inches on center.

B. Squarely seat studs against webs of top and bottom tracks. Fasten both flanges of studs to top and bottom track.

C. Set studs plumb, except as needed for diagonal bracing or required for nonplumb walls or warped surfaces and similar requirements.

D. Isolate steel framing from building structure to prevent transfer of vertical loads while providing lateral support. Install deep-leg deflection tracks and anchor to building structure.

E. Install headers over wall openings wider than the stud spacing. Locate headers above openings as indicated. Fabricate headers of compound shapes indicated or required to transfer load to supporting studs, complete with clip-angle connectors, web stiffeners, or gusset plates.

1. Frame wall openings with not less than a double stud at each jamb of frame as indicated or required by manufacturer.

2. Install runner tracks and jack studs above and below wall openings. Anchor tracks to jamb studs with clip angles or by welding, and space jack studs same as full-height wall studs.

F. Install supplementary framing, blocking, and bracing in stud framing where required to support additional loads.

G. Install horizontal bridging in stud system, spaced in rows not more than 54 inches apart. Fasten at each stud intersection.

1. Bridging: Cold-rolled steel channel, welded or mechanically fastened to webs of punched studs with a minimum of two screws into each flange of the clip angle.

2. Deflection Track: Install row of bridging within 18 inches of deflection track.

H. At shear walls install steel-sheet diagonal bracing strap to both stud flanges, terminate at and fasten to reinforced top and bottom track. Fasten clip-angle connectors to multiple studs at ends of bracing and anchor to structure.

I. Install miscellaneous framing and connections, including supplementary framing, web stiffeners, clip angles, continuous angles, anchors, and fasteners, to provide a complete and stable wall-framing system.

3.5 REPAIRS AND PROTECTION

A. Galvanized Surfaces:

1. Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A780.

2. For surfaces to be left exposed, apply galvanizing repair paint in at least two coats.

B. Provide final protection and maintain conditions in a manner acceptable to manufacturer and installer to ensure that cold-formed metal framing is without damage or deterioration at time of Substantial Completion.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this Section will not be measured separately, but payment made for on a lump sum basis for cold-formed metal framing per location indicated.

END OF SECTION 05415
SECTION 05430
SLOTTED CHANNEL FRAMING

PART 1 - GENERAL

1.1 SUMMARY

A. This section specifies slotted channel framing and supplementary items necessary to complete their installation.

1.2 REFERENCE STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM A575 - Standard Specification for Alloy Steel Bars, Carbon, Merchant Quality, M-Grades
2. ASTM A653/A653M - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process
3. ASTM A1011/A1011M - Standard Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability

B. American Welding Society (AWS):

1. AWS D1.1/D1.1M - Structural Welding Code - Steel

1.3 SYSTEM DESCRIPTION SUMMARY

A. General Description:

1. System shall consist of required elements such as struts, columns, braces, fittings, spanning members, longitudinal rails, track supports, nuts, bolts, washers, shim plates, etc. for a complete, adequate and properly functioning assembly.
2. System shall be a basic support assembly that permits transverse and longitudinal adjustment of bolt centers at the installation site.
3. System shall be adaptable to accommodate various circumstances and conditions at each installation.
4. When possible, the system shall be prefabricated for installation at the job site.
5. The system shall be rigid, securely braced and level in both directions at the finish ceiling line.

B. Aesthetic Requirements:

1. System shall be concealed above the ceiling to support items below the ceiling.
2. Bottom member shall be flush with the finished ceiling.

C. Structural Requirements:

1. System structural design shall be sufficient to support loads indicated on the drawings.
2. Top member shall be fastened to the building concrete or steel structure above.
3. Design shall include a minimum safety factor of three. Safety factor greater than three shall be used if required by applicable national, state or local codes.

D. Interface with Adjacent System(s):

1. System shall coordinate and properly interface with ceiling system.
2. System shall be installed prior to ceiling installation.
3. Coordinate with mechanical, electrical and plumbing (MEP) to avoid conflicts.

E. Tolerances (of total system):

1. Members shall be level in both directions to within 1/16 inch.
2. Members shall be parallel to within 1/16 inch.
3. System shall permit minimum 12 inch adjustment.

1.4 SUBMITTALS

A. Design Data:

1. Submit complete and specific design data for products specified.
2. Engineering design data shall be sufficient to permit the calculations of stresses and to verify the strength of individual members and/or components.

B. Product Data:

1. Submit manufacturer’s specifications to evidence compliance with these specifications.
C. Shop Drawings:
   1. Submit complete fabrication details and erection drawings.
   2. Drawings shall show plan layout, typical elevations, details and anchoring methods.

D. Samples: Submit two 12 inch long samples of each component of system, plus fasteners and anchors.

1.5 QUALITY ASSURANCE

A. Manufacturer Qualifications:
   1. Products covered under this Section shall be produced by a single manufacturer unless otherwise specified.
   2. Manufacturer shall submit evidence of having not less than five years successful production of this product.

B. Subcontractor Qualifications:
   1. Subcontractor shall submit evidence of skill and not less than three years specialized experience with this product.
   2. Subcontractor shall be trained, approved and certified by the manufacturer.

C. Designer Qualification:
   1. Each component of the slotted channel framing systems shall be designed by a professional engineer who is licensed in the State of Texas and said engineer must be employed by the system manufacturer.
   2. Submit a statement certified by the licensed professional engineer that the design of components of the system, including connections to the structural frame, is in compliance with provisions of the Contract Documents, and is in keeping with generally accepted engineering practice.

D. Welder Qualification:
   1. AWI D1.1/D1.1M
   2. AWI Certified

E. Special Requirements of Regulatory Agencies:
   1. Material and design shall conform to specifications of the following organizations:
      a. American Iron and Steel Institute (AISI)
      b. American Institute of Steel Construction (AISC)
   c. American Welding Society (AWS)
   d. American Society For Testing and Materials (ASTM)

1.6 DELIVERY, STORAGE AND HANDLING

A. Deliver, store and handle products in accordance with the manufacturer’s latest published requirements and specifications.

1.7 SEQUENCING AND SCHEDULING

A. Coordinate with structural concrete and steel trades for attachments.

B. Coordinate with mechanical (HVAC), electrical and plumbing trades to avoid conflicts.

C. Install system prior to ceiling installation. Coordinate with ceiling trade.

D. Report conflicts to the Contracting Officer.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Following manufacturers listed are “acceptable” only if manufacturer can evidence product compliance with requirements of Contract Documents.
   1. B-Line Systems, Inc.
   2. Grinnell Supply Sales - “Power-Strut"
   3. Unistrut Corporation Building Systems
   4. Or approved equal

2.2 BASIS-OF-DESIGN PRODUCT

A. Manufacturer and Series/Model Number: Unistrut “P1000 1-5/8” Channel Width Series"

2.3 MATERIALS

A. Materials shall conform to one of the following ASTM Specifications:
   1. Hot Rolled Carbon Steel Sheet and Strip, Structural Quality: ASTM A1011/A1011M, Grade 33
   2. Zinc-Coated Steel Sheet, Structural Quality: ASTM A653/A653M, Grade A, G90
   3. Hot Rolled Steel Bar: ASTM A575
   4. Hot Rolled Steel Sheet and Strip: ASTM A1011/A1011M
B. Members and connections shall be coated with a corrosion resistant finish.

1. Electro-Galvanized (EG) Finish: Bolts, screws, nuts and washers shall be coated with zinc electrolytically to ASTM B633, Type 1, Class SC3.

2. Pre-Galvanized Channel (PG) Finish: Material (steel strip) shall be coated with zinc by hot-dipped process prior to roll forming or press operations. The zinc weight is G90, conforming to ASTM A1011/A1011M.

3. Finish For Exposed Members: Exposed members shall be carefully cleaned and phosphated. Immediately after phosphating, a uniform coat of rust inhibiting baked acrylic enamel paint shall be applied by electro-deposition. Paint color shall match ceiling grid color unless otherwise specified.

2.4 SYSTEM COMPONENTS

A. Horizontal Spanning Members (flush with ceiling): #P1001 channels

B. Vertical Columns: #P1001 channel

C. Diagonal Braces: #P1000 channel

D. Connectors, Fittings, and Hardware (nuts, bolts, washers, shims, etc.): As required

2.5 SYSTEM STRUCTURAL DESIGN

A. Support Structure:

1. The support members at the ceiling plane shall be located as indicated on the drawings.

2. It shall be possible to attach equipment support rails at any point along the support members without drilling into support system or welding to same.

B. Ceiling Anchorage: Wherever possible, attachment to ceiling shall be by means of embedded concrete inserts, through-bolts or by direct attachment to structural framing.

C. Loading:

1. The "concentrated load" is the maximum that will be encountered by positioning of equipment at the extremities of its travel (maximal load configuration).

D. Safety Factor:

1. The support structure shall be designed for a minimum safety factor of 3 based on the ultimate strength under static loading conditions.

2. In addition, structure shall not deflect more than 1/720 span in either plane (vertical or horizontal) when maximal loading conditions, due to equipment operation, is applied on either rail.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine and verify that receiving substrate surfaces of the structure have no defects or errors which would result in poor or potentially defective application or cause latent defects in workmanship.

B. Starting installation shall imply acceptance of surfaces.

3.2 PREPARATION

A. Structural Adequacy:

1. Prepare the structure to insure proper and adequate structural support for the framing support system specified.

2. Coordinate placement and location of embedded anchor receivers in structural concrete above.

3. Coordinate proper anchorage to structural steel above.

B. Prepare substrate surfaces to insure proper and adequate installation, in accordance with the Contract Documents and approved Shop Drawings, or framing support system manufacturer’s requirements.

C. Field Measurements/Verifications:

1. Field measure and verify dimensions as required.

2. Make field measurements to assure that the framing support system can be installed without interference with structural framing, mechanical systems, plumbing, or other obstructions.

D. Protect adjacent areas or surfaces from damage as a result of the Work of this Section.

3.3 INSTALLATION

A. Install in accordance with framing support system manufacturer’s latest published requirements, specifications, details and approved shop drawings.

B. Interface with Other Products/Trades:

1. Coordinate and cooperate with mechanical, electrical, plumbing and ceiling installation trades.

2. Coordinate and comply with requirements of medical equipment components.
C. Installation/Erection Tolerances:

1. Supporting framework shall be installed plumb and true.

2. The mounting surfaces of the support structure shall be horizontal within the tolerance of 1/32 inch in 24 inches and within 1/16 inch in 18 foot length.

3. The elevation of one rail mounting surface to the other shall be within 1/16 inch in any 24 inch length of the rails.

3.4 ADJUSTING

A. Adjust and leave the framing support system in perfect working order and in compliance with specified tolerances.

3.5 CLEANING

A. Immediately remove spots, smears, stains, residues, adhesives, etc., from the exposed portions of the work of this Section and/or upon adjacent areas or surfaces which result from the Work of this Section.

B. Upon the completion of the work of this Section, dispose of, away from the site, debris, trash, containers, residue, remnants and scraps which result from the Work of this Section.

3.6 PROTECTION

A. After installation and until Authority acceptance, protect the framing support system from damage.

B. Remove damaged items, elements, units or materials and replace with new, undamaged ones, at no cost to the Authority.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this Section will not be measured separately, but payment made for on a lump sum price for slotted channel framing per location indicated.
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies providing miscellaneous metal, with the exception of ornamental (architectural) metal and metal work provided as a part of mechanical, electrical, and construction systems.

B. Seats for windscreens are specified in Section 02873, “Station Furnishings”.

C. Metal stairs are specified in Section 05510, “Metal Stairs”.

D. Cast abrasive nosings attached to metal stairs are specified in Section 05510, “Metal Stairs”.

E. Handrails and railings are specified in Section 05520, “Metal Railings”.

1.2 REFERENCE STANDARDS

A. American Welding Society (AWS):
   1. AWS D1.1/D1.1M - Structural Welding Code - Steel
   2. AWS D1.3 - Structural Welding Code - Sheet Steel

B. Americans with Disabilities Act Accessibility Guidelines (ADAAG).

C. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A36/A36M - Standard Specification for Carbon Structural Steel
   3. ASTM A53 - Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless
   5. ASTM A123/A123M - Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products
   6. ASTM A153/A153M - Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware
   7. ASTM A229/A229M - Standard Specification for Steel Wire, Oil-Tempered for Mechanical Springs
   8. ASTM A242/A242M - Standard Specification for High-Strength Low-Alloy Structural Steel
   9. ASTM A276 - Standard Specification for Stainless Steel Bars and Shapes
   10. ASTM A283/A283M - Standard Specification for Low and Intermediate Tensile Strength Carbon Steel Plates
   11. ASTM A307 - Standard Specification for Carbon Steel Bolts and Studs, 60 000 psi Tensile Strength
   13. ASTM A413/A413M - Standard Specification for Carbon Steel Chain
   14. ASTM A501 - Standard Specification for Hot-Formed Welded and Seamless Carbon Steel Structural Tubing
   15. ASTM A536 - Standard Specification for Ductile Iron Castings
   16. ASTM A572/A572M - Standard Specification for High-Strength Low-Alloy Columbium-Vanadium Structural Steel
   17. ASTM A588/A588M - Standard Specification for High-Strength Low-Alloy Structural Steel with 50 ksi (345 MPa) Minimum Yield Point to 4-in. (100-mm) Thick
   18. ASTM A780 - Standard Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings
   19. ASTM A786/A786M - Standard Specification for Hot-Rolled Carbon, Low-Alloy, High-Strength Low-Alloy, and Alloy Steel Floor Plates
   20. ASTM D395 - Standard Test Methods for Rubber Property - Compression Set
23. ASTM D573 - Standard Test Method for Rubber - Deterioration in an Air Oven

24. ASTM D1149 - Standard Test Method for Rubber Deterioration - Surface Ozone Cracking in a Chamber

25. ASTM D2240 - Standard Test Method for Rubber Property - Durometer Hardness

27. ASTM E488 - Standard Test Methods for Strength of Anchors in Concrete and Masonry Elements

D. Military Specification (MIL):
1. MIL-P-21035 - Paint High Zinc Dust Content, Galvanizing Repair (Metric).
2. MIL-PRF-26915 - Primer Coating, for Steel Surfaces.

E. National Association of Architectural Metal Manufacturers (NAAMM):
1. NAAMM MBG 531 - "Metal Bar Grating Manual"

F. The Society for Protective Coatings (Formerly known as Steel Structures Painting Council) (SSPC):
1. SSPC Paint 20 - Zinc-Rich Primers (Type I, "Inorganic," and Type II, "Organic").

G. Texas Accessibility Standards (TAS).

1.3 SUBMITTALS

A. Shop Drawings:
1. Include fabricated work showing details of construction and placement including hardware, fittings, and fastenings.
2. Submit manufacturer's standard drawings in lieu of prepared shop drawings if manufacturer's standard drawings show required details.

B. Certification:
1. Certificate from manufacturer of steel gratings verifying that gratings are capable of supporting loading as shown.
2. Certification that welding personnel and inspection/testing personnel are currently qualified in accordance with AWS D1.1/D1.1M and AWS CWI respectively.

1.4 QUALITY ASSURANCE

A. Qualifications of Welding Personnel:
1. Employ welders whose qualification is certified in accordance with AWS Standard D1.1/D1.1M.
2. Inspection personnel shall be an AWS CWI.
3. Certification shall remain in force for the duration of the welding operations under this Contract.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Deliver products undamaged.
B. Store products to prevent rust.
C. Handle products to prevent damage.
D. After completion of factory testing, package and ship hatches as directed.

PART 2 - PRODUCTS

2.1 METALS

A. Steel:
1. Structural steel: Plates, shapes, bars, and angles, ASTM A36/A36M.
2. Floor plate: ASTM A786 rolled from plate complying with ASTM A283, Grade C or D, ASTM A36/A36M or, diamond pattern unless otherwise specified, flat back, galvanized in accordance with ASTM A123/A123M.
3. High-strength low-alloy structural steel:
   a. ASTM A242.
   b. Resistance to atmospheric corrosion: Four times that of carbon steel, minimum.
6. Bolts:
   b. Stainless steel: ASTM F593, Group 1 for bolts and ASTM F594, Group 1 for nuts.
   c. High Strength: ASTM A325, Type 1. ASTM A563, Grade DH, for nuts. ASTM F436, Type 1 for washers.

7. Anchor Bolts, Nuts and Washers: ASTM F1554, Grade 55, unless noted otherwise on drawings. ASTM A563, Grade A for nuts. ASTM F436, Type 1 for washers. Galvanized per ASTM A153/A153M.

8. Screws: Stainless steel, ASTM F593, Group 1

B. Iron Castings:
   2. Ductile iron: ASTM A536.

C. Pipe, Pipe Sleeves, and Pipe Fittings:
   2. Steel: ASTM A53, galvanized unless otherwise shown or specified.

D. Grating: NAAMM MBG 531 Welded or pressure locked bar grating, depth and spacing as indicated, hot-dip galvanized.

2.2 FINISHES

A. Galvanizing Repair Paint:
   1. Organic zinc-rich coating containing at least 65 percent metallic zinc, by weight in dry film and meeting performance requirements of:
      a. ASTM A780.
      b. SSPC Paint 20.
   2. In addition to requirements for concealed and top coated surfaces, match aesthetic appearance of hot-dip galvanizing and meet performance requirements of:
      a. MIL-P-21035.
      b. MIL-PRF-26915.

B. Paint: As specified in Section 09970, “Coatings for Steel” Paint and Coating System No. 2A.

C. Coal tar epoxy coating: Tnemec 4H-413 coal tar epoxy, Carbolene, Ameron, or approved equal.

D. Porcelain Enamel finish on steel: Provide porcelain enamel finished cladding on steel panels where shown and in accordance with PEI Specification SE-100 matching colors on the color schedule.

E. Baked Enamel on steel: Provide baked enamel finish on steel fabrications where shown by a thorough hot chemical cleaning process, a six step zinc phosphate process, two prime coats and one finish coat of sprayed acrylic enamel (1.25 mil thickness minimum), baked at 350 degrees F for a minimum of 30 minutes. Color as directed.

2.3 FASTENERS

A. Screws: Material, type and size to suit the purpose; steel, except stainless, cadmium-plated.

B. Machine bolts: Material, type, and size best suited to the purpose. Minimum tensile strength 60,000 psi.

C. Expansion anchors: Assembly of galvanized steel or stainless steel complying with ASTM F593 best suited to the purpose. Anchors shall be capable of resisting load equal to 6 times applied load at unit masonry and 4 times applied load at concrete per ASTM E488.

D. Screw anchors: Lead or plastic, for wood or metal screws.

E. Anchor bolt sleeve: Corrugated high-density polyethylene plastic.

2.4 NONSHRINK GROUT

A. Structural Nonshrink Grout: As specified in Section 03305, “Portland Cement Concrete”.

2.5 GENERAL REQUIREMENTS - FABRICATION

A. Insofar as practicable, furnish similar products of a single manufacturer.

B. Provide materials which have been selected for their surface flatness, smoothness, and freedom from blemishes, wherever exposed to view in the finished unit. Exposed to view surfaces which exhibit pitting seam marks, roller marks, “oil-canning”, stains, discolorations, or other imperfections on finished units will not be accepted.

C. Provide material that is free from mill scale, flake rust, and mill pitting.

D. Items formed and finished to shapes and sizes indicated or required with sharp angles and lines.
E. Metal work bent by shearing or punching may be straightened and used.

F. Plates shall be welded on for mounting hardware. Holes shall be drilled or punched for bolts and screws. Fastenings shall be concealed wherever practicable.

G. Exposed edges of work shall be ground smooth. Joints exposed to weather shall be constructed to exclude water.

H. Brackets, lugs, and similar accessories, required for installation, shall be included as a part of metal item.

I. Where miscellaneous access openings, with exception of gratings, occur in finished floor areas, include stainless steel edge rims of depth to accommodate floor finishing material.

J. Welding:
   1. Perform welding in accordance with AWS D1.1/D1.1M.
   2. Ensure all welds made in units exposed to view are completely filled, ground smooth, all pin holes removed. For unpainted surfaces, conform to AWS, NAAMM Standards, welding rod manufacturer and metal producer to produce absolute color and finish match of welds to the surrounding metal.

K. Fabricate exterior components to allow for expansion and contraction for an ambient temperature range from 0 degrees F to 120 degrees F, without causing buckling, excessive opening of joints or overstressing welds or fasteners.

L. Form to required shapes and sizes, with true curves, lines, and angles. Provide necessary rebates, lugs and brackets for assembly of units. Use concealed fasteners wherever possible.

M. Mill joints to a tight hairline fit. Cope or miter corner joints. Exposed edges to be ground smooth. Form joints exposed to weather to exclude water penetration.

N. Provide concealed corrosion resistant fasteners and flush type exposed fasteners located in vertical reveals.

O. Provide castings that are sound and free of warp or defects which impair strength and appearance. Mill joints to a close fit and finish exposed surfaces to smooth, sharp, well defined lines, and arises.

2.6 GUARD CHAINS
A. ASTM A413, Class Grade 28, galvanized steel, 9/32 inch thick, except where indicated as stainless steel, provide complete with stainless steel eyes, spring-loaded catches and mounting components.

2.7 PREFABRICATED EXPANSION JOINT
A. Extrusions or fabricated plates as shown in the plans.
B. Provide compression or strip seals as shown in the plans, to provide free movement of the joint as required.
C. Compression seals shall be extruded, multi-channel, elastomeric shapes conforming to ASTM D2628.
D. Strip seals shall have physical properties in accordance with the following table:

E. Joint seals shall be supplied and installed in one continuous length.

2.8 MANHOLE FRAME AND COVER; INLET FRAME AND GRATE; BALLAST SCREEN; AERIAL STRUCTURE DRAINS AND INLETS; AND OTHER CASTINGS FOR SERVICE WITH UTILITY SYSTEMS
A. Cast iron, ASTM A48, Class 40, or ductile iron, ASTM A536, fabricated as shown, with AASHTO HS-20-44 loading, where subject to vehicular traffic.
B. True to pattern in form and dimensions, free from pouring faults, sponginess, cracks, blowholes, and defects affecting strength.

C. Fillets at angles in casting with arrises sharp and true.

D. Sandblasted to effectively remove scale and sand, presenting smooth, clean, and uniform surfaces. Coat with 8 mil DFT of coal tar epoxy coating, where shown on Contract Drawings.

E. DART logo: For utility components which will remain Authority property and are not within boundaries of utility easements as shown, Cast DART logo as shown on drawings.

2.9 TRENCH FRAME AND COVER; PIT FRAME AND COVER

A. Fabrication: Floor plate, thickness as shown but in no case less than 1/4 inch in thickness, diamond pattern, flat back.

B. Surface: Abrasive, unless otherwise shown or specified.

C. Structural angle frames, anchored to supporting construction.

D. Plates in convenient lengths for handling and each section provided with finger holes for lifting.

E. Galvanize after fabrication.

F. Removable covers match-marked with their frames prior to shipping, fastened with stainless steel bolts.

2.10 STEEL GRATING

A. Angles or other structural shapes as supports for grating: Section 05120, “Structural Steel - Bridges”.

B. Removable steel gratings equipped with locking lugs and provision for bolting to supporting members with stainless steel bolts.

C. Grating manufactured by electro-pressure welding or pressure locking process, forming sound welded, or pressure locked joints at intersection of bars and having bars in the same plane.

1. For walkways, ventilation shafts, light wells, and other locations subject to possible vehicular traffic: gratings of plain, rectangular type, suitable for AASHTO HS-20-44 loading.

2. For track drainage pumping stations and other locations subject to foot traffic only: gratings of serrated, rectangular type, unless otherwise shown, fabricated of 1-1/4 inch x 1/8 inch bearing bars on 1-3/16 inch centers with cross bars on 4 inch centers and capable of supporting 250 psf uniform loading with a maximum deflection of 1/200 of span.

D. Galvanize after fabrication.

2.11 CORROSION-RESISTANT GRATING

A. Fabricated from high-strength low-alloy structural steel.

B. Gratings and related supports capable of supporting uniformly distributed live load shown.

C. Grating system fabricated to mechanically secure units in place and permit removal in sections of such size that one man can handle, weight not to exceed 50 pounds.

D. Unless otherwise shown, 2 inch x 3/16 inch bearing bars spaced at 5 inches on centers with cross bars at end of 6 feet long units, each unit electroforged or pressure-locked.

2.12 LADDERS

A. Designed to be bolted to floor, at top and at intermediate points on not more than 4 feet centers, with approved clips and anchors, conforming to OSHA requirements, including cages as applicable.

B. Fabricated of structural steel or high-strength low-alloy structural steel or stainless steel Type 304 or 306 as shown or specified.

C. Rails fabricated as detailed, or if not detailed, punched to receive rungs spaced at 12 inches on centers and fully welded to the rails.

D. Galvanize other than stainless steel after fabrication.

E. Provide non-slip surface on top of each rung, either by coating with aluminum oxide granules set in epoxy resin adhesive, or by using a type of manufactured rung which is filled with aluminum oxide grout.

F. Rungs shall withstand a 1000 lb. loading without failure.

2.13 CAST ABRASIVE NOSINGS

A. Fabricate units in sizes and configurations indicated and in lengths necessary to accurately fit openings or conditions. Provide units of cast nickel bronze.
1. Provide cross hatched surface units, with abrasive, consisting of aluminum oxide, silicon carbide, or a combination of both, integrally cast into walking surface to minimum depth 1/32-inch.

2. Configuration: Units 3 inches wide, for casting into concrete steps.

B. Provide nosings full length of steps less 3-inch clearance at each end.

C. Provide concealed anchors for embedding units in concrete, either integral or applied to units, as standard with manufacturer.

D. Shot blasted finish.

E. Basis-of-Design Product: Wooster Products, Inc. Type 101

F. Acceptable Manufacturers:
   1. American Safety Tread Co., Inc.
   2. Safe-T-Metal Co.
   3. Wooster Products Inc.

2.14 STEEL LINTELS

A. Fabricated of structural steel.

B. Multiple members riveted or welded back-to-back or separated by spacers.

C. Shop primed and shop finish coated.

2.15 CORNER GUARDS, CURB ANGLES, AND BUMPERS

A. Fabricated of structural steel.

B. Shop primed and shop finish coated.

2.16 UNDERGROUND SAFETY WALKS

A. Grating: Bearing bars and end banding bar fabricated by electro-pressure welding process to form sound joints at intersections of bars with bars in same plane, size and design as shown.

   1. Designed to provide for hinged section of grating bolted to walls. Grating of such size to permit one-man operation and manual positioning vertically or horizontally.

   2. Structural steel plate hinges bolted to supporting construction with holes and slots as shown.

B. Locking pin: Stainless steel, diameter to fit receptacle in hinge assembly with tolerance not greater than plus or minus 1/64 inch.

C. Locking pin chain: Fabricated of 0.128 inch diameter spring steel wire.

D. Plug welded in accordance with AWS D1.1/D1.1M.

F. Bolts and washers: ASTM A325, nonrising, and vibrationproof.

G. Spring wire: ASTM A229, Class 1 or 4.

H. Ferrous metal components galvanized after fabrication.

2.17 AERIAL SAFETY WALKS

A. Fabricated of floor plate, diamond pattern, flat back.

B. Abrasive surface on plates, unless otherwise shown.

C. Structural steel angle frames anchored to supporting structure.

D. Plates in sections of convenient lengths for handling and with finger holes for lifting.

E. Galvanize after fabrication.

F. Bolts: Stainless steel.

2.18 LIFTING EYES

A. ASTM A572, Grade 50, 1 inch diameter steel rod, welded, galvanize after fabrication.

2.19 TREE GRATES, TREE GRATE FRAMES, AND TREE GUARDS

A. Tree grate:
   1. Round: Cast iron; as shown, radial pattern and expandable type.

   2. Square: Cast iron; expandable type, size as shown.

   3. Openings shall not exceed maximum width per TAS and ADAAG

B. Tree grate frame:
   1. Angles, plates, bars, and collars: Structural steel.

   2. Other elements: As shown and specified.

   3. Galvanize after fabrication.

C. Tree guard:
   1. Steel tubing; as shown.
2. Shop-coated.

2.20 PEDESTRIAN BARRIERS

A. Tubing: Hot-formed square steel. Fabricated as follows:
   1. Heated and bent smoothly without distortion.
   2. Joints fully welded as shown.
   3. Intersections coped, fully welded and ground smooth and flush.

B. Plate: Structural steel.

C. Floor cover flange: Cast steel, as shown.

D. Shop primed and shop finish coated.

2.21 BOLLARDS

A. Pipe: Black Steel, ASTM A53, Type E, Grade A, Schedule 80, sized as shown, with 1/4 inch steel plate cap welded all around and weld ground smooth.

B. Eyebolt: 1/4 inch diameter steel rod with 1/2 inch diameter eye.

C. Concrete fill: Section 03305, "Portland Cement Concrete", Mix M-1.

D. Shop primed and shop finish coated.

2.22 EQUIPMENT SUPPORTS

A. Fabricate from structural steel sections as detailed, with welded and bolted connections shown.

B. Shop primed and shop finish coated.

2.23 STEEL FINISHES

A. Galvanizing: Hot-dip galvanize items indicated to be galvanized and comply with applicable standard listed below:
   1. ASTM A123, for galvanizing steel and iron products.
   2. ASTM A153/A153M, for galvanizing steel and iron hardware.

B. Shop prime and shop finish coat steel surfaces, except the following:
   1. Items indicated to be galvanized.
   2. Surfaces embedded in concrete or mortar. Extend priming of partially embedded members to a depth of 2 inches.

C. Prepare steel surfaces; apply shop primer and shop finish coat as specified in Section 09970, “Coatings for Steel” Paint and Coating System No. 2A and as specified below:
   1. Use priming and painting methods that result in full coverage of joints, corners, edges, and exposed surfaces.
   2. Stripe paint corners, crevices, bolts, welds, and sharp edges.

PART 3 - EXECUTION

3.1 PREPARATION

A. Remove foreign substances from surfaces to receive metal items.

B. Coordinate setting drawings, diagrams, templates, instructions and directions for the installation of items having integral anchors which are to be embedded in concrete or masonry construction. Coordinate delivery of such items with concrete and masonry work.

C. Restore protective coverings that have been damaged in shipment or in the installation of the item. Remove protective covering from surfaces only when there is no possibility of damage from work yet to be performed after installation. Retain covering on all similarly finished items and remove only when all are in place, to preclude non-uniform oxidation and discoloration.

3.2 INSTALLATION

A. Perform cutting, drilling, and fitting required in the installation of the items. Where cutting, welding, and grinding are required for proper fitting and jointing of work, restore finish to eliminate evidence of such corrective work. Do not cut or abrade finishes that cannot be restored in the field. Return such items to the shop for required alterations and complete refinishing or replace with new units.

B. Provide anchors and inserts in sufficient numbers for proper fastening of metal items.

C. Provide bar anchors with turned ends extending 6 inches minimum into concrete and 12 inches minimum into masonry. Lay anchors flat in masonry joints.

D. Embed anchors accurately in concrete to permit aligning metalwork in proper position. Provide temporary bracing or anchors in formwork for items which are to be embedded.

E. Set metalwork accurately, level, plumb, and in true alignment with related work.
F. Drill holes in supports and in metal work for bolts and screws as necessary. Conceal fasteners where possible. Where fasteners are necessary, match fasteners to adjacent metal.

G. For fabricated items, use fastenings and anchors of size and type shown on approved shop drawings or manufacturer’s standard drawings.

H. Set products true to line and without sharp bends, twists, or kinks.

I. Provide lead caulkling as necessary to set, seal, and secure metal items.

J. Use bolts, screws, or locking lugs to secure safety walk gratings; do not weld.

3.3 ADJUSTING AND CLEANING

A. Touchup Painting: Immediately after erection, clean field welds, bolted connections, and abraded areas of shop paint, and paint exposed areas to blend with the adjacent surfaces. Such touch up work shall be done in accordance with manufacturer’s instructions as specified in Section 09970, “Coatings for Steel” Paint and Coating System No. 2A.

B. Galvanized Surfaces: Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A780.

1. For surfaces to be left exposed, apply galvanizing repair paint in at least two coats.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section, except for sealed expansion joints, will not be measured, but will be paid for at the lump sum price for “Metal Fabrications”, including nonshrink grout, anchoring devices and other accessories.

B. Sealed expansion joints including extrusions, fabricated plates, armor plates, and elastomeric materials will not be measured, but will be paid for at the lump sum price for the size and type specified, complete-in-place.

END OF SECTION 05500
SECTION 05510
METAL STAIRS

PART 1 - GENERAL

1.1 DESCRIPTION

A. Work required for this Section includes metal stairs and supplementary items necessary to complete their installation.

B. Handrails and railings attached to metal stairs are specified in Section 05520, "Metal Railings".

1.2 REFERENCE STANDARDS

A. American Society of Mechanical Engineers (ASME):

1. ASME B18.2.1 - Square and Hex Bolts and Screws (Inch Series)
2. ASME B18.6.3 - Machine Screws and Machine Screw Nuts
3. ASME B18.21.1 - Lock Washers (Inch Series)
4. ASME B18.22.1 - Plain Washers - Reaffirmation and Redesignation of ASA B27.2-1965

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM A36/A36M - Standard Specification for Carbon Structural Steel
2. ASTM A53 - Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamles
3. ASTM A185 - Standard Specification for Steel Welded Wire Reinforcement, Plain, for Concrete
4. ASTM A307 - Standard Specification for Carbon Steel Bolts and Studs, 60,000 psi Tensile Strength
5. ASTM A500 - Standard Specification for Cold-Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes
6. ASTM A501 - Standard Specification for Hot-Formed Welded and Seamless Carbon Steel Structural Tubing
7. ASTM A563 - Standard Specification for Carbon and Alloy Steel Nuts
8. ASTM A1011/A1011M - Standard Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability
10. ASTM E488 - Standard Test Methods for Strength of Anchors in Concrete and Masonry Elements

C. American Welding Society (AWS):

1. AWS D1.1/D1.1M - Structural Welding Code - Steel
2. AWS D1.3 - Structural Welding Code - Sheet Steel

D. National Association of Architectural Metal Manufacturers (NAAMM):

1. NAAMM AMP 510 - "Metal Stairs Manual"

1.3 PERFORMANCE REQUIREMENTS

A. Structural Performance: Provide metal stairs capable of withstanding the following structural loads without exceeding the allowable design working stress of the materials involved, including anchors and connections. Apply each load to produce the maximum stress in each component of metal stairs.

1. Treads and Platforms of Metal Stairs: Capable of withstanding a uniform load of 100 lb/sq. ft. or a concentrated load of 600 pounds per stair tread so as to produce maximum stress condition, whichever produces the greater stress.
2. Stair Framing: Capable of withstanding stresses resulting from loads specified above in addition to stresses resulting from railing system loads.
3. Limit deflection of treads, platforms, and framing members to L/360 or 1/4 inch, whichever is less.
4. Handrails and Railings: Refer to Section 05520, "Pipe and Tube Railings".
1.4 SUBMITTALS

A. Product Data: Manufactured products used in fabricating metal stairs including extruded nosings and paint products.

B. Shop Drawings: Show fabrication and installation details for metal stairs. Include plans, elevations, sections, and details of metal stairs and their connections. Show anchorage and accessory items. Provide templates for anchors and bolts specified for installation under other Sections.

1. For installed products indicated to comply with design loads, include shop drawings and structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

C. Certification: Submit certification that welding personnel and inspection/testing personnel are qualified in accordance with AWS D1.1/D1.1M, AWS D1.3 and AWS CWI respectively.

1.5 QUALITY ASSURANCE

A. Professional Engineer Qualifications: A professional engineer who is legally qualified to practice in jurisdiction where Project is located and who is experienced in providing engineering services of the kind indicated. Engineering services are defined as those performed for installations of metal stairs (including handrails and railing systems) that are similar to those indicated for this Project in material, design, and extent.

B. Fabricator Qualifications: A firm experienced in producing metal stairs similar to those indicated for this Project and with a record of successful in-service performance, as well as sufficient production capacity to produce required units.

C. Welding: Qualify procedures and personnel according to AWS D1.1/D1.1M and AWS D1.3. Inspection personnel shall be an AWS CWI.

1.6 COORDINATION

A. Coordinate installation of anchorages for metal stairs. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

PART 2 - PRODUCTS

2.1 FERROUS METALS

A. Metal Surfaces, General: Provide metal free from pitting, seam marks, roller marks, and other imperfections where exposed to view on finished units. Do not use steel sheet with variations in flatness exceeding those permitted by referenced standards for stretcher-leveled sheet.

B. Steel Plates, Shapes, and Bars: ASTM A36/A36M.

C. Steel Tubing: Cold-formed steel tubing complying with ASTM A500.

D. Steel Pipe: ASTM A53, standard weight (Schedule 40), unless another weight is indicated or required by structural loads.

E. Uncoated, Hot-Rolled Steel Sheet: ASTM A1011/A1011M Commercial Steel (CS) Type B, unless another type is required by design loads.

F. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.

2.2 FASTENERS

A. General: Provide zinc-plated fasteners with coating complying with ASTM B633, Class Fe/Zn 25 for exterior use, and Class Fe/Zn 5 where built into exterior walls. Select fasteners for type, grade, and class required.

B. Bolts and Nuts: Regular hexagon-head bolts, ASTM A307, Grade A; with hex nuts, ASTM A563; and, where indicated, flat washers.

C. Machine Screws: ASME B18.6.3.

D. Lag Bolts: ASME B18.2.1.

G. Expansion Anchors: Anchor bolt and sleeve assembly of material indicated below with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and equal to four times the load imposed when installed in concrete, as determined by testing per ASTM E488, conducted by a qualified independent testing agency.

1. Alloy Group 1 or 2 stainless-steel bolts complying with ASTM F593 and nuts complying with ASTM F594.

2.3 PAINT

A. As specified in Section 09970, “Coatings for Steel” Paint and Coating System No. 2A.

2.4 CAST ABRASIVE NOSINGS

A. Fabricate units in sizes and configurations indicated and in lengths necessary to accurately fit openings or conditions. Provide units of cast nickel bronze.

1. Provide cross hatched surface units, with abrasive, consisting of aluminum oxide, silicon carbide, or a combination of both, integrally cast into walking surface to minimum depth 1/32-inch.

2. Configuration: Units 3 inches wide, for casting into concrete pan steps.

B. Provide nosings full length of steps less 1/8-inch clearance.

C. Provide concealed anchors for embedding units in concrete, either integral or applied to units, as standard with manufacturer.

D. Shot blasted finish.

E. Basis-of-Design Product: Wooster Products, Inc. Type 101SP

F. Acceptable Manufacturers:
1. American Safety Tread Co., Inc.
2. Safe-T-Metal Co.
3. Wooster Products Inc.
4. Or approved equal.

2.5 CONCRETE FILL AND REINFORCING MATERIALS

A. Concrete Fill: Concrete, weighing not less than 120 pounds per cubic foot, with a minimum compressive strength at 28 days of 4,000 psi. Maximum aggregate size shall be 3/8 inch. Concrete materials shall conform to the applicable requirements of Section 03305, “Portland Cement Concrete”,

B. Non-slip Finish: As specified in Section 03350, “Concrete Finishing”.

C. Welded Wire Fabric: ASTM A185, 6 by 6 inches-W1.4 by W1.4, unless otherwise indicated.

2.6 FABRICATION, GENERAL

A. Provide complete stair assemblies, including metal framing, hangers, struts, handrails, railings, clips, brackets, bearing plates, and other components necessary to support and anchor stairs and platforms on supporting structure.

1. Join components by welding, unless otherwise indicated.

2. Use connections that maintain structural value of joined pieces.

B. NAAMM Stair Standard: Comply with "Recommended Voluntary Minimum Standards for Fixed Metal Stairs" in NAAMM AMP 510, "Metal Stairs Manual", for class of stair designated, unless more stringent requirements are indicated.

1. Commercial class.

C. Shop Assembly: Preassemble stairs in shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation.

D. Form exposed work true to line and level with accurate angles and surfaces and straight sharp edges. Shear and punch metals cleanly and accurately. Remove sharp or rough areas on exposed surfaces.

E. Ease exposed edges to a radius of approximately 1/32 inch, unless otherwise indicated. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.

F. Weld connections to comply with the following:

1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.

2. Obtain fusion without undercut or overlap.

3. Remove welding flux immediately.

4. At exposed connections, finish exposed welds and surfaces smooth and blended so
no roughness shows after finishing and contour of welded surface matches that of adjacent surface.

G. Form exposed connections with hairline joints, flush and smooth, using concealed fasteners where possible. Use exposed fasteners of type indicated or, if not indicated, Phillips flat-head (countersunk) screws or bolts. Locate joints where least conspicuous.

H. Fabricate joints of exterior stairs in a manner to exclude water, or provide weep holes where water may accumulate.

I. Fabricate treads and platforms of exterior stairs so finished walking surfaces slope to drain.

2.7 STEEL-FRAMED STAIRS

A. Stair Framing: Fabricate stringers of structural-steel channels, as indicated. Provide closures for exposed ends of stringers. Construct platforms of structural-steel channel headers and miscellaneous framing members as indicated. Bolt or weld headers to stringers; bolt or weld framing members to stringers and headers. If using bolts, fabricate and join so bolts are not exposed on finished surfaces.

B. Metal Risers, Subtread Pans, and Subplatforms: Form to configurations shown from steel sheet of thickness necessary to support indicated loads, but not less than 0.0677 inch.

1. Steel Sheet: Uncoated hot-rolled steel sheet.

2. Attach risers and subtreads to stringers with brackets made of steel angles or bars. Weld brackets to stringers and attach metal pans to brackets by welding.

3. Shape metal pans to include nosing integral with riser.

4. Provide subplatforms of configuration the same as subtreads. Weld subplatforms to platform framing.

C. Handrails and Railings: Fabricate handrails and railings to comply with requirements indicated in Section 05520, “Pipe and Tube Railings”.

D. Brackets, Flanges, Fittings, and Anchors: Provide wall brackets, end closures, flanges, miscellaneous fittings, and anchors for interconnecting railings and for attaching to other work. Furnish inserts and other anchorage devices for connecting to concrete or masonry work.

1. Connect railing posts to stair framing by direct welding, unless otherwise indicated.

2.8 FINISHES

A. Shop prime and shop finish coat steel surfaces, except the following:

1. Surfaces embedded in concrete or mortar. Extend priming of partially embedded members to a depth of 2 inches.

2. Surfaces to be field welded.

B. Prepare steel surfaces; apply shop primer and shop finish coat as specified in Section 09970, “Coatings for Steel” Paint and Coating System No. 2A and as specified below:

1. Use priming and painting methods that result in full coverage of joints, corners, edges, and exposed surfaces.

2. Stripe paint corners, crevices, bolts, welds, and sharp edges.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrate surfaces to receive metal stairs and associated work and conditions under which work will be installed. Do not proceed with installation until unsatisfactory conditions have been corrected in a manner acceptable to installer. Starting work within a particular area will be construed as applicator’s acceptance of surface conditions.

3.2 INSTALLATION

A. Fastening to In-Place Construction: Provide anchorage devices and fasteners where necessary for securing metal stairs to in-place construction. Include threaded fasteners for concrete and masonry inserts, through-bolts, lag bolts, and other connectors.

B. Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required for installing metal stairs. Set units accurately in location, alignment, and elevation, measured from established lines and levels and free from rack.
C. Install metal stairs by welding stair framing to steel structure or to weld plates cast into concrete, unless otherwise indicated.

D. Provide temporary bracing or anchors in formwork for items that are to be built into concrete, masonry, or similar construction.

E. Fit exposed connections accurately together to form hairline joints. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations. Do not weld, cut, or abrade surfaces of units that are for bolted or screwed field connections.

F. Field Welding: Comply with the following requirements:
   1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
   2. Obtain fusion without undercut or overlap.
   3. Remove welding flux immediately.
   4. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.

G. Concrete Treads: Fill tread and landing metal pans with concrete, smooth and level with “float finish” in combination with a “nonslip finish”, per Section 03300, “Cast-In-Place Concrete” and Section 03350, “Concrete Finishing”.

H. Cast extruded abrasive nosings into concrete treads as concrete is poured. Make nosings full width of tread, with noses flush with riser faces and level with tread surfaces.

I. Weld handrails and railing systems to stair members as indicated in Section 05520, “Pipe and Tube Railings”.

3.3 ADJUSTING AND CLEANING

A. Touchup Painting: Immediately after erection, clean field welds, bolted connections, and abraded areas of shop paint, and paint exposed areas as specified in Section 09970, “Coatings for Steel” Paint and Coating System No. 2A.
PART 1 - GENERAL

1.1 SUMMARY

A. Work required for this Section includes metal handrails, railings and supplementary items necessary to complete their installation.

1.2 REFERENCE STANDARDS

A. American Institute of Steel Construction (AISC):

B. American Iron and Steel Institute (AISI):
   1. AISI SG03 - Cold-Formed Steel Design Manual.

C. American Society of Civil Engineers (ASCE):
   1. ASCE 8 - Specification for the Design of Cold-Formed Stainless Steel Structural Members.

D. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   11. ASTM A500 - Standard Specification for Cold-Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes.
   14. ASTM A666 - Standard Specification for Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar.

E. American Welding Society (AWS):
   1. AWS D1.1/D1.1M - Structural Welding Code Steel.
   2. AWS D1.3 - Structural Welding Code - Sheet Steel.

F. Military Specification (MIL):
   1. MIL-P-21035 - Paint High Zinc Dust Content, Galvanizing Repair (Metric).
2. MIL-PRF-26915 – Primer Coating, for Steel Surfaces.

G. The Society for Protective Coatings (Formerly known as Steel Structures Painting Council) (SSPC):

2. SSPC-SP 6/NACE No. 3 - Commercial Blast Cleaning.

1.3 PERFORMANCE REQUIREMENTS

A. General: In engineering handrails and railings to withstand structural loads indicated, determine allowable design working stresses of handrail and railing materials based on the following:

1. Structural Steel: AISC S335
2. Stainless Steel: ASCE 8
3. Cold-Formed Structural Steel: AISI SG03

B. Structural Performance: Provide handrails and railings complying with requirements of ASTM E985 for structural performance, based on testing performed according to ASTM E894 and ASTM E935.

C. Thermal Movements: Provide handrails and railings that allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures by preventing buckling, opening of joints, overstressing of components, failure of connections, and other detrimental effects. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.

1. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.

D. Control of Corrosion: Prevent galvanic action and other forms of corrosion by insulating metals and other materials from direct contact with incompatible materials.

1.4 SUBMITTALS

A. Product Data: For brackets, grout and paint products.

B. Shop Drawings: Show fabrication and installation of handrails and railings. Include plans, elevations, sections, component details, and attachments to other Work.

1. For installed handrails and railings indicated to comply with design loads, include shop drawings and structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

C. Certification: Submit certification that welding personnel and inspection/testing personnel are qualified in accordance with AWS D1.1/D1.1M and AWS CWI respectively.

1.5 QUALITY ASSURANCE

A. Professional Engineer Qualifications: A professional engineer who is legally qualified to practice in jurisdiction where Project is located and who is experienced in providing engineering services of the kind indicated. Engineering services are defined as those performed for installations of handrails and railings that are similar to those indicated for this Project in material, design, and extent.

B. Qualification of Welding Personnel: Employ welding personnel whose qualification is certified in accordance with AWS D1.1/D1.1M. Such certification is to remain in force for the duration of the welding operations under this Contract. Inspection personnel shall be an AWS CWI.

1.6 PROJECT CONDITIONS

A. Field Measurements: Verify handrail and railing dimensions by field measurements before fabrication and indicate measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.

1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating handrails and railings without field measurements. Coordinate construction to ensure that actual dimensions correspond to established dimensions.

1.7 COORDINATION

A. Coordinate installation of anchorages for handrails and railings. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products
that may be incorporated into the Work include, but are not limited to, the following:

1. **Stainless-Steel Wire Rope and Fittings:**
   a. Hayn Industries, Inc.
   b. Sava Industries, Inc.
   c. Seco South, Inc.
   d. Or approved equal.

2. **METALS**

A. **General:** Provide metals free from surface blemishes where exposed to view in finished unit. Exposed-to-view surfaces exhibiting pitting, seam marks, roller marks, stains, discolorations, or other imperfections on finished units are not acceptable.

B. **Steel and Iron:** Provide steel and iron in form indicated to comply with the following requirements:

   1. **Tubing:** Cold formed, ASTM A500.
   2. **Steel Pipe:** ASTM A53; finish, type, and weight class as follows:
      a. Galvanized finish, where not shown to be painted.
      b. Type S, Grade A, standard weight (schedule 40), unless otherwise indicated, or another weight required by structural loads.
   3. **Steel Plate, Shapes, and Bars:** ASTM A36/A36M.
   4. **Steel Sheet:** Commercial-quality, cold-rolled, stretcher-leveled, carbon-steel sheet complying with ASTM A1008/A1008M, Class I, matte finish.
   5. **Gray-Iron Castings:** ASTM A48/A48M, Class 30, Class 200).
   6. **Malleable-Iron Castings:** ASTM A47/A47M, grade as recommended by fabricator for type of use indicated.

C. **Stainless Steel:** Grade and type designated below for each form required:

   1. **Tubing:** ASTM A554, Grade MT 316.
      a. for Handrails: 1-1/2 inch outside diameter, not less than 13 gage.

2. **Pipe:** ASTM A312/A312M, Grade TP 316.
3. **Castings:** ASTM A743/A743M, Grade CF 8M.
4. **Sheet, Strip, Plate, and Flat Bar:** ASTM A666, Type 316.
5. **Bars and Shapes:** ASTM A276, Type 316.
6. **Wire Rope:** Specially fabricated 1-by-19 wire rope that is drawn through a die after laying to produce a smooth outer surface; made from wire complying with ASTM A492, Type 316.

D. **Brackets:**

1. Curved top for rail. 1-1/2 inch dim. inside face of rail to finished wall surface.
2. For concrete and CMU walls: Cast stainless steel with concealed stainless steel hanger bolt and with lead shields for concrete and CMU walls.
3. For railings: Galvanized malleable iron.

E. **Flanges, and Anchors:** Cast or formed metal of the same type material and finish as supported rails, unless otherwise indicated.

2.3 **WELDING MATERIALS, FASTENERS, AND ANCHORS**

A. **Welding Electrodes and Filler Metal:** Provide type and alloy of filler metal and electrodes as recommended by producer of metal to be welded and as required for color match, strength, and compatibility in fabricated items. Comply with AWS requirements.

B. **Fasteners for Anchoring Handrails and Railings to Other Construction:** Select fasteners of type, grade, and class required to produce connections suitable for anchoring handrails and railings to other types of construction indicated and capable of withstanding design loads.

   1. Use plated fasteners complying with ASTM B633, Class Fe/Zn 25 for electrodeposited zinc coating.

C. **Cast-in-Place and Post Installed Anchors:** Fabricated from corrosion-resistant materials with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and equal to four times the load imposed when installed in concrete, as determined by testing per ASTM E 488 conducted by a qualified independent testing agency.
2.4 **GROUT**

A. Structural Nonshrink Grout: As specified in Section 03305, “Portland Cement Concrete”.

2.5 **MISCELLANEOUS MATERIALS**

A. Wire-Rope Fittings: Connectors of types indicated, fabricated from stainless steel, and with capability to sustain, without failure, a load equal to minimum breaking strength of wire rope with which they are used.

B. Galvanizing Repair Paint:

1. Organic zinc-rich coating containing at least 65 percent metallic zinc, by weight in dry film and meeting performance requirements of:
   a. ASTM A780.
   b. SSPC Paint 20.

2. Match aesthetic appearance of hot-dip galvanizing and meet performance requirements of:
   a. MIL-P-21035.
   b. MIL-PRF-26915.

C. Paint: As specified in Section 09970, “Coatings for Steel” Paint and Coating System No. 2A.

2.6 **FABRICATION**

A. General: Fabricate handrails and railings to comply with requirements indicated for design, dimensions, member sizes and spacing, details, finish, and anchorage, but not less than that required to support structural loads.

B. Assemble handrails and railings in the shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation. Use connections that maintain structural value of joined pieces.

C. Form changes in direction of railing members as follows:

1. By flush radius bends.

D. Form simple and compound curves by bending members in jigs to produce uniform curvature for each repetitive configuration required; maintain cylindrical cross section of member throughout entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces of handrail and railing components.

E. Welded Connections: Fabricate handrails and railings for connecting members by welding. Cope components at perpendicular and skew connections to provide close fit, or use fittings designed for this purpose. Weld connections continuously to comply with the following:

1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.

2. Obtain fusion without undercut or overlap.

3. Remove flux immediately.

4. At exposed connections, finish exposed surfaces smooth and blended so no roughness shows after finishing and welded surface matches contours of adjoining surfaces.

F. Brackets, Flanges, Fittings, and Anchors: Provide wall brackets, flanges, miscellaneous fittings, and anchors to interconnect handrail and railing members to other work, unless otherwise indicated.

G. Provide inserts and other anchorage devices for connecting handrails and railings to concrete or masonry work. Fabricate anchorage devices capable of withstanding loads imposed by handrails and railings. Coordinate anchorage devices with supporting structure.

H. For railing posts set in concrete, provide preset sleeves of steel not less than 6 inches long with inside dimensions not less than 1/2 inch greater than outside dimensions of post, and steel plate forming bottom closure.

I. Shear and punch metals cleanly and accurately. Remove burns from exposed cut edges.

J. Ease exposed edges to a radius of approximately 1/32 inch, unless otherwise indicated. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing the Work.

K. Cut, reinforce, drill, and tap components, as indicated, to receive finish hardware, screws, and similar items.

L. Provide weep holes or another means to drain entrapped water in hollow sections of handrail and railing members that are exposed to exterior or to moisture from condensation or other sources.
M. Fabricate joints that will be exposed to weather in a watertight manner.

N. Close exposed ends of handrail and railing members with prefabricated end fittings.

O. Provide wall returns at ends of wall-mounted handrails, unless otherwise indicated. Close ends of returns, unless clearance between end of railing and wall is 1/4 inch or less.

P. Toe Boards: Where indicated, provide toe boards at railings around openings and at edge of open-sided floors and platforms. Fabricate to dimensions and details indicated.

Q. Fillers: Provide fillers made from steel plate, or other suitably crush-resistant material, where needed to transfer wall bracket loads through wall finishes to structural supports. Size fillers to suit wall finish thicknesses and to produce adequate bearing area to prevent bracket rotation and overstressing of substrate.

R. Make up wire-rope assemblies in the shop to field-measured dimensions with fittings machine swaged. Minimize amount of turnbuckle take-up used for dimensional adjustment so maximum amount is available for tensioning wire ropes. Tag wire-rope assemblies and fittings to identify installation locations and orientations for coordinated installation.

2.7 FINISHES

A. Galvanized Railings: Hot-dip galvanize exterior steel and iron handrails and railings to comply with ASTM A123. Hot-dip galvanize hardware for exterior steel and iron handrails and railings to comply with ASTM A153.

1. Fill vent and drain holes that will be exposed in finished Work, unless indicated to remain as weep holes, by plugging with zinc solder and filing off smooth.

2. Provide galvanized fittings, brackets, fasteners, sleeves, and other ferrous components.

3. After galvanizing, thoroughly clean handrails and railings of grease, dirt, oil, flux, and other foreign matter, and treat with metallic-phosphate process.

B. Iron and Steel Finishes:

1. Shop prime and shop finish coat steel surfaces, except the following:
   a. Items indicated to be galvanized.
   b. Surfaces embedded in concrete or mortar. Extend priming of partially embedded membersto a depth of 2 inches.
   c. Surfaces to be field welded.

2. Prepare steel surfaces; apply shop primer and shop finish coat as specified in Section 09970, “Coatings for Steel” Paint and Coating System No. 2A and as specified below:
   a. Use priming and painting methods that result in full coverage of joints, corners, edges, and exposed surfaces.
   b. Stripe paint corners, crevices, bolts, welds, and sharp edges.

3. Powder-Coated Finish: Prepare, treat, and coat nongalvanized ferrous metal to comply with resin manufacturer's written instructions and as follows:
   a. Prepare uncoated ferrous-metal surfaces to comply with SSPC-SP 6.
   b. Treat prepared metal with iron-phosphate pretreatment, rinse, and seal surfaces.
   c. Apply thermosetting polyester or acrylic urethane powder coating with cured-film thickness not less than 1.5 mils.

C. Stainless-Steel Finishes:

1. Remove or blend tool and die marks and stretch lines into finish.

2. Grind and polish surfaces to produce uniform, directionally textured, polished finish indicated, free of cross scratches. Run grain with long dimension of each piece.

3. Bright, Directional Polish: No. 4 finish.

4. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrate surfaces to receive railing system and associated work and conditions under which
railings will be installed. Do not proceed with work until unsatisfactory conditions have been corrected in a manner acceptable to installer. Starting work within a particular area will be construed as applicator's acceptance of surface conditions.

3.2 INSTALLATION, GENERAL

A. Fit exposed connections together to form tight, hairline joints.

B. Perform cutting, drilling, and fitting required to install handrails and railings. Set handrails and railings accurately in location, alignment, and elevation; measured from established lines and levels and free from rack.

1. Do not weld, cut, or abrade surfaces of handrail and railing components that have been coated or finished after fabrication and that are intended for field connection by mechanical or other means without further cutting or fitting.

2. Set posts plumb within a tolerance of 1/16 inch in 3 feet

3. Align rails so variations from level for horizontal members and from parallel with rake of steps and ramps for sloping members do not exceed 1/4 inch in 12 feet

C. Adjust handrails and railings before anchoring to ensure matching alignment at abutting joints. Space posts at interval indicated, but not less than that required by structural loads.

D. Fastening to In-Place Construction: Use anchorage devices and fasteners where necessary for securing handrails and railings and for properly transferring loads to in-place construction.

E. Ground handrail per Section 16450, "Grounding and Bonding".

3.3 RAILING CONNECTIONS

A. Welded Connections: Use fully welded joints for permanently connecting railing components. Comply with requirements for welded connections in "Fabrication" Article whether welding is performed in the shop or in the field.

B. Expansion Joints: Install expansion joints where joints occur in substrates and no farther apart than required to accommodate thermal movement. Provide slip-joint internal sleeve extending 2 inches beyond joint on either side, fasten internal sleeve securely to one side, and locate joint within 6 inches of post.

3.4 ANCHORING POSTS AND RAILING

A. Posts: Use steel pipe sleeves preset and anchored into concrete for installing posts. After posts have been inserted into sleeves, fill annular space between post and sleeve with grout anchoring material, mixed and placed to comply with anchoring material manufacturer's written instructions:

1. Leave anchorage joint exposed; wipe off surplus anchoring material; and leave 1/8 inch build-up, sloped away from post.

2. Anchor posts to metal surfaces with oval flanges, angle type, or floor type as required by conditions. Weld flanges to posts and bolt to metal supporting members.

3. Install removable railing sections, where indicated, in slip-fit metal sockets cast in concrete.

B. Railing Ends: Anchor railing ends to wall construction with round flanges connected to railing ends and anchored into wall construction with postinstalled anchors and bolts.

C. Handrails: Attach handrails to wall with wall brackets. Provide bracket with 1-1/2-inch clearance from inside face of handrail and finished wall surface. Locate brackets at spacing required to support structural loads, but not less than 5 feet on center. Secure wall brackets to building construction as follows:

1. For concrete and solid masonry anchorage, use drilled-in expansion shields and hanger or lag bolts.

2. For hollow masonry anchorage, use toggle bolts.

3. For steel-framed gypsum board assemblies, fasten brackets directly to steel framing or concealed reinforcements using self-tapping screws of size and type required to support structural loads.

3.5 ADJUSTING AND CLEANING

A. Galvanized Surfaces:

1. Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A780.

2. For surfaces to be left exposed, apply galvanizing repair paint in at least two coats.
B. Clean stainless steel by washing thoroughly with clean water and soap and rinsing with clean water.

C. Touchup Painting: Immediately after erection, clean field welds, bolted connections, and abraded areas of shop paint, and paint exposed areas as specified in Section 09970, “Coatings for Steel” Paint and Coating System No. 2A.

3.6 PROTECTION

A. Protect finishes of ornamental metal from damage during construction period with temporary protective coverings approved by ornamental metal fabricator. Remove protective covering at the time of Substantial Completion.

B. Restore finishes damaged during installation and construction period so no evidence remains of correction work. Return items that cannot be refinished in the field to the shop; make required alterations and refinish entire unit, or provide new units.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this Section will not be measured separately, but payment made for on a lump sum basis for metal railings per location indicated.
SECTION 05700
ORNAMENTAL METAL

PART 1 - GENERAL

1.1 SUMMARY

A. Work required for this Section includes ornamental (architectural) metal and supplementary items necessary to complete their installation.

B. Non-ornamental metal fabrications are specified in Section 05500, “Metal Fabrications”.

C. Non-ornamental and ornamental handrails and railings are specified in Section 05520, “Metal Railings”.

1.2 REFERENCE STANDARDS

A. American Architectural Manufacturers Association (AAMA):
   1. AAMA 611 - Voluntary Standards for Anodized Architectural Aluminum.

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   6. ASTM A500 - Standard Specification for Cold-Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes.
   8. ASTM A666 - Standard Specification for Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar.
   10. ASTM A1008/A1008M - Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability.

C. American Welding Society (AWS):
   1. AWS D1.1/D1.1M - Structural Welding Code - Steel.
   2. AWS D1.2 - Structural Welding Code - Aluminum.
   3. AWS D1.3 - Structural Welding Code - Sheet Steel.

D. The Society for Protective Coatings (Formerly known as Steel Structures Painting Council) (SSPC):
   2. SSPC-SP 6/NACE No. 3 - Commercial Blast Cleaning.

1.3 PERFORMANCE REQUIREMENTS

A. Thermal Movements: Provide ornamental metal items that allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures by preventing...
buckling, opening of joints, overstressing of components, failure of connections, and other detrimental effects. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.

1. Temperature Change (Range): 120 degrees F, ambient; 180 degrees F, material surfaces.

B. Control of Corrosion: Prevent galvanic action and other forms of corrosion by insulating metals and other materials from direct contact with incompatible materials.

1.4 SUBMITTALS

A. Product Data: For each product used in ornamental metal, including finishing materials and methods.

1. Include Product Data for grout and anchoring cement.

B. Shop Drawings: Show fabrication and installation of ornamental metal. Include plans, elevations, component details, and attachments to other Work. Indicate materials and profiles of each ornamental metal member, fittings, joinery, finishes, fasteners, anchorages, and accessory items.

1. Include setting drawings, templates, and directions for installing anchor bolts and other anchorages.

C. Welding Certificates: Copies of certificates that welding personnel and inspection/testing personnel are currently qualified in accordance with AWS D1.1/D1.1M and AWS CWI respectively.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: Arrange for installation of ornamental metal specified in this Section by the same firm that fabricated it.

B. Fabricator Qualifications: A firm experienced in producing ornamental metal similar to that indicated for this Project and with a record of successful in-service performance, as well as sufficient production capacity to produce required units.

C. Qualifications of Welding Personnel:

1. Employ welders whose qualification is certified in accordance with AWS Standard D1.1/D1.1M.

2. Inspection personnel shall be an AWS CWI.

3. Certification shall remain in force for the duration of the welding operations under this Contract.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Store ornamental metal inside a well-ventilated area, away from uncured concrete and masonry, and protected from weather, moisture, soiling, abrasion, extreme temperatures, and humidity.

B. Deliver and store cast-metal products in wooden crates surrounded by sufficient excelsior to ensure that products will not be cracked or otherwise damaged.

1.7 PROJECT CONDITIONS

A. Field Measurements: Where ornamental metal is indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication and indicate measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.

1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating ornamental metal without field measurements. Coordinate other construction to ensure that actual dimensions correspond to established dimensions.

1.8 COORDINATION

A. Coordinate installation of anchorages for ornamental metal items. Furnish Setting Drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

PART 2 - PRODUCTS

2.1 METALS

A. General: Provide metals free from surface blemishes where exposed to view in finished unit. Exposed-to-view surfaces exhibiting pitting, seam marks, roller marks, stains, discolorations, or other imperfections on finished units are not acceptable.

B. Aluminum: Alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated, and with not less than the strength and durability properties of alloy and temper designated below for each aluminum form required:

C. Stainless Steel: Grade and type designated below for each form required:
1. Tubing: ASTM A554, Grade MT 316.
2. Pipe: ASTM A312/A312M, Grade TP 316.
3. Castings: ASTM A743/A743M, Grade CF 8M.
4. Sheet, Strip, Plate, and Flat Bar: ASTM A666, Type 316.
5. Bars and Shapes: ASTM A276, Type 316.

D. Steel and Iron: Provide steel and iron in form indicated to comply with the following requirements:
1. Tubing: Cold formed, ASTM A500.
2. Steel Plate, Shapes, and Bars: ASTM A36/A36M.
5. Malleable-Iron Castings: ASTM A47/A47M, grade as recommended by fabricator for type of use indicated.

2.3 FABRICATION, GENERAL

A. Form ornamental metal to required shapes and sizes, with true curves, lines, and angles. Provide components in sizes and profiles indicated, but not less than that needed to comply with requirements indicated for structural performance.

B. Provide necessary rebates, lugs, and brackets to assemble units and to attach to other work. Drill and tap for required fasteners, unless otherwise indicated. Use concealed fasteners where possible.

C. Comply with AWS for recommended practices in shop welding and brazing. Provide welds and brazes behind finished surfaces without distorting or discoloring exposed side. Clean exposed welded and brazed joints of all flux, and dress all exposed and contact surfaces.

D. Mill joints to a tight, hairline fit. Cope or miter corner joints. Form joints exposed to weather to exclude water penetration.

E. Provide castings that are sound and free of warp, cracks, blowholes, or other defects that impair strength or appearance. Grind, wire brush, sandblast, and buff castings to remove seams, gate marks, casting flash, and other casting marks.

F. Finish exposed surfaces to smooth, sharp, well-defined lines and arrise.

2.2 MISCELLANEOUS MATERIALS

A. Welding Electrodes and Filler Metal: Type and alloy of filler metal and electrodes as recommended by producer of metal to be welded, complying with applicable AWS specifications, and as required for color match, strength, and compatibility in fabricated items.

B. Fasteners: Use fasteners of same basic metal as fastened metal, unless otherwise indicated. Do not use metals that are corrosive or incompatible with materials joined.

1. Provide concealed fasteners for interconnecting ornamental metal components and for attaching them to other work, unless otherwise indicated.

C. Cast-in-Place and Post Installed Anchors: Fabricated from corrosion-resistant materials with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and equal to four times the load imposed when installed in concrete, as determined by testing per ASTM E488 conducted by a qualified independent testing agency.

D. Structural Nonshrink Grout: As specified in Section 03305, “Portland Cement Concrete”.

E. Paint: As specified in Section 09970, “Coatings for Steel” Paint and Coating System No. 2A.

F. Bituminous Paint: Cold-applied asphalt mastic complying with SSPC-Paint 12, except containing no asbestos fibers.
G. Assemble items in the shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation. Use connections that maintain structural value of joined pieces.

2.4 FINISHES, GENERAL

A. Comply with NAAMM’s “Metal Finishes Manual for Architectural and Metal Products” for recommendations for applying and designating finishes.

B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

2.5 ALUMINUM FINISHES

A. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.

B. Class I, Clear Anodic Finish: AA-M12C22A41 (Mechanical Finish: nonspecular as fabricated; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class I, clear coating 0.018 mm or thicker) complying with AAMA 607.1.

2.6 STAINLESS-STEEL FINISHES

A. Remove or blend tool and die marks and stretch lines into finish.

B. Grind and polish surfaces to produce uniform, directionally textured, polished finish indicated, free of cross scratches. Run grain with long dimension of each piece.

C. Bright, Directional Polish: No. 4 finish. Except where otherwise shown on Contract Drawings

D. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.

2.7 IRON AND STEEL FINISHES

A. Shop prime and shop finish coat steel surfaces, except the following:

1. Surfaces embedded in concrete or mortar. Extend priming of partially embedded members to a depth of 2 inches.

2. Surfaces to be field welded.

B. Prepare steel surfaces; apply shop primer and shop finish coat as specified in Section 09970, “Coatings for Steel” Paint and Coating System No. 2A and as specified below:

1. Use priming and painting methods that result in full coverage of joints, corners, edges, and exposed surfaces.

2. Stripe paint corners, crevices, bolts, welds, and sharp edges.

C. Powder-Coated Finish: Prepare, treat, and coat nongalvanized ferrous metal to comply with resin manufacturer’s written instructions and as follows:

1. Prepare uncoated ferrous-metal surfaces to comply with SSPC-SP 6, “Commercial Blast Cleaning.”

2. Treat prepared metal with iron-phosphate pretreatment, rinse, and seal surfaces.

3. Apply thermosetting polyester or acrylic urethane powder coating with cured-film thickness not less than 1.5 mils.

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

A. Provide anchorage devices and fasteners where necessary for securing ornamental metal to in-place construction.

B. Perform cutting, drilling, and fitting required to install ornamental metal. Set products accurately in location, alignment, and elevation; measured from established lines and levels. Provide temporary bracing or anchors in formwork for items to be built into concrete, masonry, or similar construction.

C. Fit exposed connections accurately together to form tight, hairline joints or, where indicated, with uniform reveals and spaces for sealants and joint fillers. Where cutting, welding, and grinding are required for proper shop fitting and jointing of ornamental metal, restore finishes to eliminate any evidence of such corrective work.

D. Do not cut or abrade finishes that cannot be completely restored in the field. Return items with such finishes to the shop for required alterations, followed by complete refinishing, or provide new units as required.

E. Restore protective coverings that have been damaged during shipment or installation. Remove protective coverings only when there is no possibility of damage from other work yet to be performed at same location.

1. Retain protective coverings intact; remove coverings simultaneously from similarly finished items to preclude nonuniform oxidation and discoloration.
F. Field Welding: Comply with applicable AWS specification for procedures of manual shielded metal arc welding, for appearance and quality of welds, and for methods used in correcting welding work. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations. Grind exposed welded joints smooth and restore finish to match finish of adjacent surfaces.

G. Corrosion Protection: Coat concealed surfaces of aluminum that will be in contact with grout, concrete, masonry, wood, or dissimilar metals with a heavy coat of bituminous paint.

3.2 CLEANING

A. Clean aluminum and stainless steel by washing thoroughly with clean water and soap and rinsing with clean water.

B. Touchup Painting: Immediately after erection, clean field welds, bolted connections, and abraded areas of shop paint, and paint exposed areas as specified in Section 09970, “Coatings for Steel” Paint and Coating System No. 2A.

3.3 PROTECTION

A. Protect finishes of ornamental metal from damage during construction period with temporary protective coverings approved by ornamental metal fabricator. Remove protective covering at the time of Substantial Completion.

B. Restore finishes damaged during installation and construction period so no evidence remains of correction work. Return items that cannot be refinished in the field to the shop; make required alterations and refinish entire unit, or provide new units.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will be paid for on a lump sum basis for ornamental metal per location indicated wherein no measurement will be made.

END OF SECTION 05700
SECTION 06100
ROUGH CARPENTRY

PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes specifications for providing miscellaneous rough carpentry, including wood nailers, backing, and blocking, as indicated or required.

B. Concrete formwork and falsework are specified in the applicable Sections under DIVISION 3 - CONCRETE.

C. Blocking and backing associated with cabinets and cabinetwork are specified in Section 06410, “Custom Cabinetwork”.

1.2 REFERENCE STANDARDS

A. ASME International (Formerly known as American Society for Mechanical Engineers) (ASME):
   1. ASME B18.2.1 - Square and Hex Bolts and Screws (Inch Series)
   2. ASME B18.6.1 - Wood Screws (Inch Series)

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A153/A153M - Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware
   2. ASTM A307 - Standard Specification for Carbon Steel Bolts and Studs, 60,000 psi Tensile Strength
   3. ASTM A563 - Standard Specification for Carbon and Alloy Steel Nuts
   4. ASTM A653 – Standard Specification for Steel Sheet, Zinc Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process
   5. ASTM B117 - Standard Practice for Operating Salt Spray (Fog) Apparatus
   7. ASTM C954 - Standard Specification for Steel Drill Screws for the Application of Gypsum Panel Products or Metal Plaster Bases to Steel Studs From 0.033 in. (0.84 mm) to 0.112 in. (2.84 mm) in Thickness
   11. ASTM E488 - Standard Test Methods for Strength of Anchors in Concrete and Masonry Elements

C. American Wood Preservers Association (AWPA):
   1. AWPA M4 – Standard for the Care of Preservative-Treated Wood Products
   2. AWPA U1 – User Specification for Treated Wood

D. Factory Mutual Global (FM Global)
   1. FM Global Property Loss Prevention Data Sheets 1-49 – Perimeter Flashing

E. U.S. Department of Commerce (DOC) Federal Construction Regulations (FED):
   1. DOC FED PS 1-83 - Construction and Industrial Plywood
   2. DOC FED PS 20-70 - American Softwood Lumber Standard

1.3 PERFORMANCE REQUIREMENTS

A. Flashings and Roof Coverings:
   1. Fabricate and install rough carpentry associated with flashings and roof coverings to withstand wind loads, structural movement, and thermally induced movement without contributing to failure of flashing or roof coverings.
2. Comply with recommendations of Factory Mutual (FM) Loss Prevention Data Sheet 1-49 for highest wind zone classification.

1.4 SUBMITTALS

A. Product Data: For each type of process and factory-fabricated product. Indicate component materials and dimensions and include construction and application details.

1. Include data for wood-preservative treatment from chemical treatment manufacturer and certification by treating plant that treated materials comply with requirements. Indicate type of preservative used, net amount of preservative retained, and chemical treatment manufacturer's written instructions for handling, storing, installing, and finishing treated material.

2. Include data for fire-retardant treatment from chemical treatment manufacturer and certification by treating plant that treated materials comply with requirements. Include physical properties of treated materials, both before and after exposure to elevated temperatures when tested according to ASTM D5516 and ASTM D5664.

3. For products receiving a waterborne treatment, include statement that moisture content of treated materials was reduced to levels specified before shipment to Project site.

4. Include copies of warranties from chemical treatment manufacturers for each type of treatment.

1.5 QUALITY ASSURANCE

A. Lumber grading agencies, and the abbreviations used to reference them, include the following:

1. NELMA - Northeastern Lumber Manufacturers Association.

2. NLGA - National Lumber Grades Authority.

3. SPIB - Southern Pine Inspection Bureau.

4. WCLIB - West Coast Lumber Inspection Bureau.

5. WWPA - Western Wood Products Association.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Keep wood products under cover and dry. Protect against exposure to moisture and contact with damp or wet surfaces. Stack material in a manner which promotes air circulation.

PART 2 - PRODUCTS

2.1 WOOD PRODUCTS, GENERAL

A. Lumber: DOC FED PS 20-70 and applicable rules of lumber grading agencies certified by the American Lumber Standards Committee Board of Review.

1. Factory mark each piece of lumber with grade stamp of grading agency.

2. For exposed lumber indicated to receive a stained or natural finish, mark grade stamp on end or back of each piece, or omit grade stamp and provide certificates of grade compliance issued by grading agency if acceptable to authorities having jurisdiction.

3. Where nominal sizes are indicated, provide actual sizes required by DOC FED PS 20-70 for moisture content specified. Where actual sizes are indicated, they are minimum dressed sizes for dry lumber.

4. Provide dressed lumber, S4S, unless otherwise indicated.

5. Provide dry lumber with 19 percent maximum moisture content at time of dressing for 2 inch nominal thickness or less, for concealed conditions.

6. Provide dry lumber with 15 percent maximum moisture content at time of dressing for 2 inch nominal thickness or less, for exposed conditions.

B. Wood Structural Panels:

1. Plywood: DOC FED PS 1-83.

2. Thickness: As needed to comply with requirements specified but not less than thickness indicated.

4. Factory mark panels according to indicated standard.

2.2 WOOD-PRESERVATIVE-TREATED MATERIALS

A. Preservative Treatment: Pressure process complying with AWPA U1 (Use Category UC2) except that lumber that is not in contact with the ground and is continuously protected from liquid water may be treated according to AWPA U1 (Use Category UC1).

1. For exposed items indicated to receive painted, stained or natural finish, use chemical formulations that do not require
incising, contain colorants, bleed through, or otherwise adversely affect finishes.

B. Kiln-dry material after treatment to a maximum moisture content of 19 percent for lumber and 15 percent for plywood. Do not use material that is warped or does not comply with requirements for untreated material.

C. Mark each treated item with the treatment quality mark of an inspection agency approved by the American Lumber Standards Committee Board of Review.

1. For exposed lumber indicated to receive a stained or natural finish, mark end or back of each piece, or omit marking and provide certificates of treatment compliance issued by inspection agency if acceptable to authorities having jurisdiction.

D. Application: Treat items indicated on Drawings, and the following:

1. Wood cants, nailers, curbs, equipment support bases, blocking, stripping, and similar members in connection with roofing, flashing, vapor barriers, and waterproofing.

2. Wood sills, sleepers, blocking, furring, stripping, and similar concealed members in contact with masonry or concrete.

3. Wood framing members less than 18 inches above grade.

2.4 DIMENSION LUMBER

A. General: Provide dimension lumber of Construction or No. 2 grade according to the American Lumber Standards Committee National Grading Rule provisions of the grading agency indicated and any of the following species:

1. Douglas fir-larch; WCLIB or WWPA.

2. Douglas fir-south; WWPA.

3. Douglas fir-larch (north); NLGA.

4. Hem-fir; WCLIB or WWPA.

5. Hem-fir (north); NLGA.

6. Mixed southern pine; SPIB.

7. Spruce-pine-fir (south); NELMA, WCLIB, or WWPA.

8. Spruce-pine-fir; NLGA.

2.5 MISCELLANEOUS LUMBER

A. General: Provide lumber for support or attachment of other construction including rooftop equipment bases and support curbs, blocking, cants, nailers, furring, and grounds.

B. For items of dimension lumber size, provide Construction, Stud, or No. 2 grade lumber with 19 percent maximum moisture content and any of the following species:

1. Mixed southern pine; SPIB.

2. Eastern softwoods; NELMA.

3. Northern species; NLGA.

4. Western woods; WCLIB or WWPA.

C. For exposed boards, provide lumber with 15 percent maximum moisture content and any of the following species and grades:

1. Eastern white pine, Idaho white, lodgepole, ponderosa, or sugar pine; D Select (Quality) grade; NELMA, NLGA, WCLIB, or WWPA.

2. Mixed southern pine, B & B Finish grade; SPIB.

3. Hem-fir or Hem-fir (north), Superior or C & Btr Finish grade; NLGA, WCLIB, or WWPA.
4. Spruce-pine-fir (south) or Spruce-pine-fir, D Select grade; NELMA, NLGA, WCLIB, or WWPA.

5. Western red cedar, A grade; NLGA or WWPA.

D. For concealed boards, provide lumber with 19 percent maximum moisture content and any of the following species and grades:

1. Mixed southern pine, No. 2 grade; SPIB.
2. Eastern softwoods, No. 3 Common grade; NELMA.
3. Northern species, No. 3 Common grade; NLGA.
4. Western woods, Standard or No. 3 Common grade; WCLIB or WWPA.

2.6 PANEL PRODUCTS

A. Miscellaneous Concealed Plywood: Exterior sheathing, span rating to suit framing in each location, and thickness as indicated but not less than 1/2 inch.

B. Miscellaneous Concealed Oriented Strand Board: Exposure 1 sheathing, span rating to suit framing in each location, and thickness as indicated but not less than 1/2 inch.

C. Exterior Cement Board: Composed of Portland cement, ground sand aggregate, cellulose fiber, selected additives and water. 1/2 inch thick, smooth surface, ASTM E84 flame spread 0, fuel contributed 0, smoke developed 5, recommended by manufacturer for exposed exterior application.

1. Fasteners: 1-5/8 inches No. 8 wafer-head steel drill screws complying with ASTM C954, with an organic-polymer coating or other corrosion-protective coating having a salt-spray resistance of more than 500 hours per ASTM B117.

D. Miscellaneous Exposed Plywood: FED PS1-83, A-D Interior, thickness as indicated but not less than 1/2 inch.

E. Telephone and Electrical Equipment Backing Panels: FED PS1-83, Exposure 1, C-D Plugged, fire-retardant treated, in thickness indicated or, if not indicated, not less than 1/2 inch thick.

2.7 FASTENERS

A. General: Provide fasteners of size and type indicated that comply with requirements specified in this Article for material and manufacture.

1. Where carpentry is exposed to weather, in ground contact, or in area of high relative humidity, provide fasteners with hot-dip zinc coating complying with ASTM A153.

D. Screws for Fastening to Cold-Formed Metal Framing: ASTM C954, except with wafer heads and reamer wings, length as recommended by screw manufacturer for material being fastened.

E. Lag Bolts: ASME B18.2.1.

F. Bolts: Steel bolts complying with ASTM A307, Grade A with ASTM A563 hex nuts and, where indicated, flat washers.

G. Expansion Anchors: Anchor bolt and sleeve assembly of material indicated below with capability to sustain, without failure, a load equal to 6 times the load imposed when installed in unit masonry assemblies and equal to 4 times the load imposed when installed in concrete as determined by testing per ASTM E 488 conducted by a qualified independent testing and inspecting agency.

1. Interior Anchors: Carbon-steel components, zinc plated to comply with ASTM B633, Class Fe/Zn 5.

2. Exterior Anchors: Stainless steel with bolts and nuts complying with ASTM F593 and ASTM F594, Alloy Group 1 or 2.

2.8 METAL FRAMING ANCHORS

A. General: Provide galvanized steel framing anchors of structural capacity, type, and size indicated and acceptable to authorities having jurisdiction.

B. Galvanized Steel Sheet: Hot-dip, zinc-coated steel sheet complying with ASTM A653, G60 coating designation.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrate surfaces to receive rough carpentry and associated work and conditions under which work will be installed. Do not proceed with installation until unsatisfactory conditions have been corrected. Starting work within a particular area will be construed as acceptance of surface conditions.

3.2 INSTALLATION, GENERAL

A. Discard units of material with defects that impair quality of carpentry and that are too small to use with minimum number of joints or optimum joint arrangement.
B. Set carpentry to required levels and lines, with members plumb, true to line, cut, and fitted. Fit carpentry to other construction; scribe and cope as needed for accurate fit. Locate furring, nailers, blocking, grounds, and similar supports to comply with requirements for attaching other construction.

C. Apply field treatment complying with AWPA M4 to cut surfaces of preservative-treated lumber and plywood.

D. Securely attach carpentry work according to applicable codes and recognized standards.

E. Use preservative treated wood for roofing and exterior conditions, and use fire-retardant treated wood for building interior conditions.

F. Use fasteners of appropriate type and length. Predrill members when necessary to avoid splitting wood.

3.3 WOOD BLOCKING, AND NAILER INSTALLATION

A. Install where indicated and where required for attaching other work. Form to shapes indicated and cut as required for true line and level of attached work. Coordinate locations with other work involved.

B. Attach items to substrates to support applied loading. Recess bolts and nuts flush with surfaces, unless otherwise indicated.

3.4 PANEL PRODUCT INSTALLATION

B. Exterior Cement Board: Install on metal framing to comply with cement board manufacturer's recommendations. Install with steel drill screws spaced no more than 8 inches o.c. along framing with perimeter fasteners at least 3/8 inch but less than 5/8 inch from edges of boards.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Rough carpentry and related rough hardware therefor will not be measured separately for payment.

B. Rough carpentry and related rough hardware will be paid for as part of the Contract unit price or Contract lump-sum price for the associated work requiring rough carpentry work as indicated in the Bid Schedule of the Bid Form.
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes specifications for furnishing and installing cabinets, countertops, and cabinet hardware as indicated.

1.2 REFERENCE STANDARDS

A. American Hardboard Association (AHA):
   1. AHA A135.4 - Basic Hardboard

B. Composite Panel Association (CPA):
   1. CPA A208.1 - Wood Particleboard
   2. CPA A208.2 - Medium Density Fiberboard (MDF) for Interior Applications

C. Architectural Woodwork Institute (AWI):
   1. AWI Architectural Woodwork Quality Standards

D. Hardwood Plywood and Veneer Association (HPVA):
   1. HPVA HP-1 - American Hardboard Association

E. National Electrical Manufacturer's Association (NEMA):
   1. NEMA LD 3 - High-Pressure Decorative Laminates
   2. NEMA LD 3.1 - Performance, Application, Fabrication, and Installation of High-Pressure Decorative Laminates

F. U.S. Department of Commerce (DOC) Federal Construction Regulations (FED):
   1. DOC FED PS1-83 - Construction and Industrial Plywood

1.3 DEFINITIONS

A. "Exposed Surfaces", "Semi-Exposed Surfaces", "Concealed Surfaces" and "Types of Cabinet Construction" and other terms are defined in referenced quality standards.

1.4 SUBMITTALS

A. Shop Drawings: Submit fully detailed Shop Drawings of the cabinetwork, including plastic-laminate work and countertop edging.

B. Product Data: Submit manufacturers' product data for plastic laminates, cabinet hardware, and any other manufactured or fabricated items indicated or specified.

C. Samples: Submit samples of plastic laminates and cabinet finish hardware.

1.5 QUALITY ASSURANCE

A. Cabinetwork, as indicated, shall be manufactured or fabricated in accordance with the standard details and specifications of AWI Architectural Woodwork Quality Standards, as hereinafter specified.

1.6 PROJECT CONDITIONS

A. Environmental Limitations: Comply with referenced standard and obtain fabricator's and installer's coordinated advice for optimum temperature and humidity conditions during cabinet storage and installation. Do not install woodwork until conditions have been attained and stabilized.

B. Field Measurements: Where woodwork is indicated to be fitted to other construction, verify dimensions of other construction by field measurements before fabrication, and indicate measurements on final shop drawings.
   1. Locate concealed framing, blocking, and reinforcements, that support cabinet work by field measurements before being enclosed and indicate measurements on final shop drawings.
   2. Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating cabinets without field measurements. Provide allowance for trimming at site and coordinate construction to ensure that actual dimensions correspond to established dimensions.

1.7 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Delivery, storage, and handling of cabinets and related items shall be in accordance with applicable requirements AWI Section 1700.

PART 2 - PRODUCTS

2.1 MATERIALS

A. General: Provide materials that comply with requirements of the referenced cabinet quality
standard for each type of cabinet and quality grade indicated unless otherwise indicated.

B. Wood Panel Products: Comply with the following:

1. Hardboard: AHA A135.4, tempered, smooth two sides (vertical dividers only).
2. Medium-Density Fiberboard: CPA A208.2, Grade MD.
3. Particleboard: CPA A208.1, Grade M-3, 47 lb. density, engineered board.

C. Thermoset Decorative Overlay: Particleboard complying with CPA A208.1, Grade M-2, or medium-density fiberboard complying with CPA A208.2, Grade MD, with surface of thermally fused, melamine-impregnated decorative paper.

D. High-Pressure Decorative Laminate: NEMA LD3 and referenced standard.

1. Face Sheet:
   a. Doors and Vertical Surfaces: General Purpose VGS, 0.028 inch thick.
   b. Shelves and Horizontal Surfaces: General Purpose HGL, 0.039 inch thick.
   c. Countertops: General Purpose HGS, 0.048 inch thick.
   d. Colors: As scheduled on Contract Drawings.

2. Cabinet Liner: Cabinet Liner CLS, 0.020 inch thick, or Thermoset Decorative Overlay (Melamine).
   a. Color: As selected from manufacturer's standard colors.
   b. Backing Sheet: Backer BKL, 0.020 inch thick.

3. Acceptable Manufacturers:
   a. Formica Corporation.
   b. International Paper
   c. Laminart.

D. Scheme for each type of cabinet and quality grade indicated unless otherwise indicated.

E. Cabinet Hardware: Comply with BHMA A156.9 for items indicated by referencing BHMA numbers or items referenced to this standard.

1. Frameless Concealed Hinges (European Type): BHMA A156.9, B01602, 100 degrees of opening, self-closing.
2. Wire Pulls: Back mounted, 4 inches long, 5/16 inches in diameter.
3. Catches: Magnetic catches, BHMA A156.9, B03141.
4. Shelf Rests: BHMA A156.9, B04013.
5. Drawer Slides: Side-mounted, full-extension, zinc-plated steel drawer slides with steel ball bearings, BHMA A156.9, B05091, and rated for 75 lbf. load.
7. Drawer Locks: BHMA A156.11, E07041.
8. Exposed Hardware Finishes: For exposed hardware, provide finish that complies with BHMA A156.18 for satin stainless steel BHMA 630.

2.2 PLASTIC LAMINATE FACED WOOD CABINETS

A. Comply with following quality standard requirements except where more restrictive requirements are specified.

1. AWI Section 400 Premium Grade.

B. Finishes:

1. Exposed Surfaces: Face Sheet
2. Semi-exposed Surfaces: Cabinet Liner
3. Concealed Surfaces: Backing Sheet
4. Edges: 3 mil PVC
5. Interior Drawer Box: Clear Polyurethane Wood Sealer
2.3 CABINET COMPONENTS

A. Body Members (Ends, Divisions, Bottoms and Tops): 3/4 inch veneer core plywood or 47 lb. particleboard.

B. Rails: 3/4 inch lumber or veneer core plywood (do not use if hinge screws enter only edge of rail).

C. Shelves: Veneer core plywood or 47 lb. particleboard in minimum thickness of:
   1. 3/4 inch for spans up to 32 inches
   2. 1 inch for spans up to 42 inches

D. Drawer Box Construction:
   1. Comply with Premium Grade requirements.
   2. Joints (one of following):
      a. Glued multiple dovetail
      b. Glued French dovetail
      c. Glued and doweled
   3. Drawer Sides, Backs and Semi-Exposed Fronts (Sub-Fronts): 1/2 inch hardwood lumber or 7-ply hardwood veneer core plywood with no voids.
   4. Drawer Bottoms: 1/4 inch hardwood faced plywood (veneer core).

E. Drawer Fronts: 3/4 inch thick 47 lb. particleboard.

F. Doors:
   1. Hinged Flush Type: 47 lb. particleboard in minimum thickness:
      a. 3/4 inch for width up to 30 inches and height up to 60 inches.
      b. 1 inch to 1-1/4 inch for width up to 36 inches and height up to 72 inches.
      c. Doors in excess of sizes listed above shall be 1-3/8 inch or 1-3/4 inch doors. See Division 8 Section “Flush Wood Doors”.
      d. If hinge screws enter only edge of door, provide 3/4 inch lumber edges glued to core prior to laminating.

2.4 COUNTERTOPS

A. Comply with referenced standard Premium Grade requirements except where more restrictive requirements are specified.

B. Plastic Laminate:
   1. Substrate: 3/4 inch thick veneer core exterior grade plywood top and 1/2 inch thick backsplash.
   2. Exposed Finish: Face sheet on exposed surfaces; Backing sheet on concealed surfaces.

2.5 CABINET HARDWARE

A. Fit hardware for drawers and doors so that it will permit items to close without forcing or rattling. Carefully fit and adjust doors as required to insure smooth and noiseless operation.

2.6 FABRICATION AND ASSEMBLY

A. Fabricate cabinets with flush overlay construction unless otherwise indicated on drawings.

B. Fabricate and assemble finished work at shop in largest possible sections and deliver to building ready for installation.

C. Construct large pieces requiring sectional construction so their several parts are accurately fitted and aligned with each other. Joints between sections shall not be obvious and distance between edges of door/drawer fronts shall be consistent.

D. Allow sufficient additional material to permit accurate scribing to walls, floors and related work, and make ample allowances for cutting and fitting, and for shrinkage as may develop after installation.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrate surfaces to receive cabinets and associated work and conditions under which cabinets will be installed. Do not proceed with installation until unsatisfactory conditions have been corrected in a manner acceptable to Installer. Starting work within a particular area will be construed as applicator’s acceptance of surface conditions.
3.2 INSTALLATION

A. Do not install cabinets with chips, cracks, stains, or other defects which might be visible in the finished work.

B. Comply with requirements of referenced standard for quality grade specified in Part 2 of this section for type cabinet work involved.

1. AWI Section 1700.

C. Install cabinets to comply with drawings and final shop drawings in strict compliance with manufacturer's instructions.

D. Install plumb, level, and true; shim as required, using concealed shims. Where cabinetwork abuts other finished work, apply filler strips and scribe for accurate fit, with fasteners concealed where practical.

E. Base Cabinets: Set cabinets straight, level, and plumb. Adjust subtops within 1/16 inch of a single plane. Fasten cabinets to partition framing, or reinforcements in partitions with fasteners spaced 24 inches o.c. Bolt adjacent cabinets together with joints flush, tight, and uniform. Align similar adjoining doors and drawers to a tolerance of 1/16 inch.

1. Where base cabinets are not installed adjacent to walls, fasten to floor at toe space with fasteners spaced 24 inches o.c. Secure sides of cabinets to floor, where they do not adjoin other cabinets, with not less than two fasteners.

F. Wall Cabinets: Hang cabinets straight, level, and plumb. Adjust fronts and bottoms within 1/16 inch of a single plane. Fasten to hanging strips, partition framing or reinforcements in partitions. Align similar adjoining doors to a tolerance of 1/16 inch.

1. Fasten through back, near top and bottom, at ends, and not more than 16 inches o.c. with No. 10 wafer-head sheet metal screws through metal reinforcement or metal framing behind wall finish.

G. Install hardware uniformly and precisely. Set hinges snug and flat in mortises, unless otherwise indicated. Adjust and align hardware so moving parts operate freely and contact points meet accurately. Allow for final adjustment after installation.

H. Adjust casework and hardware so doors and drawers operate smoothly without warp or bind. Lubricate operating hardware as recommended by manufacturer.

I. Countertops: Where possible make field jointing in the same manner as shop jointing, using dowels, splines, adhesives, and fasteners recommended by manufacturer. Prepare edges to be joined in shop so Project-site processing of top and edge surfaces is not required. Locate field joints where shown on Shop Drawings.

1. Secure field joints in plastic-laminate countertops with concealed clamping devices located within 6 inches of front and back edges and at intervals not exceeding 24 inches. Tighten according to manufacturer's written instructions to exert a constant, heavy-clamping pressure at joints.

2. Secure tops to cabinets with Z-type fasteners or equivalent, using two or more fasteners at each front, end, and back.

3. Abut top and edge surfaces in one true plane, with internal supports placed to prevent deflection.

4. Secure backsplashes to tops with concealed metal brackets at 16 inches o.c. and to walls with adhesive.

5. Seal junctures of top, splash, and walls with mildew-resistant silicone sealant or another permanently elastic sealing compound recommended by countertop material manufacturer.

3.3 ADJUSTING AND CLEANING

A. Repair damaged and defective woodwork, where possible, to eliminate functional and visual defects; where not possible to repair, replace woodwork. Adjust joinery for uniform appearance.

B. Clean, lubricate, and adjust hardware.

C. Clean woodwork on exposed and semiexposed surfaces. Touch up shop-applied finishes to restore damaged or soiled areas.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will be paid for on a lump sum basis for custom cabinetwork per location indicated wherein no measurement will be made.

END OF SECTION 06410
SECTION 07120
SHEET WATERPROOFING

PART 1 - GENERAL

1.1 SUMMARY

A. Work of this Section includes sheet waterproofing system and supplementary items necessary to complete the installation.

1.2 REFERENCE STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM C578 - Standard Specification for Rigid, Cellular Polystyrene Thermal Insulation
2. ASTM C836 - Standard Specification for High Solids Content, Cold Liquid-Applied Elastomeric Waterproofing Membrane for Use with Separate Wearing Course
3. ASTM D412 - Standard Test Methods for Vulcanized Rubber and Thermoplastic Elastomers - Tension
5. ASTM D1621 - Standard Test Method for Compressive Properties of Rigid Cellular Plastics
9. ASTM E154 - Standard Test Methods for Water Vapor Retarders Used in Contact with Earth under Concrete Slabs, on Walls, or as Ground Cover

1.3 PERFORMANCE REQUIREMENTS

A. General: Provide waterproofing that prevents the passage of liquid water under hydrostatic pressure and complies with requirements as demonstrated by testing performed by an independent testing agency of manufacturer's current sheet membrane.

1.4 SUBMITTALS

A. Samples: 6 by 6 inch square of following products:
   1. Sheet Membrane.
   2. Protection Board.

B. Product Data: Manufacturer's technical product information for membrane and accessories including instructions for evaluating, preparing, and treating substrate, technical data, and tested physical and performance properties.

C. Shop Drawings: Show locations and extent of waterproofing, including details for substrate joints and cracks, sheet flashings, penetrations, inside and outside corners, tie-ins with adjoining construction, and other termination conditions.

D. Certification: By manufacturer that products supplied comply with local VOC regulations.

E. Manufacturer's Project Acceptance Document: Certification that manufacturer and installer will warrant waterproofing system for the specific site, design, details and application indicated for this Project.

F. Product Test Reports: From a qualified independent testing agency indicating and interpreting test results of waterproofing for compliance with requirements, based on comprehensive testing of current waterproofing formulations.

G. Sample Warranty: Copy of waterproofing manufacturer's and Installer's special extended warranty stating obligations, remedies, limitations, and exclusions before starting waterproofing.

H. Manufacturer's Field Report: Summary report specified in Field Quality Control paragraph 3.4/A/2.

1.5 QUALITY ASSURANCE

A. Manufacturer's Qualifications: Obtain primary waterproofing materials of each type required from single manufacturer to the greatest extent possible. Provide secondary materials only as recommended by manufacturer of primary materials.

1. Manufacturer's qualified technical representative will be required to visit Project site to advise applicator of procedures and precautions for installation of waterproofing materials.
B. Installer Qualifications: Engage an experienced installer to perform waterproofing work who has a minimum of 5 years specialized experience in installing waterproofing systems similar to that required for this Project and who is acceptable to the waterproofing manufacturer to install manufacturer's products.

1. Installer Certification: Submit written certification from manufacturer of waterproofing system certifying that installer is approved by manufacturer to install specified system.

2. Installer’s Field Supervision: Require installer to maintain a full-time supervisor/foreman who is on job site during times that waterproofing work is in progress and who is experienced in installing systems similar to type and scope required for this Project.

1.6 WARRANTY

A. Warranty: Submit a written warranty signed by the membrane manufacturer and installer, agreeing to repair or replace sheet membrane waterproofing that fails in materials or workmanship or that does not remain watertight within five years from date of Final Acceptance.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Specific product, material or manufacturer listed under each item below is "acceptable" only if manufacturer can evidence product compliance with requirements of Contract Documents.

2.2 MEMBRANE

A. Rubberized-Asphalt Sheet: 60-mil-thick, self-adhering sheet consisting of 56 mils of rubberized asphalt laminated to a 4-mil-thick, polyethylene film with release liner on adhesive side and formulated for application with primer or surface conditioner that complies with VOC limits of authorities having jurisdiction.

1. Physical Properties: As follows, measured per standard test methods referenced:
   a. Tensile Strength: 250 psi minimum; ASTM D 412, Die C, modified.
   b. Ultimate Elongation: 300 percent minimum; ASTM D 412, Die C, modified.
   d. Crack Cycling: Unaffected after 100 cycles of 1/8-inch movement; ASTM C 836.
   e. Puncture Resistance: 40 lbf minimum; ASTM E 154.
   f. Hydrostatic-Head Resistance: 150 feet minimum; ASTM D 5385.
   g. Water Absorption: 0.15 percent weight-gain maximum after 48-hour immersion at 70 deg F; ASTM D 570.
   h. Vapor Permeance: 0.05 perms; ASTM E 96, Water Method.

2. Low Temperature Membrane: Provide manufacturers rubberized asphalt sheets produced for low-temperature if ambient and substrate temperatures are below manufacturers recommendations.

3. Acceptable Manufacturers:
   e. Pecora Corporation; Duramem 700-SM.
   f. Polyguard Products, Inc.; Polyguard 650.
   g. Progress Unlimited, Inc.; Plastiwrap 60.
   h. Tamko Roofing Products, Inc.; TW-60.
   i. Or approved equal.

2.3 AUXILIARY MATERIALS

A. General: Furnish auxiliary materials recommended by waterproofing manufacturer for intended use and compatible with waterproofing sheet membrane.

1. Furnish liquid-type auxiliary materials that meet VOC limits of authorities having jurisdiction.

B. Substrate Patching Membrane: Low-viscosity, two component, asphalt modified coating.
C. Adhesives and Mastic: Liquid mastic and adhesive compounds recommended by sheet waterproofing manufacturer.

D. Primers and Surface Conditioners: Liquid type of concrete primer or surface conditioner recommended by manufacturer of sheet waterproofing material for applications required.

E. Liquid Membrane: Elastomeric type recommended by waterproofing sheet manufacturer.

F. Sheet Flashing: Self-adhering, rubberized-asphalt composite sheet strips of same material, construction, and thickness as waterproofing sheet membrane.

G. Metal Termination Bars: Aluminum bars, approximately 1 by 1/8 inch thick, predrilled at 9-inch centers.

H. Protection Board: Provide type of protection board recommended by waterproofing sheet manufacturer. Include adhesives recommended by manufacturer.

1. Vertical Surfaces: Any of the following:
   a. Molded polystyrene, ASTM C 578, Type I, 0.90 lb. per cu. ft., 1 inch thick.
   b. Extruded polystyrene, ASTM C 578, Type X, 1/2 inch thick.
   c. Fan folded, extruded-polystyrene core sandwiched between 2 sheets of plastic film, 1/4 inch thick, with compressive strength of 15 psi per ASTM D 1621.

2. Horizontal Surfaces:
   a. Semirigid sheets of fiberglass or mineral-reinforced-asphaltic core, pressure laminated between two asphalt-saturated fibrous liners
   b. Provide 1/8 inch thick board except where covered with steel reinforced concrete slab, apply two layers of 1/8 inch thick board or one layer of 1/4 inch thick board.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates surfaces to receive waterproofing system and associated work and conditions under which work will be installed. Do not proceed with waterproofing until unsatisfactory conditions have been corrected in a manner acceptable to Installer. Starting work within a particular area will be construed as applicator's acceptance of surface conditions.

   1. Verify that concrete has cured and aged for minimum time period recommended by waterproofing manufacturer.
   2. Verify that concrete is visibly dry and free of moisture.
   3. Test for capillary moisture by plastic sheet method according to ASTM D 4263.

3.2 PREPARATION

A. Comply with manufacturer's latest published requirements, instructions and specifications for surface preparations.

B. Clean, prepare, and treat substrates to provide dust-free, and dry substrates for waterproofing application.

C. Mask off adjoining surfaces not receiving waterproofing to prevent spillage and overspray affecting other construction.

D. Remove grease, oil, bitumen, form-release agents, paints, curing compounds, and other penetrating contaminants or film-forming coatings from concrete.

E. Remove fins, ridges, mortar, and other projections and fill honeycomb, aggregate pockets, holes, and other voids, flush with adjacent surfaces.

F. Prepare, fill, prime, and treat joints and cracks in substrates. Remove dust and dirt from joints and cracks according to ASTM D 4528.

   1. Install sheet strips and center over treated construction and contraction joints and cracks exceeding a width of 1/16 inch.
   2. Install sheet strips to accommodate movement at expansion joints in accordance with manufacturer's recommendations.

G. Verify and submit certification that materials and methods to be used for repair work are compatible with the membrane material to be used and are approved by the membrane manufacturer.
3.3 INSTALLATION

A. Install in accordance with manufacturer’s latest published requirements, instructions, specifications, details and approved shop drawings.

B. Apply primer or surface conditioner to substrates at required rate and allow to dry. Limit priming to areas that will be covered by sheet waterproofing in same day. Reprime areas exposed for more than 24 hours. Provide manufacturers special primer for damp surfaces if necessary due to construction schedule.

C. Apply and firmly adhere sheets over area to receive waterproofing. Accurately align sheets and maintain uniform 2-1/2-inch minimum side and end laps. Overlap and seal seams and stagger end laps to ensure watertight installation.

1. Apply membrane firmly into place without wrinkles, buckles or kinks.

2. Apply sheets so that direction of flow of water is over and not against laps.

3. Apply double layer of membrane under clamping ring at drains, at wall angles, corners, penetrations or where waterproofing membrane may be subject to unusual strain.

4. Apply liquid membrane fillet at interior corners under sheet strips.

5. Terminate membrane into a reglet or under counter flashing.

6. Apply mastic or liquid membrane to other vertical and horizontal terminations.

7. Patch misaligned or inadequately lapped seams with membrane.

8. Slit fishmouths, overlap the flaps, and repair with a patch and press or roll in place.

9. Seal edges of patch with a troweling of mastic.

D. Protection Course Installation:

1. Apply protection course in compliance with waterproofing and protection course manufacturer’s latest published recommendations, requirements and specifications.

3. Butt edges without overlap.

E. Backfilling:

1. Place and compact backfill to specified density; prevent damage to the sheet waterproofing and to protection board.

2. Replace damaged work as recommended by the manufacturer.

3.4 FIELD QUALITY CONTROL

A. Manufacturer’s Field Services:

1. Notify manufacturer prior to start of Work and make arrangements for manufacturer’s technical representative to be present during first day’s work to verify work is being conducted in accordance with their requirements.

2. Submit summary report; include Project site observations, instructions and monitoring activities.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will be paid for on a lump sum basis for sheet waterproofing per location indicated wherein no measurement will be made.
PART 1 - GENERAL

1.1 SUMMARY
A. Work required for this section includes cold fluid-applied polyurethane membrane waterproofing system and supplementary items necessary to complete their installation.

1.2 REFERENCED STANDARDS
A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
1. ASTM C836 - Standard Specification for High Solids Content, Cold Liquid-Applied Elastomeric Waterproofing Membrane for Use with Separate Wearing Course
6. ASTM D4258 - Standard Practice for Surface Cleaning Concrete for Coating
7. ASTM D4259 - Standard Practice for Abrading Concrete
8. ASTM D4263 - Standard Test Method for Indicating Moisture in Concrete by the Plastic Sheet Method
9. ASTM D4716 - Test Method for Determining the (In-plane) Flow Rate per Unit Width and Hydraulic Transmissivity of a Geosynthetic Using a Constant Head

1.3 PERFORMANCE REQUIREMENTS
A. General: Provide waterproofing that prevents the passage of liquid water under hydrostatic pressure and complies with physical requirements of ASTM C836 as demonstrated by testing performed by an independent testing agency of manufacturer’s current waterproofing formulations.

1.4 SUBMITTALS
A. Product Data: Include manufacturer’s written instructions for evaluating, preparing, and treating substrate, technical data, and tested physical and performance properties of waterproofing.
B. Shop Drawings: Show locations and extent of waterproofing. Include details for substrate joints and cracks, sheet flashings, penetrations, inside and outside corners, tie-ins to adjoining waterproofing, and other termination conditions.
C. Samples: 6 inch by 6 inch square of the following products:
2. Flashing sheet.
D. Product Test Reports: From a qualified independent testing agency indicating and interpreting test results of waterproofing for compliance with requirements, based on comprehensive testing of current waterproofing formulations.
E. Certification: By manufacturer that products supplied comply with local VOC regulations.
F. Manufacturer's Project Acceptance Document: Certification that manufacturer and installer will warrant waterproofing system for the specific site, design, details and application indicated for this Project.
G. Manufacturer’s Field Report: Summary report specified in Field Quality Control article.
H. Sample Warranty: Copy of waterproofing manufacturer's special extended warranty stating obligations, remedies, limitations, and exclusions before starting waterproofing.

1.5 QUALITY ASSURANCE
A. Manufacturer Qualifications: Obtain primary waterproofing materials of each type required from single manufacturer to the greatest extent possible. Provide secondary materials only as recommended by manufacturer of primary materials.
1. Manufacturer’s qualified technical representative will be required to visit Project site to advise applicator of procedures and precautions for installation of waterproofing materials.
B. Installer Qualifications: Engage an experienced Installer to perform waterproofing work who has a minimum of 10 years specialized experience in installing waterproofing systems similar to that required for this Project and who is acceptable to waterproofing manufacturer to install manufacturer’s products.

1. Installer Certification: Submit written certification from manufacturer of waterproofing system certifying that Installer is approved by manufacturer to install specified system.

2. Installer’s Field Supervision: Require installer to maintain a full-time supervisor/foreman who is on job site during times that waterproofing work is in progress and who is experienced in installing systems similar to type and scope required for this Project.

1.6 PROJECT CONDITIONS

A. Environmental Limitations: Apply waterproofing within the range of ambient and substrate temperatures recommended by waterproofing manufacturer. Do not apply waterproofing to a damp or wet substrate, when relative humidity exceeds 85 percent, or when temperatures are less than 5 degrees F. above dew point.

1. Do not apply waterproofing in snow, rain, fog or mist, or when such weather conditions are imminent during application and curing period.

B. Maintain adequate ventilation during application and curing of waterproofing materials.

1.7 WARRANTY

A. Manufacturer’s Warranty: Submit written warranty, signed by waterproofing manufacturer and installer agreeing to repair or replace cold fluid applied waterproofing that fails in material or workmanship or that do not remain watertight within specified warranty period.

1. Warranty does not include failure of waterproofing due to failure of substrate prepared and treated according to requirements or formation of new joints and cracks in substrate that exceed 1/16 inch in width.

2. Warranty Period: Five years after date of Final Completion.

PART 2 - PRODUCTS

2.1 MEMBRANE

A. Cold Fluid-Applied Waterproofing: Single-component, bitumen-modified, polyurethane-based cold liquid membrane material, self-bonding to substrates, and compounded specifically for application and slope of substrate indicated. Provide VOC compliant membrane with not less than 90 percent solids, minimum 6 month shelf life in uncured state, and tested by manufacturer to comply with requirements of ASTM C836.

1. Acceptable Manufacturers and Products:
   a. The Neogard Corporation; “Neogard 7401 Perma-Gard III”.
   c. Pecora Corporation; “Duramem H-500/V-500”.
   d. Sonneborn Building Products; “HLM 5000”.
   e. Tremco, Inc.; “Tremproof 60”, “Vulkem 201”.
   f. Or approved equal.

2.2 AUXILIARY MATERIALS

A. Primer: Manufacturer’s standard, factory-formulated polyurethane or epoxy primer.

B. Sheet Flashing: 50-mil- minimum, nonstaining uncured sheet neoprene.

1. Adhesive: Manufacturer’s recommended contact adhesive.

C. Reinforcing Strip: Manufacturer’s recommended fiberglass mesh or polyester fabric.

D. Joint Sealant: Multicomponent polyurethane sealant, compatible with waterproofing, complying with ASTM C920 Type M, Class 25; Grade NS for sloping and vertical applications or Grade P for deck applications; Use NT exposure; and as recommended by manufacturer for substrate and joint conditions.

1. Backer Rod: Closed-cell polyethylene foam.

E. Protection Course: Semi-rigid sheets of fiberglass or mineral-reinforced-asphaltic core, pressure laminated between two asphalt-saturated fibrous liners and as follows:
1. Thickness: 1/8 inch, nominal, for vertical applications; 1/4 inch, nominal, for horizontal applications.

2. Adhesive: Rubber-based solvent type recommended by waterproofing manufacturer for type of protection course.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrate surfaces to receive waterproofing system and associated work and conditions under which work will be installed. Do not proceed with work until unsatisfactory conditions have been corrected in a manner acceptable to installer. Starting work within a particular area will be construed as applicator’s acceptance of surface conditions.

1. Verify that concrete has cured and aged for minimum time period recommended by waterproofing manufacturer.

2. Verify that substrate is visibly dry and free of moisture. Test for capillary moisture by plastic sheet method according to ASTM D4263.

3. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 SURFACE PREPARATION

A. Clean and prepare substrate according to manufacturer’s written instructions. Provide clean, dust-free, and dry substrate for waterproofing application.

B. Mask off adjoining surfaces not receiving waterproofing to prevent spillage and overspray affecting other construction.

C. Close off deck drains and other deck penetrations to prevent spillage and migration of waterproofing fluids.

D. Remove grease, oil, bitumen, form-release agents, paints, curing compounds, and other penetrating contaminants or film-forming coatings from concrete.

E. Abrasive blast clean concrete surfaces uniformly to expose top surface of fine aggregate according to ASTM D4259 with a self-contained, recirculating, blast-cleaning apparatus. Remove material to provide a sound surface free of laitance, glaze, efflorescence, curing compounds, concrete hardeners, or form-release agents. Remove remaining loose material and clean surfaces according to ASTM D4258.

3.3 PREPARATION AT TERMINATIONS AND PENETRATIONS

A. Prepare vertical and horizontal surfaces at terminations and penetrations through waterproofing and at expansion joints, drains, and sleeves according to ASTM C898 and manufacturer’s written instructions.

B. Prime substrate, unless otherwise instructed by waterproofing manufacturer.

C. Apply a double thickness of waterproofing and embed a joint reinforcing strip in preparation coat when recommended by waterproofing manufacturer.

1. Provide sealant cants around penetrations and at inside corners of deck-to-wall butt joints when recommended by waterproofing manufacturer.

3.4 JOINT AND CRACK TREATMENT

A. Prepare, treat, rout, and fill joints and cracks in substrate according to ASTM C898 and waterproofing manufacturer’s written instructions. Remove dust and dirt from joints and cracks complying with ASTM D4258 before coating surfaces.

2. Apply bond breaker between sealant and preparation strip.

3. Prime substrate and apply a single thickness of preparation strip extending a minimum of 3 inches along each side of joint. Apply a double thickness of waterproofing and embed a joint reinforcing strip in preparation coat.

B. Install sheet flashing and bond to deck and wall substrates where indicated or required according to waterproofing manufacturer’s written instructions.

1. Extend sheet flashings onto perpendicular surfaces and other work penetrating substrate according to ASTM C898.

3.5 WATERPROOFING APPLICATION

A. Apply waterproofing according to ASTM C898 and manufacturer's written instructions.

B. Start installing waterproofing in presence of manufacturer's technical representative.

F. Remove fins, ridges, and other projections and fill honeycomb, aggregate pockets, and other voids.
C. Apply primer over prepared substrate.

D. Mix materials and apply waterproofing by spray, roller, notched squeegee, trowel, or other application method suitable to slope of substrate.

1. Apply one or more coats of waterproofing to obtain a seamless membrane free of entrapped gases, with an average dry film thickness of 60 mils and a minimum dry film thickness of 50 mils at any point.

2. Apply waterproofing to prepared wall terminations and vertical surfaces.

3. Verify wet film thickness of waterproofing every 100 sq. ft.

E. Install protection course with butted joints over nominally cured membrane before starting subsequent construction operations.

1. Molded-sheet drainage panels may be used in place of a separate protection course when approved by waterproofing manufacturer.

3.6 FIELD QUALITY CONTROL

A. Manufacturer's Field Services:

1. Notify manufacturer prior to start of Work and make arrangements for manufacturer's technical representative to be present during first day's work to verify work is being conducted in accordance with their requirements.

2. Submit summary report; include Project site observations, instructions and monitoring activities.

B. Flood Testing: Flood test each horizontal area for leaks, according to recommendations in ASTM D5957, after completing waterproofing but before overlying construction is placed. Install temporary containment assemblies, plug or dam drains, and flood with potable water.

1. Flood to an average depth of 2-1/2 inches with a minimum depth of 1 inch and not exceeding a depth of 4 inches. Maintain 2 inches of clearance from top of sheet flashings.

2. Flood each area for 24 hours.

3. After flood testing, repair leaks, repeat flood tests, and make further repairs until waterproofing installation is watertight.

4. Keep record of test performed and repairs made.

3.7 CURING, PROTECTING, AND CLEANING

A. Cure waterproofing according to manufacturer's written recommendations, taking care to prevent contamination and damage during application stages and curing. Do not permit foot or vehicular traffic on unprotected membrane.

B. Protect waterproofing from damage and wear during remainder of construction period.

C. Clean spillage and soiling from adjacent construction using cleaning agents and procedures recommended by manufacturer of affected construction.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will be paid for on a lump sum basis for cold fluid-applied polyurethane membrane waterproofing system per location indicated wherein no measurement will be made.
PART 1 - GENERAL

1.1 DESCRIPTION

A. Section includes dampproofing and supplementary items necessary to complete work required for its installation.

1.2 REFERENCE STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

3. ASTM D1227 - Standard Specification for Emulsified Asphalt Used as a Protective Coating for Roofing

4. ASTM D1668 - Standard Specification for Glass Fabrics (Woven and Treated) for Roofing and Waterproofing

7. ASTM E1677 - Standard Specification for an Air Retarder (AR) Material or System for Low-Rise Framed Building Walls

B. Federal Specifications (FS):

1. FS UU-B-790 - Building Paper, Vegetable Fiber: (Kraft, Waterproofed, Water Repellent and Fire Resistant)

1.3 SUBMITTALS

A. Product Data: For each type of product specified, including data substantiating that materials comply with requirements for each dampproofing material specified. Include recommended method of application.

1. Certification by dampproofing manufacturer that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).

1.4 QUALITY ASSURANCE

A. Manufacturer’s Qualifications: Obtain primary waterproofing materials of each type required from single manufacturer to the greatest extent possible. Provide secondary materials only as recommended by manufacturer of primary materials.

B. Installer Qualifications: Engage experienced installer who has completed dampproofing work similar in material, design, and extent to that indicated for Project and with record of successful in-service performance.

PART 2 - PRODUCTS

2.1 DAMPPROOFING MASTIC

A. Asphalt Mastic: Dampproofing emulsion with refined asphalt, emulsifiers, non-asbestos fibers and selected clay fillers.

1. Trowel, brush or spray grade.

2. ASTM D 1227, Type II, Class 1, VOC compliant.

3. Acceptable Manufacturers and Products:

   a. Kamak Chemical Corporation

      1) "Karnak 920 Fibrated Emulsion" (trowel mastic)

      2) "Karnak 220 Fibrated Emulsion" (brush or spray)

   b. W. R. Meadows, Inc.

      1) "Sealmastic - Emulsion Type 3" (trowel mastic)

      2) "Sealmastic - Emulsion Type 2" (brush or spray)

   c. Sonneborn Building Products, Division of ChemRex Inc

      1) "Hydrocide 700 Mastic" (trowel mastic)

      2) "Hydrocide 700B Semimastic" (brush or spray)

   d. Or approved equal.
B. Primer: Emulsified asphalt primer complying with ASTM D 1227, Type III, Class 1, for asphalt-based dampproofing, water based, VOC Compliant. Dilute with water as recommended by manufacturer.

C. Glass Fabric: Woven glass fabric, treated with asphalt, complying with ASTM D 1668, Type I.

### 2.2 DAMPROOFING PAPER

A. Building Paper Dampproofing: Asphalt-saturated heavy duty building paper meeting FS UU-B-790, Type 1, Style 2, Grade D.

4. Tensile Strength: ASTM D 828, MD 68 lb.f./in., CD 31 lb.f./in.

B. Mastic Sealer: ASTM D 1227, Type IV Fibrated (Non-asbestos) asphalt mastic, VOC Compliant.

### 2.3 DAMPROOFING AIR-BARRIER

A. Air-Infiltration Barrier: ASTM E 1677, Type 1. Proprietary building wrap with flame-spread and smoke-developed ratings of less than 25 and 450, respectively, when tested according to ASTM E 84; and with a minimum water-vapor transmission rate equaling 125 g through 1 sq. m of surface in 24 hours according to ASTM E 96, Desiccant Method (Method A). Provide one of the following products:

1. Polyethylene sheet; 9.6 mils thick; formed by spinning continuous strands of fine, high-density-polyethylene inter-connected fibers and bonding them together by heat and pressure; incorporating an additive to provide ultraviolet light resistance for up to 120 days; “Tyvek CommercialWrap” by DuPont Company or approved equal.

2. Polypropylene sheet; 11.5 mils thick; consisting of spun-bonded polypropylene substrate with a polypropylene coating attached directly to one side; “Typar HouseWrap” by Reemay, Inc. or approved equal.

3. Laminated polyethylene sheet; 3 mils thick; consisting of 2 plies of microperforated, cross-laminated, high-density polyethylene; “Rufco-Wrap” by Raven Industries, Inc. or approved equal.

B. Air-Infiltration Barrier Tape: Adhesive coated, weather resistant type recommended by the air-infiltration barrier manufacturer.

### PART 3 - EXECUTION

#### 3.1 EXAMINATION

A. Examine substrate surfaces to receive dampproofing and associated work and conditions under which work will be installed. Do not proceed with work until unsatisfactory conditions have been corrected in a manner acceptable to installer. Starting work within a particular area will be construed as applicator’s acceptance of surface conditions.

#### 3.2 DAMPROOFING MASTIC INSTALLATION

A. Substrate Surface:

1. Prepare substrate surfaces to insure proper and adequate installation, in accordance with manufacturer’s requirements.

2. Clean surfaces smooth and free from projections or holes.

3. Dry surfaces before applying mastic.

4. Prime substrate as recommended by asphalt mastic manufacturer.

B. Mastic Application:

1. Apply in accordance with manufacturer’s latest published requirements.

2. Apply direct from container without heating or thinning.

3. Keep mastic material at temperature above 40 deg. F. for ease of application.

4. Apply trowel mastic heavily in one coat with trowel.

5. Apply sprayable mastic in two coats with spray or heavy brush.

6. Allow 24 hours drying between coats.
C. Coverage: Apply at manufacturer's recommended rate to produce average wet film thickness of not less than 1/8 inch.

D. Glass Fabric Application:
   1. Apply reinforcement ply of fabric and mastic at wall angles, corners, penetrations or place where dampproofing course may be subject to unusual strain.
   2. Embed glass fabric reinforcing into mastic, lapping ends not less than 4 inches and sides not less than 2 inches. Roll or press fabric firmly into place without wrinkles, buckles or kinks.
   3. Apply second coat of mastic over glass fabric as specified above.

E. Cooperate and coordinate with trades of related specified adjacent materials to ensure compatibility.

3.3 DAMPPROOFING PAPER INSTALLATION

A. Building Paper Dampproofing: Cover gypsum board sheathing with dampproofing barrier as follows:
   1. Apply sheets horizontally, starting at base of wall, and lapping each successive upper sheet over previous lower sheet.
   2. Overlap horizontal joints one half sheet to form double sheet thickness. Overlap vertical end joints 6-inches. Cover upstanding flashing with 6-inches overlap.
   3. Cut and seal with mastic sealer around penetrations, openings or projections.
   4. Install with corrosion-resistant screws and metal or plastic disk anchored into steel studs at top of each sheet. Hold bottom of sheet in place with spots of mastic.
   5. Anchor entire sheet to studs with screws and disk if metal lath is not installed immediately.

3.4 DAMPPROOFING AIR-BARRIER INSTALLATION

A. Air-Infiltration Barrier Application: Covers sheathing with air-infiltration barrier as follows:
   1. Apply proprietary building wrap to comply with manufacturer's written installation instructions.
   2. Apply air-infiltration barrier to cover vertical flashing with a 4 inch minimum overlap.
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies building insulation for walls and ceilings. Insulation for roofs is provided under each specific roofing type.

1.2 REFERENCED STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM C516 - Standard Specification for Vermiculite Loose Fill Thermal Insulation
2. ASTM C549 - Standard Specification for Perlite Loose Fill Insulation
5. ASTM E136 - Standard Test Method for Behavior of Materials in a Vertical Tube Furnace at 750 Degrees C

1.3 SUBMITTALS

A. Product Data: Submit product data including manufacturer's material, handling, adhesive mixing, installation, and application instructions.

B. Samples: Submit three of each type of the following materials used in the work:

1. Insulation: 12 inches square.
2. Adhesive: 1/2 pint containers.
3. Vapor retarder: 12 inches square.
4. Fasteners: Six each type.

C. Certification:

1. Submit certification that materials furnished meet specified requirements and are compatible with each other.

1.4 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Store products in approved dry area and protect from contact with soil, exposure to the elements and temperatures lower than 150 deg. F. Keep products dry; store rolled goods standing on end.

1.5 JOB CONDITIONS

A. Environmental Requirements: Maintain temperature of 55 deg. F minimum in structure for 48 hours prior to, during and 48 hours after application of wall insulation.

PART 2 - PRODUCTS

2.1 MASONRY WALL INSULATION

A. Loose Granular Insulation:

B. Pre-formed Foam Inserts: Expanded Polystyrene Foam: ASTM C578, Standard Type 1, pre-formed inserts for insertion in concrete masonry cores, 1.0 pounds per cubic foot density, "Korofil" as manufactured by Concrete Block Insulating Systems or approved equal.

2.2 BAT INSULATION

A. Unfaced Mineral Fiber Batts: ASTM C665, Type I, and ASTM E136; fibers from glass, slag wool or rock wool, width to match support spacing, thickness as indicated.

B. Vapor Barrier: Polyethylene sheet, 6 mil thick

C. Joint Seam Tape: As recommended by vapor barrier manufacturer

PART 3 - EXECUTION

3.1 PREPARATION

A. Prepare surfaces smooth, dry, clean, and free of projections, oil, grease, wax, rough mortar, debris, and other substances that might prevent proper application of insulation. Protect other surfaces from drippings.

B. Allow decks and wall surfaces to dry thoroughly before application of insulation.

C. Cut mortar joints flush with masonry walls. Remove fins and projections left after removal of concrete forms.

D. Back plaster walls, if necessary to obtain smooth surfaces.
E. Tape joints in precast/prestressed roof decking with hot-asphalt resistant tape so that liquid asphalt shall not pass through joints.

3.2 APPLICATION OF LOOSE GRANULAR WALL INSULATION

A. Loose Granular Insulation: Pour insulation into cells of concrete masonry units as masonry work progresses in not more than 24-inch lifts. Use manufacturer’s recommended installation procedures to ensure complete filling of masonry cells.

B. Pre-Formed Foam Inserts: Install in accordance with insulation manufacturer’s instructions.

3.3 APPLICATION OF GLASS FIBER INSULATION BOARD

A. General Application:
   1. Comply with insulation manufacturer’s instructions applicable to products and application indicated. If printed instructions are not available or do not apply to project conditions, consult manufacturer’s technical representative for specific recommendations before proceeding with installation of insulation.
   2. Extend insulation full thickness as indicated to envelop entire area to be insulated. Cut and fit tightly around obstructions, and fill voids with insulation. Remove projections that interfere with placement.
   3. Apply a single layer of insulation of required thickness, unless otherwise shown or required to make up total thickness.

B. Protection: Protect installed insulation from damage due to harmful weather exposures, physical abuse, and other causes. Provide temporary coverings or enclosures where insulation will be subject to abuse and cannot be concealed and protected by permanent construction immediately after installation.

3.4 APPLICATION OF BATT INSULATION

A. General Application:
   1. Do not install batt insulation until all penetrations through walls, floors, and decks have been sealed and bottom track cleaned.
   2. Friction fit batts between supports for full fill of cavity.
   3. Fit tightly to electrical boxes, pipe penetrations, openings, and other items within wall cavity. Where feasible, place insulation on exterior side of boxes and piping to maintain thermal envelope.
   4. Unless available otherwise, provide insulation thicknesses over 6 inches as a combination of faced and unfaced batts. Faced batts shall have a minimum thickness of 3-1/2 inches.
   5. Provide wire or chicken wire retainer at batt insulation installed at roofs or ceilings where gypsum board or other finish material is not installed directly under insulation.

B. Vapor Barrier Application:
   1. Install vapor barrier perpendicular to supports and fasten with adhesive or staples.
   2. Seal seams and staples with seam tape. Seal penetrations with tape or sealant as appropriate. Seal edges with sealant.

3.5 INSPECTION

A. After completion of insulating work, but prior to covering with other materials, notify the Contracting Officer so that insulated areas may be inspected for completeness of cover and thickness. Correct any deficiencies reported by the Contracting Officer to the satisfaction of the Contracting Officer.

3.6 CLEAN-UP

A. Clean up all rubbish and debris caused by this work and remove from site.

B. Remove drippings of asphalt and adhesives in exposed places on brick, concrete, steel, metal, or other surfaces.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described under this section will not be measured or paid for separately, but shall be considered as incidental to other items of work.

END OF SECTION 07210
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies prefinished metal roofing and associated gutters, fascias, and trim.

B. Coordinate metal roofing with roof drainage work, flashing, trim and the construction of decks, parapets, walls, and other adjoining work, to provide a permanently weather tight, secure and non-corrosive installation. Roofing details shown on the Contract Drawings are minimum requirements; and shall be modified to conform with the requirements of the manufacturer for a warranted roof at no additional cost to the Authority.

1.2 REFERENCED STANDARDS

A. American Architectural Manufacturers Association (AAMA):
   1. AAMA 2605 - Voluntary Specifications, Performance Requirements and Test Procedures for Superior Performing Organic Coatings and Aluminum Extrusions and Panels

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   2. ASTM A653/A653M - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process
   4. ASTM A792/A792M - Standard Specification for Steel Sheet, 55% Aluminum-Zinc Alloy-Coated by the Hot-Dip Process
   6. ASTM D2244 - Standard Practice for Calculation of Color Tolerances and Color Differences from Instrumentally Measured Color Coordinates
   8. ASTM E1514 - Standard Specification for Structural Standing Seam Steel Roof Panel Systems

C. National Association of Architectural Metal Manufacturers (NAAMM):
   1. NAAMM AMP 500 - 505 - Metal Finishes Manual

D. The Society for Protective Coatings (Formerly known as Steel Structures Painting Council) (SSPC):
   1. SSPC Paint 12 - Cold-Applied Asphalt Mastic (Extra Thick Film)

E. Sheet Metal & Air Conditioning Contractors National Association (SMACNA):
   1. SMACNA - Architectural Sheet Metal Manual

F. Underwriters Laboratories, Inc. (UL):

1.3 SUBMITTALS

A. Manufacturer's Data:
   1. Submit metal manufacturer's specifications, installation instructions, and general recommendations for roofing applications.

B. Samples: Submit three 12 inch square samples of specified metal to be used as roofing. Samples will be reviewed by Contracting Officer for color and texture only.

C. Shop Drawings: Submit shop drawings showing the manner of forming, joining and securing the metal roofing, and the pattern of seams, gutters, collection boxes, fascia, and trim. Show expansion joint details and waterproof connections to adjoining work and at obstructions and penetrations. Obtain manufacturer's approval of shop drawings as satisfactory for a warranted roof prior to submittal.
D. Pre-Roofing Conference: Submit copies of pre-roofing conference records.

E. Installer Qualifications: Submit resume of experience with projects listed with contact names and telephone numbers.

1.4 QUALITY ASSURANCE

A. Manufacturer: Obtain primary metal roofing from a single manufacturer. Provide secondary materials as recommended by manufacturer of primary materials.

B. Installer: A firm with not less than 3 years of successful experience in installation of roofing systems similar to those required for this project and which is pre-certified or licensed by manufacturer of primary roofing materials as a premium (top level) contractor. In the immediate past 3 years of experience on similar roof systems, installer shall have worked without interruption or work stoppage due to unacceptable materials or workmanship.

C. Assign work closely associated with metal roofing, including (but not limited to) flashing and counterflashing, underlayments, expansion joints, and joint sealers, to installer of roofing. Pre-Roofing Conference: A pre-roofing conference is to be held to include representatives from the general contractor, subcontractor, manufacturer and the COR. Issues of quality control to be reviewed are handling, lifting, installation and setting the standard for minimum acceptable appearance of the mock-up.

D. Manufacturer’s inspection: Require that a manufacturer’s representative be present at job startup to ensure that installer’s workmen are properly trained and that manufacturer’s instructions are being followed.

1. Require that manufacturer’s representative make at least two interim inspections to ensure good quality control.

2. Upon completion of installation, require manufacturer’s representative to make a final inspection and issue the specified roofing warranty. Submit written certification that installation has been completed in accordance with manufacturer’s recommendations and that punch list items have been completed.

3. The roofing manufacturer is responsible for the proper calibration of the rolling machine to the specific characteristics of the project.

E. Sample Panel: Before proceeding with final purchase of materials and fabrication of metal roofing components, prepare a sample panel of the work. Incorporate materials and methods of fabrication and installation which are identical with the project requirements. Provide sample panel of sufficient scope, as directed, to show typical pattern of seams, edge construction, and finish texture and color. Provide a full-size mock-up section for approval in the middle of a typical roof consisting of four panels to establish the standard of quality that will be accepted. The panels are to lie flat on the substrate free of buckles, excessive waves, wrinkles, creases, ridges, oil-canning and avoidable tool marks. Complete the sample panel work at the time and location directed by the Contracting Officer. Retain accepted sample panel as quality standard for acceptance of completed metal roofing.

F. Metal roofing system shall be designed by the manufacturer to resist wind uplift as indicated in Underwriter’s Laboratories Class 90. If actual UL test has not been performed, submit in-house testing methods and certified engineering calculations, signed by a Professional Engineer registered in the State of Texas, indicating that I-90 classification could be achieved.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver components, sheets, metal roof panels, and other manufactured items so as not to be damaged or deformed. Package metal roof panels for protection during transportation and handling.

B. Unload, store, and erect metal roof panels in a manner to prevent bending, warping, twisting, and surface damage.

C. Stack metal roof panels on platforms or pallets, covered with suitable weathertight and ventilated covering. Store metal roof panels to ensure dryness. Do not store metal roof panels in contact with other materials that might cause staining, denting, or other surface damage.

D. Protect strippable protective covering on metal roof panels from exposure to sunlight and high humidity, except to extent necessary for period of metal roof panel installation.

E. Protect foam-plastic insulation as follows:

1. Do not expose to sunlight, except to extent necessary for period of installation and concealment.

2. Protect against ignition at all times. Do not deliver foam-plastic insulation materials to Project site before installation time.
3. Complete installation and concealment of plastic materials as rapidly as possible in each area of construction.

1.6 PROJECT CONDITIONS

A. Weather Limitations: Proceed with installation only when existing and forecasted weather conditions permit assembly of metal roof panels to be performed according to manufacturers' written instructions and warranty requirements.

1.7 COORDINATION

A. Coordinate installation of roof curbs, equipment supports, and roof penetrations.

1.8 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of metal roof panel assemblies that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:
   a. Structural failures, including rupturing, cracking, or puncturing.
   b. Deterioration of metals, metal finishes, and other materials beyond normal weathering.

2. Warranty Period: Two years from date of Final Acceptance.

B. Special Warranty on Panel Finishes: Manufacturer's standard form in which manufacturer agrees to repair finish or replace metal roof panels that show evidence of deterioration of factory-applied finishes within specified warranty period.

1. Fluoropolymer Finish: Deterioration includes, but is not limited to, the following:
   a. Color fading more than 5 Hunter units when tested according to ASTM D2244.
   b. Chalking in excess of a No. 8 rating when tested according to ASTM D4214.
   c. Cracking, checking, peeling, or failure of paint to adhere to bare metal.

2. Finish Warranty Period: 20 years from date of Final Acceptance.

C. Special Weathertightness Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace metal roof panel assemblies that fail to remain weathertight, including leaks, within specified warranty period.

1. Weathertight Warranty Period: 20 years from date of Final Acceptance.

PART 2 - PRODUCTS

2.1 PANEL MATERIALS

A. Metallic-Coated Steel Sheet Prepainted with Coil Coating: Steel sheet metallic coated by the hot-dip process and prepainted by the coil-coating process to comply with ASTM A755/A755M.

1. Zinc-Coated (Galvanized) Steel Sheet: ASTM A653/A653M, G90 coating designation; structural quality.

2. Aluminum-Zinc Alloy-Coated Steel Sheet: ASTM A792/A792M, Class AZ50 coating designation, Grade 40; structural quality.

4. Exposed Finishes: Apply the following coil coating, as specified or indicated on Drawings.
   a. High-Performance Organic Finish: Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.

   1) Fluoropolymer Two-Coat System: Manufacturer's standard two-coat, thermocured system consisting of specially formulated inhibitive primer and fluoropolymer color topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight; complying with physical properties and coating performance requirements of AAMA 2605, except as modified below:
      a) Humidity Resistance: 2000 hours.
5. Concealed Finish: Apply pretreatment and manufacturer's standard white or light-colored acrylic or polyester backer finish, consisting of prime coat and wash coat with a minimum total dry film thickness of 0.5 mil.

2.2 UNDERLAYMENT MATERIALS

A. Self-Adhering, Polyethylene-Faced Sheet: ASTM D 1970, 40 mils thick minimum, consisting of slip-resistant polyethylene-film reinforcing and top surface laminated to SBS-modified asphalt adhesive, with release-paper backing; cold applied.

1. Products:
   a. Carlisle Coatings & Waterproofing, Div. of Carlisle Companies Inc.; Dri-Start "A."
   c. Henry Company; Perma-Seal PE.
   e. NEI Advanced Composite Technology; AC Poly Ice and StormSeal.
   f. Owens Corning; WeatherLock.
   g. Polyguard Products, Inc.; Polyguard Deck Guard.
   h. Protecto Wrap Company; Rainproof TM.
   i. Or approved equal.

B. Slip Sheet: Building paper, minimum 5 lb/100 sq. ft., rosin sized.

2.3 MISCELLANEOUS MATERIALS

A. Fasteners: Self-tapping screws, bolts, nuts, self-locking rivets and bolts, end-welded studs, and other suitable fasteners designed to withstand design loads. Provide exposed fasteners with heads matching color of metal roof panels by means of plastic caps or factory-applied coating.

1. Fasteners for Roof Panels: Self-drilling or self-tapping, zinc-plated, hex-head carbon-steel screws, with a stainless-steel cap or zinc-aluminum-alloy head and EPDM or neoprene sealing washer.

2. Fasteners for Flashing and Trim: Blind fasteners or self-drilling screws with hex washer head.

B. Bituminous Coating: Cold-applied asphalt mastic, SSPC Paint 12, compounded for 15 mil dry film thickness per coat. Provide inert-type noncorrosive compound free of asbestos fibers, sulfur components, and other deleterious impurities.

2.4 BATTEN-SEAM METAL ROOF PANELS

A. General: Provide factory-formed metal roof panel assembly designed to be field assembled by covering vertical side edges of adjacent panels with battens and mechanically attaching panels to supports using concealed clips. Include battens and accessories required for weathertight installation.

B. Narrow-Profile, Snap-on-Batten-Seam Metal Roof Panels: Formed with vertical ribs at panel edges and flat pan between ribs; designed for independent installation by mechanically attaching panels to supports using concealed clips located under one side of panels and engaging opposite edge of adjacent panels, and installation of 3/8 to-1/2 inch wide, snap-on battens over panel joints.

1. Manufacturers:
   a. AEP-Span - “Curved Cap Seam”
   b. ATAS International, Inc. - “PC Snap-On Seam”
   c. Berridge Manufacturing Company - “Curved Tee-Panel”
   d. Or approved equal.

2. Panel Material: Zinc-coated (galvanized) steel sheet or aluminum-zinc alloy-coated steel sheet, 0.0159 inch thick.
   b. Color: As selected from manufacturer's full range.

3. Batten Material: Same material, finish, and color as roof panels.
4. **Clips:** One piece.
   a. **Material:** 0.0209-inch thick, zinc-coated (galvanized) or aluminum-zinc alloy-coated steel sheet.

5. **Panel Coverage:** 12 inches nominal.

6. **Batten Height:** 1.0 inch or 1.25 inch

7. **Uplift Rating:** UL Class 90.

### 2.5 ACCESSORIES

A. **Roof Panel Accessories:** Provide components required for a complete metal roof panel assembly including trim, copings, fascia, corner units, ridge closures, clips, flashings, sealants, gaskets, fillers, closure strips, and similar items. Match material and finish of metal roof panels, unless otherwise indicated.

1. **Closures:** Provide closures at eaves and ridges, fabricated of same metal as metal roof panels.

2. **Clips:** Minimum 0.0625 inch thick, stainless-steel panel clips designed to withstand negative-load requirements.

3. **Cleats:** Mechanically seamed cleats formed from minimum 0.0250 inch thick, stainless-steel or nylon-coated aluminum sheet.

4. **Backing Plates:** Provide metal backing plates at panel end splices, fabricated from material recommended by manufacturer.

5. **Closure Strips:** Closed-cell, expanded, cellular, rubber or crosslinked, polyolefin-foam or closed-cell laminated polyethylene; minimum 1 inch thick, flexible closure strips; cut or premolded to match metal roof panel profile. Provide closure strips where indicated or necessary to ensure weathertight construction.

B. **Flashing and Trim:** Formed from 0.0179-inch thick, zinc-coated (galvanized) steel sheet or aluminum-zinc alloy-coated steel sheet prepainted with coil coating. Provide flashing and trim as required to seal against weather and to provide finished appearance. Locations include, but are not limited to, eaves, rakes, comers, bases, framed openings, ridges, fascia, and fillers. Finish flashing and trim with same finish system as adjacent metal roof panels.

   1. **Formed from other than aluminum:** Formed with straight joints; secure with screws, bolts, or similar means.

C. **Gutters:** Formed from 0.0179 inch thick, zinc-coated (galvanized) steel sheet or aluminum-zinc alloy-coated steel sheet prepainted with coil coating. Match profile of gable trim, complete with end pieces, outlet tubes, and other special pieces as required. Fabricate in minimum 96 inch long sections, sized according to SMACNA's "Architectural Sheet Metal Manual." Furnish gutter supports spaced 36 inches o.c., fabricated from same metal as gutters. Provide bronze, copper, or aluminum wire ball strainers at outlets. Finish gutters to match metal roof panels.

### 2.6 FABRICATION

A. **General:** Fabricate and finish metal roof panels and accessories at the factory to greatest extent possible, by manufacturer's standard procedures and processes, as necessary to fulfill indicated performance requirements demonstrated by laboratory testing. Comply with indicated profiles and with dimensional and structural requirements.

B. **Provide panel profile**, including major ribs and intermediate stiffening ribs, if any, for full length of panel.

C. **Where indicated**, fabricate metal roof panel joints with factory-installed captive gaskets or separator strips that provide a tight seal and prevent metal-to-metal contact, in a manner that will minimize noise from movements within panel assembly.

D. **Sheet Metal Accessories:** Fabricate flashing and trim to comply with recommendations in SMACNA's "Architectural Sheet Metal Manual" that apply to the design, dimensions, metal, and other characteristics of item indicated.

   1. **Formed from other than aluminum:** Formed with straight joints; secure with screws, bolts, or similar means.

2. **Seams for Aluminum:** Fabricate nonmoving seams with flat-lock seams. Form seams and seal with epoxy seam sealer. Rivet joints for additional strength.

3. **Seams for Other Than Aluminum:** Fabricate nonmoving seams in accessories with flat-lock seams. Tin edges to be seamed, form seams, and solder.

4. **Sealed Joints:** Form nonexpansion but movable joints in metal to accommodate elastomeric sealant to comply with SMACNA standards.

5. **Conceal fasteners and expansion provisions where possible. Exposed fasteners are not...**
allowed on faces of accessories exposed to view.

6. Fabricate cleats and attachment devices from same material as accessory being anchored or from compatible, noncorrosive metal recommended by metal roof panel manufacturer.
   a. Size: As recommended by SMACNA's "Architectural Sheet Metal Manual" or metal roof panel manufacturer for application but not less than thickness of metal being secured.

2.7 FINISHES, GENERAL

A. Comply with NAAMM AMP 500 - 505 for recommendations for applying and designating finishes.

B. Protect mechanical and painted finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

C. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

PART 3 - EXECUTION

3.1 CONDITION OF SUBSTRATE

A. Examine the substrate and the conditions under which metal roofing work is to be performed. Do not proceed with installation until unsatisfactory conditions have been corrected.

3.2 UNDERLAYMENT INSTALLATION

A. Self-Adhering Sheet Underlayment: Install self-adhering sheet underlayment, wrinkle free, on roof sheathing under metal roof panels. Apply primer if required by manufacturer. Comply with temperature restrictions of underlayment manufacturer for installation; use primer rather than nails for installing underlayment at low temperatures. Apply over entire roof, in shingle fashion to shed water, with end laps of not less than 6 inches staggered 24 inches between courses. Overlap side edges not less than 3-1/2 inches. Extend underlayment into gutter trough. Roll laps with roller. Cover underlayment within 14 days.

B. Fasteners: Use stainless-steel fasteners for surfaces exposed to the exterior and galvanized steel fasteners for surfaces exposed to the interior.

C. Metal Protection: Where dissimilar metals will contact each other or corrosive substrates, protect against galvanic action by painting contact surfaces with bituminous coating, by applying rubberized-asphalt underlayment to each contact surface, or by other permanent separation as recommended by metal roof panel manufacturer.

D. Joint Sealers: Install gaskets, joint fillers, and sealants where indicated and where required for weatherproof performance of metal roof panel assemblies. Provide types of gaskets, fillers, and
3.4 FIELD-ASSEMBLED METAL ROOF PANEL INSTALLATION

A. Standing-Seam Metal Roof Panels: Fasten metal roof panels to supports with concealed clips at each standing-seam joint at location, spacing, and with fasteners recommended by manufacturer.

1. Install clips to supports with self-tapping fasteners.

2. Install pressure plates at locations indicated in manufacturer’s written installation instructions.

3. Snap Joint: Nest standing seams and fasten together by interlocking and completely engaging factory-applied sealant.

3.5 ACCESSORY INSTALLATION

A. General: Install accessories with positive anchorage to building and weathertight mounting and provide for thermal expansion. Coordinate installation with flashings and other components.

1. Install components required for a complete metal roof panel assembly including trim, copings, ridge closures, seam covers, flashings, sealants, gaskets, fillers, closure strips, and similar items.

B. Flashing and Trim: Comply with performance requirements, manufacturer’s written installation instructions, and SMACNA’s "Architectural Sheet Metal Manual." Provide concealed fasteners where possible, and set units true to line and level as indicated. Install work with laps, joints, and seams that will be permanently watertight and weather resistant.

1. Install exposed flashing and trim that is without excessive oil canning, buckling, and tool marks and that is true to line and levels indicated, with exposed edges folded back to form hems. Install sheet metal flashing and trim to fit substrates and to result in waterproof and weather-resistant performance.

2. Expansion Provisions: Provide for thermal expansion of exposed flashing and trim. Space movement joints at a maximum of 10 feet with no joints allowed within 24 inches of corner or intersection. Where lapped or bayonet-type expansion provisions cannot be used or would not be sufficiently weather resistant and waterproof, form expansion joints of intermeshing hooked flanges, not less than 1 inch deep, filled with mastic sealant (concealed within joints).

C. Gutters: Join sections with riveted and soldered or lapped and sealed joints. Attach gutters to eave with gutter hangers spaced not more than 4 feet o.c. using manufacturer’s standard fasteners. Provide end closures and seal watertight with sealant. Provide for thermal expansion.

3.6 ERECTION TOLERANCES

A. Installation Tolerances: Shim and align metal roof panel units within installed tolerance of 1/4 inch in 20 feet on slope and location lines as indicated and within 1/8 inch offset of adjoining faces and of alignment of matching profiles.

3.7 CLEANING AND PROTECTION

A. Remove temporary protective coverings and strippable films, if any, as metal roof panels are installed, unless otherwise indicated in manufacturer’s written installation instructions. On completion of metal roof panel installation, clean finished surfaces as recommended by metal roof panel manufacturer. Maintain in a clean condition during construction.

B. Replace metal roof panels that have been damaged or have deteriorated beyond successful repair by finish touchup or similar minor repair procedures.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Light rail station roofs: Metal roof work for the construction of light rail stations will not be measured but will be paid for as “metal roofing work” as described in this section together with metal decking and removal of temporary cross bracing as per Section 05300, “Metal Decking”, on a lump sum basis for each location wherein no other measurement will be made.
B. The metal roofing described in this section for all work except light rail stations will be paid for as “metal roofing” for each location on a lump sum basis wherein no measurement will be made.

END OF SECTION 07410
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section specifies single-ply ethylene propylene
diene monomer membrane roofing (SPMR),
non-traffic-bearing partially attached sheet
membrane system intended for weather exposure
as primary roofing.

1.2 REFERENCED STANDARDS

A. ASTM International (Formerly known as American
Society for Testing and Materials) (ASTM):

1. ASTM C578 - Standard Specification for
Rigid, Cellular Polystyrene Thermal
Insulation

2. ASTM C1289 - Standard Specification for
Faced Rigid Cellular Polyisocyanurate
Thermal Insulation Board

3. ASTM E84 - Standard Test Method for
Surface Burning Characteristics of Building
Materials

4. ASTM E119 - Standard Test Methods for
Fire Tests of Building Construction and
Materials

5. ASTM E136 - Standard Test Method for
Behavior of Materials in a Vertical Tube
Furnace at 750 Degrees C

B. Factory Mutual Global (FM):

1. Factory Mutual Approval Guide

2. FM Global Property Loss Prevention Data
Sheets 1-28: Wind Design

C. Underwriter’s Laboratories, Inc. (UL)

1.3 SUBMITTALS

A. Product Data: Submit specifications, installation
instructions, and general recommendations from
manufacturers of single-ply membrane roofing
system materials, for types of roofing required.
Include data substantiating that materials comply
with requirements.

B. Samples: Submit manufacturer’s standard samples
of required insulation and membrane.

C. Shop Drawings: Submit complete shop drawings
showing roof configuration, sheet layout, seam
locations, details at perimeter, and special
conditions.

1.4 QUALITY ASSURANCE

A. Manufacturer: Obtain primary single-ply membrane
roofing and roof insulation from a single
manufacturer. Provide secondary materials as
recommended by manufacturer of primary
materials.

B. Installer: A firm with not less than 5 years of
successful experience in installation of roofing
systems similar to those required for this project
and which is acceptable to or licensed by
manufacturer of primary roofing materials.

1. Assign work closely associated with single-
ply membrane roofing, including (but not
limited to) insulation, flashing and
counterflashing, expansion joints, and joint
sealers, to Installer of flexible sheet roofing.

C. Pre-Roofing Conference: Prior to installation of
roofing and associated work, meet at project site, or
other mutually agreed location, with Installer,
roofing manufacturer, installers of related work, and
other entities concerned with roofing performance,
including (where applicable) Owner’s insurer, test
agencies, governing authorities, and Contracting
Officer. Record discussions and agreements and
furnish copy to each participant. Provide at least 72
hours advance notice to participants prior to
convening pre-roofing conference.

D. Manufacturer’s Inspection: Require that a
manufacturer’s representative be present at job
start-up to ensure that installer’s workmen are
properly trained and that manufacturer’s instructions
are being followed.

E. Insurance Certification: Assist Owner in preparation
and submittal of roof installation acceptance
certification necessary in connection with fire and
extended coverage insurance on roofing and
associated work.

1.5 JOB CONDITIONS

A. Weather: Proceed with roofing work when existing
and forecasted weather conditions permit work to
be performed in accordance with manufacturer’s
recommendations and warranty requirements.
1.6 WARRANTY

A. Special Warranty: Manufacturer's standard form, without monetary limitation (No-Dollar Limit), in which manufacturer agrees to repair or replace components of membrane roofing system that fail in materials or workmanship within specified warranty period. Failure includes roof leaks.

1. Total system warranty includes roofing membrane, base flashings, roofing accessories, roof insulation fasteners and other components of membrane roofing system.
   a. Warranty Period: 15 years from date of Final Acceptance.

2. Membrane material warranty includes membrane deterioration to point of failure due to weathering.
   a. Warranty Period: 20 years from date of Final Acceptance.

PART 2 - PRODUCTS

2.1 ROOFING SYSTEM REQUIREMENTS

A. UL Listing: Provide labeled materials which have been tested and listed by UL in "Building Materials Directory" for application indicated, with "Class A" rated materials/system for roof slopes shown.

B. FM Listing: Provide flexible sheet roofing system and component materials which have been evaluated by Factory Mutual System for fire spread, wind up-lift, and hail damage and are listed in "Factory Mutual Approval Guide" for Class I construction.

2.2 ETHYLENE PROPYLENE DIENE MONOMER (EPDM)

B. Thickness: 45 mils, nominal.

C. Reinforcing Scrim: Polyester or nylon.

D. Exposed Face Color: Manufacturer's standard gray.

2.3 MISCELLANEOUS MATERIALS FOR SPMR

A. Sheet Seaming System: Manufacturer's standard materials for sealing lapped joints, including edge sealer to cover exposed spliced edges as recommended by manufacturer of SPMR system.

B. Cant Strips, Tapered Edge Strips, and Flashing Accessories: Types recommended by manufacturer of SPMR material, provided at locations indicated and at locations recommended by manufacturer, including adhesive tapes, flashing cements, and sealants.

C. Slip Sheet: Type recommended by manufacturer of SPMR material for protection of membrane from incompatible substrates.

D. Mechanical Fasteners: Metal plates, caps, battens, accessory components, fastening devices, and adhesives to suit substrates and as recommended by SPMR membrane manufacturer.

E. Membrane Adhesive: As recommended by SPMR membrane manufacturer for particular substrate and project conditions, formulated to withstand minimum 60 psf uplift force.

2.4 INSULATING MATERIALS

A. General: Provide insulating materials to comply with requirements indicated for materials and compliance with referenced standards; in sizes to fit applications indicated, selected from manufacturer's standard thickness, widths, and lengths.

B. Polyisocyanurate Board Roof Insulation: Rigid, cellular thermal insulation with polyisocyanurate closed-cell foam core and manufacturer's standard facing laminated to both sides; complying with ASTM C1289; 23 R-value minimum as designated at mean temperatures indicated, after conditioning per RIC/TIMA Bulletin #281-1; and as follows:

1. Surface Burning Characteristics: Maximum flame spread of 25 measured in accordance with ASTM E84.

2. Thermal Resistivity: 12.1 at 75 degrees F for 2 inch thick insulation board.

3. Application: Use a primary insulation over metal decking.

C. Extruded Polystyrene Board Insulation: Rigid, cellular thermal insulation with closed cells and integral high density skin, formed by the expansion of polystyrene base resin in an extrusion process to comply with ASTM C578 for Type indicated; with minimum R-values of 23; and as follows:

1. Compressive Strength: 25 pounds per inch minimum.

2. Provide tapered boards where indicated for sloping to drain; fabricate with taper of 1/4 inch per foot in the 24 inch dimension.

2.5 MISCELLANEOUS INSULATION MATERIALS

A. Adhesive for Bonding Insulation: Type recommended by insulation manufacturer and complying with fire resistance requirements.
B. Mastic Sealer: Type recommended by insulation manufacturer for bonding edge joints and filling voids.

C. Mechanical Anchors: As recommended by insulation manufacturer for deck type, and complying with fire and insurance rating requirements.

2.6 MISCELLANEOUS ROOFING ACCESSORIES

A. Flashing Material: Manufacturer's standard system compatible with single-ply membrane.

PART 3 - EXECUTION

3.1 PREPARATION OF SUBSTRATE

A. General: Comply with manufacturer's instructions for preparation of substrate to receive SPMR system.

B. Clean substrate of dust, debris, and other substances detrimental to SPMR system work. Remove sharp projections.

C. Install cant strips, flashings, and accessory items as shown, and as recommended by manufacturer even though not shown.

3.2 INSTALLATION GENERAL

A. General: Comply with manufacturer's instructions, except where more stringent requirements are indicated.

B. Insurance/Code Compliance: Install SPMR system for compliance with governing regulations and with the following insurance requirements:

1. Factory Mutual requirements for "Class I" construction with Windstorm Resistance Classification I-90.

2. Underwriters Laboratory requirements for Class A.

3.3 INSULATION INSTALLATION

A. General: Extend insulation fill thickness as a single layer, in two layers, or in multiple layers over entire surface to be insulated, cutting and fitting tightly around obstructions. Form cant strips and tapered areas with additional material as shown, as required, for proper drainage of membrane.

1. Stagger all joints in one direction for each course. For multiple layers, stagger joints both directions between courses.

B. Do not install more insulation each day than can be covered with membrane before end of day and before start of inclement weather.

C. Secure roof insulation to substrate with mechanical anchors of type and spacing indicated; but in no case provide less than one anchor per 4 square feet of surface area, or less anchorage than required by FM "Loss Prevention Data Sheet 1-28".

3.4 SPMR MEMBRANE INSTALLATION

A. General: Start installation only in presence of manufacturer's technical representative.

B. Partially Attached SPMR: Install membrane by unrolling over prepared substrate, lapping adjoining sheets as recommended by manufacturer, and bonding and sealing seams. Install mechanical fasteners at spacing recommended by manufacturer, covering with adhesive-applied membrane so that no fasteners are exposed. Install flashings and counterflashings as shown or recommended by manufacturer.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will not be measured but will be paid for at the lump sum price for “Single-Ply Membrane Roofing” per location. No separate measurement will be made for wastage, insulation, trim, closures, roof curbs, flashing and any other equipment or accessories specified for the work, as they are considered incidental to and integral part of the finished Work.

END OF SECTION 07531
THIS PAGE INTENTIONALLY LEFT BLANK
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies metal flashing, coping, miscellaneous waterproofing sheet metal, scuppers, and downspouts where shown.

1.2 REFERENCED STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   2. ASTM A653/A653M - Standard Specification for Steel Sheet, Znc-Coated (Galvanized) or Znc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process
   3. ASTM B32 - Standard Specification for Solder Metal
   4. ASTM B101 - Standard Specification for Lead-Coated Copper Sheet and Strip for Building Construction
   5. ASTM B221 - Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes
   6. ASTM B370 - Standard Specification for Copper Sheet and Strip for Building Construction

B. Sheet Metal & Air Conditioning Contractors National Association (SMACNA):

C. Federal Specifications (FS):
   1. FS QQ-T-201F - Temeplate, for Roofing and Roofing Products
   2. FS UU-B-790A - Building Paper, Vegetable Fiber (Kraft, Waterproofed, Water Repellent and Fire Resistant)

1.3 SUBMITTALS

A. Shop Drawings: Submit shop drawings for shop-fabricated work including complete details of joints, supports, and fasteners, in accordance with SMACNA 1013 where applicable.

   1. Show dimensions and locations of wood nailing strips and details of installation.

B. Product Details: Describe complete composition and types of elements being submitted, including finishes and thicknesses.

C. Samples: Submit three of each type of the following materials used in the work:

   1. Stainless steel: 12 inches square.
   2. Sheet metal coping: 12 inches square.
   3. Aluminum coping: 12 inch by 12 inch corner section.
   5. Expansion joint flashing: 12 inch strips, Prefabricated "T", Prefabricated "X".
   6. Downspout: 12 inch length with anchor strap.
   7. Lead coated copper: 12 inches square.

1.4 QUALITY ASSURANCE

A. Sheet Metal Flashing and Trim Standard: Comply with SMACNA's "Architectural Sheet Metal Manual." Conform to dimensions and profiles shown unless more stringent requirements are indicated.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Store products in approved dry area and protect from contact with soil and exposure to the elements. Keep products dry.

PART 2 - PRODUCTS

2.1 STAINLESS STEEL FLASHING BUILT INTO MASONRY

A. ASTM A167, Type 304, 2D finish minimum thickness 26-gauge (0.0187 inch); material for flashing mechanically keyed elements of walls, or parapets. Use for flashing built onto masonry, unless otherwise shown.
2.2 SHEET METAL

A. Zinc coated steel, ASTM A653 for lock-forming. G90 hot-dipped galvanized, mill phosphotized for painting, and 20-gauge unless noted otherwise.

2.3 REGLETS

A. Closed slot, friction type, stainless steel, or lead-coated copper, matching flashing material.

2.4 EXPANSION JOINT FLASHING

A. Combination of neoprene and 16 ounce lead-coated copper, with the following additional requirements:

1. Flashing with neoprene bonded to metal edgings by means of neoprene-based adhesive comprising primer and vulcanizing cement to produce high-strength bond.

2. For neoprene part of flashing, cured neoprene sheet, tensile strength 1,500 psi minimum, elongation 250 percent minimum, bonded to lead-coated copper with peel-pull value of 25 pounds per inch minimum at right angles; thickness and width as shown.

3. Edgings of 16 ounce lead-coated copper, 4 inches wide, perforated with holes 4 inches on centers minimum.

2.5 ALUMINUM COPING AND GRAVEL STOPS

A. Type: Extruded, ASTM B221, Alloy 6063-T5; minimum thickness, 0.125 inch.

B. Size: 10 feet long sections, with factory formed corners and intersections, formed with no visible fasteners before color anodizing, or painting.

C. Finish: Factory applied, as shown on the plans.

D. Fasteners and clips: Hardened aluminum or stainless steel as standard with the manufacturer, color, and finish to match base metal.

2.6 STAINLESS STEEL

A. AISI Type 302/304, complying with ASTM A167, 2D annealed finish.

B. 26 gauge, unless noted otherwise.

2.7 COPPER SHEET AND STRIPS

A. ASTM B370: 16 ounce, unless otherwise shown.

2.8 LEAD-COATED COPPER

A. ASTM B101, 16 ounce roofing temper.

2.9 TERNE-COATED STAINLESS STEEL

A. FS QQ-T-201F, Type 304, 40 pound coating weight.

B. 26-gauge, unless noted otherwise.

C. Coating: Both sides with teule alloy, 80 percent lead and 20 percent tin.

D. Gross weight: 0.82 pounds per square foot.

E. Size: Flashing and downspouts; longest practical lengths.

2.10 STRAINER

A. Stainless steel, 12 gauge wires spaced not greater than 1/2 inch apart, as shown.

2.11 DOWNSPOUT

A. Plain, rectangular, in accordance with SMACNA 1013.

B. 20 gauge hot-dipped galvanized steel, unless otherwise noted.

2.12 METAL SCUPPERS

A. In accordance with SMACNA 1013 and as shown on the Contract Drawings.

2.13 ACCESSORIES

A. Vinyl Tape: As recommended by the metal product manufacturer.

B. Nailing Strips: Pressure treated wood nailing strips and miscellaneous wood supports: Section 06100, "Rough Carpentry".

C. Coal-Tar Epoxy Paint: Themec 4H-413 coal tar epoxy, Carboline, Ameron, or approved equal. Applied to a minimum dry thickness of 8 mils.

D. Solder: ASTM B32.

E. Sealant: Section 07900, "Seals and Sealants".

2.14 FABRICATION

A. Fabricate sheet metal work in accordance with details in referenced SMACNA 1013.
PART 3 - EXECUTION

3.1 PREPARATION

A. Clean dirt, debris, grease, oil, and other foreign substances from surfaces that are to receive metal work.

3.2 INSTALLATION

A. Coordinate flashing and sheet metal work with the work of other trades. Shop fabricate the work whenever possible. Provide for expansion and contraction of sheet metal work, in accordance with SMACNA 1013.

B. Perform cutting, drilling, and other operations in connection with sheet metal work to accommodate work of other trades. Provide accessories as recommended by SMACNA 1013.

C. Where sheet metal abuts or interfaces with adjacent materials, join as shown on approved shop drawings. Isolate dissimilar metals by use of coal-tar epoxy coating. Apply backing for sheet metal applied to any surface to permit movement caused by expansion or to prevent galvanic action.

D. Soldering:
   1. Brush liberal amount of flux on seams, solder immediately, neutralize acid, and clean.
   2. Solder slowly, thoroughly heating seam and completely sweating solder through full width of seam. Use ample solder for full width along seams.

E. Seams:
   1. Flat lock: 3/4 inch wide, minimum.
   2. Solder lap: 1 inch wide, minimum.
   3. Unsoldered plain lap: 3 inches wide, minimum.
   4. Seams: Corresponding to direction of flow.

F. Form flashings from material shown or specified made up from sheets 8 to 10 feet long with locked and soldered seams into units of not more than 16 feet. Join units together with 3 inch wide loose-locked seams filled with sealant before units are joined. Runs of flashing shorter than 16 feet will not require loose seam joints. Miter corners and join by locked and soldered joints.

G. Install expansion joint flashing at locations shown and in accordance with manufacturer's recommendations. Splice ends of adjoining lengths of flashing with neoprene tabs applied to both faces with approved adhesive. Provide prefabricated corners, intersections and crossovers.

H. Form cap flashing at parapet walls and other vertical surfaces to extend into metal reglets built into structure and prefilled with sealant. Lap built-up roof flashings and form metal to provide spring action against roof flashings. Prior to installation, coat flashing portions to be concealed with coal-tar epoxy paint.

I. Where cants do not occur at intersections of roof decks and vertical surfaces of walls and other construction, provide lead-coated copper flashings. Extend base flashings up vertical surfaces eight inches unless otherwise shown, behind metal cap flashing and out onto roof or horizontal surface not less than 8 inches. Coat back sides of base flashing with bituminous paint and set into angle formed by roof and vertical surfaces after three plies of underlayment have been laid. Nail flange with copper nails spaced 3 inches on centers and 3/4 inch from edge into wooden nailer provided in roof slab.

J. Reglets: Form reglets to reproduce detail and design shown. Form sharp, even and true profiles, bends and intersections. Lock or lap joints and solder or reinforce joints as shown or specified.

K. Aluminum Coping: Install coping in accordance with manufacturer's recommendations and as follows: Fasteners and clips:
   1. At joints and at 5 feet maximum intervals.
   2. Center butt joints over anchor clips.
   3. Secure in place allowing for thermal expansion and establishing watertight joint with vinyl seal.

L. Terne-Coated Stainless Steel: Install flat-locked seam roofing, flashing and downspouts in accordance with manufacturer's recommendations and as follows:
   1. Install clips, 2 inches wide, spaced 12 inches on center.
   2. Solder:
      a. Tin content: 50 percent minimum.
      b. Use only rosin flux for soldering.
      c. Remove excess flux after soldering.
3. Installation of strips:
   b. Form flat overlapping surface by malleting seams down. Flood seam with solder.
   c. Form base flashing and downspouts with flatlocked seams and solder as for roofing.
   d. Where shown, form compression seal between the teene-coated stainless steel flashing and other metals with closed-cell vinyl tape.

4. Install strainer at top of downspout.

3.3 CLEAN-UP

A. On completion of installation, clean finished surfaces, including removing unused fasteners, metal filings, pop rivet stems, and pieces of flashing. Maintain in a clean condition during construction.

B. Replace sheet metal flashing and trim that have been damaged or that have deteriorated beyond successful repair by finish touchup or similar minor repair procedures.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will not be measured but will be paid for on a lump sum basis as "Flashing and Sheet Metal" per location.

END OF SECTION 07600
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes through penetration firestopping systems for openings and penetrations through smoke and fire-resistance-rated assemblies, and supplementary items necessary to complete their installation.

1.2 REFERENCE STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

2. ASTM E814 - Standard Test Method for Fire Tests of Through-Penetration Fire Stops

1.3 PERFORMANCE REQUIREMENTS

A. General: Provide firestopping systems that are produced and installed to resist spread of fire according to requirements indicated, resist passage of smoke and other gases, and maintain original fire-resistance rating of assembly penetrated.

B. F-Rated Systems: Provide through-penetration firestopping systems with F-ratings determined per ASTM E814, equaling or exceeding fire-resistance rating of constructions penetrated.

C. T-Rated Systems: For the following conditions, provide through-penetration firestopping systems with T-ratings, as well as F-ratings, determined per ASTM E814, where systems protect penetrating items exposed to potential contact with adjacent materials in occupiable floor areas:

1. Penetrations located outside wall cavities.
2. Penetrations located outside fire-resistant shaft enclosures.
3. Penetrations located in construction containing fire-protection-rated openings.
4. Penetrating items larger than 4 inch diameter nominal pipe or 16 sq. in. in overall cross-sectional area.

D. For through-penetration firestopping systems exposed to view, provide products with flame-spread ratings of less than 25 and smoke-developed ratings of less than 450, as determined per ASTM E84.

1.4 SUBMITTALS

A. Product Data: For each type of firestopping system product indicated.

B. Shop Drawings: For each firestopping system, show each kind of construction condition penetrated, relationships to adjoining construction, and kind of penetrating item. Include firestopping design designation of testing and inspecting agency acceptable to authorities having jurisdiction that evidences compliance with requirements for each condition indicated.

1.  Submit documentation, including illustrations, from a qualified testing and inspecting agency that is applicable to each firestopping system configuration for construction and penetrating items.

2. Where Project conditions require modification of qualified testing and inspecting agency's illustration to suit a particular firestopping condition, submit illustration, with modifications marked, approved by firestopping system manufacturer's fire-protection engineer.

C. Product Certificates: Signed by manufacturers of firestopping system products certifying that products furnished comply with requirements.

D. Product Test Reports: From a qualified testing agency indicating firestopping system complies with requirements, based on comprehensive testing of current products.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: An experienced installer who has completed firestopping systems similar in material, design, and extent to that indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.

B. Source Limitations: Obtain through-penetration firestopping systems, for each kind of penetration and construction condition required, from a single manufacturer.

C. Fire-Test-Response Characteristics: Provide firestopping systems that comply with the following requirements and those specified in 'Performance Requirements' Article:

1. Firestopping tests are performed by a qualified testing and inspecting agency performing testing and follow-up inspection
services for firestopping systems acceptable to authorities having jurisdiction.

2. Through-penetration firestopping systems: Provide materials that are identical to those tested per ASTM E 814. Provide rated firestopping system products that bear classification marking of qualified testing and inspecting agency.

1.6 PROJECT CONDITIONS

A. Environmental Limitations: Do not install firestopping systems when ambient or substrate temperatures are outside limits permitted by firestopping system manufacturers or when substrates are wet due to rain, frost, condensation, or other causes.

B. Ventilate firestopping systems per manufacturer's written instructions by natural means or, where this is inadequate, forced-air circulation.

1.7 COORDINATION

A. Coordinate construction of openings and penetrating items to ensure that firestopping systems are installed according to specified requirements.

B. Coordinate sizing of sleeves, openings, core-drilled holes, or cut openings to accommodate firestopping systems.

C. Do not cover up firestopping system installations that will become concealed behind other construction until building inspector, if required by authorities having jurisdiction, has examined each installation.

PART 2 - PRODUCTS

2.1 FIRESTOPPING, GENERAL

A. Acceptable Manufacturers: Manufacturer is "acceptable" if firestopping system has been tested and listed by UL or other testing and inspection agency acceptable to authorities having jurisdiction and manufacturer can evidence product compliance with requirements of the Contract Documents.

B. Compatibility: Provide firestopping systems that are compatible with one another, with the substrates forming openings, and with the items, if any, penetrating firestopping systems, under conditions of service and application, as demonstrated by firestopping system manufacturer based on testing and field experience.

C. Accessories: Provide components for each firestopping system that are needed to install fill materials and to comply with “Performance Requirements” Article. Use only components specified by firestopping system manufacturer and approved by the qualified testing and inspecting agency for firestopping systems indicated.

2.2 THROUGH-PENETRATION FIRESTOP SYSTEMS

A. Description: Classified in Underwriters Laboratories (UL) Fire Resistance Directory, "Section XHEZ - Through Penetration Firestop Systems", and/or "Section XHHW - Fill Void or Cavity Materials" for specific project conditions.

B. Application Considerations:

1. Firestops exposed to view and/or are scheduled to receive finishes shall be paintable or capable of receiving finish materials.

2. Firestops exposed to traffic, moisture, and physical damage shall be products that do not deteriorate when exposed to these conditions.

3. Firestops for water piping penetrations of any type, shall be moisture-resistant products.

4. Firestops for floor penetrations with annular spaces exceeding 4 inches or more in width and exposed to possible loading and traffic shall be products capable of supporting the floor loads involved either by installing floor plates or by other means.

5. Firestops for penetrations involving insulated piping shall be products that do not require removal of insulation.

6. Firestops for cable trays and future penetrations shall be reusable pillows or bags.

C. Provide firestops within fire resistive walls and partitions containing flush mounted devices such as outlet boxes, electrical cabinets and mechanical cabinets mounted back to back and spaced less than 24 inches on center in accordance with UL Fire Resistance Directory "Wall Opening Protective Materials", Category CLIV.

D. For those products requiring mixing before application, comply with through-penetration firestopping system manufacturer's written instructions for accurate proportioning of materials, water (if required), type of mixing equipment, selection of mixer speeds, mixing containers, mixing
time, and other items or procedures needed to produce products of uniform quality with optimum performance characteristics for application indicated.

PART 3 - EXECUTION

3.1 EXAMINATION
A. Examine substrate surfaces to receive firestopping systems and associated work and conditions under which work will be installed. Do not proceed until unsatisfactory conditions have been corrected in a manner acceptable to the Installer. Starting of work within a particular area will be construed as installer’s acceptance of surface conditions.

3.2 PREPARATION
A. Surface Cleaning: Clean out openings and joints immediately prior to installing firestopping to comply with recommendations of firestopping manufacturer and the following requirements:
   1. Remove foreign materials from surfaces of openings, joints and penetrating items that could interfere with adhesion of firestopping.
   2. Clean opening and joint substrates and penetrating items to produce clean, sound surfaces capable of developing optimum bond with firestopping. Remove loose particles remaining from cleaning operation.
   3. Remove laitance and form release agents from concrete.

B. Priming: Prime substrates where recommended by firestopping manufacturer using that manufacturer’s recommended products and methods. Confine primers to areas of bond; do not allow spillage and migration onto exposed surfaces.

C. Masking Tape: Use masking tape to prevent firestopping from contacting adjoining surfaces that will remain exposed upon completion of Work and that would otherwise be permanently stained or damaged by such contact or by cleaning methods used to remove smears from firestopping materials. Remove tape as soon as it is possible to do so without disturbing firestopping’s seal with substrates.

3.3 INSTALLATION OF THROUGH-PENETRATION FIRESTOPS
A. General: Comply with the “System Performance Requirements” article and the through-penetration firestop manufacturer’s installation instructions and drawings pertaining to products and applications indicated.

B. Install forming/damming materials and other accessories of types required to support fill materials during their application and in the position needed to produce the cross-sectional shapes and depths required to achieve fire ratings of designated through-penetration firestop systems. After installing fill materials, remove combustible forming materials and other accessories not indicated as permanent components of firestop systems.

C. Install fill materials for through-penetration firestop systems by proven techniques to produce the following results:
   1. Completely fill voids and cavities formed by openings, forming materials, accessories, and penetrating items.
   2. Apply materials so they contact and adhere to substrates formed by openings and penetrating items.
   3. For fill materials that will remain exposed after completing Work, finish to produce smooth, uniform surfaces that are flush with adjoining finishes.

3.4 CLEANING
A. Clean off excess fill materials and sealants adjacent to openings and joints as work progresses by methods and with cleaning materials approved by manufacturers of firestopping system products and of products in which opening and joint occur.

B. Protect firestopping system components during and after curing period from contact with contaminating substances or from damage resulting from construction operations or other causes so that they are without deterioration or damage at time of Final Acceptance. If, despite such protection, damage or deterioration occurs, cut out and remove damaged or deteriorated firestopping immediately and install new materials to produce firestopping complying with specified requirements.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL
A. The work described in this section will be paid for on a lump sum basis for firestopping per location indicated wherein no measurement will be made.

END OF SECTION 07840
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies compression seals, joint fillers, and sealants.

B. The applications of seals and sealants required include the following:

1. Pavement, curb, and walk joints.
2. Control and expansion joints.
3. Flashing reglets and retainers.
5. Joint fillers and sealants, other than firestopping, around penetrations of equipment, and services through walls and floors.

C. Firestopping seals and sealants are specified under Section 07840, “Firestopping”.

1.2 REFERENCED STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM C719 - Standard Test Method for Adhesion and Cohesion of Elastomeric Joint Sealants under Cyclic Movement (Hockman Cycle)
2. ASTM C834 - Standard Specification for Latex Sealants
7. ASTM D2000 - Standard Classification System for Rubber Products in Automotive Applications
8. ASTM D2628 - Standard Specification for Preformed Polychloroprene Elastomeric Joint Seals for Concrete Pavements

1.3 SUBMITTALS

A. Product Data: Submit manufacturer’s specifications, recommendations, and installation instructions for each type of sealant and associated miscellaneous material required. Include manufacturer’s published data, or letter of certification, or certified test laboratory report indicating that each material complies with the requirements and is intended specifically for the applications shown.

B. Samples: Submit three of each type of the following materials used in the work. The Contracting Officer will review for color, shape, and texture only.

1. Compression seals: 12 inches long.
2. Sealants: 12 inch long samples of each color required (except black) for each type of sealant exposed to view. Install sample between two strips of material similar to or representative of typical surfaces where sealant or compound is to be used, and spaced apart to represent typical joint widths.
3. Sealant colors: Fully cured beads of each color used, each 6 inches long.
4. Color chips: Do not submit color chips. Submit actual samples of the materials.

1.4 QUALITY ASSURANCE

A. Performance Criteria: Install seals and sealants to perform as durable air-tight and watertight joints for the applications and exposures indicated, and to be free of adhesion and cohesion failures; to be resistant to abrasion, weather, extrusion, migration, and staining; and not to deteriorate in any other manner not clearly indicated by submitted manufacturer’s data as an inherent quality of the material.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Store products in approved dry area and protect from contact with soil and from exposure to the elements. Keep products dry.
1.6 JOB CONDITIONS

A. Weather Conditions: Do not proceed with installation of sealants under adverse weather conditions, or when temperatures are below or above manufacturer's recommended limitations for installation. Proceed with the work only when forecast weather conditions are favorable for proper cure and development of high early bond strength. Wherever joint width is affected by ambient temperature variations, install elastomeric sealants only when temperatures are in the lower third of manufacturer's recommended installation temperature range, so that sealant is not subjected to excessive elongation and bond stress at subsequent low temperatures.

B. Application of seals or sealants when ambient temperature is lower than 40 degrees F or when there is ice, frost, or dampness visible on surfaces to be sealed is prohibited.

1.7 WARRANTY

A. Furnish four year warranty in addition to one year warranty requirements of the General Provisions for a total of five years issued jointly by the manufacturer and the installer. Replace joints failing to meet this warranty. Replacement shall cover materials and labor.

PART 2 - PRODUCTS

2.1 GENERAL PRODUCT SELECTION REQUIREMENTS

A. Colors:
   1. Provide custom-made, factory premixed color to match material adjacent to joint or area to be sealed. Where an approved manufacturer cannot provide color-match, use custom colors by another approved manufacturer.
   2. Where sealant is not exposed to view, provide manufacturer's standard color which has the best overall performance characteristics for the application shown.

B. Compatibility: Before purchase of each specified sealant, investigate its compatibility with the joint surfaces, joint fillers and other materials in the joint system. Provide only materials (manufacturer's recommended variation of the specified materials) which are known to be fully compatible with the actual installation conditions, as shown by manufacturer's published data or written certification.

C. Non-Staining Requirement: Provide all products, adhesives, and primers non-staining to the adjacent surfaces when tested in accordance with ASTM C1248.

D. Shelf-Life: Do not use materials if shelf-life of products exceeds manufacturers published shelf-life for these materials.

2.2 COMPRESSION SEAL MATERIALS

A. Paving Compression Seals: Pre-compressed, hollow or compartmentalized neoprene extrusion, designed to withstand compression to 40 percent of normal width without extrusion from joint, and with full recovery; with heavy, durable top member, suitable for long-term exposure to severe traffic abrasion and contamination; complying with ASTM D2628.

B. Neoprene Gaskets: Extruded neoprene gaskets, complying with ASTM D2000, designation 2BC 415 to 3BC 620, black; of the profile shown or, if not shown, as required by the joint shape, size and movement characteristics to maintain a watertight and airtight seal.

C. Lubricant Adhesive and Splicing Adhesive: Non-staining, one-part, of the type recommended by the manufacturer of the compression seals, as appropriate for the use and substrates being adhered.

2.3 SEALANTS

A. Horizontal Joints Subject to Traffic: Polyurethane-based, either one-part elastomeric sealant, complying with ASTM C920, Class 25, Grade P, Type 5 or two-part elastomeric sealant, complying with ASTM C920, Class 25, Grade P, Type M as shown, or as recommended by manufacturer for application indicated.

B. Overhead, Vertical, and Horizontal Non-Traffic-Bearing Joints: Polyurethane based, low modulus, one-part elastomeric sealant, complying with or two-part elastomeric sealant, complying with ASTM C920, Class 25, Grade NS, Type M and as shown, or recommended by manufacturer for application indicated. Sealant shall have a minimum of 50 percent movement capability.

C. Overhead, vertical and horizontal non-traffic-bearing joints: silicone based, low modulus, one part elastomeric sealant, complying with ASTM C920 Class 25, Grade NS, Type S or two-part elastomeric sealant, complying with ASTM C920, Class 25, Grade NS, Type M and as shown or recommend by manufacturer for application intended. Sealant shall have a minimum of 50 percent movement capability.
D. Sanitary Sealant: Acrylic-latex based, one component sealant complying with ASTM C834 with anti-fungal additive for use in restrooms in joints without significant movement.

E. Latex sealant: Acrylic-latex or silicone-latex based, one component sealant complying with ASTM C834 for use in interior joints without significant movement. Use for perimeters of door frames and windows.

F. Primers: As recommended by sealant manufacturer tested for nonstaining and durability characteristics on samples of actual surfaces to be sealed.

G. Solvents, cleaning agents, and similar materials: As recommended by sealant manufacturer.

2.4 SEALANT BACKER ROD AND BOND-BREAKER TAPE

A. Backer Rod:

1. Compressible rod stock polyethylene foam or polyethylene-jacketed polyurethane foam, or other flexible, permanent, durable non-absorptive material which will maintain a uniform round or oval cross-sectional shape when compressed into joint, and which is recommended for compatibility with sealant by the sealant manufacturer.

2. Provide size and shape of rod which will control the joint depth for sealant placement, break bond of sealant at bottom of joint, form optimum shape of sealant bead on back side, and provide a highly compressible backer to minimize the possibility of sealant extrusion when joint is compressed.

B. Bond Breaker Tape: Polyethylene tape or other plastic tape as recommended by the sealant manufacturer, to be applied to sealant-contact surfaces where bond to the substrate or joint filler must be avoided for proper performance of sealant. Provide self-adhesive tape wherever practicable.

2.5 JOINT FILLERS

A. General:

1. Color: Provide each concealed material in manufacturer's standard color which has the best overall performance characteristics for the application shown. For exposed materials provide color selected from manufacturer's standard products, unless a special color requirement is indicated.

2. Compatibility: Before purchase of each filler material, confirm that it is compatible with the substrate, sealants, and other materials in the joint system.

3. Adhesives: Pressure sensitive adhesives, compatible with each material in the joint system, may be applied to one face of joint fillers to facilitate installation and permanent anchorage. Do not allow adhesives to contaminate sealant bond surfaces in the joint system.

4. Bituminous fillers, lubricants, and adhesives are prohibited.

5. Provide fillers as specified in this section, except as required in specific work sections.

B. Closed-Cell Neoprene Joint Filler (Paving joints below sealants, compression seals, and below expansion joint covers).

1. Provide expanded neoprene complying with ASTM D1056, Class SC (oil-resistant and medium swell), of 2 to 5 psi compression deflection (Grade SCE 41); except provide 13 to 17 psi compression deflection (Grade SCE 44) wherever filler is applied under sealant exposed to traffic.

2. Products offered by manufacturers to comply with the requirements include the following:

   b. Closed Cell Neoprene: Rubatex Corp.
   c. Neoprene NN; Williams Products, Inc.
   d. Or approved equal.

C. Sponge Rubber Joint Filler (Exposed joints in concrete surfaces):

1. Provide resilient, non-extruding, open-cell type premolded rubber, color to match concrete, complying with ASTM D1752, Type I.

2. Products offered by manufacturers to comply with the requirements include the following:

b. Gray Sponge Rubber; W.R. Meadows, Inc.

c. Concrete Grey; Williams Products, Inc.

d. Rubberfoam; Sonnebom/Contech, Inc.

e. Or approved equal.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine joint surfaces and backing for insecure surfaces and other conditions that will adversely affect the quality of the installation. Do not proceed with the installation until adverse conditions have been corrected.

B. For joints where filler is exposed to view, such as not covered with sealant or finish materials, provide sponge rubber joint filler.

C. For joints where filler is hidden, such as below sealant and backer rod, provide closed cell neoprene joint filler.

3.2 PREPARATION

A. Clean joint surfaces of dirt, coatings, moisture, and other substances which could interfere with bond of sealant or seals by means of spatula, compressed air and approved cleaners. Remove trash and dirt from the full depth of each joint immediately before proceeding with priming and sealing.

B. Etch concrete and masonry joint surfaces and roughen vitreous and glazed joint surfaces where recommended by the sealant or seal manufacturer.

1. Etch with 5 percent solution of muriatic acid, neutralize with dilute ammonia solution, rinse thoroughly with water, and allow to dry before sealant installation.

2. Roughen joint surfaces on vitreous coated and similar non-porous materials with fine abrasive cloth or wool to produce a dull sheen.

3.3 INSTALLATION

A. General:

1. Comply with manufacturer's printed instructions except where more stringent requirements are shown or specified.

2. Prime or seal the joint surfaces wherever shown or recommended by the manufacturer. Do not allow primer/sealer to spill or migrate onto adjoining surfaces.

B. Compression Seals:

1. If adjacent surfaces are to receive waterproofing, install compression seals prior to application of waterproofing.

2. Lubricate joints by coating both sides of joint with lubricant/adhesive.

3. While lubricant/adhesive is still wet, install compression seals to depth shown.

4. Recess exposed edges slightly behind adjoining surfaces, unless otherwise shown, so that compressed units will not protrude from joints.

5. Bond ends together with adhesive or adhere by other means as recommended by manufacturer to ensure continuous watertight and airtight performance. Miter-cut and bond ends at corners unless molded corner units are provided.

C. Joint Fillers:

1. Set joint filler units at depth or position, fully filling joint as shown, to coordinate with other work, including installation of bond breakers, backer rods, and sealants. Do not leave voids or gaps between ends of joint filler units.

2. Recess exposed joint fillers, slightly behind adjoining surfaces, unless otherwise shown, so that compressed units will not protrude from the joint.

Do not proceed with installation of sealants over joint surfaces which have been painted, lacquered, waterproofed, or treated with water repellent or other coating or treatment unless a test for durability (bond and cohesion) in compliance with ASTM C719 has successfully demonstrated that sealant bond is not impaired by coating or treatment. Remove bond-impairing coatings or treatments from joint surfaces before installing sealant.
D. Backer-Rod:

1. Install sealant backer rod at all liquid-applied elastomeric sealant locations, except where specifically noted to be omitted or recommended to be omitted by sealant manufacturer for the particular applications shown.

2. Install bond breaker tape in lieu of backer rod at joints having insufficient depth for proper sealant coverage over a backer rod.

3. Depth of backer rod: Install backer rod at a depth which allows sealant to be installed within the thickness limits specified below.

4. Install joint fillers and backer rods without gaps or voids between ends of units and without ends of units protruding from joints.

E. Bond Breaker Tape: Install bond breaker tape where shown and where recommended by manufacturer to ensure that sealants will perform properly.

F. Sealants:

1. Thickness (Depth): Install sealants to depths as shown or, if not shown, as recommended by the sealant manufacturer but within the following general limitations, measured at the center (thin) section of the bead.

   a. For walkways, pavements and similar joints sealed with elastomeric sealants and subject to traffic and other abrasion and indentation exposures, fill joints to a depth equal to 75 percent of joint width, but not more than 5/8 inch deep or less than 3/8 inch deep.

   b. For normal moving joints bonded with elastomeric sealants, but not subject to traffic, fill joints to a depth equal to 50 percent of joint width, but not more than 1/2 inch deep or less than 1/4 inch deep.

2. Employ installation techniques which will ensure that sealants are deposited in uniform, continuous ribbons without gaps or air pockets, with complete wetting of joint bond surfaces equally on opposite sides. Except as otherwise shown, fill sealant rabbet to slightly concave surface, slightly below adjoining surfaces. Where horizontal joints are between horizontal surface and vertical surface, fill joint to form slight cove, so that joint will not trap moisture and dirt.

3. Spillage: Do not allow sealants or compounds to overflow from confines of joints, to spill onto adjoining work or to migrate into voids of exposed finishes. Eliminate evidence of spillage.

4. Granite joints: Seal joints in granite work with sealant, except granite paving joints that are shown to be grouted.

3.4 CURING AND PROTECTING

A. Cure sealants in compliance with manufacturer's recommendations, to obtain high early bond strength, internal cohesive strength and surface durability.

B. Cure and protect joint sealants during construction period, so that they will be without deterioration or damage, other than normal wear and weathering, at time of final acceptance.

C. Replace or restore sealants damaged or deteriorated during construction.

3.5 CLEANING

A. Immediately clean adjacent surfaces which have been soiled, and leave the work in a neat, clean condition. Use cleaning fluid, solvent, of type recommended by sealant manufacturer.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described under this section will not be measured, but shall be considered as incidental to other items of work.

END OF SECTION 07900
SECTION 08115
HOLLOW METAL DOORS AND FRAMES

PART 1 - GENERAL

1.1 SUMMARY

A. Work required for this section includes custom-fabricated, commercial-quality steel doors, frames and supplementary items necessary to complete their installation.

1.2 REFERENCE STANDARDS

A. American National Standards Institute (ANSI):
   1. ANSI/SDI A250.4 - Test Procedure and Acceptance Criteria for Physical Endurance for Steel Doors and Hardware Reinforcements
   2. ANSI/SDI A250.10 - Test Procedure and Acceptance Criteria for Prime Painted Steel Surfaces for Steel Doors and Frames

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A153 - Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware
   2. ASTM A653 - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process
   3. ASTM A780 - Standard Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings
   4. ASTM A1008 - Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability
   5. ASTM A1011 - Standard Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability

C. Door & Hardware Institute (DHI):
   1. DHI A115 - Series for Steel Door Preparation Standards

D. National Fire Protection Association (NFPA):
   1. NFPA 80 - Standard for Fire Doors and Windows

E. National Association of Architectural Metal Manufacturers (NAAMM):
   1. NAAMM AMP 500-505 - "Metal Finishes Manual"

F. National Association of Architectural Metal Manufacturers (NAAMM / Hollow Metal Manufacturers Association (HMMA)):
   1. NAAMM HMMA 831 - Recommended Hardware Locations for Custom Hollow Metal Doors and Frames
   2. NAAMM HMMA 861 - Guide Specifications for Commercial Hollow Metal Doors and Frames

G. The Society for Protective Coatings (Formerly known as Steel Structures Painting Council) (SSPC):
   1. SSPC SP 1 - Solvent Cleaning
   2. SSPC SP 3 - Power Tool Cleaning
   3. SSPC SP 6 - Commercial Blast Cleaning - NACE No. 3
   4. SSPC Paint 20 - Zinc-Rich Primers (Type I - Inorganic & Type II - Organic)

1.3 SUBMITTALS

A. Product Data: Include construction details, material descriptions, core descriptions, label compliance, fire-resistance ratings, and finishes for each type of door and frame specified.

B. Shop Drawings: Show fabrication and installation of doors and frames. Include details of each frame type, elevations of door design types, conditions at openings including surrounding materials, details of construction, dimensions of profiles and hardware preparation, location and installation requirements of door and frame hardware and reinforcements, and details of joints and connections. Show anchorage and accessories.

C. Door Schedule: Submit schedule of doors and frames using same reference numbers for details and openings as those on Drawings.

D. Product Certificates: Signed by manufacturers of doors certifying that products furnished comply with or exceed the acceptance criteria of ANSI/SDI A250.4 for Level A doors.
1.4 QUALITY ASSURANCE

A. Manufacturer Qualifications: A firm experienced in manufacturing custom steel doors and frames similar to those indicated for this project and with a record of successful in-service performance, as well as sufficient production capacity to produce required units.

B. Fire-Rated Door Assemblies: Assemblies complying with NFPA 80 that are listed and labeled by a testing and inspecting agency acceptable to authorities having jurisdiction, for fire ratings indicated, based on testing according to UBC 7-2 (1997) and UL 10C.

1. Test Pressure: After 5 minutes into the test, the neutral pressure level in furnace shall be established at 40 inches or less above the sill.

2. Smoke-Labeled Doors: For 20-minute-rated doors and doors scheduled as smoke- and draft-controlled assemblies, provide doors that a smoke-control rating of 20 minutes. Fire-rating label shall have the letter "S" following the hourly fire rating.

3. Notify Contracting Officer, prior to fabrication, if fire doors indicated cannot qualify for labeling because of design, size, hardware or other reason.

4. If door specified as fire rated and labeled can be obtained from one manufacturer, no consideration will be given to those manufacturers who are not authorized to fabricate and label items.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver doors and frames palleted, wrapped, or crated to provide protection during transit and storage. Do not use nonvented plastic.

B. Inspect doors and frames, on delivery, for damage. Minor damage may be repaired provided refinished items match new work otherwise, remove and replace damaged items.

C. Store doors and frames under cover at building site. Provide wood blocking between stacked doors to permit air circulation.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Hot-Rolled Steel Sheets: ASTM A1011, CS (commercial steel), Type B; free of scale, pitting, or surface defects; pickled and oiled.

B. Cold-Rolled Steel Sheets: ASTM A1008, CS (commercial steel), Type B.

C. Metallic-Coated Steel Sheets: ASTM A653, CS (commercial steel), Type B; with G60 zinc (galvanized) or A60 zinc-iron-alloy (galvannealed) coating.

D. Inserts, Bolts, and Fasteners: Manufacturer's standard units. Where items are to be built into exterior walls, zinc coat according to ASTM A153, Class C or D as applicable.

2.2 DOORS

A. General: Provide flush-design doors, 1-3/4 inches thick, of seamless hollow construction, meeting NAAMM HMMA 861. Construct doors with smooth, flush surfaces without visible joints or seams on exposed faces or stile edges.

1. Visible joints or seams around glazed inserts are permitted.

2. For single-acting swing doors, bevel both vertical edges 1/8 inch in 2 inches.

B. Core Construction: Provide the following core construction welded to both door faces:

1. Steel-Stiffened Core: 0.026-inch (22 gauge) steel vertical stiffeners extending full-door height, spaced not more than 6 inches apart and spot welded to face sheets a maximum of 6 inches o.c. Fill spaces between stiffeners with insulation of minimum 0.6-lb/cu. ft. density or sound deadener applied to inside surfaces of face sheets.

2. Fire Door Cores: As required to provide fire-protection and temperature-rise ratings indicated.

C. Seals: Obtain fire rating without use of intumescent seals.

D. Astragals: As required by NFPA 80 to provide fire ratings indicated.

E. Top and Bottom Channels: Spot weld metal channel not less than thickness of face sheet to face sheets not more than 6 inches o.c.

1. Reinforce tops and bottoms of doors with inverted horizontal channels of same material as face sheet so flanges of channels are even with bottom and top edges of face sheets.
F. Hardware Reinforcement: Fabricate reinforcing plates from the same material as door to comply with the following:

1. Hinges and Pivots: 0.167 inch (7 gauge) thick by 1-1/2 inches wide by 6 inches longer than hinge, secured by not less than 6 spot welds.
2. Lock Face, Flush Bolts, Closers, and Concealed Holders: 0.093 inch (12 gauge) thick.
3. Other Surface-Mounted Hardware: 0.053 inch (16 gauge) thick.

G. Glass Molding and Stops: Provide frame for glazed openings between face sheets continuously around perimeter of glass opening and weld to face sheets.

1. Form frame with integrally formed stop on security side.
2. Miter corners, weld and grind smooth.
3. Do not overlap molding on face of door.
4. Use 20 gauge loose stop for flush glazing.
5. Apply stop to frame with countersunk screws 6 inches on centers.

H. Interior Doors: Fabricate face sheets of doors from two 0.042 inch (18 gauge) thick, cold-rolled, stretcher-leveled steel sheets and other metal components from hot- or cold-rolled steel sheets unless noted to be galvanized.

I. Galvanized Steel Doors: Fabricate face sheets of doors from two 0.053 inch (16 gauge) thick, stretcher-leveled, metallic-coated steel sheets.

1. Close bottom edge with metallic-coated steel closing channel and top edge with filler channel of same material, so webs of channels are flush with bottom and top door edges.
2. Provide weep-hole openings in bottom of doors to permit entrapped moisture to escape.
3. Seal joints in top edges of doors against water penetration.
4. Provide galvanized doors at following locations:
   a. Exterior doors.
   b. Elevator equipment room doors.
   c. Other locations indicated.

2.3 FRAMES

A. Fabricate frames meeting NAAMM HMMA 861, of full-welded unit construction, with comers mitered, reinforced, and continuously welded full depth and width of frame. Knockdown frames are not acceptable.

1. For exterior use, form frames from 0.067 inch (14 gauge) thick, metallic-coated steel sheets.
2. For interior use, form frames from cold- or hot-rolled steel sheet of the following thicknesses:
   a. Openings up to and Including 48 Inches Wide: 0.053 inch (16 gauge).
   b. Openings More Than 48 Inches Wide: 0.067 inch (14 gauge).

B. Hardware Reinforcement: Fabricate from same material as frame. Minimum thickness of steel reinforcing plates for the following hardware:

1. Hinges and Pivots: 0.167 inch (7 gauge) thick by 1-1/2 inches wide by 6 inches longer than hinge, secured by not less than 6 spot welds.
2. Strikes, Flush Bolts, and Closers: 0.093 inch (12 gauge).
3. Surface-Mounted Hold-Open Arms and Panic Devices: 0.093 inch (12 gauge).

C. Mullions and Transom Bars: Provide closed or tubular mullions and transom bars where indicated. Fasten mullions and transom bars at crossings and to jambs by butt welding. Reinforce joints between frame members with concealed clip angles or sleeves of same metal and thickness as frame.

D. Supports and Anchors: After fabricating, galvanize units to be built into exterior walls according to ASTM A153, Class B.

E. Jamb Anchors: Weld jamb anchors to frames near hinges and directly opposite on strike jamb as required to secure frames to adjacent construction. Unless otherwise required for fire rating, provide anchors as follows.

1. Masonry Construction: Adjustable, flat, comugated, or perforated T-shaped anchors to suit frame size; formed of same material
as frame; not less than 0.053 inch thick; with leg not less than 2 inches wide by 10 inches long. Furnish at least the number of anchors per jamb according to the following frame heights:

a. Two anchors per jamb up to 60 inches in height.
b. Three anchors per jamb from 60 to 90 inches in height.
c. Four anchors per jamb from 90 to 96 inches in height.
d. One additional anchor per jamb for each 24 inches or fraction thereof more than 96 inches in height.

2. Metal-Stud Partitions: Insert type with notched clip to engage metal stud, welded to back of frames, formed of same material as frame, not less than 0.042 inch (18 gauge) thick. Provide at least the number of anchors for each jamb according to the following heights:

a. Three anchors per jamb up to 60 inches in height.
b. Four anchors per jamb from 60 to 90 inches in height.
c. Five anchors per jamb from 90 to 96 inches in height.
d. One additional anchor per jamb for each 24 inches or fraction thereof more than 96 inches in height.

3. In-Place Concrete or Masonry: Anchor frame jambs with minimum 3/8 inch diameter concealed bolts into expansion shields or inserts 6 inches from top and bottom and 26 inches o.c., unless otherwise indicated. Reinforce frames at anchor locations. Except for fire-rated openings, apply removable stop to cover anchor bolts, unless otherwise indicated.

F. Floor Anchors: Provide floor anchors for each jamb and mullion that extends to floor, formed of same material as frame, 0.067 inch (14 gauge) thick, as follows:

1. Monolithic Concrete Slabs: Clip-type anchors, with two holes to receive fasteners, welded to bottom of jambs and mullions.
2. Separate Topping Concrete Slabs: Adjustable type with extension clips, allowing not less than 2 inch height adjustment. Terminate bottom of frames at finish floor surface.

G. Head Anchors: Provide 2 head anchors for frames more than 42 inches wide and mounted in steel-stud walls.

H. Structural Reinforcing Members: Provide as part of frame assembly, at mullions, transoms, or other locations to be built into frame where required for additional support.

I. Head Reinforcement: For frames more than 48 inches wide in masonry wall openings, provide continuous steel channel or angle stiffener, 0.093 inch (12 gauge) thick for full width of opening, welded to back of frame at head.

J. Spread Bar: Provide removable spreader bar across bottom of frames, tack welded to jambs and mullions.

K. Rubber Door Silencers: Except on weather-stripped doors, drill stop in strike jamb to receive three silencers on single-door frames and drill head jamb stop to receive two silencers on double-door frames. Install plastic plugs to keep holes clear during construction.

L. Plaster Guards: Provide 0.016 inch (26 gauge) thick plaster guards or dust-cover boxes of same material as frame, welded to frame at back of hardware cutouts to close off interior of openings and prevent mortar or other materials from obstructing hardware operation.

2.4  STOPS

A. Provide stops on door frames and around glazed panels.

B. Form fixed stops integral with frame, unless otherwise indicated.

C. Provide removable stops around glazed panels, formed of 0.032 inch (20 gauge) thick steel sheets matching steel frames. Secure with countersunk flat or oval-head machine screws spaced uniformly not more than 12 inches o.c. Form corners with butted hairline joints.

D. Coordinate rabbet width between fixed and removable stops with type of glass or panel and type of installation indicated.

2.5  FABRICATION

A. Fabricate doors and frames rigid, neat in appearance, and free of defects, warp, or buckle. Accurately form metal to required sizes and
profiles. Weld exposed joints continuously; grind, fill, dress, and make smooth, flush, and invisible. Where practical, fit and assemble units in manufacturer's plant. Clearly identify work that cannot be permanently factory assembled before shipment, to assure proper assembly at Project site.

B. Hardware Preparation: Prepare doors and frames to receive hardware, including cutouts, reinforcement, mortising, drilling, and tapping, according to final hardware schedule and templates provided by hardware supplier. Comply with applicable requirements of DHI A115 Series specifications for door and frame preparation for hardware.

1. Reinforce doors and frames to receive surface-applied hardware. Drilling and tapping for surface-applied hardware may be done at Project site.

2. Locate hardware according to NAAMM HMMA 831, "Recommended Hardware Locations for Custom Hollow Metal Doors and Frames."

2.6 FINISHES

A. Comply with NAAMM AMP 500-505 - "Metal Finishes Manual " for recommendations for cleaning, treating, priming, and when specified, finishing.

B. Finish products specified in this Section after fabrication.

C. Metallic-Coated Steel Surface Preparation: Clean surfaces with nonpetroleum solvent so surfaces are free of oil and other contaminants. After cleaning, apply a conversion coating suited to primer to be applied over it. Clean welds, mechanical connections, and abraded areas, and apply galvanizing repair paint specified below to comply with ASTM A 780.

D. Non-Coated Steel Surface Preparation: Clean surfaces to comply with SSPC-SP 1, "Solvent Cleaning"; remove dirt, oil, grease, or other contaminants that could impair paint bond. Remove mill scale and rust, if present, from uncoated steel, complying with SSPC SP 3, "Power Tool Cleaning", or SSPC SP 6, "Commercial Blast Cleaning- NACE No. 3"

E. Factory Priming for Field-Painted Finish for Non-Coated Steel: Apply shop primers specified below immediately after surface preparation and pretreatment. Apply a smooth coat of even consistency to provide a uniform dry film thickness of not less than 0.7 mils.

1. Shop Primer: Manufacturer's or fabricator's standard, fast-curing, corrosion-inhibiting, lead- and chromate-free, universal primer complying with ANSI/SDI A250.10 acceptance criteria; compatible with substrate and field-applied finish paint system indicated; and providing a sound foundation for field-applied topcoats despite prolonged exposure.

F. Do not prime metallic-coated steel.

PART 3 - EXECUTION

3.1 INSTALLATION

A. General: Install doors and frames according to DHI A115.IG and manufacturer's written instructions.

B. Frames: Install steel frames for doors, transoms, sidelights, borrowed lights, and other openings, of size and profile indicated.

1. Floor anchors may be set with powder-actuated fasteners instead of masonry anchorage devices and machine screws, if so indicated on Shop Drawings.

2. Placing Frames: Set frames accurately in position; plumb; align, and brace securely until permanent anchors are set. After wall construction is complete, remove temporary braces and spreaders, leaving surfaces smooth and undamaged.

a. At existing concrete or masonry construction, set frames and secure in place with machine screws and masonry anchorage devices.

b. At fire-rated openings, install frames according to NFPA 80.

c. Field splice only at approved locations. Weld, grind, and finish as required to conceal evidence of splicing on exposed faces.

C. Doors: Fit non-fire-rated doors accurately in their respective frames, with the following clearances:

3. Bottom: 3/8 inch, if no threshold or carpet.

4. Bottom: 1/8 inch, at threshold or carpet.

D. Fire-Rated Doors: Install with clearances as specified in NFPA 80.

3.2 ADJUSTING AND CLEANING

A. Final Adjustments: Check and readjust operating hardware items just before final inspection. Leave work in complete and proper operating condition. Remove and replace defective work, including doors or frames that are warped, bowed, or otherwise unacceptable.

B. Factory-Finish Touchup: Immediately after erection, sand to feather-edge minor scratched, chipped, or damaged areas and apply touchup of compatible air-drying paint. Minor finish imperfections may be repaired provided finish matches new work finish and is approved by Contracting Officer; otherwise, remove and replace.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will be paid for on a lump sum basis for hollow metal doors and frames per location indicated wherein no measurement will be made.

END OF SECTION 08115
PART 1 - GENERAL

1.1 DESCRIPTION

A. Work required for this section includes access doors and frames in walls, floors, and ceilings, and supplementary items necessary to complete their installation:

1.2 REFERENCE STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM A36/A36M - Standard Specification for Carbon Structural Steel
2. ASTM A123/A123M - Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products
3. ASTM A153/A153M - Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware
4. ASTM A276 - Standard Specification for Stainless Steel Bars and Shapes
5. ASTM A480/A480M - Standard Specification for General Requirements for Flat-Rolled Stainless and Heat-Resisting Steel Plate, Sheet, and Strip
7. ASTM A591/A591M - Standard Specification for Steel Sheet, Electrolytic Zinc-Coated, for Light Coating Weight (Mass) Applications
8. ASTM A653/A653M - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process
9. ASTM A666 - Standard Specification for Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar
10. ASTM A780 - Standard Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings
11. ASTM A924/A924M - Standard Specification for General Requirements for Steel Sheet, Metallic-Coated by the Hot-Dip Process
12. ASTM A1008/A1008M - Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability

B. Military Specifications (ML):

1. MIL-PRF-26915 - Primer Coating, for Steel Surfaces

C. National Fire Protection Association (NFPA):

1. NFPA 80 - Standard for Fire Doors and Fire Windows

D. The Society for Protective Coatings (Formerly known as Steel Structures Painting Council) (SSPC):

1. SSPC-Paint 20 - Zinc-Rich Primers (Type I, "Inorganic," and Type II, "Organic")
2. SSPC-PA 1 - Shop, Field, and Maintenance Painting of Steel
3. SSPC-SP 3 - Power Tool Cleaning
4. SSPC-SP 6 - Commercial Blast Cleaning-NACE No. 3

1.3 SUBMITTALS

A. Product Data: For each type of door and frame indicated. Include construction details relative to materials, individual components and profiles, finishes, and fire ratings (if required).

B. Door Schedule: Provide complete door and frame schedule, including types, general locations, sizes, construction details, latching or locking provisions, and other data pertinent to installation.

C. Coordination Drawings: Reflected ceiling plans drawn to scale and coordinating penetrations and ceiling-mounted items with concealed framing, suspension systems, piping, ductwork, and other construction. Show the following:

1. Method of attaching door frames to surrounding construction.
2. Ceiling-mounted items including access doors and frames, lighting fixtures, diffusers, grilles, speakers, sprinklers, and special trim.

1.4 QUALITY ASSURANCE

A. Source Limitations: Obtain doors and frames through one source from a single manufacturer.

DART - September 2004 08313 - 1
B. Fire-Rated Access Doors and Frames: Units complying with NFPA 80 that are identical to access door and frame assemblies tested for fire-test-response characteristics that are labeled and listed by UL, ITS, or another testing and inspecting agency acceptable to authorities having jurisdiction.

C. Size Variations: Obtain Contracting Officer’s acceptance of manufacturer’s standard-size units, which may vary slightly from sizes indicated.

1.5 COORDINATION

A. Verification: Determine specific locations and sizes for access doors needed to gain access to concealed equipment, and indicate on door schedule specified in “Submittals” Article.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Following manufacturers listed are “acceptable” only if manufacturers can evidence product compliance with requirements of Contract Documents.

1. Acudor Products, Inc.
2. Cierra Products.
3. J. L. Industries, Inc.
5. Larsen’s Manufacturing Company.
7. Nystrom Building Products Co.
8. Williams Bros. Corporation of America (The).
9. Or approved equal.

2.2 MATERIALS

A. Steel Plates, Shapes, and Bars: ASTM A36/A36M.

B. Cold-Rolled Steel Sheets: ASTM A1008/A1008M, Commercial Steel (CS), stretcher-leveled standard of flatness; with minimum thickness indicated representing specified nominal thickness according to ASTM A568. Electrolytic zinc-coated steel sheet, complying with ASTM A591/A591M, Class C coating, may be substituted at fabricator’s option.

C. Metallic-Coated Steel Sheet: ASTM A653/A653M, Commercial Steel (CS), Type B, with A60 zinc-iron-alloy (galvannealed) coating or G60 mill-phosphatized zinc coating; stretcher-leveled standard of flatness; with minimum thickness indicated representing specified thickness according to ASTM A924.

D. Stainless-Steel Sheet, Strip, Plate, and Flat Bars: ASTM A666, Type 304; with minimum sheet thickness indicated representing specified thickness according to ASTM A480 with No. 4 satin finish.

E. Stainless-Steel Bars and Shapes: ASTM A276, Type 304.

F. Drywall Beads: Edge trim formed from 0.0299-inch zinc-coated steel sheet formed to receive joint compound and in size to suit thickness of gypsum board.

G. Plaster Bead: Casing bead formed from 0.0299-inch zinc-coated steel sheet with flange formed out of expanded metal lath and in size to suit thickness of plaster.

2.3 PAINT

A. Shop Primer for Ferrous Metal: Fast-curing, lead- and chrome-free, universal modified-alkyd primer complying with performance requirements in MIL-PRF-26915; selected for good resistance to normal atmospheric corrosion, compatibility with finish paint systems indicated, and capability to provide a sound foundation for field-applied topcoats despite prolonged exposure.

2.4 ACCESS DOORS AND FRAMES

A. Flush, Insulated, Fire-Rated Doors with Exposed Frame:

1. Metal: Steel, metallic-coated steel or stainless-steel sheet as scheduled.
2. Locations: Masonry and Ceramic-tile wall surfaces.
3. Fire-Resistance Rating: One and one-half hours.
4. Temperature Rise Rating: 250 deg F at the end of 30 minutes.
5. Door: Flush panel with a core of mineral-fiber insulation enclosed in sheet metal with a minimum thickness of 0.036 inch.
6. Frame: Minimum 0.060 inch thick sheet metal with 1 inch to 1-1/2 inch wide, surface-mounted trim.
10. Size: 12 inch by 12 inch unless otherwise indicated.

11. Basic-of-Design Product: Nystrom Building Products, model IT.

B. Flush, Insulated, Fire-Rated Doors with Trimless Frames:

1. Metal: Steel, metallic-coated steel or stainless-steel sheet as scheduled.
2. Locations: Gypsum board wall surfaces.
3. Fire-Resistance Rating: One and one-half hours.
4. Temperature Rise Rating: 250 deg F at the end of 30 minutes.
5. Door: Flush panel with a core of mineral-fiber insulation enclosed in sheet metal with a minimum thickness of 0.036 inch.
6. Frame: Minimum 0.060 inch thick sheet metal with drywall bead.
10. Size: 12 inch by 12 inch unless otherwise indicated.
11. Basic-of-Design Product: Nystrom Building Products, model IT.

C. Flush Doors with Exposed Frames:

1. Metal: Steel, metallic-coated steel or stainless-steel sheet as scheduled.
2. Locations: Masonry and Ceramic-tile wall surfaces.
3. Door: Minimum 0.075 inch thick sheet metal, set flush with exposed face flange of frame.
4. Frame: Minimum 0.060 inch thick sheet metal with 1 inch to 1-1/4 inch wide, surface-mounted trim.
5. Hinges: Continuous piano hinge.
7. Size: 12 inch by 12 inch unless otherwise indicated.
8. Basic-of-Design Product: Nystrom Building Products, model IW or IP as applicable.

D. Flush Doors with Trimless Frames:

1. Metal: Steel, Metallic-coated steel or stainless-steel sheet as scheduled.
2. Locations: Gypsum board wall and ceiling surfaces.
3. Door: Minimum 0.075 inch thick sheet metal, set flush with surrounding finish surfaces.
4. Frame: Minimum 0.060 inch thick sheet metal with drywall bead.
5. Hinges: Continuous piano hinge.
7. Size: 12 inch by 12 inch unless otherwise indicated.
8. Basic-of-Design Product: Nystrom Building Products, model NT.

2.5 FABRICATION

A. General: Provide access door assemblies manufactured as integral units ready for installation.

B. Metal Surfaces: For metal surfaces exposed to view in the completed Work, provide materials with smooth, flat surfaces without blemishes. Do not use materials with exposed pitting, seam marks, roller marks, rolled trade names, or roughness.

C. Steel Doors and Frames: Grind exposed welds smooth and flush with adjacent surfaces. Furnish attachment devices and fasteners of type required to secure access panels to types of supports indicated.

1. For trimless frames with drywall bead for installation in gypsum board assembly provide edge trim for gypsum board base securely attached to perimeter of frames.
2. For trimless frames with plaster bead for full-bed plaster applications, provide zinc-coated expanded metal lath and exposed casing bead welded to perimeter of frames.
3. Provide mounting holes in frames to attach frames to metal framing in metal stud construction and to attach masonry anchors in masonry construction.

D. Latching Mechanisms: Furnish number required to hold doors in flush, smooth plane when closed.

1. For cylinder lock, furnish two keys per lock and key all locks alike.
2. Coordinate with DART system keying.

2.6 FINISHES

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Finish metal fabrications after assembly.

C. Metallic-Coated Steel Finishes:
   1. Galvanizing: Hot-dip galvanize items indicated to comply with applicable standard listed below:
      a. ASTM A123/A123M, for galvanizing steel and iron products.
      b. ASTM A153/A153M, for galvanizing steel and iron hardware.
   2. Surface Preparation: Clean surfaces with nonpetroleum solvent so surfaces are free of oil and other contaminants. For galvanized surfaces, apply, after cleaning, a conversion coating suited to the organic coating to be applied over it. For metallic-coated surfaces, clean welds, mechanical connections, and abraded areas, and apply galvanizing repair paint specified below to comply with ASTM A780.
   3. Factory Priming for Field-Painted Finish: Apply shop primer immediately after cleaning and pretreating.

D. Steel Finishes:
   1. Surface Preparation: Prepare uncoated ferrous-metal surfaces to comply with minimum requirements indicated below for SSPC surface-preparation specifications and environmental exposure conditions of installed metal fabrications:
      a. Exteriors (SSPC Zone 1B): SSPC-SP 6, "Commercial Blast Cleaning-NACE No. 3."
      b. Interiors (SSPC Zone 1A): SSPC-SP 3, "Power Tool Cleaning."

E. Stainless-Steel Finishes:
   1. Remove tool and die marks and stretch lines or blend into finish.

2. Grind and polish surfaces to produce uniform, directionally textured, polished finish indicated, free of cross scratches. Run grain with long dimension of each piece.

3. Bright, Directional Polish: No. 4 finish. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.

PART 3 - EXECUTION

3.1 PREPARATION

A. Advise installers of other work about specific requirements relating to access door and floor door installation, including sizes of openings to receive access door and frame, as well as locations of supports, inserts, and anchoring devices.

3.2 INSTALLATION

A. Comply with manufacturer's written instructions for installing access doors and frames.

B. Set frames accurately in position and attach securely to supports with plane of face panels aligned with adjacent finish surfaces or recessed to receive finish material.

3.3 ADJUSTING AND CLEANING

A. Adjust doors and hardware after installation for proper operation.

B. Remove and replace doors and frames that are warped, bowed, or otherwise damaged.

3.4 SCHEDULE

A. Provide access doors, where indicated on the drawings, and where scheduled below.
   1. Provide access doors at concealed valves and controls for plumbing and HVAC.
   2. Provide fire rated access doors at rated walls and ceilings.
   3. Provide access doors at fire dampers above non-accessible ceilings.
   4. Provide access doors to motor operated doors and grilles above non-accessible ceilings.
   5. Provide access doors to attics with electrical junction boxes and system elements, concealed catwalks and maintenance platforms above ceilings.
   6. Provide zinc coated steel access doors at exterior locations.
7. Provide stainless steel access doors at ceramic tile and other damp locations.

8. Provide fire rated floor access doors at rated floors.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will be paid for on a lump sum basis for access doors and frames per location indicated wherein no measurement will be made.

END OF SECTION 08313
PART 1 - GENERAL

1.1 SUMMARY

A. Work required for this section includes aluminum-framed windscreens and supplementary items necessary to complete their installation.

B. Exterior aluminum-framed wall system at elevators is specified in Section 08913, "Glazed Aluminum Elevator Enclosures".

1.2 REFERENCE STANDARDS

A. American Architectural Manufacturers Association (AAMA):
   1. AAMA 611 - Voluntary Standards for Anodized Architectural Aluminum

B. American Welding Society (AWS):
   1. AWS A5.10/A5.10M - Specification for Bare Aluminum and Aluminum-Alloy Welding Electrodes and Rods

C. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A36/A36M - Standard Specification for Carbon Structural Steel
   2. ASTM A1008/A1008M - Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability
   3. ASTM A1011/A1011M - Standard Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability
   4. ASTM B209 - Standard Specification for Aluminum and Aluminum-Alloy Sheet and Plate
   5. ASTM B221 - Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes

D. Porcelain Enamel Institute (PEI):
   1. PEI ARCH S-100 - Specification for Architectural Porcelain Enamel on Steel for Exterior Use

E. The Society for Protective Coatings (Formerly known as Steel Structures Painting Council) (SSPC):
   1. SSPC PS Guide 12.00 - Guide to Zinc-Rich Coating Systems
   2. SSPC SP COM - Surface Preparation Commentary for Steel and Concrete Substrates

1.3 PERFORMANCE REQUIREMENTS

A. General: Provide aluminum-framed windscreens capable of withstanding loads and thermal and structural movement requirements indicated without failure, based on testing manufacturer's standard units in assemblies similar to those indicated for this Project.

   1. Deflection of framing members normal to wall plane is limited to 1/175 of clear span for spans up to 13 feet 6 inches and to 1/240 of clear span plus 1/4 inch for spans greater than 13 feet 6 inches or an amount that restricts edge deflection of individual glazing lites to 3/4 inch whichever is less.

B. Wind Loads: Provide aluminum-framed windscreens capable of withstanding wind-load design pressures calculated according to requirements of latest adopted Local Building Code.

C. Thermal Movements: Provide aluminum-framed windscreens that accommodate thermal movements of supporting elements resulting from the following maximum change (range) in ambient and surface temperatures without buckling, damaging stresses on glazing, damaging loads on fasteners, failure of doors or other operating units to function properly, and other detrimental effects.

   1. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.

1.4 SUBMITTALS

A. Product Data: Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for each type of product indicated.

B. Shop Drawings: Show details of fabrication and installation. Include plans, elevations, sections, details, and attachments to other work.

   1. Include setting drawings, templates, and directions for the installation of anchor bolts and other anchorages installed as a unit of work under other sections.

   2. Indicate where and how the system deviates from Contract Documents.

   3. Shop Drawings: Prepared by or under the supervision of a qualified professional engineer
1.6 PROJECT CONDITIONS

A. Field Measurements: Verify actual locations of structural supports for aluminum-framed systems by field measurements before fabrication and indicate measurements on Shop Drawings.

1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating aluminum-framed systems without field measurements. Coordinate construction to ensure that actual dimensions correspond to established dimensions.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Following manufacturers listed are "acceptable" only if manufacturer can provide evidence product compliance with requirements of Contract Documents.

2. Kawneer Company, Inc.
3. Tubelite Inc.
4. United States Aluminum Corp.
5. Vistawall Architectural Products.
6. Or approved equal.

2.2 MATERIALS

A. Aluminum: Alloy and temper recommended by manufacturer for type of use and finish indicated.

2. Extruded Bars, Rods, Profiles, and Tubes: ASTM B 221.
4. Structural Profiles: ASTM B 308/B308M.
5. Welding Rods and Bare Electrodes: AWS A5.10.
B. Steel Reinforcement: With manufacturer's standard corrosion-resistant primer complying with SSPC PS Guide 12.00 applied immediately after surface preparation and pretreatment. Select surface preparation methods according to recommendations in SSPC SP COM and prepare surfaces according to applicable SSPC standard.

1. Structural Shapes, Plates, and Bars: ASTM A36/A36M.
2. Cold-Rolled Sheet and Strip: ASTM A1008/A1008M.
3. Hot-Rolled Sheet and Strip: ASTM A1011/A1011M.

C. Framing Members: Manufacturer's standard extruded-aluminum framing members of thickness required and reinforced as required to support imposed loads.

D. Brackets and Reinforcements: Manufacturer's standard high-strength aluminum with nonstaining, nonferrous shims for aligning system components.

E. Fasteners and Accessories: Manufacturer's standard corrosion-resistant, nonstaining, nonbleeding fasteners and accessories compatible with adjacent materials.

F. Glazing: As specified in Division 8 Section "Glazing."

G. Glazing Gaskets: Manufacturer's standard compression types, replaceable, molded or extruded, that maintain uniform pressure and seal.

H. Spacers and Setting Blocks: Manufacturer's standard elastomeric types.

I. Porcelain Enamel Steel Panels:

1. Porcelain enamel steel panels: substantially vitreous, or glassy inorganic coating bonded to metal by fusion at a temperature above 800 deg. F, double sided panel with all edges finished.
2. Porcelain enamel steel panels shall meet the requirements of PEI ARCH S-100.
3. Steel panels are to be specially designed and fabricated for use in architectural porcelain enamel steel panels.
4. Finished faces of porcelain enamel panels shall have a maximum variation of 1/8 inch in both the convex and concave direction when measured perpendicular to the nominal plane of the panel face.
5. Surface hardness of porcelain enamel steel panels is to be 3.5 to 6 (Moh’s Scale).
6. Sizes and shapes of porcelain enamel steel panels are to be as indicated on the drawings.

7. Color of porcelain enamel steel panels is to match Benjamin Moore #1600, unless noted otherwise.

J. Hinges and Locks:

1. Hinges used at operable doors are to be heavy duty stainless steel continuous Markar FM-300 hinges.
2. Locks used at operable doors are to be Adams Rite #4712-628, with standard cylinder with Adams Rite style cam.
3. Coordinate keying with DART system keying.

K. Attachments shall have secure or vandal and tamper-resistant heads.

L. Neoprene Stops:

1. Neoprene stops shall be closed-cell, Type II.
2. Neoprene stops shall be continuous around frame opening.
3. Stops shall be installed with fasteners; adhesive may only be used to facilitate installation.

2.3 FABRICATION

A. Weld in concealed locations to greatest extent possible to minimize distortion or discoloration of finish. Remove weld spatter and welding oxides from exposed surfaces by descaling or grinding.

B. Framing Members: Fabricate components that, when assembled, have the following characteristics:

1. Profiles that are sharp, straight, and free of defects or deformations.
2. Accurately fitted joints with ends coped or mitered.
3. Physical and thermal isolation of glazing from framing members.
4. Accommodations for thermal and mechanical movements of glazing and framing to maintain required glazing edge clearances.
5. Fasteners, anchors, and connection devices that are concealed from view to greatest extent possible.

C. Door Frames: Reinforce as required to support loads imposed by door operation and for installing hardware.

1. Provide silencers at stops to prevent metal-to-metal contact. Install three silencers on strike jamb of single-door frames and two silencers on head of frames for pairs of doors.
D. After fabrication, clearly mark components to identify their locations in Project according to Shop Drawings.

2.4 **ALUMINUM FINISHES**

A. General: Comply with NAAMM’s “Metal Finishes Manual for Architectural and Metal Products” for recommendations for applying and designating finishes.

B. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.

C. Clear Anodic Finish: AA-M12C22A31 (Mechanical Finish: nonspecular as fabricated; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class II, clear coating 0.010 mm or thicker) complying with AAMA 611.

**PART 3 - EXECUTION**

3.1 **EXAMINATION**

A. Examine substrate surfaces to receive glazed aluminum partitions and associated work and conditions under which work will be installed. Do not proceed with work until unsatisfactory conditions have been corrected in a manner acceptable to installer. Starting work within a particular area will be construed as installer’s acceptance of surface conditions.

3.2 **INSTALLATION**

A. General: Comply with manufacturer’s written instructions.

1. Do not install damaged components.

2. Fit joints to produce hairline joints free of burrs and distortion.

3. Rigidly secure nonmovement joints.

4. Install anchors with separators and isolators to prevent metal corrosion and electrolytic deterioration.

B. Metal Protection:

1. Where aluminum will contact dissimilar metals, protect against galvanic action by painting contact surfaces with primer or by applying sealant or tape or installing nonconductive spacers as recommended by manufacturer for this purpose.

2. Where aluminum will contact concrete or masonry, protect against corrosion by painting contact surfaces with bituminous paint.

C. Install components plumb and true in alignment with established lines and grades, without warp or rack.

D. Install glazing as specified in Division 8 Section "Glazing."

E. Erection Tolerances: Install aluminum-framed systems to comply with the following maximum tolerances:

1. Location and Plane: Limit variation from true location and plane to 1/8 inch in 12 feet; 1/4 inch over total length.

2. Alignment: Limit offset from true alignment to:

   a. Where surfaces abut in line, 1/16 inch.

   b. Where surfaces meet at corners, 1/32 inch.

3. Diagonal Measurements: Limit difference between diagonal measurement to 1/8 inch.

**PART 4 - MEASUREMENT AND PAYMENT**

4.1 **GENERAL**

A. The work described in this section will be paid for on a lump sum basis for aluminum-framed windscreens per location indicated wherein no measurement will be made.

END OF SECTION 08413
1.1 DESCRIPTION

A. This section specifies providing door hardware as shown.

B. Any opening shown on plans requiring hardware and not specifically mentioned shall be furnished with hardware corresponding to that of similar openings. Any item of hardware not specifically called for in the hardware groups but obviously required for proper operation of the openings or compliance with the applicable codes, including handicapped requirements, if not brought to the attention of the Contracting Officer prior to bid date, is assumed to be included in the suppliers proposal.

1.2 REFERENCE STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A413/A413M - Standard Specification for Carbon Steel Chain

B. International Code Council (ICC):
   1. ICC/ANSI A117.1 - Accessible and Usable Buildings and Facilities

C. National Fire Protection Association (NFPA):
   1. NFPA 80 - Standard for Fire Doors and Fire Windows

D. Builders Hardware Manufacturers Association (BHMA):
   1. BHMA A156.1 - Butts and Hinges
   2. BHMA A156.3 - Exit Devices
   3. BHMA A156.4 - Door Controls - Closers
   4. BHMA A156.5 - Auxiliary Locks & Associated Products
   5. BHMA A156.8 - Door Controls - Overhead Stops and Holders
   6. BHMA A156.13 - Mortise Locks & Latches
   7. BHMA A156.16 - Auxiliary Hardware
   8. BHMA A156.18 - Materials and Finishes

1.3 SUBMITTALS

A. Shop Drawings: Include finish hardware schedule, prepared by a current certified AHC (Architectural Hardware Consultant), based on same set numbers as used on drawings and in hardware Schedule bound herein, manufacturer's literature, catalog cuts, model numbers, and other information necessary to identify and delineate in detail lockset functions, types of strike plates, hand and back set of locks, degree of closer openings, lengths of kick plates, lengths of flush bolts, types of stops, and other such pertinent data, following the criteria listed below.

   1. Finish Hardware Schedules: Based on finished hardware indicated, organize hardware schedule into groups or sets showing complete designations of every item required for each door opening. Horizontal hardware schedules are not acceptable and will not be reviewed by the Contracting Officer. Include the following:
      a. Number, locations, hand, and material of each door opening. (Hands and swings to be determined in relation to key side of opening.)
      b. Type, style, function, size, finish, and quantity of each hardware item.
      c. Name and manufacturer of each item.
      d. Fastening requirements.
      e. Explanation of abbreviations used.
      f. Special mounting locations and instructions.
      g. Keying Schedule: Submit separate detailed schedule indicating clearly how Authority's final instructions on keying of locks has been fulfilled.

   2. Furnish an index cross referencing door number, drawing hardware group, and suppliers hardware group. Schedule shall be vertical layout. Lines shall be double spaced; pages numbered and dated.

B. Samples:

   1. Finish: Manufacturer's standard, but not less than one 1 inch by 3 inch sample of each finish to be furnished. Submit with shop drawings.
2. The Contracting Officer reserves the right to require actual samples of each hardware item to be furnished. Samples will be returned to the Contractor for installation in the project.

3. Provide finishes so that color and surface finish or polish of various items match throughout the work. Nonmatching finishes will be rejected.

C. Documentation: Construction keying schedule.

D. Product Data:
   1. Submit catalog cuts of all items used in the suppliers schedule.
   2. Operating Instructions: Furnish Contracting Officer with two complete sets of installation instructions, including the manufacturer's catalog and maintenance instructions. One complete catalog shall be furnished for each manufacturer listed in the approved hardware schedule.

E. Six-Month Adjustment: Submit report upon completion of observations.

1.4 QUALITY ASSURANCE

A. Manufacturer: Obtain each kind of hardware (latch and locksets, hinges, closers, etc.) from one manufacturer even though several may be listed as acceptable.

B. Supplier: Subcontract the furnishing of hardware only to a recognized builders hardware supplier who has been furnishing hardware for a period of not less than 5 years and who has in his full time employed an Architectural Hardware Consultant to supervise the execution of this section. Consultant will be available at all reasonable time, during the course of the work, for project consultation with the Contracting Officer.

C. Contractor: Assign the installation of hardware to tradesmen experienced in the installation of commercial finish hardware.

D. Scheduled Designations: Except as otherwise indicated, the use of one manufacturer's numeric designation system in schedules does not imply other manufacturer's products will not be acceptable.

E. Fire-Rated Openings: Provide hardware for fire-rated openings in compliance with NFPA 80. This requirement takes precedence over other requirements for such hardware. Provide only hardware which has been tested and listed by UL and bears appropriate label or symbol for the types and sizes of doors required and compliance with the requirements of the required label and function of the opening.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Deliver products to Worksite in original unopened packages, clearly labeled with manufacturer's name, brand, specification identification data, and identification as shown on approved hardware schedule.

B. Store products in an approved dry area, protect from contact with soil, and from exposure to the elements. Keep products dry.

C. Handle products so as to prevent breakage of containers and damage to products.

1.6 WARRANTY

A. Warranty: All hardware shall be warranted by the manufacturer to be free from defects in materials and workmanship for a period of two years from substantial completion of the Project.

PART 2 - PRODUCTS

2.1 GENERAL

A. Uniformity: Provide hardware devices of each type, such as hinges, locking devices, bolts, and stops by the same manufacturer.

B. Template Hardware: Use templates to locate holes and mounting locations of hardware.
   1. Furnish templates and reinforcing units to hollow metal manufacturer.
   2. Make hardware to be applied to metal doors and frames to template and secure with machine screws.
   3. Manufacture hardware to conform to published templates generally prepared for machine screw installation. Do not provide hardware which has been prepared for self-tapping sheet metal screws.
C. Fastenings: Furnish finish hardware with all necessary bolts, screws, and other fastenings in suitable size, quantity, and type for heavy use and durability. Provide fastenings to match the hardware material and finish or, if exposed in surfaces of other work, to match the finish of such other work as closely as possible, including “prepared for paint” for surfaces to receive painted finish. Provide fastenings meeting the following requirements:

1. Furnish items for application to concrete or masonry with machine screws and expansion shields.
2. Furnish exit devices or other items for application to hollow or mineral core doors with hex bolts, unless otherwise specified.
3. Furnish items for application on applied veneer finishes with screws of sufficient length to provide solid connection to framing or backing behind them.
4. Furnish items for application to wood with wood screws.
5. Use Phillips head screws, countersunk, oval headed, for exposed screws.
6. Use full-threaded screws.
7. Provide concealed fasteners for hardware units which are exposed when the door is closed, except to the extent no standard units of the type specified are available with concealed fasteners. Do not use through bolts for installation where the bolt head or the nut on the opposite face is exposed in other work, except where it is not feasible to adequately reinforce the work and such through bolts are approved by the Contracting Officer.

D. Splicing of electrical wires for electrical items, to achieve specified lengths is not acceptable.

E. Hand of Door: The drawings show the direction of swing of each door leaf. Furnish each item of hardware for proper installation and operation of the door movement as shown.

F. Manufacturer’s Name Plate: Do not use manufacturer’s products which have manufacturer’s name or trade name displayed in a visible location (omit removable nameplates), except in conjunction with required UL labels and as otherwise acceptable to the Contracting Officer. Permit manufacturer’s identification on rim of lock cylinders only.

G. Base Metals: Produce hardware units of the basic metal and forming method indicated, using the manufacturer’s standard metal alloy, composition, temper and hardness, but in no case of lesser commercially recognized quality than BHMA A156.18. Do not furnish other materials or forming methods than those indicated, except as otherwise specified.

H. Tools for Maintenance: Furnish a complete set of specialized tools as needed for Contracting Officer’s use for adjustment, maintenance, and removal and replacement of hardware.

2.2 HARDWARE TYPES

A. General Requirements:

1. UL listing required for hardware applied to UL-labeled doors and frames.
2. Finish designations are U.S. Standards and are subject to approval for color, texture and appearance. Furnish finishes to match samples available from the Contracting Officer.

B. Common Requirements of All Hinges for Construction: Five knuckle, eight screw, full mortise, template type, flat button tip except where otherwise scheduled, non-rising pin.

C. Butt Hinges:

1. Permanently lubricated concealed bearings.
3. Height: 4-1/2 inches minimum.
4. Finish: As scheduled.

D. Intrusion Switch Hinge Feature (Switch Hinge): Where switch hinge is indicated on finish hardware schedule, provide one hinge at middle of jamb for each leaf, matching other hinges, having a weatherproof single pole magnetic switch and wires at least 18 inches long, designed to activate alarm or indicator when door is opened, 24 volts DC.

E. Electric Hinge Feature: Where electric hinges are indicated on finish hardware schedule, provide one hinge at middle of jamb for each leaf, matching other hinges, having concealed 24 volts DC power conduction capability and wires at least 18 inches long.
F. Hinges: BHMA A156.1 for Butt hinges: Button tips, types, and sizes as specified.

1. Quantity required per door leaf:
   a. Doors 61 inches to 90 inches in height: 1-1/2 pairs.
   b. Doors 91 inches to 120 inches in height: Two pairs.

2. Types:
   a. Exterior doors and doors from public passageways: Butts, Type A2111. Finish as shown (in the Schedule).
   b. Interior doors: Steel butts, Type A8112, plated. Finish as indicated (in the hardware schedule).

G. Locksets and Latchsets:

1. Construction: Heavy duty mortise lockset.
3. Latch bolt: 3/4 inch minimum throw, anti-friction type, brass with nylon split cam.
4. Guardbolt or triggerbolt (for deadlocking latch bolt): Brass.
5. Deadbolt: One inch throw, with rotating armor pin or hardened steel anti-saw insert.
7. Strike: Of same material as levers, curved extended lip with wrought strike box of anti-corrosive steel.
9. Construction cylinders: Key control system cylinders.
10. UL listing: Provide UL listed locksets at openings indicated to receive UL rated hardware.
11. Finish: As indicated in the Hardware Schedule.

H. Keying:

1. Cylinders: Lock cylinders shall be suitable for use in system wide Authority key control.
   a. For locksets: BHMA A156.5, with finish as indicated in the Hardware Schedule. Provide keying system which permits a rapid change-out of keys. As a minimum, provide a multiple level master key system to permit ease of use and convenience in changing key combinations when necessary.
   b. Provide key system to establish commonality of key-lock combinations, to the greatest possible extent, while still maintaining acceptable security.

2. Keys and keying:
   a. Stamped with the Authority inscription as provided by the Contracting Officer, and the words: DART AUTHORITY - DO NOT DUPLICATE, and with visual key control data.
   b. Quantity: Three keys for each core plus blanks equal to 10 percent of total keys furnished.

3. Key tags and holders: BHMA A156.5, Type A, Class 1, inscribed with key-change number and key-control symbol.

I. Push Plates and Door Pulls: Finish as indicated in the Hardware Schedule, and with the following additional requirements:

1. Push Plate: 3/16 inch by 10 inches by 20 inches, unless otherwise shown, with edges beveled.
2. Door pull: 3/4 inch round bar, 8 inches center to center, concealed fasteners; escutcheon plate same as push plate.

J. Door Closers: BHMA A156.4, Type CO2021, streamlined design, with the following additional requirements:

1. Surface-mounted.
2. Parallel arms.
3. Cover plate: Finish as indicated in the Hardware Schedule.
4. Parallel arms and drop brackets as necessary. Where hold-open feature is specified for closers, use type that permits doors to open 140 degrees, conditions permitting.

5. Qualities:
   a. Exposed: Overhead type, hydraulically controlled full rack and pinion operation, with separate adjustable regulator of closing speed, latching speed, backcheck control, and spring power. Provide parallel arm type closer for reverse bevel exterior doors. Closers mounted on non-public side of doors only.

6. Size: Provide in sizes according to manufacturer's published recommendation for each door size and weight with consideration for wind velocity at each location.

7. Case Material: Cast iron or aluminum case.

8. Cover Finish: As indicated in the Hardware Schedule.

9. Sources of exposed door closers: LCN, Sargent Yale, Russwin.

10. Where door closers are indicated for doors required to be accessible to the physically handicapped, provide adjustable units complying with both ICC/ANSI A117.1 and State of Texas Program for the Elimination of Architectural Barriers provisions and ADAAG for door opening force and delayed action closing.

K. Stops:
   1. Overhead-type, wall-type, or floor-type, and as follows:
      a. Overhead: BHMA A156.8, Type CO2511. Finish as indicated in the Hardware Schedule.
      b. Wall: BHMA A156.16, Type L12101. Finish as indicated in the Hardware Schedule.
      c. Floor: BHMA A156.16, Type L12141. Finish as indicated in the Hardware Schedule.

L. Flush Extension Bolts: BHMA A156.16, with finish as indicated in the Hardware Schedule.

   1. Dustproof strikes, Type L14021, provided for bolts located at bottom of doorleaf, except where metal thresholds are specified. Cut opening to suit bolt.
   2. Operating mechanism located approximately 6 feet from floor for top bolts and approximately 12 inches from floor for bottom bolts.
   3. Bolts located in edge of inactive leaf of pair of doors.
   4. Automatic flush bolts: BHMA A156.3, 4.4 Type 25. UL-listed for 1-1/2 hour, B-labeled double doors with strikes. Finish as indicated in the Hardware Schedule.

M. Weather Stripping:
   1. Sill: National Guard l5DKBN or approved equal.
   2. Head and jamb: National Guard l33NDKB or approved equal.

O. Padlock:
   1. Removable core with 2 keys, keyed and master keyed as directed. Key to match part of Authority systemwide keying.
   3. Five-pin tumblers.

P. Deadlock: BHMA A156.5, Type 190, with interchangeable-core cylinder.

2.3 SILENCERS

A. Provide each single leaf door with three silencers, or mutes. Provide each pair of doors with four silencers.

B. Material: Rubber.
2.4 HARDWARE FINISHES

A. Provide matching finishes for hardware units at each door or opening, to the greatest extent possible, and except as otherwise indicated. Reduce differences in color and textures as much as commercially possible where the base metal or metal forming process is different for individual units of hardware exposed at the same door or opening. In general, match items to the manufacturer's standard finish for the latch and lock set (or push-pull units if no latch-lock sets) for color and texture.

B. Provide finishes which match those established by BHMA.

C. Provide quality of finish, including thickness of plating or coating, composition, hardness, and other qualities complying with manufacturer's standards, but in no case less than specified for the applicable units of hardware by referenced standards or named products.

D. The designations scheduled to indicate hardware finishes are those listed in BHMA A156.18, including coordination with the traditional U.S. finishes shown by certain manufacturers for their products.

2.5 SCHEDULED HARDWARE QUALITY STANDARD

A. Requirements: The design, grade, function, finish, size, and other distinctive qualities of each type of builders' hardware is indicated in the Hardware Schedule. Products are identified by using hardware designation numbers of proprietary companies. These named products become the standard by which hardware is judged.

PART 3 - EXECUTION

3.1 INSTALLATION

A. General: Install finish hardware in accordance with manufacturer's templates and instructions. Fit hardware accurately and properly then fasten fixed parts securely for smooth, trouble-free and nonbinding operation. Fit faces of mortised parts snugly and flush. Install operating parts for free and smooth operation without binding, sticking or excessive clearance. Make maximum use of concealed fastenings for security.

B. Mount hardware units at heights recommended in "Recommended Locations for Builders' Hardware", published by the Door and Hardware Institute, except as otherwise specifically indicated or required to comply with governing regulations.

C. Set items level, plumb, and true to line and location. Adjust and reinforce the attachment substrate as necessary for proper installation and operation.

D. Drill and countersink units which are not factory-prepared for anchorage fasteners. Space anchors and fasteners in accordance with industry standards.

E. Locks, Latches, and Bolts: Install locks, latches, and bolts to automatically engage in strike or keeper, whether activated by closer or by manual push. Do not require additional manual pressure to engage latch or bolt.

F. Closers: Carefully adjust closers to operate evenly and noiselessly ensuring compliance with accessibility standards.

G. Mortar Shield Junction Box: Provide mortar shield junction boxes to hollow metal fabricator for use at electric and switch hinge locations; and connect conduit before frames are grouted.

H. Coordinate work of this section with work of other trades.

I. Apply finish hardware in a neat and workmanlike manner.

J. Prior to Final Acceptance, replace missing hardware.

K. Cut mortises neat, clean, and of proper net size.

L. Adjust hardware to operate as designed and replace hardware that is scratched, marred non-functioning, or otherwise damaged.

M. Provide keying in accordance with master keying schedule prepared by the hardware manufacturer. Deliver keying schedule and keys to the Contracting Officer prior to Final Acceptance.

N. Install UL-labeled hardware at doors indicated as rated.

3.2 ADJUSTING, CLEANING, AND DEMONSTRATING

A. Adjust and check each operating item of hardware and each door, to ensure proper operation or function of every unit. Replace units which cannot be adjusted to operate freely and smoothly as intended for application made.

B. Wherever hardware installation is made more than one month prior to acceptance or occupancy of space or area, return to work during week prior to acceptance or occupancy, and make final check and adjustment of hardware items. Clean operating items as necessary to restore proper function and finish of hardware and doors. Adjust
door control devices to compensate for final operation of heating and ventilating equipment.

C. Clean adjacent surfaces soiled by hardware installation.

D. Instruct Agency's personnel in proper adjustment and maintenance of hardware and hardware finishes, during final adjustment of hardware.

E. Six-Month Adjustment: Approximately six months after date of Final Acceptance, Installer, accompanied by representatives of manufacturers of latchsets and locksets and of door control devices, and of other major hardware suppliers, shall return to Project to perform following work:

1. Examine and re-adjust each item of door hardware as necessary to restore function of doors and hardware to comply with specified requirements.

2. Consult with and instruct Agency's personnel in recommended additions to maintenance procedures.

3. Replace hardware items that have deteriorated or failed due to faulty design, materials, or installation of hardware units.

4. Prepare written report of current and predictable problems (of substantial nature) in performance of hardware.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described under this section will not be measured directly, but shall be considered as incidental to other items of work.

B. The work described under this section will not be paid for directly, but the cost shall be allowed for in the cost of other related items of work for which finish hardware have been specified.

END OF SECTION 08710
1.1 DESCRIPTION

A. This Section specifies providing glass and sealing of glass areas.

1.2 REFERENCE STANDARDS

A. American National Standards Institute (ANSI):

1. ANSI Z97.1 - Safety Glazing Materials Used in Buildings - Safety Performance Specifications and Methods of Test

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM C158 - Standard Test Methods for Strength of Glass by Flexure (Determination of Modulus of Rupture)
2. ASTM C864 - Standard Specification for Dense Elastomeric Compression Seal Gaskets, Setting Blocks, and Spacers
4. ASTM C1036 - Standard Specification for Flat Glass
5. ASTM C1048 - Standard Specification for Heat-Treated Flat Glass - Kind HS, Kind FT Coated and Uncoated Glass
6. ASTM E774 - Standard Specification for the Classification of the Durability of Sealed Insulating Glass Units

1.3 SUBMITTALS

A. Samples of three each of the following:

1. Glass and safety plastic: 12 inches square, each material and type.
2. Cast glass blocks: One each type.
3. Glazing compound: One tube of each type.
4. Setting blocks and edge blocks.
5. Sealant: Cured color samples.
6. Gasket material: 12 inches long.

B. Product Data: Submit manufacturer’s product data for each of the glass types indicated. Include product description and performance criteria.

C. Certification: When glass is not cut to size by manufacturer and is furnished unlabeled from local stock, submit certification stating quality, thickness, type, and manufacturer of glass furnished.

1.4 QUALITY ASSURANCE

A. High-Impact Laminated Safety Glass shall comply with the following Testing Standards:

1. ANSI Z97.1
2. ASTM C158
3. ASTM C1036

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Deliver products to the Worksite in original unopened containers clearly labeled with manufacturer’s name and brand designation, referenced specification number, type, class, and rating as applicable. Deliver glass with each light bearing manufacturer’s label showing strength, grade, thickness, type, quality, and safety marking. Do not remove labels from glass until it has been set and inspected.

B. Store products in approved dry area, protect from contact with soil, and from exposure to the elements. Keep products dry.

C. Handle products so as to prevent breakage of containers and damage to products.

1.6 JOB CONDITIONS

A. Environmental Requirements:

1. Do not install glass when the ambient temperature is below 40 deg. F or expected to fall below 40 deg. F, unless otherwise approved by the Contracting Officer.
2. Do not apply glazing materials to unprotected surfaces in wet weather or to surfaces on which ice, frost, water, or dampness is visible.

1.7 WARRANTY

A. In addition to General Provisions, Paragraph 21, "Warranty of Construction", provide warranty for a period of 5 years for all materials and workmanship.
PART 2 - PRODUCTS

2.1 GLASS

A. Sheet glass: ASTM C1036, glazing select quality; 1/4 inch thick minimum.

B. Float glass: ASTM C1036, glazing select quality; 1/4 inch thick minimum.

C. Safety glass:
   1. Tempered: ASTM C1048, kind FT, glazing select quality, clear or colored as shown.
   2. Chemically Strengthened Laminated: ASTM C1048, kind HS, glazing select quality, 0.050 inch thick polyvinyl butyl sheet factory-laminated between two pieces of tempered safety glass, with protective edgecoat, clear or colored as shown.

D. Chemically Strengthened Laminated Safety Glass for Windscreens: Laminated glass panels, nominally 3/8 inch thick comprised of a layer each of 1/4 inch and 1/8 inch thick clear chemically strengthened glass with an interlayer of 0.050 inch clear poly vinyl butyl (PVB) and protective edgecoat. The 1/4 inch thick side shall be installed as the outer layer unless directed otherwise. Laminated safety glass panels shall have a minimum Modulus of Rupture (MOR) of 30,000 pounds per square inch (PSI). Glass panels shall be factory cut and laminated to exact dimensions required prior to shipment and labeled with same designation indicated on shop drawings to facilitate placement. Field cutting of glass panels will not be permitted.

   1. Each panel (including samples) shall be permanently marked prior to shipment to indicate: name of glass manufacturer; production date (day/month/year); Modulus of Rupture (MOR). Glass markings shall be located in the lower left corner of the panel and shall be clearly visible and legible after installation of panels.

   E. Insulated Glass at Elevators: Preassembled units complying with ASTM E774, Class CBA; two 1/4 inch nominal thickness clear laminated glass sheets separated by a 1/2 inch dehydrated space filled with air for a 1 inch nominal overall thickness of the unit. Provide spandrel glass at outer sheet where indicated. Each light shall have a permanent marking in accordance with ANSI Z97.1. Align markings in same corner of unit placed to be visible after installation. Laminated glass shall have polyvinyl butyl sheet interlayer and comply with ANSI Z97.1 and ASTM C1172. With low-emissivity sputtered on No. 2 surface.

2.2 GLAZING ACCESSORIES

A. Sealant: Polyurethane: ASTM C920, Type I and II, Class A. Color to match framing system in which installed.

B. Sealant: Silicone: ASTM C920, Type II, Class A. Color: Black.

C. Glazing compound: ASTM C920, Type I. Color to match framing system in which installed.

D. Glazing tape: Preformed 100 percent solids, polyisobutylenebutyl, pressure sensitive, pre-shimmed with built-in spacer of synthetic rubber size as shown or required. Flame spread 20 and smoke density 10 when tested in accordance with ASTM E84. Minus 40 deg. F to plus 200 degrees F service temperature range. Density 1.40 plus or minus 0.05 grams/cc. Comply with AAMA requirements for static, dynamic water infiltration and structural testing. Color, as directed. Tremco 440 Pre-shimmed tape or equal.

E. Pressure sensitive tape: Vinyl electrical tape, 3-M or approved equal.

F. Neoprene gasket: Extruded closed-cell neoprene, ASTM C864, 55 durometer Shore A hardness, profile shown or required.

G. Setting blocks: Neoprene, 70-90 durometer, shore A hardness approximately full channel width, 4 inches long and high enough to afford correct cover and 3/8 inch edge clearance for the glass.

H. Edge blocks (Spacers): Neoprene 40-50 durometer, shore A hardness approximately full channel width, 3 inches long and providing 3/8 inch edge clearance for the glass.

I. Glazing Gasket:
   1. Preformed 100 percent solids, polyisobutylenebutyl, pressure sensitive, of synthetic rubber size as shown or required.
   2. Flame spread 20 and smoke density 10 when tested in accordance with ASTM E84.
   4. Density 1.40 plus or minus 0.05 grams/cc.
   5. Comply with AAMA requirements for static, dynamic water infiltration and structural testing.
   6. Color as directed.
   7. Tremco NA-9119F or NA-9120F, or approved equal.
J. **Dielectric screw shield:** Nylon expansion anchor, round head, sized to ensure snug fit in predrilled hole and to accommodate size of screw used.

### PART 3 - EXECUTION

#### 3.1 PREPARATION

A. Verify dimensions before proceeding; obtain measurements at structure for work to be fitted to other construction, including wall-to-wall dimensions, floor-to-ceiling dimensions and those controlled by other trades.

B. Remove foreign substances from surfaces to receive glass and glazing accessories.

#### 3.2 INSTALLATION

A. Coordinate work of this section with installation of supporting substrates.

B. Size glass by measuring actual frames or sash. Sizes shown are approximate. Cut glass to form 3/8 inch bite on all sides.

C. Install glass or plastic using glazing gaskets or other glazing accessories as shown.

D. Set glass on setting blocks at each quarter point of sill with equal bearing for entire width of each panel. Accurately cutting glass to fit frames and provide smooth edges with no sharp or ragged surfaces.

E. Unless otherwise shown, set glass in metal interior frames and doors or by back face glazing with glazing compound; tape to prevent rattling. Reset glazing beads, if necessary, without marring or injuring finish.

F. Perform tape glazing of metal sash or frame after metal is cleaned of foreign material, including dust, dirt, grease, and moisture. Clean glass surfaces and wipe dry.

G. Place tape approximately 1/16 inch below sight line on fixed stops and apply around entire perimeter of opening. Cut tape with sharp shears. Do not overlap butt corners. Place spacer or centering shims, 3 inches in length, 3/16 inch in height and 3/32 inch in thickness, every 18 inches under tape. Hold spacers in position by gently placing them in contact with under edge of tape. Position setting blocks for installation of glass. Use setting blocks 1/4 inch in height.

H. Align glass carefully to opening and press glass firmly in place. Apply removable stops and repeat application of spacers of centering shims. Ensure that they are seated as deeply as possible in channel. Fill interior opening in conventional manner with glazing compound.

I. Set glass in exterior metal windows and doors with neoprene setting blocks at 1/4 points and neoprene spacers 2 inches long placed 18 inches on center, and glaze with sealants.

J. Install glass and glazing accessories in accordance with manufacturer's recommendations. Neatly apply sealants, compounds, and tapes in straight lines parallel with glazing rebates and as shown.

K. Perform direct glazing in dry weather, 40 deg. F or warmer.

L. Tape edges of laminated safety glass with pressure-sensitive tape, if sealant or glazing tape is incompatible with inner layer. Do not expose edges of laminated glass to solvents, cleaners or prolonged contact with water.

M. Set lead shim rings on lips at bottom of openings and blocks. Set glass blocks to bring flat face level with the top of frame, centered in openings. Use spacers to maintain blocks in position while filling the annular space with sealant as shown.

#### 3.3 INSTALLATION OF ELEVATOR HOISTWAYS

A. Install glazing at elevator hoistways as shown and in accordance with applicable requirements for glass and glazing.

B. Size screw holes for dielectric screw shields to permit installation so as to prevent metal-to-metal contact between screws and frame.

C. Apply sealant around entire frame, inside and outside, and at other areas where metals are joined resulting in unfilled space.

#### 3.4 FIELD QUALITY CONTROL

A. **Hose Tests:**

   1. Upon completion of glazing and sealing, perform hose test against exterior glazing, and framing members in the presence of the Contracting Officer.

   2. Use 3/8 inch minimum diameter hose operated at approximately 50 psi pressure, and a flow rate of not less than 25 gallons per minute for a duration time of 15 minutes. Hold hose at maximum distance of 15 feet from glazing to produce a circle of impact of not less than 5 feet, nor more than 6 feet in diameter, directed at glazing seals, framing members and joints. Repair leaks as soon as surfaces are dry; retest until approved.

B. **Breakage:** Prior to final acceptance, replace damaged glass.
C. Dielectric Testing:

1. After installation at elevator hoistways, test for electrical isolation between screws and hoistway metal, using ohmmeter.

2. Resistance requirement: 10,000 ohms.

3. Replace screws and shields that do not meet resistance requirements and retest as for initial installation. Repeat as necessary until all screws meet resistance requirement.

3.5 CLEAN-UP

A. At completion of work, remove labels, clean glass, and remove excess glazing compound and sealant from frames and surrounding finish work.

B. Remove from the Worksite rubbish and debris resulting from work of this section.

C. Leave areas surrounding work in broom-clean condition.

3.6 GLASS SCHEDULE

A. GL-1: 3/8 inch thick chemically strengthened laminated safety glass; clear.

B. GL-2: 1 inch thick insulating glass unit; both lights laminated, tinted and color to match Contracting Officer’s sample as shown.

C. GL-3: 1/4 inch thick float glass, clear.

D. GL-4: 9/16 inch thick laminated safety glass, clear.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will be paid for on a lump sum basis per location indicated wherein no measurement will be made.

END OF SECTION 08800
PART 1 - GENERAL

1.1 SUMMARY

A. Work required for this section includes decorative plastic glazing, including supplementary items necessary to complete their installation.

1.2 REFERENCED STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   2. ASTM D635 - Standard Test Method for Rate of Burning and/or Extent and Time of Burning of Plastics in a Horizontal Position
   4. ASTM D2843 - Standard Test Method for Density of Smoke from the Burning or Decomposition of Plastics

1.3 SUBMITTALS

A. Product Data: Indicate product description, fabrication information, compliance with specified performance requirements.

B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.

C. Samples for Initial Selection: Submit minimum 6 inch by 6 inch samples. Indicate full color and pattern variation.

D. Samples for Verification: Submit minimum 18 inch by 18 inch sample for each type, texture, pattern and color of solid polymer.

E. Maintenance Data: Submit manufacturer’s care and maintenance data, including care, repair and cleaning instructions. Include in Project close-out documents.

1.4 QUALITY ASSURANCE

A. Fire-Test-Response Characteristics: Provide original fire test reports to ensure compliance with the following requirements:
   1. Rate of Burning (ASTM D635): Class CC1 for a nominal thickness of 1.5 mm (0.060 in.)
   2. Self-Ignition Temperature (ASTM D1929): Greater than 650 deg F
   3. Density of Smoke (ASTM D2843): Less than 75 percent
   4. Flammability Classification (ASTM E84): Smoke less than 450, flamespread less than 75.

B. Impact Resistance: Provide decorative plastic glazing that comply with the following requirements:
   1. Impact Strength, Un-notched (23 degrees) (ASTM D4812): No breakage
   2. Impact Strength, Notched (23 degrees) (ASTM D256): 88J/m (1/16)

C. Allowable Tolerances:
   1. Maximum deflection: 1/16 inch over 12 inches.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Do not deliver decorative plastic glazing, system components and accessories to Project site until areas are ready for installation.

B. Handle materials to prevent damage to finished surfaces. Provide protective coverings to prevent damage or staining following installation for duration of project.

C. Before installing decorative plastic glazing, permit them to reach site temperature.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:
   1. 3-Form, Inc., Varia™
2. Or approved equal

2.2 MATERIALS

A. EcoResin™ Resin Sheet
   1. Engineered polyester resin, Glycol modified.
   2. Sheet Size: Maximum 4 feet x 10 feet
   3. Thickness: Minimum 1/16 inch

B. Interlayer Materials: Compatible with Polyester and bonding process to create a monolithic sheet of material when complete.

2.3 SELECTION

A. Product: Varia Collection, Custom Encapsulated Print
B. Gauge: 1/2 inch (two 1/4 inch layers).
C. Surface Finish: Stucco
D. UV Protection: Required
E. Edge Seal: Not required
F. Orientation: Vertical

2.4 FABRICATION

A. General: Fabricate decorative plastic glazing to designs, sizes and thicknesses indicated and to comply with indicated standards. Sizes, profiles and other characteristics are indicated on the drawings.
B. Arrange panels in shop or other suitable space in proposed sequence for examination by Artist. Mark units with temporary sequence numbers to indicate position in proposed layout.
   1. Lay out one elevation at a time if approved by Artist.
   2. Notify Artist seven days in advance of the date and time when layout will be available for viewing.
   3. Provide lighting of similar type and level as that of final installation for viewing layout, unless otherwise approved by Artist.
   4. Rearrange panels as directed by Artist until layout is approved.
   5. Obtain Artist's approval of layout before start of assembly. Mark units and Shop Drawings with assembly sequence numbers based on approved layout.
C. Comply with manufacturer's written recommendations for fabrication.
D. Machining: Acceptable means of machining are listed below. Ensure that material is not chipped or warped by machining operations.
   1. Sawing: Select equipment and blades suitable for type of cut required.
   2. Drilling: Drills specifically designed for use with plastic products.
   4. Routing
   5. Tapping
   6. Shearing and Punching: Acceptable only on 1/16 inch material.
   7. Die Cutting: Acceptable only on material 1/8 inch or less.
E. Forming: Form products to shapes indicated using the appropriate method listed below. Comply with manufacturer's written instructions.
   1. Cold Bending
   2. Hot Bending
   3. Thermoforming: Acceptable only on uncoated material.
   4. Drape Forming
   5. Matched Mold Forming
   6. Mechanical Forming
F. Laminating: Laminate to substrates indicated using adhesives and techniques recommended by manufacturer.

2.5 MISCELLANEOUS MATERIALS

A. General: Provide products of material, size, and shape required for application indicated, and with a proven record of compatibility with surfaces contacted in installation.
B. Cleaner: Type recommended by manufacturer.
C. Fasteners: Use screws designed specifically for plastics. Self-threading screws are acceptable for permanent installations.
D. Bonding Cements: Solvent or adhesives, suitable for use with product and application.

E. Drilled Panel Wall Anchors: Décor Cable, FMSPVC Wall Anchor or approved equal. Provide extensions to accommodate thicknesses scheduled or illustrated.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions where installation of decorative plastic glazing will occur, with Installer present, for compliance with manufacturer’s requirements. Verify that substrates and conditions are satisfactory for installation and comply with requirements specified.

3.2 INSTALLATION

A. General: Comply with manufacturer’s written instructions for the installation of decorative plastic glazing.

B. Shop fabricate items to the greatest degree possible.

C. Utilize fasteners, adhesives and bonding agents recommended by manufacturer for type of installation indicated. Material that is chipped, warped, hazed or discolored as a result of installation or fabrication methods will be rejected.

D. Install components plumb, level and rigid, scribed to adjacent finishes, in accordance with approved shop drawings and product data.

E. Form field joints using manufacturer’s recommended procedures. Locate seams in panels so that they are not directly in line with seams in substrates.

3.3 PROTECTION AND CLEANING

A. Protect decorative plastic glazing from contact with contaminating substances from construction operations. If, despite such protection, contaminating substances do come into contact with decorative plastic glazing, remove immediately and wash by method recommended by decorative plastic glazing manufacturer.

B. Remove and replace decorative plastic glazing that is broken, chipped, cracked, abraded, or damaged in other ways during construction period, including natural causes, accidents, and vandalism.

C. Wash plastic glazing on both faces before date scheduled for inspections intended to establish date of Substantial Completion in each area of Project. Wash plastic glazing by method recommended by decorative plastic glazing manufacturer.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will be paid for on a lump sum basis for decorative plastic glazing per location indicated wherein no measurement will be made.
SECTION 08913
GLAZED ALUMINUM ELEVATOR ENCLOSURES

PART 1 - GENERAL

1.1 SUMMARY

A. Work required for this section includes glazed aluminum elevator enclosures and supplementary items necessary to complete their installation.

B. Windscreens are specified in Section 08413, "Aluminum-Framed Windscreens".

1.2 REFERENCE STANDARDS

A. American Architectural Manufacturers Association (AAMA):

1. AAMA 501 - Methods of Test for Exterior Walls

2. AAMA 611 - Voluntary Standards for Anodized Architectural Aluminum

3. AAMA 2605 - Voluntary Specifications, Performance Requirements and Test Procedures for Superior Performing Organic Coatings and Aluminum Extrusions and Panels

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM A36/A36M - Standard Specification for Carbon Structural Steel

2. ASTM A240/A240M - Standard Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications

3. ASTM A1008/A1008M - Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability

4. ASTM A1011/A1011M - Standard Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability

5. ASTM B209 - Standard Specification for Aluminum and Aluminum-Alloy Sheet and Plate

8. ASTM C719 - Standard Test Method for Adhesion and Cohesion of Elastomeric Joint Sealants under Cyclic Movement (Hockman Cycle)

10. ASTM C1184 - Standard Specification for Structural Silicone Sealants

12. ASTM E283 - Standard Test Method for Determining Rate of Air Leakage Through Exterior Windows, Curtain Walls, and Doors Under Specified Pressure Differences Across the Specimen

C. The Society for Protective Coatings (Formerly known as Steel Structures Painting Council) (SSPC):

1. SSPC Paint 12 - Cold-Applied Asphalt Mastic (Extra Thick Film)

1.3 PERFORMANCE REQUIREMENTS

A. General: Provide glazed aluminum curtain-wall systems, including anchorage, capable of withstanding, without failure, the effects of the following:

1. Structural loads.

2. Movements of supporting structure indicated on Drawings including, but not limited to, story drift, twist, column shortening, long-term creep, and deflection from uniformly distributed and concentrated live loads.

3. Dimensional tolerances of building frame and other adjacent construction.
4. Failure includes the following:
   a. Deflection exceeding specified limits.
   b. Thermal stresses transferred to building structure.
   c. Framing members transferring stresses, including those caused by thermal and structural movements, to glazing.
   d. Noise or vibration created by wind and thermal and structural movements.
   e. Loosening or weakening of fasteners, attachments, and other components.
   f. Sealant failure.

G. Structural Sealant: Provide structural sealant capable of withstanding tensile and shear stresses imposed by curtain-wall systems without failing adhesively or cohesively. Provide sealant that fails cohesively before sealant releases from substrate when tested for adhesive compatibility with each substrate and joint condition required.

   1. Adhesive failure occurs when sealant pulls away from substrate cleanly, leaving no sealant material behind.
   2. Cohesive failure occurs when sealant breaks or tears within itself but does not separate from each substrate because sealant-to-substrate bond strength exceeds sealant’s internal strength.
   3. Design structural-sealant joints to produce tensile or shear stress in structural-sealant joints of less than 20 psi.

1.4 SUBMITTALS

A. Product Data: For each product indicated.

B. Shop Drawings: Prepared by or under the supervision of a qualified professional engineer licensed in State of Texas detailing fabrication and assembly of glazed aluminum curtain-wall systems.

   1. Include structural analysis data signed and sealed by the qualified professional engineer licensed in State of Texas responsible for their preparation.

C. Samples: For each exposed finish.

D. Product test reports.

E. Structural Sealant Test Reports: Compatibility and adhesion test reports from sealant manufacturer indicating that materials forming joint substrates and joint-sealant backings have been tested for compatibility and adhesion with sealants; include sealant manufacturer’s interpretation of test results for sealant performance and recommendations for primers and substrate preparation needed to obtain adhesion.

F. Field quality-control test reports.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: Acceptable to manufacturer and capable of preparing data for glazed aluminum curtain-wall systems including Shop Drawings based on testing and engineering analysis of manufacturer’s standard units in assemblies similar to those indicated for this Project.
B. Preinstallation Conference: Conduct conference at Project site.

C. Structural Sealant Testing: Perform sealant manufacturer's standard tests for compatibility and adhesion of sealants with each material that will come in contact with sealants and each condition required by curtain-wall systems.

1. Test a minimum of five samples of each metal, glazing, and other material.
2. Prepare samples using techniques and primers required for installed systems.
3. Perform tests under environmental conditions that duplicate those under which systems will be installed.
4. For materials that fail tests, determine corrective measures required to prepare each material to ensure compatibility with and adhesion of sealants.
5. After performing corrective measures on the minimum number of samples required for each material, retest materials.

1.6 WARRANTY

A. Finish Warranty on fluoropolymer finish: Manufacturer's standard form in which manufacturer agrees to repair or replace components on which finishes fail within specified warranty period. Warranty does not include normal weathering.

1. Warranty Period: 20 years from date of Final Acceptance.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Following manufacturers listed are “acceptable” only if manufacturer can evidence product compliance with requirements of Contract Documents.

2. Kawneer Company, Inc.
3. Tubelite Inc.
4. United States Aluminum Corp.
5. Vistawall Architectural Products.
6. Or approved equal.

2.2 FRAMING SYSTEMS

A. Aluminum: Alloy and temper recommended by manufacturer for type of use and finish indicated.

2. Extruded Bars, Rods, Shapes, and Tubes: ASTM B221.

B. Steel Reinforcement: With manufacturer's standard corrosion-resistant primer.

1. Structural Shapes, Plates, and Bars: ASTM A36/A36M.
2. Cold-Rolled Sheet and Strip: ASTM A1008/A1008M.
3. Hot-Rolled Sheet and Strip: ASTM A1011/A1011M.

C. Brackets and Reinforcements: Manufacturer's standard high-strength aluminum with nonstaining, nonferrous shims for aligning system components.

D. Fasteners and Accessories: Manufacturer's standard corrosion-resistant, nonstaining, nonbleeding fasteners and accessories compatible with adjacent materials.

1. Where fasteners are subject to loosening or turn out from thermal and structural movements, wind loads, or vibration, use self-locking devices.
2. Reinforce members as required to receive fastener threads.
3. At movement joints, use slip-joint linings, spacers, and sleeves of material and type recommended by manufacturer.

E. Anchors: Three-way adjustable anchors that accommodate fabrication and installation tolerances in material and finish compatible with adjoining materials and recommended by manufacturer.

F. Concealed Flashing: Dead-soft, 0.018-inch thick stainless steel, ASTM A240/A240M of type recommended by manufacturer.

G. Framing Gaskets: As recommended by manufacturer for joint type.

H. Framing Sealants: As recommended by manufacturer for joint type.
2.3 GLAZING SYSTEMS

A. Glazing: As specified in Section 08800, "Glass and Glazing."

B. Glazing Gaskets: Manufacturer's standard sealed-corner pressure-glazing system of black, resilient elastomeric glazing gaskets, setting blocks, and shims or spacers.

C. Structural Glazing Sealants: As recommended by manufacturer for joint type and as follows:

   1. Structural Sealant: ASTM C1184, neutral-curing silicone formulation compatible with system components with which it comes in contact, specifically formulated and tested for use as structural sealant, and approved by structural-sealant manufacturer for use in curtain-wall systems indicated.
      a. Color: Black unless otherwise indicated.
      b. Type: Manufacturer's standard single component.
      c. Minimum Tensile Strength: 100 psi.
      d. Modulus of Elasticity: As required by structural-sealant-glazed curtain-wall system design to meet performance requirements.

   2. Weatherseal Sealant: ASTM C920 for Type S, Grade NS, Class 25, neutral-curing silicone formulation compatible with structural sealant and other system components with which it comes in contact; and recommended by structural- and weatherseal-sealant manufacturers for this use.
      a. Joint Movement Capability: Accommodates a 50 percent increase or decrease in joint width at time of application when measured according to ASTM C719.
      b. Color: Matching structural sealant.

2.4 ACCESSORY MATERIALS

A. Bituminous Paint: Cold-applied asphalt-mastic paint complying with SSPC Paint 12 requirements except containing no asbestos, formulated for 30-mil thickness per coat.

2.5 FABRICATION

A. Form aluminum shapes before finishing.

B. Fabricate components that, when assembled, have the following characteristics:

   1. Sharp profiles, straight and free of defects or deformations.
   2. Accurately fitted joints with ends coped or mitered.
   3. Internal guttering systems or other means to drain water passing joints, condensation occurring within framing members, and moisture migrating within the system to exterior.
   4. Physical and thermal isolation of glazing from framing members.
   5. Accommodations for thermal and mechanical movements of glazing and framing to prevent glazing-to-glazing contact and to maintain required glazing edge clearances.

C. Factory-Assembled Frame Units:

   1. Rigidly secure nonmovement joints.
   2. Seal joints watertight, unless otherwise indicated.
   3. Pressure equalize system at its interior face.
   4. Install glazing to comply with requirements in Section 08800, "Glass and Glazing."

D. After fabrication, clearly mark components to identify their locations in Project according to Shop Drawings.

2.6 ALUMINUM FINISHES

A. General: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.

C. Clear Anodic Finish: AA-M12C22A31 (Mechanical Finish: nonspecular as fabricated; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class II, clear coating 0.010 mm or thicker) complying with AAMA 611.

D. High-Performance Organic Finish (2-Coat Fluoropolymer): AA-C12C40R1x (Chemical Finish:
cleaned with inhibited chemicals; Chemical Finish: conversion coating; Organic Coating: manufacturer's standard 2-coat, thermocured system consisting of specially formulated inhibitive primer and fluoropolymer color topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight). Prepare, pretreat, and apply coating to exposed metal surfaces to comply with AAMA 2605 and with coating and resin manufacturers' written instructions.

1. Color and Glass: As scheduled on Drawings.

PART 3 - EXECUTION

3.1 INSTALLATION

A. General:

1. Fit joints to produce hairline joints free of burrs and distortion.
2. Rigidly secure nonmovement joints.
3. Install anchors with separators and isolators to prevent metal corrosion and electrolytic deterioration and to prevent impeding movement of moving joints.
4. Seal joints watertight, unless otherwise indicated.

B. Metal Protection:

1. Where aluminum will contact dissimilar metals, protect against galvanic action by painting contact surfaces with primer or by applying sealant or tape or installing nonconductive spacers as recommended by manufacturer for this purpose.
2. Where aluminum will contact concrete or masonry, protect against corrosion by painting contact surfaces with bituminous paint.

C. Install components to drain water passing joints, condensation occurring within framing members, and moisture migrating within the system to exterior.

D. Install components plumb and true in alignment with established lines and grades.

E. Install glazing as specified Section 08800, "Glass and Glazing."

F. Structural Sealant Glazing: Prepare surfaces that will contact structural sealant according to sealant manufacturer's written instructions to ensure compatibility and adhesion.

1. Preparation includes, but is not limited to, cleaning and priming surfaces.
2. Install weatherseal sealant according to sealant manufacturer's written instructions to produce weatherproof joints.
3. Install joint filler behind sealant as recommended by sealant manufacturer.

G. Install sealants as specified in Section 07900 "Seal and Sealants."

H. Erection Tolerances: Install glazed aluminum curtain-wall systems to comply with the following maximum tolerances:

1. Plumb: 1/8 inch in 10 feet.
2. Level: 1/8 inch in 20 feet.
3. Alignment:
   a. Where surfaces abut in line or are separated by reveal or protruding element up to 1/2 inch wide, limit offset from true alignment to 1/16 inch.
   b. Where surfaces are separated by reveal or protruding element from 1/2 to 1 inch wide, limit offset from true alignment to 1/8 inch.
   c. Where surfaces are separated by reveal or protruding element of 1 inch wide or greater, limit offset from true alignment to 1/4 inch.

4. Location: Limit variation from plane to 1/8 inch in 12 feet; 1/2 inch over total length.

3.2 FIELD QUALITY CONTROL

A. Water Spray Test: After the installation of minimum area of 75-feet-by-2-story glazed aluminum curtain-wall system has been completed but before installation of interior finishes has begun, test a 2-bay area of system designated by Architect according to AAMA 501.2.

1. Repair or remove work where test results indicate water penetration of systems.
2. Perform additional testing to determine resistance to water penetration of replaced or additional work.
B. Structural Sealant Compatibility and Adhesion:
Structural sealant shall be tested, inspected and evaluated according to recommendations in ASTM C1401.

1. Destructive test method, Method A, Hand Pull Tab (Destructive) in ASTM C1401, Appendix X2 shall be used.

2. A minimum of two areas on each elevator enclosure shall be tested.

3. Repair installation areas damaged by testing.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will be paid for on a lump sum basis for glazed aluminum elevator enclosures per location indicated wherein no measurement will be made.

END OF SECTION 08913
PART 1 - GENERAL

1.1 DESCRIPTION
A. Work required for this section includes gypsum sheathing attached to steel framing members in exterior walls (behind exterior finish) and supplementary items necessary to complete their installation.
B. Refer to Section 06100, “Rough Carpentry” for other types of sheathing boards.
C. Refer to Section 07150, "Dampproofing" for air or vapor retarders applied over sheathing.

1.2 DEFINITIONS
A. Gypsum Board Construction Terminology Standard: Refer to ASTM C11 for definitions of terms for gypsum sheathing board construction not defined in this Section or in other referenced standards.

1.3 REFERENCED STANDARDS
A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM B117 - Standard Practice for Operating Salt Spray (Fog) Apparatus
   2. ASTM C11 - Standard Terminology Relating to Gypsum and Related Building Materials and Systems
   3. ASTM C954 - Standard Specification for Steel Drill Screws for the Application of Gypsum Panel Products or Metal Plaster Bases to Steel Studs From 0.033 in. (0.84 mm) to 0.112 in. (2.84 mm) in Thickness
   4. ASTM C1002 - Standard Specification for Steel Self-Piercing Tapping Screws for the Application of Gypsum Panel Products or Metal Plaster Bases to Wood Studs or Steel Studs
   5. ASTM C1396/C1396M – Standard Specification for Gypsum Board
B. Gypsum Association (GA):
   1. GA-253 - Application of Gypsum Sheathing
   2. GA-600 - Fire Resistance Design Manual Sound Control

1.4 SUBMITTALS
A. Product Data: For each type of gypsum sheathing and accessory material specified.
B. Samples: 6 inch square of gypsum sheathing.

1.5 QUALITY ASSURANCE
A. Fire-Resistance-Rated Assemblies: Where gypsum sheathing boards are part of fire-resistance-rated assemblies, provide assemblies as follows:
   1. Assemblies comply with requirements of fire-response-tested assemblies indicated by GA File Numbers in GA-600, or by design designations in UL's "Fire Resistance Directory" or in certification listings of another testing and inspecting agency acceptable to authorities having jurisdiction.
   2. Fire-resistance ratings were determined by fire-response testing assemblies according to ASTM E119.

1.6 COORDINATION
A. Coordinate sheathing installation with exterior cladding installation to comply with following requirements unless otherwise recommended by sheathing manufacturer:
   1. Do not leave paper-surfaced gypsum sheathing board exposed to weather for more than 30 days.
   2. Do not leave paper-surfaced gypsum sheathing board exposed to weather for more than 30 days or for more than 180 days if protected with dampproofing barrier.

PART 2 - PRODUCTS

2.1 GYPSUM SHEATHING
A. Paper-Surfaced Gypsum Sheathing Board: ASTM C1396/C1396M with water-resistant material incorporated into the gypsum core and with water-repellent paper bonded to the core's face, back, and long edges.
   1. Fire-rated board: Type X, 5/8 inch thick, 48 x 96 inches, square edge and ends.

2.2 ACCESSORY MATERIALS
A. Fasteners: Steel drill screws, in length recommended by sheathing manufacturer for thickness of sheathing board to be attached, with organic-polymer or other corrosion-protective
coating having a salt-spray resistance of more than 800 hours according to ASTM B117, and as follows:

1. ASTM C1002 when attaching sheathing to steel framing less than 0.0329 inch thick.

2. ASTM C954 when attaching sheathing to steel framing from 0.033 to 0.112 inch thick.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrate surfaces to receive gypsum sheathing and associated work and conditions under which work will be installed. Do not proceed with work until unsatisfactory conditions have been corrected in a manner acceptable to installer. Starting work within a particular area will be construed as applicator’s acceptance of surface conditions.

3.2 INSTALLATION

A. General: Install gypsum sheathing to comply with GA-253 and manufacturer's written instructions.

B. Cut boards at penetrations, edges, and other obstructions of the work; fit tightly against abutting construction, except provide a 3/8 inch setback where sheathing abuts structural elements or materials that may retain moisture.

C. Coordinate sheathing installation with flashing and joint sealant installation so these materials are installed in the sequence and manner that prevent exterior moisture from passing through completed exterior wall assembly.

D. Apply fasteners so screw heads bear tightly against face of sheathing boards but do not cut into facing.

E. Do not bridge building expansion joints with sheathing; cut and space edges to match spacing of structural support elements.

F. Vertical Installation: Install 48 inch wide gypsum sheathing boards vertically with vertical edges centered over flanges of steel studs. Abut ends and edges of each board with those of adjacent boards. Screw-attach boards at perimeter and within field of board to each steel stud.

G. Space Fasteners approximately 8 inches o.c. and set back a minimum of 3/8 inch from edges and ends of boards.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will be paid for on a lump sum basis for gypsum sheathing per location indicated wherein no measurement will be made.

END OF SECTION 09253
PART 1 - GENERAL

1.1 SUMMARY

A. Work required for this section includes gypsum board wall and ceiling assemblies, finishing of gypsum board (taping and bedding) and supplementary items necessary to complete their installation.

B. Refer to Section 05415, “Cold-Formed Steel Stud Framing” for structural load-bearing steel stud framing.

C. Refer to Section 09253, “Gypsum Sheathing” for sheathing installations over exterior steel stud framing.

1.2 DEFINITIONS

A. Gypsum Board Construction Terminology: Refer to ASTM C 11 for definitions of terms for gypsum board assemblies not defined in this Section or in other referenced standards.

B. Accessories: Metal beads, trim, or molding used to protect or conceal corners, edges, or abutments of gypsum board construction.

C. Critical Lighting:

1. Strong sidelighting from windows or surface-mounted light fixtures. Synonym: Severe lighting.

2. Wall and ceiling areas abutting window mullions or skylights, long hallways, or atriums with large surface areas flooded with artificial or natural lighting are few examples of critical lighting areas.

E. Primer/Sealer:

1. Paint material formulated to fill pores and equalize suction difference between gypsum board surface paper and compound used on finished joints, angles, fastener heads, and accessories, and over skim coatings.

2. Specified in Section 09920, "Interior Painting".

F. Skim Coat: Thin coat of joint compound over entire surface to fill imperfections in joint work, smooth paper texture, and provide uniform surface for decorating.

G. Spotting: To cover fastener heads with joint compound.

H. Texture: Decorative treatment of gypsum board surfaces. Specified in Section 09920, "Interior Painting".

I. Texturing:

1. Regular or irregular patterns typically produced by applying mixture of joint compound and water, or proprietary texture materials including latex base texture paint, to gypsum board surface previously coated with primer/sealer. Specified in Section 09920, "Interior Painting".

1.3 REFERENCED STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM A641 – Standard Specification for Zinc-Coated (Galvanized) Carbon Steel Wire

2. ASTM C11 - Standard Terminology Relating to Gypsum and Related Building Materials and Systems

3. ASTM C475 - Specification for Joint Compound and Joint Tape for Finishing Gypsum Board

4. ASTM C636 – Standard Practice for Installation of Metal Ceiling Suspension Systems for Acoustical Tile and Lay-In Panels

5. ASTM C645 – Standard Specification for Non-Load Bearing (Axial) Steel Studs, Runners (Tracks), and Rigid Furring Channels for Screw Application of Gypsum Board

7. ASTM C754 - Specification for Installation of Steel Framing Members to Receive Screw-Attached Gypsum Board

9. ASTM C840 - Specification for Application and Finishing of Gypsum Board

10. ASTM C919 – Standard Practice for Use of Sealants in Acoustical Applications
11. ASTM C954 - Specification for Steel Drill Screws for the Application of Gypsum Board or Metal Plaster Bases to Steel Studs From 0.033 in. (0.84 mm) to 0.112 in. (2.84 mm) in Thickness

12. ASTM C1002 - Specification for Steel Drill Screws for the Application of Gypsum Board or Metal Plaster Bases

13. ASTM C1047 - Specifications for Accessories for Gypsum Wallboard and Gypsum Veneer Base

14. ASTM C1396/C1396M - Standard Specification for Gypsum Board

17. ASTM E413 – Classification for Rating Sound Insulation

19. ASTM E497 - Practice for Installing Sound-Isolating Lightweight Partitions

B. Gypsum Association (GA):

1. GA 214 - Recommended Levels of Gypsum Board Finish

2. GA 216 - Application and Finishing of Gypsum Board

3. GA 600 - Fire Resistance Design Manual Sound Control

1.4 SUBMITTALS

A. Product Data: For each type of product indicated on Contract Drawings.

B. Shop Drawings: Show locations, fabrication, and installation of control and expansion joints including plans, elevations, sections, details of components, and attachments to other units of Work.

1.5 QUALITY ASSURANCE

A. Perform gypsum board systems work in accordance with recommendations of ASTM C754, ASTM C840 and GA 216 unless otherwise specified in this section.

B. Comply with requirements of GA 216 and ASTM C840.

C. Single-Source Responsibility for Finishing Materials: Obtain finishing materials from either same manufacturer that supplies gypsum board and other panel products or from manufacturer acceptable to gypsum board manufacturer.

D. Fire-Test-Response Characteristics: For gypsum board assemblies with fire-resistance ratings, provide materials and construction identical to those tested in assembly indicated according to ASTM E119 by an independent testing and inspecting agency acceptable to authorities having jurisdiction.

E. Sound Transmission Characteristics: For gypsum board assemblies with STC ratings, provide materials and construction identical to those tested in assembly indicated according to ASTM E90 and classified according to ASTM E413 by a qualified independent testing agency.

1.6 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Deliver materials in original packages, containers, or bundles bearing brand name and identification of manufacturer or supplier.

B. Store materials inside under cover and keep them dry and protected against damage from weather, direct sunlight, surface contamination, corrosion, construction traffic, and other causes. Stack gypsum panels flat to prevent sagging.

C. Handle gypsum board to prevent damage to edges, ends, and surfaces. Do not bend or otherwise damage metal corner beads and trim.

1.7 PROJECT CONDITIONS

A. Environmental Conditions: Establish and maintain environmental conditions for finishing gypsum board to comply with ASTM C840 and with gypsum board manufacturer's written recommendations, whichever are more stringent.
B. Ventilation: Ventilate building spaces, as required, for drying joint treatment materials. Avoid drafts during hot dry weather to prevent finishing materials from drying too rapidly.

PART 2 - PRODUCTS

2.1 STEEL FRAMING FOR SUSPENDED CEILINGS

A. General: Provide components of sizes indicated but not less than that required to comply with ASTM C754 for conditions indicated.

B. Tie Wire: ASTM A641, Class 1 zinc coating, soft temper, 0.0625 inch diameter wire, or double strand of 0.0475 inch diameter wire.

C. Hanger Attachments to Concrete: As follows:
   1. Anchors: Fabricated from corrosion-resistant materials with holes or loops for attaching hanger wires and capable of sustaining, without failure, a load equal to 5 times that imposed by construction as determined by testing according to ASTM E488 by a qualified independent testing agency.
      a. Cast-in-place anchor, designed for attachment to concrete forms.
      b. Post installed, chemical anchor.
      c. Post installed, expansion anchor.
   2. Powder-Actuated Fasteners: Suitable for application indicated, fabricated from corrosion-resistant materials, with clips or other devices for attaching hangers of type indicated, and capable of sustaining, without failure, a load equal to 10 times that imposed by construction as determined by testing according to ASTM E1190 by a qualified independent testing agency.

D. Wire Hangers: ASTM A641, Class 1 zinc coating, soft temper, 0.162 inch diameter.

2.2 METAL FRAMING FOR WALLS AND PARTITIONS

A. General: Provide metal framing members of sizes and spacings indicated but not less than that required to comply with ASTM C754 under the following maximum deflection and lateral loading conditions:
   1. Maximum Deflection - Typical: L/240 at 5 lbf/sq. ft.
   2. Maximum Deflection - At Ceramic Tile Walls: L/120 at 5 lbf/sq. ft.

B. Metal Studs and Runners: ASTM C645, with flange edges of studs bent back 90 deg and doubled over to form 3/16 inch wide lip (return) and minimum thickness of base (uncoated) metal of 20 Gauge (0.0312 inch) unless otherwise indicated.

C. Deep-Leg Deflection Track: ASTM C645 top runner with 2 inch deep flanges.

D. Flat Strap and Backing Plate: Steel sheet for blocking and bracing in length and width indicated.

E. Furring Channels: ASTM C645, hat-shaped, depth of 7/8 inch and minimum thickness of base (uncoated) metal of 0.0312 inch (20 gauge) unless otherwise indicated.

F. Fasteners for Metal Framing: Provide fasteners of type, material, size, corrosion resistance, holding power, and other properties required to fasten steel framing and furring members securely to substrates involved; complying with the recommendations of
GYPSUM BOARD ASSEMBLIES

gypsum board manufacturers for applications indicated.

2.3 GYPSUM BOARD PRODUCTS

A. General: Provide gypsum board in maximum lengths available that will minimize end-to-end butt joints in each area indicated to receive gypsum board application.

B. Gypsum Wallboard: ASTM C1396/C1396M, Type X, tapered edges, 5/8 inch thick unless otherwise indicated.

C. Water-Resistant Gypsum Backing Board: ASTM C1396/C1396M, Type X, 5/8 inch thick, unless otherwise indicated.

2.4 TRIM ACCESSORIES

A. Standard Accessories: Corner beads, edge trim, and control joints complying with ASTM C1047 and requirements indicated below:

2. Shapes indicated below by reference to Fig. 1 designations in ASTM C1047:
   a. Cornerbead for outside corners.
   b. LC-bead with both face and back flanges; face flange formed to receive joint compound. Provide LC-beads for exposed edge trim.
   c. L-bead with face flange only; face flange formed to receive joint compound. Provide L-bead for non-exposed edge trim.
   d. One-piece control joint formed with V-shaped slot, with removable strip covering slot opening.
   e. Provide other trim or special shapes where indicated.

2.5 JOINT TREATMENT MATERIALS

A. Provide joint treatment materials complying with ASTM C 475 and recommendations of both manufacturers of sheet products and of joint treatment materials for each application indicated.

B. Joint Tape:
   2. Tile Backing Panels: As recommended by panel manufacturer.

C. Joint Compound for Interior Gypsum Wallboard: For each coat use formulation that is compatible with other compounds applied on previous or for successive coats.

1. Prefilling: At open joints, rounded or beveled panel edges, and damaged surface areas, use setting-type taping compound.

2. Embedding and First Coat: For embedding tape and first coat on joints, fasteners, and trim flanges, use setting-type taping compound or drying-type, all-purpose compound.
   a. Use setting-type compound for installing paper-faced metal trim accessories.

3. Fill Coat: For second coat, use drying-type, all-purpose compound.

4. Finish Coat: For third coat, use drying-type, all-purpose compound.

5. Skim Coat: For final coat of Level 5 finish, use drying-type, all-purpose compound.

2.6 ACOUSTICAL SEALANT

A. Acoustical Sealant for Exposed Joints: Non sag, paintable, non-staining latex sealant complying with ASTM C 834 that is effective in reducing airborne sound transmission through perimeter joints and openings in building construction as demonstrated by testing representative assemblies per ASTM E 90.

1. Acceptable Manufacturers and Products:
   a. Pecora Corp. - “AC-20 FTR Acoustical and Insulation Sealant”.
   b. United States Gypsum Co. - “SHEETROCK Acoustical Sealant”.
   c. Or approved equal.

B. Acoustical Sealant for Concealed Joints: Nondrying, non hardening, non skinning, non staining, gunnable, synthetic rubber sealant recommended for sealing interior concealed joints to reduce airborne sound transmission.

1. Acceptable Manufacturers and Products:
   a. Pecora Corp. - “BA-98”
   b. Tremco, Inc. - “Tremco Acoustical Sealant”
   c. Or approved equal.
2.7 MISCELLANEOUS MATERIALS

A. General: Provide auxiliary materials for gypsum board construction that comply with referenced standards and recommendations of gypsum board manufacturer.

B. Spot Grout: ASTM C475, setting-type joint compound recommended for spot grouting hollow metal door frames.

C. Steel drill screws complying with ASTM C1002 for fastening gypsum board to steel members less than 0.03 inch thick.

D. Steel drill screws complying with ASTM C954 for fastening gypsum board to steel members from 0.033 to 0.112 inch thick.

E. Sound Attenuation Blankets: Unfaced mineral-fiber blanket insulation produced by combining mineral fibers of glass or slag with thermosetting resins to comply with ASTM C665 for Type I (blankets without membrane facing), 3 inch thick unless otherwise indicated.

1. Comply with assembly mineral fiber requirements for fire-resistance rated assemblies.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates to which gypsum board assemblies attach or abut, with Installer present including hollow metal frames, cast-in-anchors, and structural framing for compliance with requirements for installation tolerances and other conditions affecting performance.

B. Do not proceed with installation until unsatisfactory conditions have been corrected. Starting work within a particular area will be construed as applicator's acceptance of surface conditions.

3.2 PREPARATION

A. Suspended Ceilings: Coordinate installation of ceiling suspension systems with installation of overhead structure to ensure that inserts and other provisions for anchorages to building structure have been installed to receive ceiling hangers at spacing required to support ceilings and that hangers will develop their full strength.

1. Furnish concrete inserts and other devises indicated to other trades for installation in advance of time needed for coordination and construction.

3.3 INSTALLING METAL FRAMING, GENERAL

A. Installation Standard: Install steel framing to comply with ASTM C754 and ASTM C840 requirements that apply to framing installation.

B. Install supplementary framing, blocking, reinforcing, and bracing in gypsum board assemblies to support fixtures, equipment services, heavy trim, grab bars, toilet accessories, handrails, furnishings, or similar construction. Comply with details and recommendations of gypsum board manufacturer.

C. Isolate metal framing from building structure to prevent transfer of loading imposed by structural movement.

1. Isolate ceiling assemblies where they abut or are penetrated by building structure.

2. Isolate partition framing and wall furring where it abuts structure, except at floor.

3. Install slip type joints at head assemblies that avoid axial loading of assembly and laterally support assembly.

4. Use firestop assembly where fire rated partitions are indicated.

5. Use proprietary deflection track or deep leg deflection track as detailed.

D. Do not bridge building expansion and control joints with steel framing or furring members. Frame both sides of joints independently with framing or furring members.

E. Ceiling System: Suspend ceiling hangers from building structural members and as follows:

1. Install hangers plumb and free from contact with insulation or other objects within ceiling plenum that are not part of supporting structural or ceiling suspension system. Splay hangers only where required to miss obstructions and offset resulting horizontal forces by bracing, countersplaying, or other equally effective means.

2. Where width of ducts and other construction within ceiling plenum produces hanger spacings that interfere with the location of hangers required to support standard suspension system members, install supplemental suspension members and hangers in form of trapezes or equivalent devices. Size supplemental suspension members and hangers to support ceiling loads within performance limits established by referenced standards.

3. Secure wire hangers by looping and wire-tying, either directly to structures or to inserts, eye screws, or other devices and
fasteners that are secure and appropriate for substrate, and in a manner that will not cause them to deteriorate or otherwise fail.

4. Install steel framing components for suspended ceilings so that cross-furring members or grid suspension members are level to within 1/8 inch in 12 feet as measured both lengthwise on each member and transversely between parallel members.

5. Do not support ceilings directly from permanent metal forms. Fasten hangers to cast-in-place hanger inserts, or drilled-in anchors that extend through forms into concrete. Do not attach hangers to steel deck tabs.

7. Do not attach hangers to steel roof deck. Attach hangers to structural members.

8. Do not connect or suspend steel framing from ducts, pipes or conduit.

9. Do not install hangers to prevent access doors from being correctly operated.

3.4 CEILING GRID SUSPENSION SYSTEM

A. Install suspension system in accordance with ASTM C636. Lay out spaces and arrange suspension system in a regular pattern, parallel or perpendicular to surrounding walls.

B. Attach perimeter wall track or angle where grid suspension system meets vertical surfaces. Mechanically join main beam and cross-furring members to each other and butt-cut to fit into wall track.

C. Main Beams:

1. Suspend main beams spaced 48 inches on center from structure with wire hangers spaced 48 inches on center.

2. Install main beams level within 1/8 inch in 12 feet with hanger wire taut and tightly wrapped to prevent vertical movement or rotation.

3. Do not make local kinks or bends in hanger wires as a means of leveling.

D. Cross Tees:

1. Install cross tees at right angles to main beams, space at 24 inches on center and join to main beams with positive interlock.

2. Install cross tees to within 1/32 inch of their required location and within 0.015 inch of the same horizontal plane as main beam, and never below continuous member.

3. Install cross tees at right angles to beams and cross tees to support ends of recessed light fixtures, diffusers or grilles.

E. Angle Moldings: Lay ends of main beams and cross tees on angle moldings at vertical surfaces.

F. Concentrated Load Conditions: Provide additional hanger wires at each corner of recessed light troffers and other concentrated load conditions to prevent excess deflection.

3.5 METAL STUD PARTITION FRAMING

A. Install runners (tracks) at floors, ceilings, and structural walls and columns where gypsum board stud assemblies abut other construction.

B. Installation Tolerances: Install each metal stud steel framing and furring member so that fastening surfaces do not vary more than 1/8 inch from the plane formed by the faces of framing members.

C. Extend partition framing full height to structural supports or substrates above suspended ceilings, except where partitions are indicated to terminate at suspended ceilings. Continue framing over framing for doors and openings and frame around ducts penetrating partitions above ceiling to provide support for gypsum board.

1. Cut studs 3/4 inch short of full height to provide perimeter relief.

2. For STC-rated, smoke-rated and fire-resistive-rated partitions that extend to the underside of floor/roof slabs and decks or other continuous solid structural surfaces to obtain ratings, install framing around structural and other members extending below floor/roof slabs and decks, as needed, to support gypsum board closures and make partitions continuous from floor to underside of solid structure.

D. Space studs at 16 inches on center unless otherwise indicated. Install studs so that flanges point in the same direction. Lap studs a minimum of 8 inches where splicing is necessary and secure with screws.
E. At partition intersections and corners, locate studs no more than 2 inch from partition intersections and corners and secure with screws through both flanges of studs and tracks.

F. Chase Wall: Install framing as follows:
1. Position double row of metal studs vertically in runners, opposite each other in pairs with flanges pointing in the same direction.
2. Space studs 24 inches on centers unless otherwise indicated.
3. Attach with screws through each stud flange and runner flange.
4. Cross brace between rows of studs with 5/8 inch wallboard, 12 inches by chase width, or with metal studs.
5. Screw-attach to stud webs at 48 inches on center maximum in partition height with minimum of three screws per web.

G. Furred Wall: Install framing as follows:
1. Erect furring channels vertically, spaced 24 inches on centers.
2. Attach to surface with concrete nails spaced 24 inches on centers, staggered on flanges.
3. Splice ends by nesting channels 8 inches and securely anchoring to surface.
4. Miter 24 inches long horizontal furring channels at corners and space 24 inches on centers vertically.
5. Locate furring channels around perimeter of openings and secure to surfaces.

H. Door Openings: Frame door openings to comply with GA-600, and with applicable written recommendations of gypsum board manufacturer. Screw attach vertical studs at jambs to jamb anchor clips on door frames.
1. Install two metal studs on each side of doorframes.
2. Install runner track section (for cripple studs) at head and secure to jamb studs.
3. Install short intermediate studs 16 inches on center between ceiling runner and doorframe head runner.

3.6 APPLYING GYPSUM BOARD

A. Gypsum Board Application Standards: Install gypsum panels to comply with ASTM C840 and GA 216.

B. Install sound attenuation blankets before installing gypsum panels unless blankets are readily installed after panels have been installed on one side.

C. Single-Layer Partition Application: Apply gypsum panels vertically (parallel to framing), to minimize end joints unless otherwise indicated or required by fire-resistance-rated assembly.
1. Stagger abutting end joints not less than one framing member in alternate courses of board.
2. At stairwells and other high walls, install panels horizontally, unless otherwise indicated or required by fire-resistance-rated assembly.

D. Multilayer Partition Application: Apply gypsum board indicated for base layers and face layers vertically (parallel to framing) with joints of base layers located over stud or furring member and face-layer joints offset at least one stud or furring member with base-layer joints, unless otherwise indicated or required by fire-resistance-rated assembly. Stagger joints on opposite sides of partitions.

E. Ceiling Application: Install ceiling board panels at right angles to framing to minimize the number of abutting end joints and avoid abutting end joints in the central area of each ceiling. Stagger abutting end joints of adjacent panels not less than one framing member. Install ceiling board panels before partition board application.

F. Install gypsum panels with face side out. Do not install imperfect, damaged, or damp panels. Butt panels together for a light contact at edges and ends with not more than 1/16 inch of open space between panels. Do not force into place.

G. Locate both edge or end joints over supports, except in ceiling applications where intermediate supports or gypsum board back-blocking is provided behind end joints. Do not place tapered edges against cut edges or ends. Stagger vertical joints on opposite sides of partitions. Do not make joints other than control joints at corners of framed openings.

H. Attach gypsum panels to metal studs so that the leading edge or end of each panel is attached to open (unsupported) edges of stud flanges first.

I. Attach gypsum panels to framing provided at openings and cutouts. Install gypsum panel over door heads and extend to one stud (16 inches) each side of door.

J. Spot grout hollow metal doorframes for solid core wood doors, hollow metal doors, and doors over 32 inches wide. Apply spot grout at each jamb anchor clip and immediately insert gypsum panels into frames.
K. Form control joints and expansion joints at locations indicated with space between edges of adjoining gypsum panels.

L. Cover both faces of metal stud partition framing with gypsum panels in concealed spaces (above ceilings, etc.), except in chase walls that are braced internally.
   1. Fit gypsum panels around ducts, pipes, and conduits.
   2. Where partitions intersect open concrete coffers, concrete joists, and other structural members projecting below underside of floor/roof slabs and decks, cut gypsum panels to fit profile formed by coffers, joists, and other structural members; allow 1/4 to 3/8 inch wide joints to install sealant.

M. Isolate perimeter of non-load-bearing gypsum board partitions at structural abutments, except floors. Provide 1/4 inch to 1/2 inch wide spaces at these locations and trim edges with edge trim where edges of gypsum panels are exposed. Seal joints between edges and abutting structural surfaces with acoustical sealant.

N. Seal construction at perimeters, behind control and expansion joints, and at openings and penetrations with a continuous bead of acoustical sealant. Install acoustical sealant at both faces of partitions at perimeters and through penetrations. Comply with ASTM C919 and manufacturer's written recommendations for locating edge trim and closing off sound-flanking paths around or through gypsum board assemblies, including sealing partitions above acoustical ceilings.

O. Space fasteners in gypsum panels according to referenced gypsum board application and finishing standard and manufacturer's written recommendations.
   1. Attach gypsum board to metal supports with self-drilling screws.
   2. Drive screws to slightly dimple surface but not to break paper.
   3. Space screws as recommended by GA-216 for non-fire rated partitions and ceilings.
   4. Start field screwing near center and work towards edges.
   5. Space screws not less than 3/8 inch from gypsum board edges.
   6. Space screws for fire rated partitions as required by fire test.
   7. Do not attach gypsum board to top runner where partition extends to structure unless required by fire test.

P. Wall Tile Substrates: For substrates indicated to receive thin-set ceramic tile and similar rigid applied wall finishes, comply with the following:
   1. Install water-resistant gypsum backing board panels at walls to receive thin set tile and walls containing plumbing fixtures ("wet walls") and walls adjacent to plumbing fixtures.

3.7 INSTALLING TRIM ACCESSORIES

A. Fasten trim accessories according to accessory manufacturer's directions for type, length, and spacing of fasteners.

B. Install corner beads at external corners.

C. Install edge trim where gypsum board abuts dissimilar material and where edge of gypsum panels would otherwise be exposed.
   1. Install LC-bead where gypsum panels are tightly abutted to other construction and back flange can be attached to framing or supporting substrate.
   2. Install L-bead where edge trims can only be installed after gypsum panels are installed.

D. Install control joints as follows and in locations approved by Architect for visual effect.
   1. Not to exceed 24 feet in either direction for ceilings and partitions.
   2. Where gypsum board abuts any dissimilar wall or ceiling assembly.
   3. Where gypsum board construction changes within the same plane.
   4. Where framing system changes direction.
   5. Where gypsum board construction abuts an exterior wall.
   6. Where wall of different fire ratings abut or align in the same plane.
   7. Make joint 1/4 inch wide with supports non continuous over joint.

3.8 FINISHING GYPSUM BOARD ASSEMBLIES

A. Treat gypsum board joints, interior angles, flanges of corner bead, edge trim, and control joints; penetrations; fastener heads, surface defects, and elsewhere as required to prepare gypsum board surfaces for decoration and levels of gypsum board finish indicated.

B. Prefill open joints, rounded or beveled edges, and damaged areas using setting-type joint compound.
C. Apply joint tape and compound over gypsum board to prevent cracks from developing in joint treatment at flange edges.

D. Gypsum Board Finish Levels: Finish panels to levels indicated below, according to ASTM C840. Sand between coats and after last coat to produce a surface free of defects and ready for decoration.

1. Level 1: Embed tape at joints unless a higher level of finish is required for fire-resistance-rated assemblies.

2. Level 2: Embed tape and apply separate first coat of joint compound to tape, fasteners, and trim flanges.

3. Level 3: Embed tape and apply separate first and fill coats of joint compound to tape, fasteners, and trim flanges.

4. Level 4: Embed tape and apply separate first, fill, and finish coats of joint compound to tape, fasteners, and trim flanges.

5. Level 5: Embed tape and apply separate first, fill, and finish coats of joint compound to tape, fasteners, and trim flanges, and apply skim coat of joint compound over entire surface.

E. Schedule of Gypsum Board Finish: Provide following levels of gypsum board finish per ASTM C840 and GA 214.

1. Level 1: Plenum areas above ceilings.

2. Level 2: Moisture resistant gypsum board used as substrate for ceramic tile.

3. Level 3: Mechanical, electrical and elevator equipment rooms.

4. Level 4: Typical.

5. Level 5: Not used.

3.9 PROTECTION

A. Promptly remove any residual joint compound from adjacent surfaces.

B. Provide final protection and maintain conditions, in a manner suitable to Installer that ensures gypsum board assemblies remain without damage or deterioration at time of Substantial Completion.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will be paid for on a lump sum basis for gypsum board assemblies per location indicated wherein no measurement will be made.

END OF SECTION 09260
1.1 DESCRIPTION

A. This Section includes specifications for exposed-grid suspended acoustical ceilings, including metal suspension system and acoustical panels, as indicated.

B. Coordinate the work of this Section with the work under Division 15 - Mechanical for above-ceiling ductwork and for ceiling-mounted air diffusers.

C. Coordinate the work of this Section with the work under Division 16 - Electrical for above-ceiling electrical conduits and raceways and for ceiling-mounted lighting fixtures and speaker boxes.

1.2 REFERENCE STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A641/A641M - Standard Specification for Zinc-Coated (Galvanized) Carbon Steel Wire
   3. ASTM C636 - Standard Practice for Installation of Metal Ceiling Suspension Systems for Acoustical Tile and Lay-In Panels
   5. ASTM E1264 - Standard Classification for Acoustical Ceiling Products

1.3 SUBMITTALS

A. Product Data: For each type of product specified.

B. Samples for Verification: Full-size units of each type of ceiling assembly indicated; in sets for each color, texture, and pattern specified, showing the full range of variations expected in these characteristics.
   1. 12 inch square samples of each acoustical panel type, pattern, and color.
   2. Set of 12 inch long samples of exposed suspension system members, including moldings, for each color and system type required.

C. Product Test Reports: Indicate compliance of acoustical panel ceilings and components with requirements based on comprehensive testing of current products.

1.4 QUALITY ASSURANCE

A. Installer Qualifications: Engage an experienced installer who has completed acoustical panel ceilings similar in material, design, and extent to that indicated for this Project and with a record of successful in-service performance.

B. Source Limitations: Obtain each acoustical ceiling panel and each suspension system from one source with resources to provide products of consistent quality in appearance and physical properties without delaying the Work.
   1. Obtain both acoustical ceiling panels and suspension system from the same manufacturer if both are offered by the manufacturer.

C. Fire-Test-Response Characteristics: Provide acoustical panel ceilings that comply with the following requirements:
   1. Fire-response tests were performed by UL or another independent testing and inspecting agency that is acceptable to authorities having jurisdiction and that perform testing and follow-up services.
   2. Surface-burning characteristics of acoustical panels comply with ASTM E1264 for Class A materials as determined by testing identical products per ASTM E84.
   3. Products identified with appropriate markings of applicable testing and inspection agency.

1.5 PROJECT CONDITIONS

A. Environmental Limitations: Do not install acoustical panel ceilings until spaces are enclosed and weatherproof, wet-work in spaces is complete and dry, work above ceilings is complete, and ambient temperature and humidity conditions are maintained at the levels indicated for Project when occupied for its intended use.

1.6 COORDINATION

A. Coordinate layout and installation of acoustical panels and suspension system with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC
ACOUSTICAL PANEL CEILINGS

equipment, fire-suppression system, and partition assemblies.

B. Center penetrations in panels including fire sprinkler heads, can lights, fire alarm devices.

1.7 EXTRA MATERIALS

A. Deliver to Contracting Officer, extra materials described below that match products installed, are packaged with protective covering for storage, and are identified with labels describing contents.

1. Acoustical Ceiling Units: Full-size units equal to 2.0 percent of amount installed.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Acoustical Ceiling Panels.

1. ASTM E1264, Type III, Pattern D, high-density mineral-fiber lay-in panels, Class 25 NRC 60, LR1.

2. Size: 5/8 inch minimum thickness by 24 inches by 48 inches, with square edges.

3. Finish: Manufacturer’s standard factory-applied white paint finish, with light reflectance value of more than 75 percent.

4. Surface design: Fissured, unless noted otherwise.

5. Thermal conductance K-factor: 0.35.

B. Ceiling Suspension System:

1. Main and cross runners: ASTM C635, direct-hung, heavy-duty, interlocking double-web steel, matte white baked enamel finish. Width 15/16 inch.

2. Moldings: 1 inch by 1 inch steel angle, with smooth, matte white baked enamel finish, unless noted otherwise.

3. Attachment Devices: Size for five times design load indicated in ASTM C635, Table 1, Direct Hung, unless otherwise indicated.

4. Wire Hangers, Braces, and Ties: Provide wires complying with the following requirements:

b. Size: Select wire diameter so its stress at three times hanger design load (ASTM C 635, Table 1, Direct Hung) will be less than yield stress of wire, but provide not less than 0.106-inch diameter wire.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates surfaces to receive acoustical ceiling system and associated work and conditions under which work will be installed. Do not proceed with installation until unsatisfactory conditions have been corrected in a manner acceptable to installer. Starting work within a particular area will be construed as applicator’s acceptance of surface conditions.

3.2 PREPARATION

A. Coordination: Furnish layouts for cast-in-place anchors, clips, and other ceiling anchors. Furnish cast-in-place anchors and similar devices to other trades for installation well in advance of time needed for coordinating other work.

B. Measure each ceiling area and establish layout of acoustical panels to balance border widths at opposite edges of each ceiling. Avoid using less-than-half-width panels at borders, and comply with layout shown on reflected ceiling plans.

3.3 INSTALLATION

A. General: Install acoustical panel ceilings to comply with publications referenced below per manufacturer’s written instructions and CISCA’s “Ceiling Systems Handbook.”

B. Suspend ceiling hangers from building’s structural members and as follows

1. Install hangers plumb and free from contact with insulation or other objects within ceiling plenum that are not part of supporting structure or of ceiling suspension system.

2. Splay hangers only where required to miss obstructions; offset resulting horizontal forces by bracing, countersplaying, or other equally effective means.

3. Where width of ducts and other construction within ceiling plenum produces hanger spacings that interfere with location of hangers at spacings required to support
standard suspension system members, install supplemental suspension members and hangers in form of trapezes or equivalent devices. Size supplemental suspension members and hangers to support ceiling loads within performance limits established by referenced standards and publications.

4. Secure wire hangers to ceiling suspension members and to supports above with a minimum of three tight turns. Connect hangers directly either to structures or to inserts, eye screws, or other devices that are secure; that are appropriate for substrate; and that will not deteriorate or otherwise fail due to age, corrosion, or elevated temperatures.

5. Do not support ceilings directly from permanent metal forms. Fasten hangers to cast-in-place hanger inserts, power-actuated fasteners, or drilled-in anchors that extend through forms into concrete.

6. Do not attach hangers to steel deck tabs.

7. Do not attach hangers to steel roof deck. Attach hangers to structural members.

8. Space hangers not more than 48 inches o.c. along each member supported directly from hangers, unless otherwise indicated; and provide hangers not more than 8 inches from ends of each member.

C. Install edge moldings and trim at perimeter of acoustical ceiling area and where necessary to conceal edges of acoustical panels.

1. Screw attach moldings to substrate at intervals not more than 16 inches o.c. and not more than 3 inches from ends, leveling with ceiling suspension system to a tolerance of 1/8 inch in 12 feet. Miter corners accurately and connect securely.

2. Do not use exposed fasteners, including pop rivets, on moldings and trim.

3. Provide control joints where joints occur in abutting surfaces.

4. Hold tees in place with concealed clips.

D. Install suspension system runners so they are square and securely interlocked with one another. Remove and replace dented, bent, or kinked members.

1. Space steel main runners at 48 inches on center.

E. Install acoustical panels with undamaged edges and fitted accurately into suspension system runners and edge moldings. Scribe and cut panels at borders and penetrations to provide a neat, precise fit.

1. Arrange directionally patterned acoustical panels with pattern running in one direction parallel to long axis of space.

2. For square-edged panels, install panels with edges fully hidden from view by flanges of suspension system runners and moldings.

3. Install hold-down clips in areas indicated, in areas required by authorities having jurisdiction, and for fire-resistance ratings; space as recommended by panel manufacturer's written instructions, unless otherwise indicated or required.

3.4 CLEANING

A. Clean exposed surfaces of acoustical panel ceilings, including trim, edge moldings, and suspension system members. Comply with manufacturer's written instructions for cleaning and touchup of minor finish damage. Remove and replace ceiling components that cannot be successfully cleaned and repaired to permanently eliminate evidence of damage.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will be paid for on a lump sum basis for acoustical panel ceilings per location indicated wherein no measurement will be made.

END OF SECTION 09512
PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes steel acoustical snap-in metal pans for ceilings.
B. For framing system above, see Section 05430, “Slotted Channel Framing”.

1.2 REFERENCE STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM C636 - Standard Practice for Installation of Metal Ceiling Suspension Systems for Acoustical Tile and Lay-In Panels

1.3 SUBMITTALS

A. Product Data: Manufacturer’s published literature, including specifications.
B. Shop Drawings; showing:
   1. Reflected Ceiling Plan(s): Indicating metal ceiling tile layout, ceiling mounted items, and penetration locations.
   2. Suspension System and Component Layout.
   3. Details of system assembly and connections to building components.
C. Samples; submit:
   1. Ceiling tile: Minimum 8 inch piece of each type and finish.
   2. Suspension system components and moldings/trim.
   3. Acoustical material sample.
D. Quality Assurance / Control Submittals:
   1. Test Reports: Certified reports from independent agency substantiating structural compliance to governing requirements.
   2. Certificates:
      a. Data substantiating manufacturer and installer qualifications.
      b. Certified data attesting fire rated materials comply with specifications.

1.4 QUALITY ASSURANCE

A. Manufacturer/Installer Qualifications:
   1. Provide tile components produced by a single manufacturer with resources to provide consistent quality in appearance and physical properties, without delaying the work.
   2. Provide suspension system components produced by a single manufacturer to provide compatible components for a complete metal tile ceiling system installation.
   3. Perform installations using a firm with installers having no less than 3 years of successful experience on projects of similar size and requirements.
B. Regulatory Requirements:
   1. Fire Rating Performance Characteristics: Install system to provide a flame spread of 0 - 25, complying with certified testing to ASTM E84.
   2. Structural Criteria: Install and certify system to comply with structural and wind uplift requirements of governing codes.
C. Mock-Up: Prior to beginning installation erect a mock-up section, where directed, using all system components.
D. Pre-installation Conference: Conduct a conference, prior to start of installation, to review system requirements, shop drawings, and all coordination needs.

1.5 DELIVERY, STORAGE AND HANDLING

A. Deliver system components in manufacturer’s original unopened packages, clearly labeled.
B. Store components in fully enclosed dry space. Carefully place on skids to prevent damage from moisture and other construction activities.
C. Handle components to prevent damage to surfaces and edges, and to prevent distortion and other physical damage.
ACOUSTICAL SNAP-IN METAL PAN CEILINGS

1.6 COORDINATION
A. Coordinate layout and installation of acoustical snap-in metal pans and suspension system with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, fire-suppression system, and partition assemblies.

1.7 EXTRA MATERIALS
A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Acoustical Snap-in Metal Pans: Full-size units equal to 2.0 percent of quantity installed.
   2. Suspension System Components: Quantity of each concealed grid and exposed molding and trim equal to 2.0 percent of quantity installed.

PART 2 - PRODUCTS

2.1 MANUFACTURER

2.2 SYSTEM MATERIALS
A. Metal Tile Ceiling System for exterior installations:
   1. Tile:
      a. Profile: Square edged.
      b. Size: 24 inches x 24 inches.
      c. Material / thickness: 0.040 inch aluminum.
      d. Tile Type: Snap-In tile formed with two sides raised and dimpled for secure engagement into runners.
   2. Snap-in Suspension System:
      a. Structural Classification: Heavy duty.
      b. Primary runners: 1-1/2 inches deep, 16 Ga., galvanized steel “C” channels.
      c. Hanger wire: 12 Ga. pre-stretched galvanized steel.
      d. Secondary runners: 24 Ga. galvanized steel, 1-1/2 inches (38 mm) deep inverted V shaped profile providing interlocking snap-in capability.
      e. Clamps: Manufacturer’s standard die-formed primary/secondary runner connector two-piece clamps.
   B. Wind Uplift Compression Struts: 1-1/2 inch deep, 16 Ga., cold rolled steel “C” channels.
   C. Perforations: Provide metal tile with nominal 1/4 inch solid border and perforation pattern 103, 20 percent open.
   D. Color and Finish: Cotton White baked-on polyester enamel.

2.3 ACCESSORY MATERIALS
A. Suspension System Carrier/Channel Splices: Manufacturer’s standard splices with matching profile and attachment holes.
B. Wall Moldings / Trim: Box mold design.
C. Clips: Manufacturer’s standard hold-down and security clips.
D. Access Panels: Manufacturer’s standard hinged style at locations indicated.
E. Acoustic Material: 1 inch thick glass fiber, 1-1/2 pcf density, enclosed in black polyethylene of sizes to completely fill ceiling panel.
F. Custom Panels and Trim Pieces: Fabricate panels for dropped soffit returns and similar conditions from materials and finishes to match selected ceiling tile.
G. Plenum Access Tool: Manufacturer’s standard for removing snap-in type panels.

PART 3 - EXECUTION

3.1 EXAMINATION
A. Examine areas receiving metal tile ceiling system for conditions that might adversely affect installation.
B. Verify that all work above ceiling system has been satisfactorily completed prior to start of ceiling installations.
C. Do not start ceiling installations until all unsatisfactory conditions affecting ceiling systems have been corrected.

3.2 PREPARATION
A. Provide layouts for inserts, clips and other support items required to be installed by other trades. Furnish inserts, clips and related items to other trades in a timely manner to preclude construction delays.
B. Coordinate with other trades for proper installation of inserts and related items.

C. Verify ceiling layouts by actual field measurements.
   1. Establish ceiling layout to balance borders and minimize out-of-square conditions. Coordinate all work that penetrates tile.

3.3 INSTALLATION

A. Install metal tile system in accordance with manufacturer’s printed installation instructions, submittals, applicable industry standards, and governing regulatory requirements for the work.

B. Suspend ceiling hangers from slotted channel framing specified in Section 05430, “Slotted Channel Framing” and as follows:
   1. Install hangers plumb and free from contact with insulation or other objects within ceiling plenum that are not part of supporting structure or of ceiling suspension system.
   2. Splay hangers only where required to miss obstructions; offset resulting horizontal forces by bracing, countersplaying, or other equally effective means.
   3. Where width of ducts and other construction within ceiling plenum produces hanger spacings that interfere with location of hangers at spacings required to support standard suspension system members, install supplemental suspension members and hangers in form of trapezes or equivalent devices. Size supplemental suspension members and hangers to support ceiling loads within performance limits established by referenced standards and publications.
   4. Secure wire hangers to ceiling suspension members and to supports above with a minimum of three tight turns. Connect hangers directly either to structures or to inserts, eye screws, or other devices that are secure; that are appropriate for substrate; and that will not deteriorate or otherwise fail due to age, corrosion, or elevated temperatures.
   5. Do not support ceilings directly from permanent metal forms. Fasten hangers to cast-in-place hanger inserts, power-actuated fasteners, or drilled-in anchors that extend through forms into concrete.
   6. Do not attach hangers to steel deck tabs.
   7. Do not attach hangers to steel roof deck. Attach hangers to structural members.

C. Snap-in Metal Tile Suspension System Installation:
   1. Primary runners: Install C channels at maximum spacing of 48 inches.
      a. Install wind uplift struts at spacings to comply with structural requirements of governing codes. Attach securely to runner channels and structure above.
   2. Assemble snap-in suspension system by clamping primary and secondary runners together to form a mounting grid.
   3. Install snap-in metal tile by holding level and applying pressure on panel dimple points. Examine dimples on panel edge to ensure positive lock into secondary runner.
   4. Install lock-clips at exterior locations to prevent lifting of panels due to wind pressure.

D. Plenum Access: Install hinged access panels at locations shown.

E. Install acoustical material to completely fill each ceiling panel.

F. Install custom panels and trim pieces for dropped soffit returns, and other required locations, with neat, tight joints and to comply with approved details.

G. Install specified perimeter trim edge molding at all locations required to conceal edges of ceiling system.

H. Install air distribution devices and lighting fixtures at indicated locations.
   1. Support devices and fixtures from building structure above, independent from ceiling suspension system.
   2. Field fabricate ceiling panels to accommodate air distribution devices.
   3. Verify that only fixtures with Modular Type “M” or “MT” flanges will be installed.

3.4 ADJUST AND CLEAN

A. Adjust components to provide uniform tolerances.

B. Replace tile that are scratched, dented or otherwise damaged.

C. Clean exposed surfaces with non-solvent, non-abrasive commercial type cleaner.
PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will be paid for on a lump sum basis for acoustical snap-in metal pans ceilings per location indicated wherein no measurement will be made.

END OF SECTION 09513
SECTION 09660
RESILIENT FLOORING

PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies providing resilient flooring, resilient base, and accessories.

1.2 REFERENCE STANDARDS
A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM D2047 - Standard Test Method for Static Coefficient of Friction of Polish-Coated Floor Surfaces as Measured by the James Machine
   4. ASTM F710 - Standard Practice for Preparing Concrete Floors to Receive Resilient Flooring
   5. ASTM F1066 - Standard Specification for Vinyl Composition Floor Tile
   7. ASTM F1869 - Standard Test Method for Measuring Moisture Vapor Emission Rate of Concrete Subfloor Using Anhydrous Calcium Chloride

1.3 SUBMITTALS
A. Samples include three of each type and color of the following materials used in the work: Tile, 12 inches square; base, six inches long; edge strips, six inches long; and adhesive, 1/2 pint container.

1.4 QUALITY ASSURANCE
A. Installer Qualifications: Engage an experienced installer to perform work of this Section who has specialized in installing resilient products similar to those required for this Project and with a record of successful in-service performance of at least 5 years.

B. Slip Resistance: Provide products identical to those tested for slip resistance per ASTM D2047 with a static coefficient of friction not less than 0.6 for level surfaces and 0.8 for ramped surfaces.

C. Fire-Test-Response Characteristics: Provide products with the following fire-test-response characteristics as determined by testing identical products per test method indicated below by a testing and inspecting agency acceptable to authorities having jurisdiction:
   1. Critical Radiant Flux: Class I, 0.45 W/sq. cm or greater when tested per ASTM E648.
   2. Smoke Density: Maximum specific optical density of 450 or less when tested per ASTM E662.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING
A. Deliver materials to the Worksite in original unopened containers, clearly labeled with manufacturer's name and brand designation, referenced specification number, type, and color.

B. Store and protect materials so as to prevent damage. Keep materials dry.

C. Handle products so as to prevent breakage of containers and damage to products.

1.6 JOB CONDITIONS
A. Environmental Requirements:
   1. Maintain temperature of materials stored on Worksite at above 70 deg. F minimum for at least 24 hours before installation.
   2. Maintain temperature of rooms or spaces in which work is to be installed at 70 deg. F for 24 hours before, during and 24 hours after installation.
   3. Do not install tile unless floors are completely dry with no trace of dampness. Test by laying approximately 2 feet square of rubber sheeting on floor in stationary location. After 24 hours, lift sheeting. Show no dampness after test. If dampness is still present, allow floor to dry further and retest until dry.

1.7 MAINTENANCE MATERIALS
A. After completion of the work, furnish and store, where directed by the Contracting Officer, at least
1 percent of the total quantity of tile and 1 percent of base material for future maintenance.

B. Include proportional quantities of each type and color in original containers clearly marked to show contents and area of placement of each type and color.

PART 2 - PRODUCTS

2.1 VINYL COMPOSITION TILE
A. ASTM F1066, Class 2, 12 inches square, 1/8 inch thick, color as scheduled on Contract Drawings.

2.2 BASE
A. Vinyl, 4 inches high, Type II, 1/8 inch thick, with molded top, in longest practicable lengths. Color as scheduled on Contract Drawings.

2.3 EDGE STRIP
A. ASTM F1700, Type IV, vinyl, beveled, 1 inch wide, 1/8 inch thick. Color to match base.

2.4 ADHESIVE
A. Water-resistant type, as recommended by manufacturer for surface to which tile is to be cemented.

2.5 PRIMER
A. As recommended by the adhesive manufacturer.

2.6 BASE CEMENT
A. Water-resistant, type recommended by manufacturer of base.

PART 3 - EXECUTION

3.1 EXAMINATION
A. Examine substrate surfaces to receive resilient tile flooring and associated work and conditions under which work will be installed. Do not proceed with work until unsatisfactory conditions have been corrected in a manner acceptable to installer. Starting work within a particular area will be construed as applicator’s acceptance of surface conditions.

B. Concrete Subfloors: Verify that concrete slabs comply with ASTM F710 and the following:

1. Slab substrates are dry and free of curing compounds, sealers, hardeners, and other materials that may interfere with adhesive bond. Determine adhesion and dryness characteristics by performing bond and moisture tests recommended by flooring manufacturer.

2. Subfloor finishes comply with requirements specified in Section 03350, “Concrete Finishing” for slabs receiving resilient flooring.

3. Subfloors are free of cracks, ridges, depressions, scale, and foreign deposits.

PREPARATION

A. Prepare substrates according to manufacturer’s written recommendations and with oversight by manufacturer’s representative to ensure adhesion of floor coverings and conductive continuity of floor covering systems.

B. Concrete Substrates: Prepare concrete slabs according to ASTM F710.

1. Verify that substrates are dry and free of curing compounds, sealers, and hardeners. Remove substrate coatings and other substances that are incompatible with floor covering adhesives and that contain soap, wax, oil, or silicone, using mechanical methods recommended by manufacturer. Do not use solvents.

2. Alkalinity and Adhesion Testing: Perform tests recommended by manufacturer. Proceed with installation only after substrates pass testing.

3. Moisture Testing:
   a. Perform anhydrous calcium chloride test, ASTM F1869. Proceed with installation only after substrates have maximum moisture-vapor-emission rate of 3 lb of water/1000 sq. ft in 24 hours.
   b. Also perform concrete internal relative humidity test, ASTM F2170. Proceed with installation only after substrates have maximum relative humidity of 75 percent.
   c. Perform tests recommended by manufacturer. Proceed with installation only after substrates pass testing.

C. Use trowelable leveling and patching compound to fill cracks, holes, and depressions in substrates.

D. Broom and vacuum clean substrates to be covered immediately before product installation. After cleaning, examine substrates for moisture, alkaline salts, carbonation, or dust. Do not proceed with installation until unsatisfactory conditions have been corrected.

E. Prime surfaces, as recommended by adhesive manufacturer.
3.3 INSTALLATION

A. General: Comply with tile manufacturer's written installation instructions.

B. Centering:
   1. Establish center lines for tile patterns parallel to principal walls in areas or rooms. Start laying tile from center lines, keeping joints parallel to centerlines.
   2. Lay out the pattern so that perimeter tiles are not smaller than half tiles.

C. Application of Primer: If adhesive manufacturer recommends primer, apply at rate and by method recommended.

D. Uniformity of Color: Use tile alternately from at least two cartons so that pattern will be uniform and not spotty due to variation that may be found in different cartons.

E. Application of Adhesive:
   1. Evenly spread adhesive on surfaces as recommended by tile manufacturer. While adhesive is tacky, embed each tile firmly in place to ensure proper bond.
   2. Cover only that amount of area which can be covered by tile within recommended working time of adhesive.

F. Laying Tile:
   1. Cut tiles to fit neatly and snugly around pipes and other vertical projections.
   2. Provide hairline joints; cut straight and true. Seal tile joints at pipes and penetrations through tile, with waterproof cement.
   3. Embed tiles level, flush with surface and tightly against adjoining tiles.
   4. Immediately remove stains, spots and adhesive smears.

G. Installing Base:
   1. Do not install base until plaster or other backing material has thoroughly dried. Install bases on walls, including walls behind movable equipment.
   2. Install bases around fixed equipment bases unless otherwise shown. Extend bases into closets and offsets adjoining areas scheduled to receive base.
SECTION 09663
STATIC DISSIPATIVE RESILIENT FLOORING

PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies resilient floor coverings (static dissipative vinyl composition tile) designed to control electrostatic discharge (ESD).

B. Refer to Section 16876, “Grounding and Bonding – Communications System” for connecting grounding strips to ground.

1.2 REFERENCED STANDARDS
A. The American Association of Textile Chemists and Colorists (AATCC):
   1. AATCC-134 - Electrostatic Propensity of Carpets

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM D2047 - Standard Test Method for Static Coefficient of Friction of Polish-Coated Floor Surfaces as Measured by the James Machine
   5. ASTM F710 - Standard Practice for Preparing Concrete Floors to Receive Resilient Flooring
   6. ASTM F1066 - Standard Specification for Vinyl Composition Floor Tile
   7. ASTM F1700 - Standard Specification for Solid Vinyl Floor Tile
   8. ASTM F1869 - Standard Test Method for Measuring Moisture Vapor Emission Rate of Concrete Subfloor Using Anhydrous Calcium Chloride

C. Electrical Overstress/Electrostatic Discharge Association Inc. (EOS/ESD):
   1. EOS/ESD DS7.1 - Floor Materials - Resistive Characterization of Materials

D. Military Specification (MIL):
   1. MIL-STD-3010 - Test Procedures for Packaging Materials

1.3 SUBMITTALS
A. Product Data: For each type of product indicated.
B. Samples for Initial Selection: For each type of floor covering and exposed accessory indicated.
C. Samples for Verification: For each type of floor covering indicated and of size indicated below:
   1. Tile: Full-size units.
   2. Accessories: In length equal to length of floor covering samples.

D. Qualification Data: For Installer.
E. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for floor coverings.
F. Maintenance Data: For floor coverings to include in maintenance manuals.

1.4 QUALITY ASSURANCE
A. Installer Qualifications: A qualified installer who employs workers for this Project that are competent in techniques required by manufacturer for static-control floor covering installation indicated.

1. Engage an installer who employs workers for this Project that are trained or certified by floor covering manufacturer for installation techniques required.

B. Static-Control Properties: Provide floor coverings with static-control properties indicated as determined by testing identical products per test method indicated by an independent testing and inspecting agency.

C. Slip Resistance: Provide products identical to those tested for slip resistance per ASTM D2047 with a static coefficient of friction not less than 0.6 for level surfaces and 0.8 for ramped surfaces.
D. Fire-Test-Response Characteristics: Provide products with the following fire-test-response characteristics as determined by testing identical products per test method indicated below by a testing and inspecting agency acceptable to authorities having jurisdiction.

1. Critical Radiant Flux: Class I, 0.45 W/sq. cm or greater when tested per ASTM E648.

2. Smoke Density: Maximum specific optical density of 450 or less when tested per ASTM E662.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Deliver materials to the Worksite in original unopened containers, clearly labeled with manufacturer's name and brand designation, referenced specification number, type, and color.

B. Store and protect materials so as to prevent damage. Keep materials dry.

C. Handle products so as to prevent breakage of containers and damage to products.

1.6 JOB CONDITIONS

A. Environmental Requirements:

1. Maintain temperature of materials stored on Worksite at above 70 degrees F minimum for at least 24 hours before installation.

2. Maintain temperature of rooms or spaces in which work is to be installed at 70 degrees F for 24 hours before, during and 24 hours after installation.

3. Do not install tile unless floors are completely dry with no trace of dampness. Test by laying approximately 2 feet square of rubber sheeting on floor in stationary location. After 24 hours, lift sheeting. Show no dampness after test. If dampness is still present, allow floor to dry further and retest until dry.

1.7 MAINTENANCE MATERIALS

A. After completion of the work, furnish and store, where directed by the Contracting Officer, at least 1 percent of the total quantity of tile and 1 percent of base material for future maintenance.

B. Include proportional quantities of each type and color in original containers clearly marked to show contents and area of placement of each type and color.

PART 2 - PRODUCTS

2.1 STATIC DISSIPATIVE RESILIENT FLOOR COVERINGS

A. Static Dissipative Vinyl Composition Tile (VCT): ASTM F 1066 (VCT, nonasbestos formulated), Class 2 (through-pattern tile); tiles 12 x 12 inches, 0.125 inch thick.

1. Armstrong World Industries, Inc.; Excelon SDT.

2. Or approved equal.

B. Static-Control Properties:

1. Electrical Resistance: Test per ASTM F150 with 100-V applied voltage and ESD-S7.1.

   a. Average greater than 1 megohm and less than or equal to 1000 megohms when test specimens are tested surface to ground.

   b. Average no less than 1 megohm and less than or equal to 1000 megohms when installed floor coverings are tested surface to ground.

2. Static Generation: Less than 300 V when tested per AATCC-134 at 20 percent relative humidity with conductive footwear.

3. Static Decay: 5000 to 0 V in less than 0.25 seconds when tested per MIL-STD-3010, Method 4046.

C. Color: As scheduled on Contract Drawings.

2.2 INSTALLATION MATERIALS

A. Trowelable Leveling and Patching Compounds: Latex-modified, portland cement or blended hydraulic cement based formulation provided or approved by floor covering manufacturer for applications indicated.

B. Static-Control Adhesive: Adhesive product of floor covering manufacturer that produces conductive continuity of floor covering system.

C. Grounding Strips: Provided and approved by floor covering manufacturer and that produce conductive continuity of floor covering system to ground connection.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, with Installer and manufacturer's representative present, for compliance with requirements for installation
tolerances, moisture content, and other conditions affecting performance.

1. Verify that finishes of substrates comply with tolerances and other requirements specified in other Sections and that substrates are free of cracks, ridges, depressions, scale, and foreign deposits that might interfere with adhesion or static-control characteristics of floor coverings.

2. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Prepare substrates according to manufacturer's written recommendations and with oversight by manufacturer's representative to ensure adhesion of floor coverings and conductive continuity of floor covering systems.

B. Concrete Substrates: Prepare concrete slabs according to ASTM F710.

1. Verify that substrates are dry and free of curing compounds, sealers, and hardeners. Remove substrate coatings and other substances that are incompatible with floor covering adhesives and that contain soap, wax, oil, or silicone, using mechanical methods recommended by manufacturer. Do not use solvents.

2. Alkalinity and Adhesion Testing: Perform tests recommended by manufacturer. Proceed with installation only after substrates pass testing.

3. Moisture Testing:
   a. Perform anhydrous calcium chloride test, ASTM F1869. Proceed with installation only after substrates have maximum moisture-vapor-emission rate of 3 lb of water/1000 sq. ft in 24 hours.
   b. Also perform concrete internal relative humidity test, ASTM F2170. Proceed with installation only after substrates have maximum relative humidity of 75 percent.
   c. Perform tests recommended by manufacturer. Proceed with installation only after substrates pass testing.

C. Use trowelable leveling and patching compound to fill cracks, holes, and depressions in substrates.

D. Access Flooring Panels: Remove protective film of oil or other coating using method recommended by access flooring manufacturer.

E. Move floor coverings and installation materials into spaces where they will be installed at least 48 hours in advance of installation.

1. Do not install floor coverings until they are same temperature as space where they are to be installed.

F. Broom and vacuum clean substrates to be covered by floor coverings immediately before installation. After cleaning, examine substrates for moisture, alkaline salts, carbonation, and dust. Proceed with installation only after unsatisfactory conditions have been corrected.

3.3 INSTALLATION, GENERAL

A. Arrange for manufacturer's representative to oversee installation of static-control resilient floor coverings.

B. Embed grounding strips in static-control adhesive. Extend strips beyond perimeter of static-control resilient floor covering surfaces to ground points.

C. Scribe and cut floor coverings to butt neatly and tightly to vertical surfaces, permanent fixtures, and built-in furniture including cabinets, pipes, outlets, edgings, thresholds, and nosings.

D. Extend floor coverings into toe spaces, door reveals, closets, and similar openings.

E. Maintain reference markers, holes, or openings that are in place or marked for future cutting by repeating on floor coverings as marked on substrates. Use chalk or other nonpermanent-marking device.

F. Install floor coverings on covers for telephone and electrical ducts, and similar items in installation areas. Maintain overall continuity of color and pattern with pieces of floor coverings installed on covers. Tightly adhere floor covering edges to substrates that abut covers and to cover perimeters.

G. Adhere floor coverings to substrates using a full spread of adhesive applied to substrate to produce a completed installation without open cracks, voids, raising and puckering at joints, telegraphing of adhesive spreader marks, and other surface imperfections.

3.4 TILE INSTALLATION

A. Lay out tiles from center marks established with principal walls, discounting minor offsets, so tiles at opposite edges of room are of equal width. Adjust as necessary to avoid using cut widths that equal less than one-half tile at perimeter.
1. Lay tiles square with room axis.

2. Match tiles for color and pattern by selecting tiles from cartons in same sequence as manufactured and packaged, if so numbered. Discard broken, cracked, chipped, or deformed tiles.

3. Lay static-dissipative VCT with grain direction alternating in adjacent tiles (basket-weave pattern).

3.5 FIELD QUALITY CONTROL

A. Testing: Contractor shall engage a qualified independent testing and inspecting agency to test electrical resistance of static-control resilient floor covering systems for compliance with requirements.

1. Arrange for testing after installation adhesives have fully cured and floor covering systems have stabilized to ambient conditions.

2. Arrange for testing of floor coverings before and after performing polish procedures.

B. Remove and replace static-control floor coverings where test results indicate that they do not comply with specified requirements.

C. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.

3.6 CLEANING AND PROTECTION

A. Perform the following operations immediately after completing floor covering installation:

1. Remove adhesive and other surface blemishes from floor covering surfaces.

2. Sweep and vacuum floor coverings thoroughly.

3. Damp-mop floor coverings to remove marks and soil.

a. Do not wash floor coverings until after time period recommended by manufacturer.

B. Protect floor coverings from mars, marks, indentations, and other damage from construction operations and placement of equipment and fixtures during remainder of construction period. Use protection methods indicated or recommended in writing by manufacturer.

1. If recommended in writing by static-control resilient floor tile manufacturer, apply protective static-control floor polish formulated to maintain or enhance tile's electrical properties to tile surfaces that are free from soil, adhesive, and surface blemishes.

a. Verify that both polish and its application method are approved by tile manufacturer and that polish will not leave an insulating film that reduces tile's effectiveness for static control.

2. Cover floor coverings with undyed, untreated building paper until final acceptance.

3. Do not move heavy and sharp objects directly over floor coverings. Place plywood or hardboard panels over floor coverings and under objects while they are being moved. Slide or roll objects over panels without moving panels.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will be paid for on a lump sum basis for static dissipative resilient flooring per location indicated wherein no measurement will be made.

END OF SECTION 09663
1.1 SUMMARY

A. Work required for this section includes surface preparation and field painting of exposed interior items and surfaces.

1. Surface preparation, priming, and finish coats specified in this Section are in addition to shop priming and surface treatment specified in other Sections.

B. Exterior and interior steel surfaces coatings are specified and scheduled in Section 09970, "Coatings for Steel", except for galvanized sheet metal, which is specified in this Section.

C. Exterior concrete and masonry surfaces coatings are specified and scheduled in Section 09980, "Coatings for Concrete and Masonry".

D. Paint exposed surfaces, except where indicated that the surface or material is not to be painted or is to remain natural. If an item or a surface is not specifically mentioned, paint the item or surface the same as similar adjacent materials or surfaces. If a color of finish is not indicated, Contracting Officer will select from standard colors and finishes available.

1. Painting includes field painting of exposed bare and covered pipes and ducts, hangers, exposed steel and iron supports, and surfaces of mechanical and electrical equipment that do not have a factory-applied final finish.

E. Do not paint prefinished items, concealed surfaces, finished metal surfaces, operating parts, and labels.

1. Prefinished items include the following factory-finished components:

b. Acoustical materials.

c. Prefinished Architectural woodwork and cabinets.

d. Elevator equipment.

e. Finished mechanical and electrical equipment.

f. Light fixtures.

g. Distribution cabinets.

h. Baked enamel coated items.

i. Fluorocarbon coated items.

2. Concealed surfaces include walls or ceilings in the following generally inaccessible spaces:

a. Foundation spaces.

b. Furred areas.

c. Ceiling plenums.

d. Utility tunnels.

e. Pipe spaces.

f. Duct shafts.

3. Finished metal surfaces include the following:

a. Anodized aluminum.

b. Stainless steel.

c. Chromium plate.

d. Copper and copper alloys.

e. Bronze and brass.

4. Operating parts include moving parts of operating equipment and the following:

a. Valve and damper operators.

b. Linkages.

c. Sensing devices.

d. Motor and fan shafts.

5. Labels: Do not paint over UL, FMG, or other code-required labels or equipment name, identification, performance rating, or nomenclature plates.

1.2 REFERENCE STANDARDS

A. American Society of Mechanical Engineers (ASME):

1. ASME A13.1 - Scheme for the Identification of Piping Systems

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
1. ASTM D16 - Standard Terminology for Paint, Related Coatings, Materials, and Applications

1.3 DEFINITIONS

A. General: Standard coating terms defined in ASTM D16 apply to this Section.

1. Flat refers to a lusterless or matte finish with a gloss range below 15 when measured at an 85-degree meter.

2. Eggshell refers to low-sheen finish with a gloss range between 20 and 35 when measured at a 60-degree meter.

3. Semigloss refers to medium-sheen finish with a gloss range between 35 and 70 when measured at a 60-degree meter.

4. Full gloss refers to high-sheen finish with a gloss range more than 70 when measured at a 60-degree meter.

B. Consumer Line Paint: Paint products that are usually sold to consumers through normal retail outlets such as company paint stores and independent dealers.

C. Professional Line Paint: Paint products specially manufactured primarily for professional painters.

D. Interior Painting: Generally includes surfaces located in conditioned spaces.

1.4 SUBMITTALS

A. Product Data: For each paint system indicated. Include block fillers and primers.

1. Material List: An inclusive list of required coating materials. Indicate each material and cross-reference specific coating, finish system, and application. Identify each material by manufacturer's catalog number and general classification.

2. Manufacturer's Information: Manufacturer's technical information, including label analysis and instructions for handling, storing, and applying each coating material.

3. Certification by manufacturer that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).

4. Product performance characteristics for paint materials upon request.

B. Detailed Painting Schedule:

1. Furnish "Detailed Painting Schedule" indicating type of surface, type of paint material, and number of coats required, as set forth in "Painting Requirements".

2. Submit brand designation and grade of indicated type produced by approved manufacturer for each application listed or required.

C. Samples: For each color and material to be applied, with texture to simulate actual conditions, on representative Samples of the actual substrate, 8 inches by 10 inches.

1. Provide stepped Samples, defining each separate coat, including block fillers and primers. Use representative colors when preparing Samples for review. Resubmit until required sheen, color, and texture are achieved.

2. Provide a list of materials and applications for each coat of each Sample. Label each Sample for location and application.

1.5 QUALITY ASSURANCE

A. Regulatory Requirements: Meet Federal, State and Local EPA requirements for maximum VOC.

B. Applicator Qualifications: An individual with 5 years experience in applying paints and coatings similar in material, design, and extent to those indicated for this Project, whose work has resulted in applications with a record of successful in-service performance.

C. Source Limitations: Obtain block fillers and field applied primers for each coating system from the same manufacturer as the finish coats.

1.6 DELIVERY AND STORAGE

A. Deliver materials to Project site in manufacturer's original, unopened packages and containers bearing manufacturer's name and label.

B. Store materials not in use in tightly covered containers in a well-ventilated area at a minimum ambient temperature recommended by manufacturer. Maintain storage containers in a clean condition, free of foreign materials and residue.

1.7 PROJECT CONDITIONS

A. Apply paint only when temperatures of surfaces to be painted and surrounding air are between
minimum and maximum range recommended by manufacturer.

B. Do not apply paint in snow, rain, fog, or mist; or when relative humidity exceeds 85 percent; or at temperatures less than 5 deg F above the dew point; or to damp or wet surfaces.

1. Painting may continue during inclement weather if surfaces and areas to be painted are enclosed and heated within temperature and humidity limits specified by manufacturer during application and drying periods.

1.8 EXTRA MATERIALS

A. Furnish extra paint materials from the same production run as the materials applied and in the quantities described below. Package with protective covering for storage and identify with labels describing contents. Deliver extra materials to Owner.

1. Quantity: Furnish the Owner with an additional 3 percent, but not less than 1 gal. or 1 case, as appropriate, of each material and color applied.

2. Label each container with color, color number, texture and room locations, in addition to manufacturer’s label.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Following manufacturers listed are “acceptable” only if manufacturer can evidence product compliance with requirements of Contract Documents.

1. Benjamin Moore & Co. (Benjamin Moore).

2. ICI Paint Stores, Inc. (ICI Dulux Paint).

3. PPG Industries, Inc. (Pittsburgh Paints).

5. Or approved equal.

2.2 PAINT MATERIALS, GENERAL

A. Material Compatibility: Provide block fillers, primers, and finish-coat materials that are compatible with one another and with the substrates indicated under conditions of service and application, as demonstrated by manufacturer based on testing and field experience.

B. Material Quality: Provide manufacturer’s best-quality “Consumer Line” paint material of the various coating types specified that are factory formulated and recommended by manufacturer for application indicated. Manufacturer’s “Professional Line” products are NOT acceptable. Paint-material containers not displaying manufacturer’s product identification will not be acceptable.

1. Proprietary Names: Use of manufacturer’s proprietary product names to designate colors or materials is not intended to imply that products named are required to be used to the exclusion of equivalent products of other listed acceptable manufacturers.

C. Colors: As indicated.

2.3 TEXTURE/COATINGS

A. Orange Peel Effect Texture: USG Multi-Purpose Texture Finish, “orange peel” effect created with spray gun application.

2.4 MASONRY BLOCK FILLERS

A. Concrete Unit Masonry Block Filler: Factory-formulated high-performance latex block fillers.

2. ICI Dulux Paint; Bloxfil 4000-1000 Interior/Exterior Heavy Duty Acrylic Block Filler.

3. Pittsburgh Paints; 6-7 SpeedHide Interior/Exterior Masonry Latex Block Filler.

2.5 PRIMERS

A. Concrete and Masonry Primer: Factory-formulated alkali-resistant acrylic-latex interior primer for interior application.

1. Benjamin Moore; Regal FirstCoat Interior Latex Primer & Underbody No. 216.

2. ICI Dulux Paint; 1000-1200 Dulux Ultra Basecoat Interior Latex Wall Primer.

3. Pittsburgh Paints; 6-2 SpeedHide Interior Quick-Drying Latex Sealer.

4. Sherwin-Williams; PrepRite Masonry Primer B28W300.
INTERIOR PAINTING

2.6 FINISH COATS

A. Flat Acrylic Paint: Factory-formulated flat acrylic-emulsion latex paint for interior application.

1. Benjamin Moore; Regal Wall Satin No. 215 Premium Interior Finishes Flat Finish.

B. Low-Luster Acrylic Enamel: Factory-formulated eggshell acrylic-latex interior enamel.

1. Benjamin Moore; Moore's Regal AquaVelvet No. 319.

C. Semigloss Acrylic Enamel: Factory-formulated semigloss acrylic-latex enamel for interior application.

D. Semi-Gloss Epoxy Coating: Factory-formulated waterbased epoxy coating for interior application.

1. Benjamin Moore; Acrylic Epoxy Coating M43/M44.

E. Heat Resistant Paint: High-heat silicone aluminums for protection against weather, moisture, heat and fumes, to 600 deg. F.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Applicator present, for compliance with
requirements for paint application. Comply with procedures specified by the paint manufacturer.

1. Proceed with paint application only after unsatisfactory conditions have been corrected in manner acceptable to installer and surfaces receiving paint are thoroughly dry.

2. Start of painting will be construed as Applicator's acceptance of surfaces and conditions within a particular area.

B. Coordination of Work: Review other Sections in which shop applied primers are provided to ensure compatibility of the total system for various substrates. Furnish information on characteristics of finish materials to shop applicators to ensure use of compatible primers.

3.2 PREPARATION

A. General: Remove hardware and hardware accessories, plates, machined surfaces, lighting fixtures, and similar items already installed that are not to be painted. If removal is impractical or impossible because of size or weight of the item, provide surface-applied protection before surface preparation and painting.

1. After completing painting operations in each space or area, reinstall items removed using workers skilled in the trades involved.

B. Surface Preparation: Prepare surfaces to be painted according to manufacturer's written instructions for each particular substrate condition. Clean substrates of substances that could impair the bond of the various coatings.

1. Provide barrier coats recommended by paint manufacturer over incompatible primers or remove and reprime.

2. Cementitious Materials: Prepare surfaces to remove loose material, stains and unsuitable surface conditions. Roughen, as required, to remove glaze.
   a. Use mechanical methods of surface preparation recommended by paint manufacturer.
   b. Determine alkalinity and moisture content of surfaces by performing appropriate tests.
   c. Do not paint surfaces where moisture content exceeds that permitted in manufacturer's printed directions.

3. Ferrous Metals: Clean ungalvanized ferrous-metal surfaces that have not been shop coated; to remove foreign substances. Use solvent or mechanical cleaning methods that comply with SSPC's recommendations.
   a. Touch up bare areas and shop-applied prime coats that have been damaged. Wire-brush, clean with solvents recommended by paint manufacturer, and touch up with same primer as the shop coat.

4. Galvanized Surfaces: Clean galvanized surfaces free of oil and surface contaminants. Remove pretreatment from galvanized sheet metal fabricated from coil stock by mechanical methods.

C. Material Preparation: Mix and prepare paint materials according to manufacturer's written instructions.

1. Maintain containers used in mixing and applying paint in a clean condition, free of foreign materials and residue.

2. Use only thinners approved by paint manufacturer and only within manufacturer's recommended limits.

D. Tinting: Tint each undercoat a lighter shade to simplify identification of each coat when multiple coats of same material are applied. Tint undercoats to match the color of the finish coat, but provide sufficient differences in shade of undercoats to distinguish each separate coat.

3.3 APPLICATION

A. General: Apply paint according to manufacturer's written instructions. Use applicators and techniques best suited for substrate and type of material being applied.

1. Paint colors, surface treatments, and finishes are indicated in the paint schedules.

2. Do not paint over dirt, rust, scale, grease, moisture, scuffed surfaces, or conditions detrimental to formation of a durable paint film.

3. Provide finish coats that are compatible with primers used.

4. Paint surfaces behind movable equipment and furniture the same as similar exposed surfaces.
5. Before final installation of equipment, paint surfaces behind permanently fixed equipment or furniture with prime coat only.

6. Paint interior surfaces of ducts with a flat, nonspecular black paint where visible through registers or grilles.

7. Paint back sides of access panels and removable or hinged covers to match exposed surfaces.

8. Sand lightly between each succeeding enamel coat on metals.

9. Apply first coat to surfaces that have been cleaned, pretreated, or otherwise prepared for painting as soon as practicable after preparation.

10. The number of coats and film thickness required are the same regardless of application method.

11. Do not apply succeeding coats until previous coat has cured as recommended by manufacturer.

12. If sanding is required to produce a smooth, even surface according to manufacturer's written instructions, sand between applications.

13. Omit primer over metal surfaces that have been shop primed and touchup painted.

14. If undercoats, stains, or other conditions show through final coat of paint, apply additional coats until paint film is of uniform finish, color, and appearance.

15. Ensure that edges, corners, crevices, welds, and exposed fasteners receive a dry film thickness equivalent to that of flat surfaces.

16. Allow sufficient time between successive coats to permit proper drying.

B. Minimum Coating Thickness: Apply paint materials no thinner than manufacturer's recommended spreading rate to achieve total dry film thickness of the entire system as recommended by manufacturer.

C. Mechanical and Electrical Work: Painting of mechanical and electrical work is limited to items exposed to view in occupied spaces.

D. Block Fillers: Apply block fillers to concrete masonry block at a rate to ensure complete coverage with pores filled.

E. Prime Coats: Before applying finish coats, apply a prime coat, as recommended by manufacturer, to material that is required to be painted or finished and that has not been prime coated by others. Recoat primed and sealed surfaces where evidence of suction spots or unsealed areas in first coat appears, to ensure a finish coat with no blemish or other defects due to insufficient sealing.

F. Pigmented (Opaque) Finishes: Completely cover surfaces as necessary to provide a smooth, opaque surface of uniform finish, color, appearance, and coverage. Cloudiness, spotting, holidays, laps, brush marks, runs, sags, ropiness, or other surface imperfections will not be acceptable.

G. Stipple Finish: Roll and redistribute paint to an even and fine texture. Leave no evidence of rolling, such as laps, irregularity in texture, skid marks, or other surface imperfections.

H. Completed Work: Match approved samples for color, texture, and coverage. Remove, refinish, or repaint work not complying with requirements.

3.4 CLEANING

A. After completing painting, clean glass and paint-spattered surfaces. Remove spattered paint by washing and scraping without scratching or damaging adjacent finished surfaces.

3.5 PROTECTION

A. Protect work of other trades, whether being painted or not, against damage by painting. Correct damage by cleaning, repainting, repairing or replacing. Coordinate corrections with other trades involved.

B. Provide "Wet Paint" signs to protect newly painted finishes. Remove temporary protective wrappings provided by others to protect their work after completing painting operations.

C. At completion of construction activities of other trades, touch up and restore damaged or defaced painted surfaces.

3.6 INTERIOR PAINTING SCHEDULE

A. PAINT AND COATINGS SYSTEM NO. 5: Galvanized Sheet Metal

1. Semigloss Acrylic-Enamel Finish: Two finish coats over primer.
   a. Primer: Galvanized metal primer.
b. Finish Coats: Interior semigloss acrylic enamel.

B. PAINT AND COATINGS SYSTEM NO. 6: Gypsum Board Walls - Typical
1. Low-Luster (Eggshell) Acrylic-Enamel Finish: Two finish coats over primer.
   a. Primer: Interior gypsum board primer.
   c. Texture: Roll to “Orange Peel” texture.

C. PAINT AND COATINGS SYSTEM NO. 7: Gypsum Board Ceilings - Typical
1. Flat Acrylic Finish: Two finish coats over primer and texture.
   a. Primer: Interior gypsum board primer.
   b. Texture: “Orange Peel”.
   c. Finish Coats: Interior flat acrylic paint.

D. PAINT AND COATINGS SYSTEM NO. 8: Gypsum Board Walls and Ceilings - Epoxy
1. Locations: Rest Rooms and Janitor Closets
2. Semigloss Epoxy Finish: Two finish coats over primer.
   a. Primer: Interior gypsum board primer.
   b. Finish Coats: Interior semi-gloss epoxy coating.

E. PAINT AND COATINGS SYSTEM NO. 9: CMU Walls - Typical
   a. Block Filler: Concrete unit masonry block filler.
   b. Finish Coats: Interior semigloss acrylic enamel.

F. PAINT AND COATINGS SYSTEM NO. 10: CMU Walls - Epoxy
1. Locations: Janitor Closets
2. Semigloss Epoxy Finish: Two finish coats over block filler.
   a. Block Filler: Concrete unit masonry block filler.
   b. Finish Coats: Interior semigloss epoxy coating.

G. PAINT AND COATINGS SYSTEM NO. 11: Concrete Walls
1. Semigloss Acrylic-Enamel Finish: Two finish coats over primer.
   b. Finish Coats: Interior semigloss acrylic enamel.

H. PAINT AND COATINGS SYSTEM NO. 12: Concrete Ceilings
1. Low-Luster (Eggshell) Acrylic-Enamel Finish: Two finish coats over primer.

I. PAINT AND COATINGS SYSTEM NO. 13: Canvas, Pipe Wrapping, and Mechanical Insulation
1. Flat Acrylic Finish: Two finish coats over primer.
   a. Primer: Interior gypsum board primer.
   b. Finish Coats: Interior flat acrylic paint.

J. PAINT AND COATINGS SYSTEM NO. 14: Color Coding and Identification Painting
1. Low-Luster (Eggshell) Acrylic-Enamel Finish: Two finish coats over a primer.
   a. Primer: Interior ferrous-metal primer unless shop primed.
K. PAINT AND COATINGS SYSTEM NO. 15: Heat Resistant Coating

L. PAINT AND COATINGS SYSTEM NO. 16: Dustproofing of Concrete Floors, sealed concrete floors:

1. Type of Coating: Colorless, transparent odorless, nontoxic, nonflammable, and noncombustible silicate solution or water-based sealer as manufactured by: Curecrete Chemical Co., “Ashford Formula” or Cehmpore Coating Systems, L.P., “CTDensifier 201”.

2. Surface Preparation: Clean concrete surfaces free from dust, dirt, and other foreign materials.

3. Application and Mix: Apply dustproofing material on freshly finished surface sprayed with a low pressure to assure proper curing. Apply the product in accordance with the manufacturer's directions when the surface is firm enough to walk on and before checking and temperature cracking begins. Keep the entire surface wet for 30 minutes by brooming excess product onto the dry spots or respraying the dry spots immediately. As the product begins to dry into the surface and become slippery underfoot, lightly sprinkle the surface with water to aid penetration and to bring alkali to the surface when dry, flush the surface with water, and squeegee the surface totally dry. Remove all excess product and alkali brought to the surface.

3.7 COLOR CODING OF PIPING AND EQUIPMENT

A. General Requirements:

1. Color coding is required for accessible piping systems and related equipment in accordance with Paragraph 3.7.C of this section.

2. Identify piping systems and related equipment to be color coded in accordance with ASME A13.1 and as follows:
   a. Apply color to entire length of piping.
   b. Lettered legends indicating the name of the contents of the system as specified.

3. Paint associated supports, brackets, hangers, and similar accessories as identified for interior steel, and not as required for color coding.

B. Location of Legends and Bands:

1. Stencil lettered legends on the piping at the horizontal or vertical center line. Where pipe lines are too close together and where located above the operator's normal line of vision, place the lettering below the horizontal center line at a point which will be easily visible.

2. Position lettered legends and bands at joints where pipes enter and leave rooms or spaces, at junction points, points of distribution, close to valves and equipment, at changes in direction, and at intervals along piping where necessary for identification.

3. Stencil piping to show service and direction of flow. Space stencils within sight of each other and approximately 20 feet apart on long runs.

C. Schedule of Colors and Legends: See Section 01086, "Color Codes and Color Standards" or as noted on drawing.

3.8 FIRE AND SMOKE BARRIER IDENTIFICATION

A. Corridor partitions, smokestop partitions, horizontal exit partitions, exit enclosures and fire walls shall be effectively and permanently identified with signs, labels or stencils in a manner acceptable to authority having jurisdiction.

1. Identification shall be above decorative ceiling and in concealed spaces.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will be paid for on a lump sum basis for interior painting per location indicated wherein no measurement will be made.

END OF SECTION 09920
PART 1 - GENERAL

1.1 SUMMARY

A. Section includes exterior and interior, steel fabricator shop and field applied, high-performance coatings for steel, other than galvanized sheet metal and supplementary items necessary to complete the installation.

B. Surface preparation, priming, and finish coats specified in this Section are in addition to shop priming and surface treatment specified under other Sections.

C. Exterior concrete and masonry surfaces coatings are specified and scheduled in Section 09980, "Coatings for Concrete and Masonry".

D. Interior surfaces, including galvanized sheet metal, receiving conventional paint are specified and scheduled in Section 09920, "Interior Painting".

E. Do not paint UL labels.

1.2 REFERENCED STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM D16 - Standard Terminology for Paint, Related Coatings, Materials, and Applications
2. ASTM D2092 - Standard Guide for Preparation of Zinc-Coated (Galvanized) Steel Surfaces for Painting
3. ASTM D2244 - Standard Practice for Calculation of Color Tolerances and Color Differences from Instrumentally Measured Color Coordinates
5. ASTM D4417 - Standard Test Methods for Field Measurement of Surface Profile of Blast Cleaned Steel

B. NACE International (Formerly known as National Association of Corrosion Engineers):

1. NACE Certified Inspector Program

C. The Society for Protective Coatings (Formerly known as Steel Structures Painting Council) (SSPC):

1. SSPC-PA 2 - Measurement of Dry Coating Thickness with Magnetic Gages
2. SSPC PAINT 20 - Zinc-Rich Coating Type I Inorganic and Type II Organic
3. SSPC PAINT 27 - Basic Zinc Chromate-Vinyl Butyral Wash Primer
4. SSPC-SP 1 - Solvent Cleaning
5. SSPC-SP 6/NACE No. 3 - Commercial Blast Cleaning
6. SSPC-SP 11 - Power Tool Cleaning to Bare Metal
7. “Good Painting Practice, SSPC Painting Manual Volumes I and II”

1.3 DEFINITIONS

A. Qualification: Should particular conditions not be definable according to these definitions, request clarification from the Architect.

B. Interior: Defined as surfaces that are within heated and air-conditioned spaces, areas and rooms. Ceiling cavities and plenums above conditioned spaces and within the confines of the exterior walls shall be considered as interior.

C. Exterior: Defined as surfaces that are exposed to temperature and humidity variations, precipitation, and ultraviolet light. Exterior shall include spaces and areas that are covered by roof structures but are not heated and air-conditioned.

D. Coatings Terminology: Refer to ASTM D16 for definitions of terms related to coating work not otherwise defined in this Section.

1.4 SUBMITTALS

A. Standards: Submit trade association and independent testing agency standards (i.e. ASTM, etc.) Stated within the specification.

B. Product Data: Submit for each coating system specified, including each coating required.

1. Material List: Inclusive list of required coating materials identifying each by manufacturer's product number and general classification.
2. Manufacturer's Information: Technical information, including label analysis and instructions for handling, storing, and applying each coating material. Include instructions for preparation for and field touch up of primer and finish coats.

3. Manufacturer's Certification: Stating that products supplied will comply with local regulations controlling use of volatile organic compounds (VOC).

C. Detailed Coating Schedule: Submit schedule detailing type of surface, specific data for each coating material, and number of coats required.

D. Samples for Verification Purposes: Submit for each substrate, separate coat, coating color and material to be applied, with texture to simulate actual conditions, on 8 inch by 10 inch stepped samples of the actual substrate to be coated. Use representative colors when preparing samples for review. Label each sample with product data defining each separate coat, including primers. Resubmit until required sheen, color, and texture are achieved.

E. Manufacturer's Project Acceptance Document: Submit certification and acceptance of compatibility and suitability of materials scheduled with substrate and project conditions indicated.

F. Maintenance Instructions: For inclusion in operation and maintenance manual required by Division 1, submit manufacturer's instructions for maintenance of installed work, including methods and frequency for maintaining optimum condition under anticipated use. Include precautions against cleaning materials and methods which may be detrimental to finishes and performance.

G. Applicator's Qualification: Submit applicator's resume, include list of a minimum of 5 completed projects of similar size and complexity to this Work. Include for each project:
   1. Project name and location.
   2. Name of owner.
   3. Name of contractor.
   4. Name of architect.
   5. Name of coating manufacturer.
   6. Approximate area of coatings applied.
   7. Date of completion.

H. Manufacturer's Qualifications: Submit resume.

I. Contractor's Field Quality Control: Submit specified reports.

J. Manufacturer Representative's Reports: Submit reports of representative's periodic inspections.

1.5 QUALITY ASSURANCE

A. Material Requirements:
   1. Compatibility: Provide materials that are compatible with one another under conditions of service and application required, as demonstrated by manufacturer based on testing and field experience.
   2. Single-Source Responsibility: Provide primers and undercoat material produced by the same manufacturer as the finish coats for each type of coating. Use only thinners recommended by the manufacturer and only within recommended limits.

B. Applicator Qualifications: Applicator shall be experienced in performing high-performance coating work, shall have completed not less than 10 years with coating system applications similar in material and extent to those indicated for Project, and have a record of successful in-service performance.

C. Manufacturer's Technical Representative Qualifications: Direct employee of technical services department of manufacturer with minimum of 5 years experience in providing recommendations, observations, evaluations, and problem diagnostics. Sales representatives are not acceptable.

D. Independent (third party) painting (coating) inspector shall be certified under NACE Certified Inspector Program as a Certified Coating Inspector. Also Coating Inspector shall have documented experience in the inspection of the system of type specified for projects of similar size and character.

E. Quality Standard for Steel Preparation: Surface preparation and painting practices shall conform to the SSPC - Steel Structures Painting Manual, Volumes 1 and 2.

F. Field Applied Mock-Ups: Provide a full-coat finish mock-up of each type of coating and substrate required on the Project. Mock-ups may be actual substrates of the Work. Duplicate finish of approved prepared samples.
   1. Select 1 surface, approved by the Contracting Officer, to represent surfaces and conditions for each type of coating and substrate to be painted.
2. Apply coatings to each surface according to the Schedule or as specified. Provide required sheen, color, and texture on each surface.

3. After finishes are accepted, the surface will be used to evaluate coating systems of a similar nature.

G. Pre-Application Meeting: Convene a pre-application meeting three weeks before start of application of coating systems. Require attendance of parties directly affecting work of this Section, including Contractor, Authority’s representative and inspector, applicator, and manufacturer’s representative. Review the following:

1. Environmental requirements.
2. Protection of surfaces not scheduled to be coated.
4. Application.
5. Repair.
6. Field quality control.
7. Cleaning.
8. Protection of coating systems.
9. One-year inspection.
10. Coordination with other work.

1.6 DELIVERY, STORAGE, AND PROTECTION

A. Delivery: Deliver coating materials to the job site in manufacturer's original, new, unopened packages and containers bearing manufacturer's name and label and following information:

1. Name or title of material.
2. Manufacturer's name, stock number, and date of manufacture.
3. Contents by volume.
4. Thinning instructions (if permitted).
5. Application instructions.
6. Color name and number.
7. Handling instructions and precautions.

B. Storage: Store materials not in actual use in accordance with weather, temperature, humidity and substrate conditions recommended by material manufacturer, in tightly covered containers at a minimum ambient temperature of 45 degrees F in a well-ventilated area. Maintain containers used in storage of coatings in clean condition, free of foreign materials and residue.

C. Protection: Protect work of other trades and vehicles, structures, landscaping, paving, and other surfaces on and off the site from marking or injury from coating application and from field surface preparation.

1.7 PROJECT CONDITIONS

A. Weather Condition Limitation:

1. Proceed with coating work only when existing and forecasted weather conditions will permit application of coating material in accordance with manufacturers' recommendations and warranty requirements.
2. Work may continue during inclement weather if surfaces and areas to be coated are enclosed and heated within temperature and humidity limits specified by manufacturer during application and drying periods and job site conditions are acceptable to the manufacturer and applicator.
3. If anticipated time of coating application is such that weather would likely restrict coating application, the Contractor may, with the approval of the Contracting Officer, apply complete finish system within shop.

B. Enclosures to permit coating of surfaces during inclement weather may be used provided that the environmental conditions specified are maintained throughout coating and curing periods.

1.8 WARRANTY

A. Manufacturers Extended Special Warranty: Furnish warranty for a period of 5 years from date of substantial completion agreeing to repair or replace defects, signed by an authorized representative of manufacturer, on the form that was published with product literature as of date of Contract Documents.

B. Defects shall include, but not be limited to, the following:

1. Fading or color change in excess of 8 delta E units (Hunter) as measured in accordance with ANSI/ASTM D2244.
2. Chalking in excess of 6 or less in accordance with ASTM D4214.
3. Cracking.
4. Checking.
5. Adhesion loss (delamination).

1.9 MAINTENANCE MATERIALS

A. Field Touch-Up Kits: Furnish to the Authority field touch-up kits complete with preparation, mixing, and application instructions for each coat and color used. Kits shall consist of quart containers. Larger containers may be acceptable if approved by the Contracting Officer. Quantity of kits shall equal one gallon for each 5,000 square feet of coating.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Specific product or material manufactured by following listed manufacturers is “acceptable” only if specific product or material can evidence compliance with requirements of Contract Documents.

1. Ameron International
2. Carboline
3. International Protective Coatings
4. Or approved equal

2.2 PRODUCTS

A. Material Compatibility: Provide primers, intermediate coat materials, finish coat materials, and related materials that are compatible with one another and the substrates indicated under conditions of service and application as demonstrated by the manufacturer based on testing and field experience.

B. Colors: As indicated.

C. System:

1. Type of Coating:
   a. Epoxy zinc-rich primer shop applied.
   b. Polysiloxane finish coat.
   c. Gloss sheen.

2. Dry Film Thickness (DFT): As specified by the approved manufacturer.

D. Epoxy Zinc-Rich Primer: Shop or field applied as scheduled.

1. Generic Product Description:
   a. Two component, metallic zinc rich epoxy primer which complies with composition and performance requirements of SSPC PAINT 20
   b. Extended overcoating interval of at least 6 months for specified topcoat.
   c. Recommended by manufacturer as suitable for specified topcoat.

2. Acceptable Manufacturers and Products:
   b. Carboline - “Carbozinc 859 EZ”, DFT 2-3 mils.

1. Generic Product Description:
   a. Two component, metallic zinc rich epoxy primer which provides rapid cure and overcoating even under low temperature conditions.
   b. Recommended by manufacturer as suitable for specified topcoat.

2. Acceptable Manufacturers and Products:
   a. International Protective Coatings (Akzo Nobel) - “Interzinc 315”, DFT 2 to 3 mils.

F. Thick Finish Coat: Field applied.

1. Generic Product Description:
   a. Thick coat (4 to 6 mils) high performance, two component, high solid inorganic hybrid polysiloxane finish
   b. Isocyanate free.
   c. With extended recoatability.

2. Sheen: Gloss.
3. Acceptable Manufacturers and Products:
   a. Ameron International - “PSX 700”, DFT 3 to 5 mils.
   c. International Protective Coatings (Akzo Nobel) - “Interfine 979”, DFT 4 to 6 mils.

G. Thin Finish Coat: Shop or field applied, as scheduled.
   1. Generic Product Description:
      a. Thin coat (2 to 3mils) high performance, two component, high solid inorganic hybrid polysiloxane finish
      b. Isocyanate free.
      c. With extended recoatability.

2. Sheen: Gloss.

3. Acceptable Manufacturers and Products:
   a. International Protective Coatings (Akzo Nobel) - “Interfine 878”, DFT 2 to 3 mils.
   b. Other manufacturers may furnish their thick coat system specified above in lieu of thin coat system, however system must be applied at rate listed in manufacturer’s literature.

2.3 SHOP QUALITY CONTROL

A. The requirements specified herein in the Article entitled “Field Quality Control” apply to surface preparation and shop application of prime coat and, if applicable, other shop coats.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrate surfaces to receive high performance coatings for steel and associated work and conditions under which work will be installed. Do not proceed until unsatisfactory conditions have been corrected in a manner complying with the Contract Documents and acceptable to the Installer. Starting of work within a particular area will be construed as installer's acceptance of surface conditions.

3.2 PREPARATION

A. Coordination of Work: Review other Sections in which shop applied primers are provided to ensure compatibility of the total system for various substrates. Furnish information on characteristics of finish materials to shop applicators to ensure use of compatible primers.

B. General: Remove plates, machined surfaces, and similar items already in place that are not to be coated, or provide surface-applied protection prior to surface preparation and coating. Remove these items, if necessary, to completely coat the items and adjacent surfaces. Following the coating operations in each space or area, have removed items reinstalled by workers skilled in the trades involved. After completing coating operations, reinstall items that were removed.

   1. Areas which may become inaccessible or difficult to coat after erection shall be coated prior to assembly or erection.

C. Cleaning: Before applying coatings or other surface treatments, clean the substrates of substances that could impair bond of the various coatings. Remove oil and grease prior to cleaning. Schedule cleaning and coating application so dust and other contaminants from the cleaning process will not fall on wet, newly coated surfaces.

   1. Marks for color coding of bulk materials and erection marking which are not compatible with coating system shall be removed or sealed as instructed in the coating system manufacturer's instructions.

D. Ferrous Metals Surface Preparation: Clean and prepare surfaces to be coated according to the manufacturer's instructions for each particular substrate condition as scheduled in either the fabricator's shop or in field.

   1. Uncoated Metal Surfaces:
      a. Fabrication Defects: Correct steel and fabrication defects revealed by surface preparation.
         1) Scrape or grind protrusions flush with surface.
         2) Remove weld spatter and slag.
         3) Round sharp edges and corners of welds to a smooth contour.
         4) Smooth weld undercuts and recesses.
         5) Grind down porous welds to pinhole-free metal.
6) Remove weld flux from surface.

b. Remove oil, grease, dirt, loose mill scale and other foreign substances using methods that comply with SSPC/NACE recommendations.

c. Blast-clean steel surfaces as recommended by the coating system manufacturer and according to the requirements of SSPC/NACE Specification referenced herein.

1) Achieve surface profile recommended by the primer manufacturer.

2) Coat abrasive blast-cleaned surfaces with primer before visible rust forms on surface. Do not leave blast-cleaned surfaces uncoated for more than 8 hours.

d. Ensure surfaces are dry.

e. Treat cleaned metal with a metal treatment wash coat prior to priming.

2. Coated Metal Surfaces: Remove foreign substances using methods that comply with coating system manufacturer recommendations. Touch-up bare areas and previous coatings that have been damaged.

E. Material Preparation: Carefully mix and prepare coating materials according to the manufacturer’s directions.

1. Maintain containers used in mixing and application of coatings according to the manufacturer’s directions.

2. Stir materials before applying to produce a mixture of uniform density; stir as required during application. Do not stir surface film into the material. Remove film and, if necessary, strain the coating material before using.

3. Use only the type of thinners approved by the manufacturer and only within recommended limits.

F. Tinting:

1. Tinting at the site is not permitted.

2. Tint undercoats to match color of finish coat, but provide sufficient difference in shade to distinguish each separate coat.

3.3 APPLICATION

A. General: Apply high performance coatings according to manufacturer’s instructions, approved submittals and Contract Documents, as scheduled in either the fabricator’s shop or in field.

B. Application Requirements:

1. Use application techniques best suited for the coating materials being applied. Apply shop coatings by brush, roller, spray, or other applicators according to coating manufacturer’s instructions. Apply field coatings by brush or roller according to coating manufacturer’s instructions, no spray application of field coatings.

a. Brush Application: Use brushes best suited for material applied and of appropriate size for surface or item being coated. Brush out and work brush coats into surfaces in an even film.

b. Roller Application: Use rollers of carpet, velvet back, or high-pile sheep’s wool as recommended for material applied.

c. Spray Application:

1) Spray application may only be used for shop application.

2) Use mechanical methods to apply coatings if permitted by manufacturer and governing regulations. Use spray equipment with orifice size as recommended by manufacturer for material being applied. Do not double back with spray equipment building up film thickness of 2 coats in one pass, unless recommended by manufacturer.

2. The number of coats and film thickness required is the same regardless of the application method. Do not apply succeeding coats until the previous coat has cured as recommended by the manufacturer. Where sanding is required, according to the manufacturer’s directions, sand between applications to produce a smooth, even surface.

3. Apply coating systems to provide an opaque, smooth surface of uniform finish, color, appearance and coverage. Cloudiness, spotting, holidays, laps, brush marks, runs, sags, ropiness or other surface imperfections will not be accepted.
4. Make edges of coatings adjoining other materials clean and sharp with no overlapping. Work material into surfaces voids and hairline cracks.

5. Do not apply coatings over dirt, rust, scale, grease, moisture, scuffed surfaces, or conditions detrimental to forming a durable coating film.

6. Do not use materials that are beyond the manufacturers recommended pot life.

7. Do not apply initial coating until moisture content of surface is within limitations recommended by coating manufacturer according to moisture meter testing.

8. Do not apply succeeding coats until previous coat has cured as recommended by coating manufacturer. Do not exceed manufacturer’s recommended maximum time limit for re-coating. If the manufacturer’s recommended maximum time limit has been exceeded, prepare surface as required by manufacturer prior to applying next coat.

9. Dry film thickness of each coat shall be according to the requirements specified herein or manufacturer’s recommendation, whichever is greater.

C. Primer Application: Apply primer coats to surfaces, in fabricator’s shop or in field as indicated in schedules below, that have been cleaned, pretreated (if required), or otherwise prepared for coating as soon as practical after preparation and before subsequent surface deterioration.

D. Finish Coats:

1. Recoat primed surfaces where there is evidence of suction spots or unsealed areas in first coat, to assure a finish coat with no burn-through or other defects due to insufficient sealing.

2. When undercoats or other conditions show through the final coat, apply additional coats until the cured film has a uniform coating finish, color, and appearance. Give special attention to edges, corners, crevices, welds, exposed fasteners, and similar surfaces to ensure that they receive a dry film thickness equivalent to that of flat surfaces.

E. Completed Work: Match approved samples for color, texture, and coverage. Remove, refinish, or recoat work that does not comply with specified requirements.

3.4 REPAIR

A. Repair defects such as overspray, runs, sags, voids, blistering, peeling, rusting, inadequate cure, and lack of adhesion according to the touch-up and repair procedures accepted by the Authority.

B. Remove mud cracking on steel, except sheet metal by blasting. Remove mud cracking on sheet metal per SSPC-SP 11; take care to avoid deformation of the metal. Suitably restore the surface profile for the specified paint material.

3.5 FIELD QUALITY CONTROL

A. Independent Inspection Agency: Authority reserves the right to invoke testing by an independent testing laboratory whenever and as often as deemed necessary during coating applications.

1. Samples of materials delivered to site will be taken, identified, sealed, and certified in presence of Contractor.

2. Tests include, but are not limited to, the following:
   a. Quantitative materials analysis.
   b. Absorption.
   c. Accelerated weathering.
   d. Accelerated yellowness.
   e. Color retention.
   f. Alkali and mildew resistance.
   g. Abrasion resistance.
   h. Apparent reflectivity.
   i. Washability.
   j. Dry Opacity.
   k. Recoating.
   l. Skinning.

3. If results indicate materials being used does not conform with Contract Documents, Contractor may be directed to remove nonconforming materials, pay for testing, recoat surfaces coated with rejected materials, or remove rejected materials from previously coated surfaces if, upon recoating with specified materials, the two coatings are not compatible.

B. Contractor’s Field Quality Control: The Contractor shall furnish the necessary testing and inspection
COATINGS FOR STEEL

instruments, calibrated and maintained. Such equipment shall be available for use by the Contracting Officer upon request. Verify, in the presence of the Contracting Officer, that the following are as specified and document using the form at the end of this Section or form approved by the Contracting Officer. Obtain Contracting Officer's sign-off of forms.

1. Coatings and other materials.

2. Surface preparation and application.

3. Environmental conditions prerequisite for each coat.

4. Surface conditions prerequisite for each coat.

5. Minimum and maximum re-coating time limitations and pot life expiration times.

6. Mixing, thinning, and induction time.

7. DFT of each coat and total DFT of coating system using wet film and dry film gauges.

8. Coating Defects: Check coatings for film characteristics or defects that would adversely affect performance or appearance of coating systems.

9. Report:
   a. Complete Surface Preparation and Coating Inspection Record for each portion of the work for each system as agreed to by the Authority.
   b. Written reports describing inspections made and actions taken to correct nonconforming work.
   c. Nonconforming work not corrected.

C. Independent Painting Inspector: In addition to the Contractor's Quality Control, the Contractor shall provide an independent painting inspector to verify the items listed under Contractor's Field Quality Control.

D. Determination of Dry Film Thickness (DFT):

1. The specified DFT shall be a minimum of the profile depth of the coating, when dry, as measured from the face of the surface to be coated. The specified DFT over blasted or otherwise roughened surface requires a dry film thickness gage reading on the bare surface prior to painting. The bare surface gage reading shall then be deducted from the coated surface gage readings.

2. Measure film thickness as follows:
   a. Magnetic surfaces by use of a Mikrotest or Elcometer thickness gauge in accordance with SSPC-PA 2.
   b. Nonmagnetic surfaces by wet film thickness readings, thus verifying the calculated wet film thickness required to achieve the specified dry film thickness.
   c. Disputed thickness shall have a final check using the Tooke gage.

E. Surface Preparation and Coating Inspection:

1. Determine dew point and relative humidity following procedures of ASTM E337.

2. Readings are required prior to application and approximately every four hours or at other time intervals approved in writing by the Contracting Officer. Alternatively, continuous monitoring shall be performed using systems established and/or accepted by the Contracting Officer in writing.

3. Review temperature, humidity, and dew point readings upon noticeable deterioration of conditions or as requested by the Contracting Officer.

4. Compare blast cleaned surfaces with SSPC Vis 1, visual standards. Verify the anchor pattern profile depth in accordance with ASTM D4417.

5. Use grease-free chalk to mark local areas which do not meet specified standards.

6. Take surface temperature and humidity reading prior to application of each coat. The work shall not proceed if the ambient temperature parameters are outside the specified requirements. If more stringent, the coating manufacturer's requirements shall dictate.

7. Visually inspect the coating for defects such as overspray, runs, sags, voids, blistering, peeling, rusting, mud cracking, inadequate cure, and lack of adhesion.

F. Manufacturers Field Service:

1. Manufacturer shall provide qualified technical representative.

2. Representative shall periodically inspect material and application to insure installation is proceeding in accordance with manufacturers designs,
COATINGS FOR STEEL

recommendations and warranty requirements.

3. Representative shall submit reports as indicated in the "Quality Assurance" Article above.

3.6 CLEANING

A. After completing painting, clean glass and paint-spattered surfaces. Remove spattered paint by washing and scraping.

3.7 PROTECTION AND TOUCH UP

A. Protect surfaces, structures, landscaping, and vehicles including those of adjacent property owners from damage by painting including over spray.

B. Protect work of other trades, whether being painted or not, against damage by painting. Correct damage by cleaning, repainting, repairing or replacing. Coordinate corrections with other trades involved.

C. Provide "Wet Paint" signs to protect newly painted finishes. Remove temporary protective wrappings provided by others to protect their work after completing painting operations.

D. At completion of construction activities of other trades, touch up and restore damaged or defaced painted surfaces. Prepare areas requiring touch up as required by coating manufacturer. Touch up with materials used in the work. In the case of shop primer, primer shall be product recommended in writing by coating manufacturer for field touch up.

3.8 COATINGS FOR STEEL (HIGH PERFORMANCE COATINGS) SCHEDULE

A. PAINT AND COATINGS SYSTEM NO. 1: Thick Polysiloxane Coating System for exterior steel and ferrous metals:

1. Locations:
   a. Exterior architectural exposed structural steel (AESS) and steel bridges.

2. Steel Surface Preparation: As recommended by coating manufacturer, but not less than SSPC-SP 6/NACE No. 3

3. Coatings:
   b. 2nd Coat: Field applied touch-up of Epoxy Zinc-Rich Primer Coat. Brush or roller applied.

B. PAINT AND COATINGS SYSTEM NO. 2: Thin Polysiloxane Coating System for steel and ferrous metals, other than galvanized sheet metal:

1. System No. 2A:
   a. Locations (including, but limited to):
      1) Miscellaneous metal fabrications.
      2) Metal stairs
      3) Pipe and tube railings.
      4) Non-galvanized sheet metal.
   b. Steel Surface Preparation: As recommended by coating manufacturer, but not less than SSPC-SP 6/NACE No. 3.
   c. Coatings:
      1) 1st Coat: Shop applied Epoxy Zinc-Rich Primer Coat.
      2) 2nd Coat: Shop applied Thin Finish Coat.
      3) 3rd Coat: Field applied touch-up Thin Finish Coat. Brush or roller applied. Note: Brush applying may require 2 coats to achieve required coverage.

2. System No. 2B:
   a. Locations (including, but limited to):
      1) Structural steel (other than AESS)
   b. Steel Surface Preparation: As recommended by coating manufacturer, but not less than SSPC-SP 6/NACE No. 3.
   c. Coatings:
      1) 1st Coat: Shop applied Epoxy Zinc-Rich Primer Coat.
      2) 2nd Coat: Field applied touch-up of shop primer with Rapid Recoat Epoxy Zinc-
3) 3rd Coat: Field applied Thin Finish Coat. Brush or roller applied. Note: Brush applying may require 2 coats to achieve required coverage.

3. System No. 2C:
   a. Locations (including, but limited to):
      1) Hollow metal doors and frames.
      2) Other metal items specified to be shop primed by manufacturer.
   b. Steel Surface Preparation: As recommended by coating manufacturer, but not less than SSPC-SP 1.
   c. Coatings:
      1) 1st Coat: Field applied touch-up of shop primer with Rapid Recoat Epoxy Zinc-Rich Primer or Epoxy Zinc-Rich Primer Coat. Brush or roller applied.
      2) 2nd Coat: Field applied Thin Finish Coat. Brush or roller applied. Note: Brush applying may require 2 coats to achieve required coverage.

4. System No. 2D:
   a. Locations (including, but limited to):
      1) Exposed view galvanized mechanical and electrical items including pipe, conduit, junction boxes and hangers.
      2) Interior slotted channel framing system specified in Section 05430, “Slotted Channel Framing”.
   b. Surface Preparation: ASTM D2092 and as required by coating manufacturer.
   c. Coatings:
      1) 1st Coat: SSPC PAINT 27 or as required by coating manufacturer.
      3) 3rd Coat: Field applied Thin Finish Coat. Brush or roller applied. Note: Brush applying may require 2 coats to achieve required coverage.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL
   A. The work described in this section will be paid for on a lump sum basis for coatings for steel per location indicated wherein no measurement will be made.

PART 1 - GENERAL

1.1 DESCRIPTION
   A. Work required for this Section includes coatings for exterior concrete and masonry and supplementary items necessary to complete their installation.

   B. Exterior and interior steel surfaces coatings are specified and scheduled in Section 09970, "Coatings for Steel".

   C. Interior painting is specified in Section 09920, "Interior Painting".

1.2 REFERENCED STANDARDS
   A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

      1. ASTM D16 - Standard Terminology for Paint, Related Coatings, Materials, and Applications

1.3 SUBMITTALS
   A. Product Data: For each coating system specified.

   B. Samples for Verification: Of each color and material to be applied, with texture to simulate actual conditions, on representative samples of actual substrate.

      1. Submit samples on the following substrates for the Contracting Officer’s review of color and texture only:

      2. Provide two 4-inch square samples of actual substrate material for each color and texture.

1.4 QUALITY ASSURANCE
   A. Applicator Qualifications: Engage an experienced applicator who has completed coating system applications similar in material and extent to those indicated for this Project with a record of successful in-service performance.

   B. Control Samples (Mockups): Provide full-coat control finish samples of each type of coating and substrate required on the Project. Duplicate finish of approved prepared samples.

      1. The Contracting Officer will select one exterior wall surface at least 100 sq. ft. to represent surfaces and conditions for each substrate.

      2. After control samples are approved, these surfaces will be used to evaluate coating systems.

      3. Obtain the Contracting Officer’s approval of control samples before starting application of coatings.

      4. Final approval of colors will be from control samples, not samples submitted for verification.

1.5 PROJECT CONDITIONS
   A. Temperature Conditions: Apply coatings only when temperature of surfaces to be coated and surrounding air temperatures are within range permitted by manufacturer’s written instructions.

   B. Weather Conditions: Do not apply coatings in snow, rain, fog, or mist; when relative humidity exceeds 85 percent; or at temperatures less than 5 degrees F above the dew point; or to damp or wet surfaces.

      1. Allow wet surfaces to dry thoroughly and attain temperature and conditions recommended by manufacturer before starting or continuing coating operation.

PART 2 - PRODUCTS

2.1 PRODUCTS
   A. Clear Sealer:

      1. Acceptable Manufacturers and Products:

         c. Sherwin-Williams SW244-40L VOC Silane Sealer Water Proofer.

         d. Or approved equal.

   B. Penetrating Acrylic Stain:

      1. Acceptable Manufacturers and Products:

         a. United Coatings - "Canyon Tone Stain".

         b. Chemprobe Coating Systems, L.P. - “Conformal Stain”.

         c. Tnemec Co., Inc. - “Series 180 Tneme-Crete”.

DART Standard Specifications – July 2014
d. Sherwin-Williams - SWD Bridge and Highway Heavy Waterbased Stain, B97 Series.
e. Or approved equal.

C. Anti-Graffiti Coatings (Permanent, Water-Cleanable):
   1. Acceptable Manufacturers and Products:
      a. CSL Silicones, Inc
         1) Si-Coat 530 (Clear)
         2) Si-Coat 579 (Pigmented)
      b. Sherwin-Williams - “B97C00150”
      c. Monopole, Inc – “Permashield Premium”
      d. Prosco
         1) Sure Klean Weather Seal Blok-Guard and Graffiti Control
e. Or approved equal.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates surfaces to receive elastomeric coating system and associated work and conditions under which work will be installed. Do not proceed with work until unsatisfactory conditions have been corrected in a manner acceptable to installer. Starting work within a particular area will be construed as applicator’s acceptance of surface conditions.

3.2 PREPARATION

A. General: Remove items already installed that are not to be coated. If removal is impractical or impossible because of size or weight of item, provide surface-applied protection before surface preparation and coating. After completing coating operations in each area, reinstall items removed, using workers skilled in trades involved.

B. Cleaning: Before applying coatings or other surface treatments, clean substrates of substances that could impair bond of coating systems. Remove oil and grease before cleaning. Schedule cleaning and coating application so dust and other contaminates will not fall on wet, newly coated surfaces.

C. Surface Preparation: Clean and prepare surfaces to be coated according to manufacturer’s written instructions for the particular substrate conditions and as specified.
   1. For Clear Sealer: Remove efflorescence and roughen surfaces where necessary to improve adhesion. Point up holes.
   2. For Penetrating Acrylic Stain: Methods and materials used for cleaning of substrate shall be as recommended by the manufacturer of the water repellent stain.

D. Material Preparation: Mix and prepare materials according to coating manufacturer’s written instructions.
   1. Stir materials before application to produce a mixture of uniform density. Stir as required during application. Do not stir surface film that may form into material. Remove film and, if necessary, strain coating material before using.
   2. If manufacturer permits thinning, use only thinners recommended by manufacturer, and only within limits recommended by manufacturer.

3.3 APPLICATION

A. General: Apply coatings to exposed surfaces indicated, according to manufacturer’s written instructions.

B. Application Procedures: Apply coatings by brush, roller, or spray according to manufacturer’s written instructions.
   1. Brushes: Use brushes best suited for material being applied.
   2. Rollers: Use professional-quality quick-release rollers of carpet, velvet back, or high-pile sheep’s wool covers as recommended by the manufacturer for material and texture required.
   3. Spray Equipment: Use airless spray equipment with orifice size as recommended by the manufacturer for material and texture required.
   4. Minimum Coating Thickness: Apply each material no thinner than manufacturer’s recommended spreading rate.
   5. Wherever spray application is used, apply each coat to provide equivalent hiding of brush-applied coats. Do not double back with spray equipment, building up film thickness of 2 coats in 1 pass.
C. Brush Application: Brush out and work brush coats into surfaces in an even film. Eliminate cloudiness, spotting, holidays, laps, brush marks, runs, sags, ropiness, or other surface imperfections. Neatly draw glass lines and color breaks.

D. Roller Application: Keep the cover wet at all times; do not dry roll. Work in sections. Lay on required amount of material, working material into grooves and rough areas; then level material, working it into surface.

E. Spray Application: Use spray equipment for application only when required by manufacturer’s written recommendations and authorities having jurisdiction.

F. Completed Work: Match approved samples for color, texture, and coverage. Remove, refinish, or recoat work not complying with specified requirements.

3.4 CLEANING

A. At end of each workday, remove rubbish, empty cans, rags, and other discarded materials from the Project site.

B. After completing coating work, clean glass and spattered surfaces. Remove spattered coatings by washing, scraping, or other methods, being careful not to scratch or damage adjacent finished surfaces.

3.5 PROTECTION

A. Protect work of other trades from damage whether being coated or not. Correct damage by cleaning, repairing, replacing, and recoating as approved by the Contracting Officer. Leave in an undamaged condition.

B. Provide "Wet Paint" signs to protect newly coated finishes. Remove temporary protective wrappings provided by others to protect their work after completing coating operations.

C. After construction activities of other trades are complete, touch up and restore damaged or defaced coated surfaces.

3.6 COATINGS FOR CONCRETE AND MASONRY SCHEDULE

A. PAINT AND COATINGS SYSTEM NO. 3: Clear Sealer.
   1. Locations: All exterior concrete and masonry.
   2. Coatings:
      a. Two Coats: Clear Sealer.

B. PAINT AND COATINGS SYSTEM NO. 4: Penetrating Acrylic Stain.
   1. Locations: Where indicated.
   2. Coatings:
      a. Two Coats: Clear Sealer. Only one coat required on Sherwin-Williams system.
      b. Two Coats: Penetrating Acrylic Stain. For first coat on CMU, use heavy-duty product.

C. Anti-Graffiti Permanent, Water-Cleanable:
   1. Locations: Where indicated.
   2. Application:
      a. Apply anti-graffiti coatings on dry concrete surfaces only, when the temperature of the substrate surface and material is 50 degrees F or above.
      b. Do not apply anti-graffiti coatings when impending weather conditions might result in injury to fresh coating.
      c. Do not apply anti-graffiti coatings over any existing appearance coating unless otherwise noted on plans.

3. Coatings:
   a. Apply a primer, when required by the manufacturer, in accordance with manufacturer's recommendations.
   b. Do not thin the coating without prior approval.
   c. Replace permanent anti-graffiti coatings not meeting with ASTM D4752.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will be paid for on a lump sum basis for coatings for concrete and masonry per location indicated wherein no measurement will be made.
PART 1 - GENERAL

1.1 SUMMARY

A. Work required for this Section includes wall louvers and supplementary items necessary to complete their installation.

1.2 REFERENCE STANDARDS

A. Air Movement and Control Association (AMCA):
   1. AMCA 500-L - Laboratory Methods of Testing Louvers for Rating
   2. AMCA 501 - Application Manual for Air Louvers

B. American Architectural Manufacturers Association (AAMA):
   1. AAMA 611 - Voluntary Standards for Anodized Architectural Aluminum Revised
   2. AAMA 2605 - Voluntary Specifications, Performance Requirements and Test Procedures for Superior Performing Organic Coatings and Aluminum Extrusions and Panels

C. American Welding Society (AWS):
   1. AWS D1.2 - Structural Welding Code - Aluminum

D. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM B209 - Standard Specification for Aluminum and Aluminum-Alloy Sheet and Plate
   2. ASTM B221 - Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes
   3. ASTM D1187 - Standard Specification for Asphalt-Base Emulsions for Use as Protective Coatings for Metal
   4. ASTM E488 - Standard Test Methods for Strength of Anchors in Concrete and Masonry Elements

E. Building Research and Information Association (BSRIA):
   1. HEVAC Technical Specification - Laboratory Testing and Rating of Weather Louvres When Subjected to Simulated Rain

F. National Association of Architectural Metal Manufacturers (NAAMM):
   1. NAAMM's "Metal Finishes Manual for Architectural and Metal Products"

G. Sheet Metal & Air Conditioning Contractors National Association (SMACNA):
   1. SMACNA - Architectural Sheet Metal Manual

1.3 DEFINITIONS

A. Louver Terminology: Definitions of terms for metal louvers contained in AMCA 501 apply to this Section, unless otherwise defined in this Section or in referenced standards.

B. Standard Free Area: Free area of a louver 48 inches wide by 48 inches high, identical to that provided.

C. Maximum Standard Airflow: Airflow at point of beginning water penetration through a louver 48 inches wide by 48 inches high, identical to that provided.

D. Drainable-Blade Louver: Louver designed to collect and drain water to exterior at sill by means of gutters in front edges of blades and channels in jambs and mullions.

1.4 PERFORMANCE REQUIREMENTS

A. Structural Performance: Provide exterior metal louvers capable of withstand the effects of loads and stresses from wind and normal thermal movement without evidencing permanent deformation of louver components including blades, frames, and supports; noise or metal fatigue caused by louver blade rattle or flutter; or permanent damage to fasteners and anchors.

   1. Design: By professional engineer employed by louver manufacturer.
   2. Wind Load: Uniform pressures (velocity pressures) required by applicable local code acting inward or outward. Refer to Design Wind Pressure Schedule on drawings.
   3. Thermal Movements: Provide louvers that allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures by preventing buckling, opening of joints, overstressing of components, and other detrimental effects:
      a. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.

B. Air-Performance, Water-Penetration, and Air-Leakage Ratings: Provide louvers complying with performance requirements indicated, as demonstrated by testing
WALL LOUVERS

manufacturer's stock units 48 inches wide by 48 inches high.

1. Perform testing on unpainted, cleaned, degreased units.
2. Perform water-penetration testing on louvers without screens.
3. Test units according to AMCA 500-L.
4. Storm Resistant Louvers: Performance ratings of units shall be certified by BSRIA under HEVAC Technical Specification.

1.5 SUBMITTALS

A. Product Data: For each type of product specified.

B. Shop Drawings: For louver units and accessories. Include plans; elevations; sections; and details showing profiles, angles, and spacing of louver blades. Show unit dimensions related to wall openings and construction; free area for each size indicated; profiles of frames at jambs, heads, and sills; and anchorage details and locations.

1. For louvers indicated to comply with design loadings, include shop drawings and structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

C. Samples for Initial Selection: Manufacturer’s color charts showing the full range of colors available for units with factory-applied color finishes.

D. Samples for Verification: Of each type of metal finish required, prepared on Samples of same thickness and material indicated for final Work. Where finishes involve normal color and texture variations, include Sample sets showing the full range of variations expected.

E. Product Certificates: Signed by manufacturers of louvers certifying that the products furnished comply with requirements and are licensed to bear the AMCA seal based on tests made according to AMCA 500 and complying with AMCA’s Certified Ratings Program.

1.6 QUALITY ASSURANCE

A. Professional Engineer Qualifications: A professional engineer who is licensed in State of Texas and who is experienced in providing engineering services of kind indicated. Engineering services are defined as those performed for installations of louvers that are similar to those indicated for this Project in material, design, and extent.

B. Source Limitations: Obtain louvers through one source from a single manufacturer where indicated to be of same type, design, or factory-applied color finish.

C. Welding Standards: As follows:

1. Comply with AWS D1.2.
2. Certify that each welder has satisfactorily passed AWS qualification tests for welding processes involved and, if pertinent, has undergone recertification.

1.7 PROJECT CONDITIONS

A. Field Measurements: Verify louver openings by field measurements before fabrication and indicate measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.

1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish opening dimensions and proceed with fabricating louvers without field measurements. Coordinate construction to ensure that actual opening dimensions correspond to established dimensions.

1.8 WARRANTY

A. Finish Warranty: Provide written warranty signed by manufacturer and installer, agreeing to repair or replace work which exhibits defects in finish. "Defects" is defined to include, but is not limited to, peeling, chipping, chalking, fading, abnormal aging or deterioration, and failure to perform as required.

1. Warranty Period for Fluoropolymer Finish: 10 years from date of Final Acceptance for color and film integrity.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Following manufacturers listed are “acceptable” only if manufacturer can evidence product compliance with requirements of Contract Documents.

1. Airline Products Co.
2. Airolite Co.
3. American Warming and Ventilating, Inc.
5. Construction Specialties, Inc.
7. Industrial Louvers, Inc.
8. Nystrom Building Products
9. Ruskin Company Tomkins PLC.
10. Or approved equal.

2.2 MATERIALS

A. Aluminum Extrusions: ASTM B221, alloy 6063-T5 or T-52.
B. Aluminum Sheet: ASTM B209, alloy 3003 or 5005, 0.032 inch minimum thickness with temper as required for forming, or as otherwise recommended by metal producer for required flashings.
C. Fasteners: Of same basic metal and alloy as fastened metal or 300 series stainless steel, unless otherwise indicated. Do not use metals that are incompatible with joined materials.
   1. Use types and sizes to suit unit installation conditions.
   2. Use Phillips flat-head screws for exposed fasteners, unless otherwise indicated.
D. Postinstalled Fasteners: Torque-controlled expansion anchors, made from stainless-steel components, with capability to sustain, without failure, a load equal to 4 times the loads imposed, for concrete, or 6 times the load imposed, for masonry, as determined by testing per ASTM E488, conducted by a qualified independent testing agency.
E. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D1187.

2.3 FABRICATION, GENERAL

A. Assemble louvers in factory to minimize field splicing and assembly. Disassemble units as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation.
   1. Continuous Assemblies: Where height of louver units exceeds fabrication and handling limitations, fabricate units to permit field-bolted assembly with close-fitting joints in jambs and mullions, reinforced with splice plates and without interrupting blade-spacing pattern.
B. Maintain equal louver blade spacing, including separation between blades and frames at head and sill, to produce uniform appearance.
C. Fabricate frames, including integral sills, to fit in openings of sizes indicated, with allowances made for fabrication and installation tolerances, adjoining materials’ tolerances, and perimeter sealant joints.
   1. Frame Type: Channel type, unless otherwise indicated.
D. Include supports, anchorages, and accessories required for complete assembly.
E. Provide vertical Mullions of type and at spacings indicated, but not more than recommended by manufacturer, or 72 inches o.c., whichever is less.
   1. Fully Recessed Mullions: Where indicated, provide mullions fully recessed behind louver blades. Where length of louver exceeds fabrication and handling limitations, fabricate with close-fitting blade splices designed to permit expansion and contraction.
   2. Semirecessed Mullions: Where indicated, provide mullions partly recessed behind louver blades so louver blades appear continuous. Where length of louver exceeds fabrication and handling limitations, fabricate with interlocking split mullions and close-fitting blade splices designed to permit expansion and contraction.
   3. Exposed Mullions: Where indicated, provide units with exposed mullions of same width and depth as louver frame. Where length of louver exceeds fabrication and handling limitations, provide interlocking split mullions designed to permit expansion and contraction.
   4. Exterior Corners: Prefabricated corner units with concealed close-fitting splices or welded blades and with semirecessed mullions at corners.
F. Provide sill extensions and loose sills made of same material as louvers where required for drainage to exterior and to prevent water penetrating to interior.
G. Join frame members to one another and to fixed louver blades with manufacturer’s standard fillet welds or threaded fasteners concealed from view, unless size of louver assembly makes bolted connections between frame members necessary.

2.4 FIXED, EXTRUDED-ALUMINUM LOUVERS

A. Standard Horizontal Louvers: Nondrainable fixed-blade louvers with extruded-aluminum frames and blades.
   1. Louver Depth: 4 inches or 6 inches as indicated.
   2. Frame Thickness: As required by the engineered design, but not less than 0.080 inch.
   3. Blade Thickness: As required by the engineered design, but not less than 0.080 inch.
4. Blade Angle and Spacing: 45 degrees and 4 inches o.c. for 4 inches deep louver.

5. Blade Angle and Spacing: 45 degrees and 6 inches o.c. for 6 inches deep louver.

6. Free Area: Not less than 8.0 sq. ft. for 48-inch wide by 48-inch high louver.

7. Point of Beginning Water Penetration: Not less than 790 fpm.

8. Air Performance: Not more than 0.12-inch wg static pressure drop at 790 fpm free-area velocity.

9. AMCA Seal: Mark units with AMCA Certified Ratings Seal.

B. Continuous, Horizontal, Drainable-Blade Louvers: Fabricated with close-fitting, field-made splice joints in blades designed to permit expansion and contraction without deforming blades or framework and with mullions recessed from front edges of blades so blades have continuous appearance.

1. Louver Depth: 6 inches unless otherwise indicated.

2. Frame Thickness: As required by the engineered design, but not less than 0.080 inch.

3. Blade Thickness: As required by the engineered design, but not less than 0.080 inch.

4. Blade Profile: Continuous Dual Drain.

5. Mullion Profile: Semi Recessed.

6. Blade Angle and Spacing: 45 degrees and 6 inches o.c. for 6 inches deep louver.

7. Free Area: Not less than 7.8 sq. ft. for 48 inch wide by 48 inch high louver.

8. Point of Beginning Water Penetration: Not less than 850-fpm.

9. Air Performance: Not more than 0.10 inch wg static pressure drop at 850 fpm free-area velocity.

2.5 LOUVER SCREENS

A. General: Provide each exterior louver with louver screens complying with the following requirements:

1. Screen Location: Interior face, unless otherwise indicated.

2. Screening Type: Bird screening, unless otherwise indicated.

B. Secure screens to louver frames with stainless-steel machine screws, spaced a maximum of 6 inches from each corner and at 12 inches o.c.

C. Louver Screen Frames: Fabricate screen frames with mitered corners to louver sizes indicated and to comply with the following requirements:

1. Metal: Same kind and form of metal as indicated for louver to which screens are attached. Reinforce extruded-aluminum screen frames at corners with clips.

2. Finish: Same finish as louver frames to which louver screens are attached.

3. Bird Screen Type: Non-rewirable, U-shaped frames for permanently securing screen mesh.

D. Louver Screening for Aluminum Louvers:

1. Bird Screening: Aluminum, 1/2 inch square mesh, 0.063 inch wire.
2.6 FINISHES, GENERAL

A. Comply with NAAMM’s "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Finish louvers after assembly.

2.7 ALUMINUM FINISHES

A. Finish designations prefixed by AA comply with system established by the Aluminum Association for designating aluminum finishes.

B. Clear Anodic Finish: AA-M12C22A41 (Mechanical Finish: nonspecular as fabricated; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class I, clear coating 0.018 mm or thicker) complying with AAMA 611.

C. High-Performance Organic Coating Finish: AA-C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: acid-chromate-fluoride-phosphate conversion coating; Organic Coating: as specified below). Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.

1. Fluoropolymer Two-Coat Coating System: Manufacturer's standard two-coat, thermocured system consisting of specially formulated inhibitive primer and fluoropolymer color topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight; complying with AAMA 2605.

3.3 INSTALLATION

A. Locate and place louver units level, plumb, and at indicated alignment with adjacent work. Use concealed anchorages where possible. Provide brass or lead washers fitted to screws where required to protect metal surfaces and to make a weathertight connection. Form closely fitted joints with exposed connections accurately located and secured. Provide perimeter reveals and openings of uniform width for sealants and joint fillers.

B. Repair finishes damaged by cutting, welding, soldering, and grinding. Restore finishes so no evidence remains of corrective work. Return items that cannot be refinished in the field to the factory, make required alterations, and refinish entire unit or provide new units.

C. Protect metal surfaces from corrosion or galvanic action by applying a heavy coating of bituminous paint on surfaces that will be in contact with concrete, masonry, or dissimilar metals.

D. Install concealed gaskets, flashings, joint fillers, and insulation, as louver installation progresses, where weathertight louver joints are required. Comply with Section 07900, "Seals and Sealants" for sealants applied during louver installation.

3.4 CLEANING, AND PROTECTING

A. Clean exposed surfaces with water and a mild soap or detergent not harmful to finishes. Thoroughly rinse surfaces and dry.

B. Protect louvers from damage during construction. Use temporary protective coverings where needed and approved by louver manufacturer. Remove protective covering at the time of Substantial Completion.

C. Restore louvers damaged during installation and construction so no evidence remains of corrective work. If results of restoration are unsuccessful, as determined by Contracting Officer, remove damaged units and replace with new units.

1. Clean and touch up minor abrasions in finishes with air-dried coating that matches color and gloss of, and is compatible with, factory-applied finish coating.

3.5 LOUVER SCHEDULE

A. Standard Horizontal Louver: Typical exterior protected locations - Lower level of aerial and cut stations.

B. Drainable Blade Louvers: Typical exterior semi-protected locations - Above elevators doors at upper level of aerial and cut stations.

C. Storm Resistant Louvers: Typical exterior non-protected locations - Locations not listed above.
PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will be paid for on a lump sum basis for wall louvers per location indicated wherein no measurement will be made.

END OF SECTION 10210
SECTION 10430
SPECIALTY SIGNS

PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies furnishing and installing specialty signs. The extent and location of "specialty signs" work is indicated on the drawings, and includes:

1. Site Identification Signs (sign Types 1.X)
2. Platform Sign Bands (Sign Types 4.X)
3. Kiosks (Sign Types 6.X)

1.2 REFERENCED STANDARDS

A. American Institute of Steel Construction, Inc. (AISC):
   1. "Specifications for Design, Fabrication, and Erection of Structural Steel for Buildings"

B. American Welding Society (AWS):
   1. AWS D1.1/D1.1M - Structural Welding Code - Steel
   2. AWS D1.2 - Structural Welding Code Aluminum

C. DART Sign Standards Manual.

1.3 SUBMITTALS

A. Manufacturer's Data: Submit manufacturer's technical data and installation instructions for each type of sign required.

B. Samples: Submit samples of the color and finish of exposed materials and accessories required for specialty signs prior to proceeding with prototype signs. The Contracting Officer's review of samples will be for color and texture only. Compliance with other requirements is the exclusive responsibility of the Contractor.

C. Submit samples for approval of the following materials and colors:

   1. DART Yellow background on 0.125 inch extruded aluminum plate (minimum 24 inch x 24 inch), with typical DART logo screen-printed in white and DART Blue, in baked enamel.
   2. White background on 0.125 inch extruded aluminum plate (minimum 24 inch x 24 inch), with typical DART Blue screen-printed lettering, in baked enamel.
   3. White background baked enamel finish, on 0.125 inch extruded aluminum plate (minimum 24 inch x 24 inch), with typical DART Blue vinyl cut-out lettering.
   4. Bright Blue background on cast aluminum plate (minimum 12 inch x 12 inch) with typical raised characters or symbol and grade 2 Braille.

D. Shop Drawings: Submit shop drawings of sign components, fittings, parts, wiring, and installation procedures showing layout, jointing, and complete anchoring and supporting systems for the various applications, and mounting details. Drawings shall clearly show provisions for performance functions described herein. Provide details and sections at full size. Differences from the Contract Drawings shall be clearly identified and brought to the Contracting Officer's attention in writing.

E. Sign Face Patterns: Submit, in duplicate, accurate full-size sign face patterns of each sign, accurately showing the relationship of parts to each other, including the sign border, and a description of the method of executing the work. Obtain the Contracting Officer's approval of patterns before proceeding with the work part of the assembly. Submit, where required, in duplicate, accurate full-size translations of Grade 2 Braille sign messages.

F. Prototypes: Manufacturer to fabricate and submit for approval, one completed sign of each type specified in the construction documents before proceeding with subsequent signs. When approved, the prototype sign will be counted as a completed unit.

G. Certifications: Submit certificates indicating that materials and products used on the Project meet or exceed specified requirements.

1.4 QUALITY ASSURANCE

A. The Contractor shall be an established firm which is regularly engaged in the fabrication of sign systems. The Contractor shall also submit a list of sizable installations provided over a period of at least three years, or the Contracting Officer shall be sufficiently convinced by observation and other substantiating data that fabrication and installation of a lesser period of time will prove adequate.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Deliver specialty signs in cartons or crates to provide protection during transit and storage to the Worksite.
B. Inspect specialty signs upon delivery for damage. Repair minor damage provided that the finish items are equal in all respects to new work; otherwise, remove and replace damaged items as indicated. If damaged, polycarbonate panels shall not be repaired but shall be replaced.

c. Insofar as practicable, fabricate, assemble, and fit the work in the shop with the various parts or assemblies ready for erection at the site.

d. Trial fit work that cannot be shipped to site, shop assembled, to assure a proper and expeditious field assembly.

e. Accurately machine, file, fit, and rigidly frame together sign joints, corners, miters, etc., at joint and contact points. Form materials to shapes with straight lines, sharp angles and smooth curves, and hairline joints. Fit operable parts to stationary components with only enough clearance for proper operation. Final product to resemble custom metal casework in quality and tolerances. On plastic materials upon which graphics will be fixed or surfaced, make joints “seamless” from a viewing distance of 5 feet.

f. Machine and fit removable and operable members and devices carefully for smooth, easy operation.

g. Secure members, components, and elements by mechanical fasteners of proper size and spacing as detailed or otherwise required to rigidly hold members in place without distortion or deflection. Utilize concealed mechanical fasteners unless otherwise allowed or indicated to be exposed.

h. Exposed fasteners are to be of tamper proof type, painted to match adjacent material.

i. Perform welding of the correct type to minimize permanent distortions of flat surfaces. Utilize welding rods of the same alloy as the substrate panel. Remove welding flux, oxides, and discolorations by pickling or grinding, to match the finish of the adjacent areas. Comply with AWS D1.1/D1.1M for structural steel and AWS D1.2 for aluminum. Make welds full penetration type unless noted to be spot welds.

k. Provide cutouts, fittings, and anchorages required for coordination of assembly and installation with other work.

C. Store specialty signs under cover. Place units on at least 4 inch sills on floors in a manner that will prevent damage and rusting. Avoid the use of non-vented plastic or canvas shelters which could create a humidity chamber, or contact with soil or exposure to the elements.

D. Specialty signs shall be delivered to the Worksite in original unopened packages, clearly labeled with manufacturer’s name, brand, specification identification data, and identification as shown on approved shop drawings or submittals.

E. Packaging shall be made with labels fixed identifying clearly the type and quantity of the specialty signs, and the station where these signs will be installed.

PART 2 - PRODUCTS

2.1 ALL SIGNS

A. Lettering: Lettering shall be computer generated/cut. Hand-rendered or hand-cut lettering is not acceptable.

B. Where noted, utilize camera-ready art provided by the Contracting Officer.

C. Structural Frame: The framework of signs shall have sufficient strength and rigidity to support the weight and horizontal loads (wind loads) of the entire sign box assembly, from mounting points located as indicated in the mounting detail drawings, without noticeable deformation due to deflection or warping of any part of the assembly. Separate aluminum from steel with suitable bituminous coating.

D. Sign Cabinets, Cladding, and Trim:

1. Aluminum: 0.125 inch extruded aluminum with channel framework. Pieces shall be true, square, and free from warping, bending, blemishes, and scratches.

2. Fabrication:
   a. Develop details for fabrication engineering on shop drawings.
   b. Fabricate signs to comply with requirements indicated for materials, thickness, finishes, colors, designs, shapes, sizes, and details of construction as shown in the Contract documents.
SPECIALTY SIGNS

1. Punch or drill for temporary field connections and attachment of work by other trades. Pre-drill for attachments in steel sign faces and trim panels before porcelainizing.

m. Touch-up fabrication abrasions prior to shipment.

3. Accessibility: Provide for easy access by Authority's maintenance crews to interior of the sign box for changing lamps and ballasts. Provide for easy removal and easy, accurate reinstallation of the sign face by maintenance crews.

4. Expansion/Contraction: Provide for expansion and contraction of the sign face, without bowing, warping, or exposure of light leaks, to a range of ambient temperatures from plus 100 degrees F to 0 degrees F for exterior signs and from 85 degrees F to 55 degrees F for interior signs, taking into account the added temperature of the ballast and lamps.

5. Heat Dissipation: Provide means to adequately and safely dissipate heat from the ballast, ensuring that light leaks, moisture, or dust penetration do not result.

6. Moisture and Water Dissipation: Provide means to adequately and safely dissipate moisture and water from the signs.

7. Interior Painted Illuminated Signs: Paint interior surfaces and parts (except the inside of raceways) with two coats of matte white, noncombustible paint compatible with the receiving surface.

E. Sign Faces:

1. Steel Faces: Steel sign faces shall be 16 gauge, porcelain enamel grade. Exposed edges shall be true and smooth, shall have sharp interior corners, and shall be colored identical to the face. Back steel faces with 1/2 inch thick exterior gypsum sheeting, followed with an additional 22 gauge sheet steel backing. Attach backing with suitable adhesive and/or welded studs.

2. Aluminum Faces: Aluminum sign faces shall be 0.125 inch extruded aluminum plate. Exposed edges shall be true and smooth, shall have sharp interior corners, and shall be colored identical to the face. Back faces with ½ inch thick exterior gypsum sheeting, followed with an additional 0.0625 inch sheet backing. Attach backing with suitable adhesive and/or welded studs.

3. Polycarbonate:

   a. 1/8 inch thick translucent polycarbonate plastic sheeting, G.E. "Lexan", or approved equal. The following is a standard Lexan color and shall be strictly adhered to in hue, shade, and tone. Backup or body sheet; Green #2108.

   b. Polycarbonate for faces and backup sheets must not discolor with age or under conditions of normal light, cold, heat, and moisture of exterior weather.

   c. Exposed edges or cut-outs shall be true and smooth and have sharp interior corners.

   d. Attachment of polycarbonate backup or body sheet to porcelain enamel shall be done with approximately 1/8 inch diameter studs welded to interior surface of sign face.

4. Vinyl Film Graphics:

   a. Vinyl film graphics and/or backgrounds shall be placed on sign faces as noted in the Contract Drawings. Vinyl to be applied only by mechanics skilled and experienced in vinyl application.

   b. Shop conditions of the Contractor shall be clean, free of air dust and of proper temperature.

   c. Applied vinyl film shall be free of air bubbles, dirt and dust bubbles. Lines shall be accurately and sharply cut by computerized cutting equipment, tightly seamed, and applied per manufacturer's specifications.

   d. Vinyl film shall be 3M, in the following materials and colors for vinyl sheeting and copy: Refer to DART Sign Standards Manual.

5. Joints:

   a. Joints are permitted only where shown on the Contract Drawings. Vertical and horizontal joints in the sign faces shall be true, tight, and unnoticeable with respect to shadows, dark strips, light strips, gaps, light leaks, or mismatched coloration.
b. Make provision to ensure that joints will remain true and tight under conditions of expansion and contraction of the faces, and under conditions of reinstallation of lamps and ballasts by maintenance crews.

6. Removability: Sign faces shall be removable and replaceable, without damage to the faces or the sign box assembly.

7. Illumination: Space lamps and arrange so that the entire sign face has uniform light intensity. Fluorescent lamps to be placed at no more than 12 inches on centers.

8. Antistatic Treatment: Treat polycarbonate surfaces with an antistatic solution following installation.

9. Manufacturer's Identification, Date, Sign Number: Illuminated signs shall have a label on the underside corner showing the manufacturer's name, date of manufacture, and numbers of the sign as shown on the drawings (sign number and elevation number), in 1/4 inch letters. The label shall be of clear material or of a matching dark blue color, with black letters.

10. Interchangeability: Sign faces of same sign types must be fabricated with identically matching mountings and mounting holes to ensure interchangeability.

11. Baked Enamel Colors: Baked enamel sign panels and graphics are to be gloss finish, and shall match the following colors: Refer to DART Sign Standards Manual.

12. Screen Printing: Signs designated in the DART Sign Standards Manual to have screen-printed legends shall be screen printed using materials and processes that are compatible with baked enamel finishes and processes. Colors shall match the above referenced Pantone colors. Screen-printing shall be performed in accordance with manufacturers instructions.

13. Grade 2 Braille: Where required, translations of sign messages to grade 2 Braille shall be provided by the Contractor.

2.2 ROOM NUMBER / ROOM IDENTIFICATION SIGNS

A. General: Provide combination room number/room identification signs as indicated on the schedules and/or Drawings.

B. Material: Sign type shall be white copy and background color on matte acrylic facing panel and aluminum frame.

C. Typeface: Helvetica Medium, all caps. Tactile text complying with applicable accessibility standards shall be provided at each location.

D. Composition:

1. A standard format shall be followed on all signs. The exact room numbers, titles and locations will be supplied to the Contractor in sufficient time to allow for fabrication and installation prior to completion.

2. Allow for fifty letters maximum for each sign. Letters shall be heights indicated with a minimum of 1/2 inch space at top, bottom and ends.

3. Locate graphics on sign as indicated on the drawings.

4. Provide one sign to read “Men” with graphic and tactile symbols at each Men’s restroom outer door.

5. Provide one sign to read “Women” with graphic and tactile symbols at each Women’s restroom outer door.

6. Provide one sign to read “Restroom” with graphic and tactile symbols at each Unisex’s restroom outer door.

7. Provide one handicap accessibility sign with graphic and tactile symbols at each restroom outer door. Symbols may be incorporated with room identification sign.

8. Door signs will be placed on the public side of the door and wall to latch side of door except where noted otherwise.

9. Signs shall have edges properly finished and with letters and numbers evenly and accurately cut. Spacing of letters and numbers shall be optically correct.

E. Sizes: As indicated on the drawings.

F. Attachment: Mounting to surfaces shall be done by pressure sensitive frame double-faced tape. Signs shall be delivered to the project site with the tape in place and trimmed on each sign, but with the protective paper not removed. Paper shall be removed just prior to installation of signs.

2.3 PAINTING

A. General: Refer to drawings for specific color locations.
B. Sign Painting:
   1. The painting of signs shall be performed only by mechanics skilled in painting and experienced in producing quality work. Lines shall be sharply cut.
   2. The shop conditions of the Contractor shall be clean, free of air dust, and of proper temperature.
   3. Apply shop painting by spraying except where inaccessible surfaces require brushing. Protect adjoining or adjacent surfaces against any discoloration.
   4. Painted faces shall be baked porcelain enamel finish unless otherwise noted, and be accomplished in compliance with the Porcelain Enamel Institute requirements.
   5. Paint sign brackets and exposed hardware (where required) to match adjacent surfaces.

C. Bituminous Coating: Heavy based asphaltic type. Apply to contact surfaces between aluminum and concrete and between aluminum and other dissimilar metals.

2.4 ELECTRICAL WORK

A. Electrical Work:
   1. Materials and equipment shall be new and UL approved for the purpose used. Accomplish work in accordance with applicable electrical construction codes and electrical safety codes.
   2. Obtain permits and pay fees required by governmental agencies having jurisdiction over the work. Arrange for inspections required during installation. Upon completion of the work, furnish satisfactory evidence that work has been installed in accordance with codes.
   3. Do cutting and patching required for installation of the work. Perform cutting and patching carefully to prevent damage to the structure and work of other trades. Cutting and patching shall be done by mechanics skilled in the trade affected and subject to approval of the Contracting Officer.
   4. Promptly remove and dispose of waste material and rubbish from the site. At completion of the work, clean lighting fixtures and signs and check for proper operation.
   5. Materials and workmanship shall be guaranteed for a period of one year after acceptance. Repair or replace failures or defects in materials or workmanship during this period without delay, at no expense to the Authority, provided that in the judgment of the Contracting Officer, such failures are not the result of misuse or abuse.

B. Raceways and Wiring:
   1. Install wiring in metallic raceways. Conceal raceways in finished areas. Exposed conduit is not permitted. In moist or damp areas, conduit shall be rigid galvanized steel; in dry areas, use electrical metallic tubing, galvanized or sheradized. E.M.T. fittings shall be compression type, similar to Appleton 96T050.
   2. Where crossing expansion joints or areas of movement of structure, install expansion joints O-Z type AX or AX8. Where approved by the Contracting Officer, flexible steel conduit may be used, either galvanized steel or watertight, depending upon environment. Connectors shall be of the type to provide secure connection for continuity of the raceway system.
   3. Outlet boxes or box extensions shall be galvanized or sheradized, processed steel not less than 1-1/2 inches deep and 4 inches square or octagonal.
   4. Wire shall be of copper conductors with type THHN/THWN or XHHW insulation. Minimum wire size shall be No. 12 A.W.G.
   5. Make splices or taps with 3M Brand "Scotch-Lok" connectors or equal with insulating caps. Color-coding of wires shall follow standardized building color-coding system.
   6. Plates, where required, shall be stainless steel in finished areas and galvanized steel in unfinished areas except for sign-mounted switch plates as noted below.
   7. When voltage and circuit designations are not shown on the drawings, verify these voltages and connection points before proceeding with the manufacture of the electrical portions of the signs and lighting.

C. Ballast:
   1. Ballasts shall be rated 120 or 277, as shown, CBM-certified by ETL, shall be high-power factor, and shall operate with a case temperature not to exceed 90 degrees C in the installed location. Ballasts shall be specifically qualified for sign usage, manufactured by Advance, Magnetic, Valmont, or approved equal.
   2. Fixtures located in areas subject to outside temperatures shall have low-temperature ballasts.
D. Sign Wiring: Conform to Article 600 of the N.E. Code. Label the stubbed-up conduit with the appropriate load.

E. Fluorescent Lamps: Lamps shall be standard T-12, rapid-start, high-output, 60 Hz units unless otherwise shown. "Watt Miser" type lamps are not acceptable. The color of fluorescent lamps shall be cool white for signs and lighting fixtures. Lamps shall be General Electric, Sylvania, Westinghouse, or equal.

F. Incandescent Lamps: 69 watt, type A21 clear traffic signal lamps (8000 hour rating) shall be used for flashing lamp applications indicated.

G. Fixtures: Fixtures and installation shall be Underwriters Laboratories - and Texas Electrical Code-approved.

H. Individual Sign Switch: Provide an "on - off" sign illumination switch, Bryant No. 7201 or approved equal, where noted on the drawings or schedule.

I. Switchable Signs: Signs incorporating switchable messages shall have appropriate internal baffles to prevent light from leaking from one sign message onto another. Cabinets shall be sealed to prevent light leaks to the sign exterior.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL
A. Specialty signs described in this section will be paid for on a lump sum basis per location indicated wherein no measurement will be made.

END OF SECTION 10430
PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies the furnishing and installation of permanent specialty post and pole mounted signs, including Traffic Control Signs (Sign Types 3.X), and Bus Stop Signs (Sign Types 7.X), placed within the Light Rail Transit (LRT) Station areas as shown on the drawings.

B. Refer to Section 02845 “Traffic Control Signs” for requirements for regulatory and warning signs to be placed within City or State street right-of-way.

C. This section also specifies the furnishing and installation of posts for Pathfinder Signs (Sign Types 2.X), but does not include sign panels for this sign type.

1.2 REFERENCED STANDARDS
A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A36/A36M - Standard Specification for Carbon Structural Steel
   2. ASTM A53/A53M - Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless
   3. ASTM A500 - Standard Specification for Cold-Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes

B. DART Sign Standards Manual.

1.3 SUBMITTALS
A. Manufacturer’s Data: Submit the manufacturer’s technical data and installation instructions for each type of sign required.

B. Samples: Submit full-size samples of complete sign panels of each sign type to be manufactured. The Contracting Officer’s review of samples will be for color, material, and compliance with the DART Signage Standards Manual. Compliance with other requirements is the exclusive responsibility of the Contractor.

C. Shop Drawings: Submit to the Contracting Officer shop drawings of sign components, fittings, parts, and installation procedures showing layout, jointing, and complete anchoring and supporting systems for the various applications and installation details. Drawings shall clearly show provisions for performance functions described herein. Provide details and sections at full size. Differences from the Contract Drawings shall be clearly identified and brought to the Contracting Officer’s attention in writing.

D. Submit copies of manufacturer’s product warranties for aluminum signs, vinyl film sheeting, screen printing inks and related materials.

E. Submit qualifications of sign manufacturer.

1.4 QUALITY ASSURANCE
A. The sign manufacturer shall be an established firm which is regularly engaged in the fabrication of specialty post and pole mounted signs. The Contractor shall submit a list of sizable fabrication projects completed over a period of at least three years, or the Contracting Officer shall be sufficiently convinced by observation and other substantiating data that experience over a lesser period of time will prove adequate.

1.5 JOB CONDITIONS
A. Location of Underground Facilities and Structures:
   1. Prior to excavating for sign post foundations, Contractor shall verify locations of underground facilities and structures. Locations shown for utility facilities are taken from the various utility records and are approximate.
   2. Verify locations of existing utilities in accordance with Section 02760, “Maintenance, Support and Restoration of Existing Utility Facilities”.

1.6 WARRANTY
A. Upon completion of sign installation, provide a 10 year warranty for the sign substrate and sign face against chipping, delaminating, and fading. Also, provide a warranty against retroreflectivity loss of not more than 50 percent for the reflective film over a 7 year period.

B. Refer to the General Provisions, Warranty of Construction, for additional warranty requirements applicable to the work of this section.

PART 2 - PRODUCTS

2.1 SIGNS
A. Sign Panels:
   1. Sign panels shall be fabricated from 0.125” thick aluminum and shall have retroreflective sheeting on face side. Pieces shall be true, square, and free from warping, bending, blemishes and scratches. Exposed edges shall be true and smooth. Panel fabrication
including cutting, punching, and drilling of holes shall be completed prior to final surface preparation and application of retroreflective sheeting.

2. Reflectivity: Copy and graphics shall be screen-printed over 3M Scotchlite Reflective Sheeting Diamond Grade VIP (Visual Impact Performance).

3. Sign faces shall be capable of withstanding the following tests:
   a. Sign face shall not be permanently defaced by steam, acids, aromatics, scratching, inks, or paints.
   b. Sign face shall be readily wiped clean with paint remover or solvents without affecting the appearance or legibility of the sign finish or graphics.
   c. Sign face shall retain legibility and finished appearance when sprayed with a 10 percent solution of hydrochloric, nitric, or sulfuric acid for one-half hour.
   d. Sign face shall retain legibility and finished appearance when scrubbed by a brush of medium hardness using common commercial cleaning compounds such as ammonia, laundry soaps, detergents, or petroleum base solvents.

4. Fabrication: Fabricate components in a uniform manner in compliance with the following requirements:
   a. Joints and seams are not acceptable. Pieces shall be true, square, and free from warping, bending, blemishes, and scratches. Edges shall not be crazed or cracked, and the edge finish shall be smooth, clean, and neat.
   b. The finished sign shall be absolutely flat.

5. Removability: Sign faces shall be removable and replaceable, without damage to the faces or the sign supports.

6. Manufacturer’s Identification, Date, Sign Number: Signs shall have a label on the support post, placed between the sign face brackets showing the manufacturer’s name, date of manufacture and number of the sign as shown on the Contract Drawings (sign number and elevation number), all in 1/4 inch letters. The label shall be of clear material, or of a matching gray color with black letters. The label shall not exceed 2 inches in width or height.

7. Interchangeability: Sign faces of like dimensions shall be fabricated with identical matching mountings and mounting holes to ensure interchangeability and ease of replacement.

B. Sign Graphics: Sign graphics shall be screen printed, utilizing camera-ready art provided by the Contracting Officer. Neither hand rendered nor hand-cut legends will be accepted.

1. SCOTCHLITE Sheeting Series 3990/SCOTCHLITE Ink Series 880:
   3M Products/Literature Bulletins
   Base/Application Film: 3990
   SCOTCHLITE Reflective Sheeting Series 3990
   Screen Printing Ink: SCOTCHLITE Ink Series 880
   Thinner: 821
   Overprint Clear: SCOTCHLITE
   Overprint Clear 880
   Thinner: 821
   Related Literature:
   Scoring/Cutting 4.1
   Surface Preparation 5.1
   Application Procedures 5.5
   Removal Procedures 6.5

2. Manufacturing: Manufactured using materials and procedures described in the appropriate Product Instruction Bulletins referred to above.

3. Graphics Installation: Surface preparation and application of marking must use the material, methods and tools described in the appropriate Product and Instruction Bulletins referred to above.

4. Screen-printing shall be performed in a "first class" manner, with edges of graphics sharp and accurate, and with adequate ink opacity and color consistency to avoid any changes in colors or graphics, including where graphic elements overlap.

C. Support Posts:

1. Support posts shall be 3-inch square steel tubes, as specified in the Contract Drawings, galvanized ASTM A500. Post shall be
designed to bend on impact at a height six inches above finished grade.

2. Support post for Pathfinder Signs: Breakaway as specified in with Section 02845, “Traffic Control Sign”.

D. Sign Face Brackets: Where signs are to be mounted to new poles, the mounting brackets shall be steel angle, galvanized ASTM A36/A36M.

E. Flared Leg Bracket (for Existing Poles): Where signs are to be mounted to existing poles, a flared leg bracket, #M2G-FUB as manufactured by Hawkins Traffic Safety Supply, Berkeley, CA; or approved equal shall be used. The signs shall be attached to the bracket with vandal-resistant screws. Stainless steel straps with tightening clips shall hold the brackets to the post.

2.2 PAINTING

A. Where specialty post and pole mounted signs are installed on LRT platforms, paint posts and brackets gray (Benjamin Moore #1600), gloss finish, in accordance with Section 09970, “Coatings for Steel”.

2.3 CONCRETE

A. Concrete: Mix S-7, as specified in Section 03305, “Portland Cement Concrete”.

B. Concrete Reinforcement: In accordance with Section 03200, “Concrete Reinforcement”.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine the substrates and conditions under which the specialty post and pole mounted signs are to be installed.

B. Verify location of underground utilities prior to installing posts.

3.2 INSTALLATION

A. Excavate for concrete foundations in accordance with Section 02220, “Grading, Excavating, and Backfilling”. Install concrete foundations in accordance with Section 03300, “Cast-in-Place Concrete”.

B. Install sign posts plumb.

C. Set posts at locations and to elevations shown.

D. Install posts for Pathfinder Signs in accordance with Section 02845, “Traffic Control Signs”.

E. Install sign units and components at the locations shown or scheduled, securely mounted.

F. Install level, plumb, and at the proper height. Coordinate with work of other sections for installation of sign units to finish surfaces. Repair or replace damaged units as directed by the Contracting Officer.

3.3 TEMPORARY COVERS

A. Signs which are installed prior to their assigned function being open to public use shall be covered by the Contractor to conceal the face from view.

B. Coverings shall be dark gray or black plastic material acceptable to the Contracting Officer, neatly affixed to the sign face with matching or concealed fasteners. Clean the signs when coverings are removed.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Specialty post and pole mounted signs described in this section will be paid for on a lump sum basis per location indicated wherein no measurement will be made.

B. Pathfinder Signs (Sign Types 2.X) shall have all components installed as shown on the drawings, with exception of sign panels. Sign panels will be furnished and installed by others.

END OF SECTION 10441
SECTION 10522
FIRE EXTINGUISHERS AND CABINETS

PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies the furnishing and installing of fire extinguishers and cabinets as specified herein and supporting devices as shown.

1.2 REFERENCE STANDARDS
A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A666 - Standard Specification for Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar
   2. ASTM A1008/A1008M - Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability
   3. ASTM C1048 - Standard Specification for Heat-Treated Flat Glass - Kind HS, Kind FT Coated and Uncoated Glass
B. National Fire Protection Association (NFPA)
   1. NFPA 10 - Standard for Portable Fire Extinguishers

1.3 SUBMITTALS
A. Product Data: Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for fire-protection specialties.
   1. Fire Extinguishers: Include rating and classification.
   2. Cabinets: Include roughing-in dimensions, details showing mounting methods, relationships of box and trim to surrounding construction, door hardware, cabinet type, trim style, and panel style.

1.4 QUALITY ASSURANCE
A. Source Limitations: Obtain fire extinguishers and cabinets through one source from a single manufacturer.
B. NFPA Compliance: Fabricate and label fire extinguishers to comply with NFPA 10, "Standard for Portable Fire Extinguishers".
C. Fire Extinguishers: Listed and labeled for type, rating, and classification by an independent testing agency acceptable to authorities having jurisdiction.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS
A. Following manufacturers listed are "acceptable" only if manufacturer can evidence product compliance with requirements of Contract Documents.
   1. J.L. Industries, Inc.
   2. Larsen's Manufacturing Co.
   3. Potter-Roemer, Div. of Smith Industries Inc.
   4. Or approved equal.

2.2 MATERIALS
A. Cold-Rolled Steel Sheet: Carbon steel, complying with ASTM A1008/A1008M, commercial quality, stretcher leveled, temper rolled.
B. Stainless Steel Sheet: ASTM A666, Type 302 or Type 304 alloy.

2.3 PORTABLE FIRE EXTINGUISHERS
A. General: Provide fire extinguishers of type, size, and capacity for each cabinet and other locations indicated.
B. Multipurpose Dry Chemical Type: UL-rated 4-A:60-B:C, 10-lb nominal capacity, in enameled steel container.
C. Clean-Agent Type: UL-rated 2A:10B:C, 15-1/2 lb. nominal capacity of a proprietary blend of HCFC-123 and inert material, in enameled-steel container with pressure-indicating gage.
D. Carbon-Dioxide Type: UL-rated 10-B:C, 15-lb nominal capacity, in enameled high pressure aluminum container.

2.4 FIRE-PROTECTION CABINETS
A. Cabinet Construction: Provide manufacturer's standard box (tub), with trim, frame, door, and hardware to suit cabinet type, trim style, and door style indicated. Weld joints and grind smooth. Miter and weld perimeter door frames.
B. Cabinet:
3. Cabinet Type: Suitable for 10 lb. Fire extinguisher.
4. Cabinet Mounting: Recessed in walls of sufficient depth to suit style of trim indicated.
5. Cabinet Trim Style: Fabricate cabinet trim in one piece with corners mitered, welded, and ground smooth.
   a. Exposed Trim: One-piece combination trim and perimeter door frame overlapping surrounding wall surface with exposed trim face and wall return at outer edge (backbend).
      1) Rolled-Edge Trim: 2-1/2 inch backbend depth.
6. Cabinet Trim Material: Manufacturer's standard, same metal and finish as door.
8. Door Glazing: Tempered float glass, ASTM C1048, Kind FT, Condition A, Type I, Quality q3, Class 1 (clear).
9. Door Style: Manufacturer's standard vertical duo panel design.
10. Door Construction: Fabricate doors according to manufacturer's standards, of materials indicated, and coordinated with cabinet types and trim styles selected. Provide minimum 1/2 inch thick door frames, fabricated with tubular stiles and rails, and hollow-metal design.
11. Door Hardware: Provide manufacturer's standard door-operating hardware of property type for cabinet type, trim style, and door material and style indicated. Provide either lever handle with cam-action latch, or exposed or concealed door pull and friction latch. Provide concealed or continuous-type hinge permitting door to open 180 degrees. Hardware shall comply with applicable accessibility standards.

2.5 ACCESSORIES

A. Mounting Brackets: Manufacturer's standard steel, designed to secure extinguisher, of sizes required for types and capacities of extinguishers indicated, with plated or baked-enamel finish. Provide brackets for extinguishers not located in cabinets.

B. Identification: Provide lettering to comply with authorities having jurisdiction for letter style, color, size, spacing, and location.
   1. Bracket-Mounted Extinguishers: Identify with the words "FIRE EXTINGUISHER" in red letter decals applied to wall surface.
   2. Fire Extinguisher Cabinet: Identify with the words "FIRE EXTINGUISHER" in black die cut vinyl letters applied to door.

2.6 FINISHES

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
C. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.
D. Interior of Cabinet Finish: Provide manufacturer's standard baked-enamel paint.
E. Door and Exterior of Cabinet Finish: Provide stainless steel finish.
F. Baked-Enamel Finish: Immediately after cleaning and pretreating, apply manufacturer's standard two-coat, baked-enamel finish consisting of prime coat and thermosetting topcoat. Comply with paint manufacturer's written instructions for applying and baking to achieve a minimum dry film thickness of 2 mils.
G. Stainless Steel Finish: Remove or blend tool and die marks and stretch lines into finish. Grind and polish surfaces to produce uniform, directionally textured polished finish indicated, free of cross scratches. Run grain with long dimension of each piece. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.
   1. Bright, Directional Polish: No. 4 finish.
PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrate surfaces to receive fire extinguishers, cabinets and associated work and conditions under which work will be installed. Do not proceed with work until unsatisfactory conditions have been corrected in a manner acceptable to Installer. Starting work within a particular area will be construed as applicator's acceptance of surface conditions.

3.2 INSTALLATION

A. Install products in accordance with the requirements of NFPA-10.

B. Mount extinguishers at a height of 48 inches to the top above finished floor.

C. Set fire extinguisher cabinets true and level at a height of 54 inches to the top above finish floor.

3.3 ADJUSTING, CLEANING, AND PROTECTION

A. Adjust cabinet doors that do not swing or operate freely.

B. Refinish or replace cabinets and doors damaged during installation.

C. Provide final protection and maintain conditions that ensure that cabinets and doors are without damage or deterioration at the time of Substantial Completion.

3.4 CHARGING

A. Just prior to final acceptance by the Authority, notify the local fire department and charge and tag all extinguishers, showing date tagged and expiration date.

3.5 FIRE EXTINGUISHER SCHEDULE

A. FE-1: Dry Chemical extinguisher mounted on surface of wall with mounting bracket.

B. FE-2: Dry Chemical extinguisher installed in a single type cabinet.

C. FE-3: Clean-Agent extinguisher mounted on surface of wall with mounting bracket.

D. FE-4: Carbon-Dioxide extinguisher mounted on surface of wall with mounting bracket.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Fire Extinguishers and Cabinets described in this section will be paid for on a lump sum basis where in no measurement will be made.

END OF SECTION 10522
SECTION 10525
FIRE DEPARTMENT KEY KEEPER

PART 1 - GENERAL

1.1 DESCRIPTION
A. Work required for this section includes fire department key keeper and supplementary items necessary for their proper installation.
B. Connection to tamper switch is specified in Section 16721, “Fire Alarm and Detection Systems”.

1.2 QUALITY ASSURANCE
A. Local Authority Approval: Obtain approval of local fire department for keyway access and exact location of key keeper box. Coordinate contact with AHJ through Contracting Officer.
B. Key keepers are required at locations shown on Contract Drawings.

1.3 SUBMITTALS
A. Product Data: Manufacturer’s product data, marked specifically to indicate compliance with these specifications.
B. Samples: 3 inch square samples of finishes. For selection of finish colors.

PART 2 - PRODUCTS

2.1 KEY KEEPER
A. Basis-of-Design Product: Knox Co. “Knox Box” Recessed Mounted with Lift-Off Door, Alarm Tamper Switch option (UL Listed) and Recessed Mounting Kit (RMK).
B. Finish: Manufacturer’s standard weather resistant polyester powder coat.
   1. Color: As selected from manufacturer’s standard colors. Color for each location will be selected separately.
C. Types:
   1. Type A: 4400 Series with RMK (Part No. 4440).
      a. Size: 9-1/2 inches wide, 9-1/2 inches high, 5 inches deep
   2. Type B: 3200 Series with RMK (Part No. 3240).
      a. Size: 7 inches wide, 7 inches high, 3-1/4 inches deep

PART 3 - EXECUTION

3.1 INSTALLATION
A. Install in accordance with manufacturer’s latest published requirements.
B. Coordinate installation of tamper switch through Contracting Officer.
C. Coordinate closure or securing of box through Contracting Officer.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL
A. The work described in this section will be paid for on a lump sum basis for fire department key keepers per location indicated wherein no measurement will be made.

END OF SECTION 10525
SECTION 10800
TOILET ACCESSORIES

PART 1 - GENERAL

1.1 SUMMARY
A. Work required for this section includes toilet accessories and supplementary items necessary to complete their installation.

1.2 REFERENCE STANDARDS
A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A153/A153M - Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware
   2. ASTM A666 - Standard Specification for Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar
   3. ASTM C1036 - Standard Specification for Flat Glass
B. Federal Specifications (FS):
C. International Code Council (ICC):
   1. ICC/ANSI A117.1 - Accessible and Usable Buildings and Facilities

1.3 SUBMITTALS
A. Product Data: Include construction details, material descriptions and thicknesses, dimensions, profiles, fastening and mounting methods, specified options, and finishes for each type of accessory specified.
B. Setting Drawings: For cutouts required in other work; include templates, substrate preparation instructions, and directions for preparing cutouts and installing anchoring devices.
C. Maintenance Data: For accessories to include in maintenance manuals specified in Division 1. Provide lists of replacement parts and service recommendations.

1.4 QUALITY ASSURANCE
A. Source Limitations: Provide products of same manufacturer for each type of accessory unit and for units exposed to view in same areas.

1.5 COORDINATION
A. Coordinate accessory locations with other work to prevent interference with clearances required for access by disabled persons, proper installation, adjustment, operation, cleaning, and servicing of accessories.
B. Deliver inserts and anchoring devices set into wall construction as required to prevent delaying the Work.

1.6 WARRANTY
A. Mirror Warranty: Manufacturer's written warranty, executed by mirror manufacturer agreeing to replace mirrors that develop visible silver spoilage defects within minimum warranty period indicated.
   1. Minimum Warranty Period: 15 years from date of Final Acceptance.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS
A. Following manufacturers listed are "acceptable" only if manufacturer can evidence product compliance with requirements of Contract Documents.
   2. American Specialties, Inc.
   5. General Accessory Manufacturing Co.
   6. Or approved equal.

2.2 MATERIALS
A. Stainless Steel: ASTM A666, Type 304, with No. 4 finish (satin), in 0.0312-inch minimum nominal thickness, unless otherwise indicated.
B. Mirror Glass: ASTM C1036, Type I, Class 1, Quality Q2, nominal 6.0 mm thick, with silvering,

D. Fasteners: Screws, bolts, and other devices of same material as accessory unit, tamper and theft resistant when exposed, and of galvanized steel when concealed.

2.3 FABRICATION

A. General: Unless otherwise indicated, fabricate units of all-welded construction, without mitered corners. Fabricate frames drawn and leveled, one-piece seamless construction. Hang doors and access panels with full-length, stainless-steel hinge. Provide anchorage that is fully concealed when unit is closed.

B. Names or labels are not permitted on exposed faces of accessories. On interior surface not exposed to view or on back surface of each accessory, provide printed, waterproof label or stamped nameplate indicating manufacturer's name and product model number.

C. Framed Glass-Mirror Units: Fabricate frames for glass-mirror units to accommodate glass edge protection material. Provide mirror backing and support system that permits rigid, tamper-resistant glass installation and prevents moisture accumulation.
   1. Provide galvanized steel backing sheet, not less than 0.034 inch and full mirror size, with nonabsorptive filler material. Corrugated cardboard is not an acceptable filler material.
   2. Provide mirror-unit mounting system that permits rigid, tamper- and theft-resistant installation.
   3. Heavy-duty wall brackets of galvanized steel, equipped with concealed locking devices requiring a special tool to remove.

D. Keys: Provide universal keys for internal access to accessories for servicing and resupplying. Provide minimum of six keys to Contracting Officer.

2.4 TOILET TISSUE DISPENSERS

A. Jumbo Roll Tissue Dispenser - MARK TA-1: Fabricate of stainless steel, size to accommodate two 10 inch diameter toilet tissue rolls.

2.5 GRAB BARS

A. Provide Stainless Steel grab bars with wall thickness not less than 0.05 inch and 1-1/2 inch outside diameter.
   1. Mounting: Concealed, manufacturer's standard flanges with snap flange cover.
   2. Clearance: 1-1/2 inch clearance between wall surface and inside face of bar.
   3. Anchorage: Concealed steel plate for steel stud walls to support 300 lbs.
   4. Basis-of-Design Product:
      a. MARK TA-5: Bobrick B-6806 x 36.
      b. MARK TA-6: Bobrick B-6806 x 42.

2.6 SANITARY NAPKIN VENDORS

A. Surface Mounted MARK - TA-9: Fabricate cabinet of stainless steel, not less than 0.0312 inch thick, all-welded construction. Provide door of stainless steel, minimum 0.05 inch thick, equipped with tumblers lockset. Provide identification reading "Napkins" and "Tampons" at coin slots; brand name advertising is not allowed.
   1. Capacity: Not less than 30 napkins and 27 tampons.
   2. Operation: Twenty-five-cent coin operation, with locked coin box keyed separately from door and other accessory units. Operation shall comply with both ICC/ANSI A117.1 and State of Texas Program for the Elimination of Architectural Barriers provisions and ADAAG.

2.7 SANITARY NAPKIN DISPOSAL UNITS

A. Surface-Mounted - MARK TA-8: Fabricate of stainless steel with seamless exposed walls, self-closing panel and reusable receptacle. Provide flush door with continuous piano hinge and tumblers lock.

2.8 SOAP DISPENSERS

A. Surface Mounted - MARK TA-4: Fabricate of stainless steel, sized for 40-oz. minimum capacity. Provide stainless steel piston, springs, and internal parts designed to dispense liquid soap in measured quantity by pump action. Provide cover of
TOILET ACCESSORIES

stainless steel, with unbreakable window-type refill indicator.

2.9 MOP AND BROOM HOLDER

A. Holder without Utility Shelf - MARK TA-10: 0.05-inch Type 304, stainless steel hat channel with spring-loaded, rubber, cam-type mop/broom holders. Provide unit 24 inches long and complete with three holders.

2.10 MIRROR UNITS

A. Stainless Steel Framed Mirror Without Shelf - MARK TA-3: Fabricate frame with angle shapes not less than 0.05 inch with square comers mitered, welded, and ground smooth. Galvanized steel back panel with hanging brackets for attachment to steel wall hanger assembly.

2.11 MISCELLANEOUS ACCESSORIES

A. Robe Hook - MARK TA-7: Heavy duty, one-piece brass casting with satin nickel-plated finish.

1. Basis-of-Design Product: Bobrick B-211.

B. Warm-Air Hand Dryer MARK - TA-2: Surface-mounted, warm-air hand dryer with no-touch operation controlled by electronic sensor and with manufacturers' standard white-painted cover.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install accessories according to manufacturers' written instructions, using fasteners appropriate to substrate indicated and recommended by unit manufacturer. Install units level, plumb, and firmly anchored in locations and at heights indicated.

B. Secure mirrors to walls in concealed, tamper-resistant manner with special hangers, toggle bolts, or screws. Set units level, plumb, and square at locations indicated, according to manufacturer's written instructions for substrate indicated.

C. Install grab bars to withstand a downward load of at least 250 lbf when tested according to method in ASTM F446.

3.2 ADJUSTING AND CLEANING

A. Adjust accessories for unencumbered, smooth operation and verify that mechanisms function properly. Replace damaged or defective items.

B. Remove temporary labels and protective coatings.

C. Clean and polish exposed surfaces according to manufacturer's written recommendations.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will be paid for on a lump sum basis for toilet accessories per location indicated wherein no measurement will be made.

END OF SECTION 10800
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies products and installation procedures for furnishing complete cathodic protection and stray current corrosion control systems for buried, pressurized ferrous piping systems and test facilities for PVC piping installations and steel encasement pipe.

B. Steel waterline piping shall be coated as described in these Specifications. Two options are shown on the utility drawings for anode installations for ductile iron pipe (DIP) depending on whether the piping is coated or uncoated. The piping is considered to be uncoated and additional anodes are required if the DIP is installed without applying the recommended coating systems described herein. The option for uncoated pipe is included in the event that the DIP suppliers refuse to allow aftermarket coatings on the piping supplied. Under no circumstances will the use of the polyethylene encasement be allowed on cathodically protected piping.

1.2 REFERENCED STANDARDS

A. American Water Works Association (AWWA):
   1. AWWA C209 - Cold-Applied Tape Coatings for the Exterior of Special Sections, Connections, and Fittings for Steel Water Pipelines
   2. AWWA C214 – Tape Coating Systems for the Exterior Steel Water Pipelines
   3. AWWA C900 - Polyvinyl Chloride (PVC) Pressure Pipe and Fabricated Fittings, 4 in. Through 12 in. (100 mm Through 300 mm), for Water Distribution

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A536 – Standard Specification for Ductile Iron Casting
   2. ASTM B8 – Standard Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft
   5. ASTM D570 - Standard Test Method for Water Absorption of Plastics
   8. ASTM D693 - Standard Specification for Crushed Aggregate for Macadam Pavements
   11. ASTM D1000 – Standard Test Methods for Pressure-Sensitive Adhesive-Coated Tapes Used for Electrical and Electronic Applications

C. National Fire Protection Association (NFPA):
   1. NFPA 70 - National Electrical Code (hereinafter referred to as NEC)

D. National Association of Corrosion Engineers (NACE)
   1. SSPC-SP 2 – Hand Tool Cleaning
   2. SSPC-SP 3 – Power Tool Cleaning
   3. SSPC-SP 7/NACE No. 4 – Brush-Off Blast Cleaning

1.3 SUBMITTALS

A. Shop Drawings:
   1. Indicate the exact locations of test facilities, bonding cables, and installation details.
   2. Include manufacturer’s literature and data for each proposed product, including installation procedures.
   3. Contractor shall provide photos showing the actual connection at the piping or encasements along with final installed locations that are marked or identified from a minimum of two dimensions added to the as-built drawings to all test stations to be located.
1.4 QUALITY ASSURANCE

A. Manufacturer: Select a firm regularly engaged in the manufacture of corrosion control products, cathodic protection, and stray current control systems of the type specified herein.

B. Products and Equipment: Incorporate corrosion control products, cathodic protection, and stray current control systems into the work that duplicate products and equipment that have been in satisfactory use for a minimum period of five years prior to the bid opening of this project.

C. Comply with:
   1. Codes and regulations of the jurisdictional authorities
   2. NEC

1.5 PROJECT CONDITIONS

A. Environmental Conditions:
   1. Apply coatings to dry clean surfaces only, in strict accordance with the manufacturer’s recommendations.
   2. Perform exothermic welding after surfaces have been cleaned, using a power grinder, and dried.

PART 2 - PRODUCTS

2.1 ANODE MATERIALS

A. Magnesium Anode: Weight as shown; prepackaged in a permeable cloth sack containing a backfill mixture consisting of 75 percent gypsum, 20 percent bentonite, and 5 percent sodium sulfate. Provide magnesium ingot of the high-potential type with the following chemical composition:

<table>
<thead>
<tr>
<th>Element</th>
<th>Percent</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aluminum</td>
<td>0.01 (maximum)</td>
</tr>
<tr>
<td>Manganese</td>
<td>0.5 to 0.8 (a minimum of 0.5 plus 60 percent of aluminum)</td>
</tr>
<tr>
<td>Copper</td>
<td>0.02 (maximum)</td>
</tr>
<tr>
<td>Iron</td>
<td>0.03 (maximum)</td>
</tr>
<tr>
<td>Nickel</td>
<td>0.001 (maximum)</td>
</tr>
<tr>
<td>Other Impurities</td>
<td>0.05 (maximum) each element, 0.3 (maximum) Total</td>
</tr>
<tr>
<td>Magnesium</td>
<td>Remainder</td>
</tr>
</tbody>
</table>

B. Zinc Anode: Weight as shown, high purity zinc, ASTM B-418, Type II, prepackaged in a permeable cloth sack containing a backfill mixture consisting of 75 percent hydrated gypsum, 20 percent bentonite clay and 5 percent sodium sulfate.

   1. Lead Wire: 12 AWG single conductor, solid copper with type TW 600 volt insulation, factory-welded or soldered to the steel core, and the connection sealed with cast epoxy resin or suitable potting compound.

C. Manufacturers of anode products that comply with these requirements include the following companies:

   1. Duriron Company, Inc.
   2. Dow Chemical Company.
   3. Corrpro Companies Inc.

2.2 DIELECTRIC INSULATORS

A. Plastic Casing Insulator: High density, injection molded polyethylene, sized to provide permanent insulation between pipe casing and carrier pipe, with the following additional requirements:

   2. Tensile strength (ASTM D638): 3,100 psi to 5,500 psi.
   3. Water absorption (ASTM D570): 0.1 percent
   4. Temperature impact strength 180 degrees F Min (82 degrees C)(ASTM D256): 1.5 to 2.0 feet lb./in. notch.
   5. Bolts and Nuts: Cadmium plated steel (square nuts).

B. Insulating Flange Kit: Supplied in complete sets from a single manufacturer; securely packaged and clearly labeled as to size, ANSI rating, style, and material; and with the following provisions:

   1. Gasket: Full faced, neoprene coated phenolic; size, temperature, and pressure rating suitable for the application, with the following additional minimum requirements:

      a. Thickness: 1/8 inch minimum
      b. Water Absorption: 1.6 percent maximum
      c. Tensile Strength (with grain): 13,000 psi minimum
2. Sleeves: NEMA Grade LE laminated phenolic; size, temperature, and pressure rating suitable for the application; and with the following additional requirements:
   a. Thickness: 1/32 inch minimum
   b. Dielectric Strength (volts per mil): 400 minimum
   c. Water Absorption: 2 percent maximum
   d. Length: Shall extend through both flanges and insulating washers

3. Insulating Washers: Glass mat polyester laminated phenolic; size, temperature, and pressure rating suitable for the application; and with the following additional requirements:
   a. Thickness: 1/8 inch minimum
   b. Dielectric Strength (volts per mil): 400 minimum
   c. Compressive Strength (flatwise): 26,000 psi minimum
   d. Water Absorption: 2 percent maximum

4. Steel Washers: 1/8 inch thick, SAE zinc plated, two per stud.

C. Insulating Couplings: Pre-assembled steel, compression gasket type; factory coated with 12 mils minimum thermosetting epoxy-polyamide; size, temperature and pressure rating suitable for the application; and with the following additional requirements:
   1. Insulating gasket to extend entirely under the follower rings.
   2. Armored gasket to bond between metal parts and protected piping.
   3. Middle insulator ring to extend over the pipe ends.

D. Insulating Unions: Air refined malleable iron; complete with brass bearing ring and molded nylon insulated material; size, temperature, and pressure rating suitable for the application, with the following additional requirements:
7. Or approved equal.

I. Pipeline Casing Insulators:

1. Band: 14 Ga. (0.074 inch) steel, hot rolled and pickled. Two piece through 36 inch carrier pipe size. Width of band as recommended by manufacturer as determined by carrier pipe size. PVC Liner shall have the following properties:

- Thickness minimum: 0.09 inch
- Hardness: Durometer “A” 85-90
- Dielectric Strength (1/8” thick): Surge Test 60,000 V, Step-by-Step Test 58,000 V
- Test Water Maximum Absorption: 1 percent

2. Studs, Nuts, and Washers: Stainless steel or cadmium plated; number, size, and length as required by manufacturer.

3. Runners: 2 inch wide glass reinforced plastic (G_2), height as required to center the carrier pipe within the casing pipe, and to provide permanent 1 inch minimum clearance between casing, and carrier pipe couplings and hubs, and with the following additional requirements:

<table>
<thead>
<tr>
<th>Characteristic</th>

J. PVC Insulating Insert: 18 inch, plain end length of PVC in accordance with AWWA C900.

2.3 PIPE COATINGS

A. Wax-Tape Coating System:

1. Primer: Petrolatum primer containing moisture-displacing corrosion inhibiting compounds.

4. Protective Outer Wrap: Plasticized PVC sheeting coated on one side with a pressure sensitive rubber resin adhesive.

B. Butyl Adhesive Tape Coating System:

1. Primer: Liquid adhesive system with butyl based elastomers blended with polymeric resins, dissolved in an organic solvent system, compatible with the tape coating system.

2. Filler Tape: Moldable butyl rubber compatible with primer and tape coating.

3. Tape Coating: High tack butyl rubber adhesive with polyethylene backing (35 mils total thickness) with the following additional properties:

<table>
<thead>
<tr>
<th>Property</th>

</tr>
</tbody>
</table>

C. Coal Tar Mastic: Cold, brush applied one-part solvent drying thixotropic coal tar with chemically inert resins and fillers; supplied in one gallon containers; and with the following additional requirements.

1. Minimum of 60 percent solids by volume;

2. Film Thickness: 20 mils wet - 12 mils dry per coat

3. Products that comply with these requirements include:
   a. Bitumastic 50, as manufactured by the Kop-Coat/Carboline Company
   b. Roskote A-51, as manufactured by Royston Laboratories, Inc.
   c. Or approved equal.

D. Coal Tar Epoxy:

1. Two-component

2. Chemically cured

3. High-build (up to 40 mils per coat)
4. 100 percent solids, 0.0 lbs V.O.C.

E. Heat Shrink Sleeve: Heat shrinkable joint wrap sleeve for below grade insulating joints, crosslinked polyolefin backing and butyl alloy adhesive, with compatible filler material to fill voids and other irregularities prior to application of the sleeve, and with the following requirements:

1. Minimum Total Thickness: 50 mils
2. Tensile Strength: 85lb./in. width or 2,900 psi
3. Elongation: 300 percent
4. Nominal Application Temperature Range: Minus 30 degrees F to 122 degrees F
5. Dielectric Strength: 30,000 Volts
6. Insulation Resistance: 1,000,000 megohms
7. Water Vapor Transmission Rate: Less than 0.04g/100 in²/24 hr at 70 degrees F

2.4 TEST BOXES

A. At-Grade Test Box: A.B.S. polymer body with a heavy duty cast iron pentagon locking lid and flange, supplied with a stand-off type seven post, terminal polyester laminate block as shown, with the following additional requirements:

1. Top Logo to read “DART TEST”
2. Minimum internal body diameter: 5-inches
3. Supply each test box with a pentagon wrench opening key.
4. All test boxes, if not installed in concrete pavement or walks, shall be installed in an individually placed concrete pad a minimum of 18 inches x 18 inches x 12 inches flush with adjacent surfaces.

B. Above-Grade Test Box: Cast Aluminum Alloy, suitable for wall or post mounting, sized as shown complete with a weather tight neoprene gasket with the following additional requirements:

1. Threaded outlet(s) for conduit entry
2. Cover Logo to read “DART TEST”
3. Nominal minimum box width, length, or diameter: 4 inches for flush wall boxes; 6-inches for wall-mount boxes; 4.5 inches for post-mount boxes.
4. Nominal minimum box depth: 4 inches for wall-mount boxes; 2.5-inches for post mount boxes.

C. Roadway Test Box: Cast Ductile Iron - ASTM A536 Grade 65-45-12, rated medium duty suitable for driveways, parking lots, and sidewalks; and with the following additional requirements:

1. Cover Logo to read “DART TEST”
2. Shop coated with manufacturer's standard paint
3. Total Weight-frame and lid not to exceed 50 pounds

D. Cable:

1. Magnesium Anode Header Wire: 10 AWG stranded copper, with Type TW 600 volt insulation.
2. Extruded Magnesium Anode Wire: 4 No. 12 AWG stranded copper, with Type TW 600 volt insulation.
3. Pipe Bond Wire: 4 AWG stranded copper, with Type TW 600 volt black insulation.
4. Pipe Test Wires: 10 AWG stranded copper ASTM B8, Class B wire with Type TW 600 volt insulation.
5. Reference Electrode Wire: 10 AWG stranded copper ASTM B8, Class B wire with Type TW 600 volt insulation.
6. Reinforcing Steel Bond Wire: 1/0 AWG Class G Stranded tinned bare copper wire.
7. Reinforcing Steel and Welded Wire Fabric Test Wire: 4 AWG stranded copper, with Type HMWPE black insulation.
8. Ground Mat/Rod Wire: 1/0 AWG Class G stranded copper with Type TW 600 volt insulation.

E. Wire Connections:

1. Exothermic cartridge, type and size suitable for the metals being connected using molds, disks, and sleeves as recommended by the manufacturer.
2. At the sump pump locations, mechanical type (bolt/crimp) connections can be used.

F. Manufacturers offering electrical component products that comply with these requirements include:

1. Handley Industries, Inc.
2. Gerome Manufacturing Company
3. Cott Manufacturing Company
4. Bingham and Taylor Corporation
5. Harco Technologies Corporation
6. Stuart Steel Protection Corporation
7. Or approved equal.

**2.5 WIRE AND CABLE**

A. Anode Header Cable: 8 AWG stranded copper, with Type RHW/USE direct burial insulation.

B. Pipe Bond Wire: Stranded copper with type RHW/USE direct burial insulation. Sizing of Bond Wire shall be as follows:

<table>
<thead>
<tr>
<th>Nominal Pipe Diameter</th>
<th>Wire Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 4 inches</td>
<td>12 AWG</td>
</tr>
<tr>
<td>4 inches to 12 inches</td>
<td>6 AWG</td>
</tr>
<tr>
<td>Greater than 12 inches</td>
<td>2 AWG</td>
</tr>
</tbody>
</table>

C. Pipe Test Wires: 10 AWG stranded copper ASTM B8, Class B wire with Type TW 600 V insulation.

D. Reference Electrode Wire: 10 AWG stranded copper ASTM B8, Class B wire with type TW 600 V insulation.

E. Reinforcing Steel Bond Wire: 1/0 AWG Class G stranded copper with Type RHW/USE direct burial insulation.

F. Reinforcing Steel and Welded Wire Fabric Test Wire: 4 AWG stranded copper, with Type RHW/USE direct burial insulation.

G. Ground Mat/Rod Wire: 1/0 AWG Class G stranded bare copper in earth. 1/0 AWG Class G stranded copper with Type TW 600 V insulation from test or junction box to earth 3 feet past conduit/earth interface.

H. Exothermic Welding Process: Exothermic cartridge, type and size suitable for the metals being connected using properly sized molds, disks, and sleeves as recommended by the manufacturer’s printed materials. Exothermic weld materials and products shall be Cadweld as manufactured by Erico Products, Inc. Thermoweld, or approved equal.

**PART 3 - EXECUTION**

**3.1 INSTALLATION**

A. Anodes: Bury anodes of type, size, and number at locations shown with the following additional requirements:

1. Wet pre-packaged anodes thoroughly before backfilling hole.
2. Use fine clay or native soil, free from stones, bricks, and organic matter, for backfilling.

3. Use exothermic welding process to connect anode leads to header cable as shown and route as sown on the drawings. Terminate cables in test boxes at the locations shown on the drawings.

B. Test Stations:

1. At-Grade Test Box: Install at locations shown on the drawings. Route all wires as shown and in a manner that will not cause damage to the wire insulation. Allow enough slack to compensate for soil movements and to extend panel above grade for test access. Coil excess wire inside box. Boxes shall be placed outside of vehicular traffic lanes, and shall be accessible for performing future cathodic protection testing.

2. Wall and Post-Mount Test Boxes: Install at locations shown on the drawings. Route all wires as shown and in a manner that will not cause damage to the wire insulation. Allow enough slack to compensate for soil movements. Mount terminal board inside box in a manner that will not permit electrical contact between the test wires and box.

C. Wire and Cable: Electrically bond mechanical joints on metallic piping as shown. Provide test wires of the size and type shown from each bonded facility and terminate at locations shown on the drawings. All wire/structure connections and buried wire and cable splices shall be exothermically welded and coated. Use of compression and split bolt connectors is prohibited. Identify each wire in test boxes using nonmetallic tags or pressure sensitive labels. Ring tongue connectors shall be attached to test wires, for connection to test box terminal board, using a crimping tool specifically designed for use with type of connectors used.

D. Exothermic Welds:

1. Molds, weld metal, and associated accessories shall be sized and designed for making electrical connections for copper-to-copper, copper-to-steel, and copper-to-ductile iron as required.

2. Perform exothermic welding after surfaces have been cleaned, using a power grinder, and dried.

3. Place weld cap over completed wire/pipe exothermic welds. The edges of the weld cap shall extend over the existing pipe coating as shown and totally encapsulate the weld, exposed pipe surface, and bare wire. If weld caps with coal tar mastic are used, fill weld cap with coal tar mastic and place over weld, exposed pipe surface, and bare wire.
4. Wire and cable splices, including anode-to-header cable connections, shall be exothermically welded. Connection shall be clean and dry prior to wrapping. Completed weld shall be initially wrapped with 3 layers of butyl rubber splicing tape, followed by two layers of vinyl plastic tape, using 50 percent overlap during application.

E. Insulating Fittings:

1. Insulating Flange: Provide appropriate sized flange-to-flange joint and install insulating gasket, sleeves, and washers in accordance with the manufacturer’s written instructions, using all thread studs. Entire flange, exposed nuts, studs, and washers shall be coated with petrolatum coating system or heat shrink sleeve as described in Subsections 3.1.G.2 and 3.1.G.3.

2. Insulating Coupling: Install at locations shown with insulating adapter gasket located away from cathodically protected piping. Install bond wires as shown to electrically connect coupling to cathodically protected piping. Coat all exothermic welds, bare steel, and threaded rods with 24 mils DFT coal tar mastic as described in Subsection 3.1.G.5.

F. Steel Pipe Coating System: Cathodically protected steel pipe used for waterlines shall be tape-coated in accordance with AWWA C214 and AWA C209.

G. Ductile Iron Pipe (DIP) Coating Systems: Five pipe coating options may be considered for cathodically protected DIP as described below. Polyethylene encasement shall not be used on cathodically protected DIP.

1. Butyl Adhesive Tape Coating System: May be used for straight piping, fittings, and field joints. Do not use on insulating fittings. Apply in strict accordance with coating manufacturer’s published application instructions with the following minimum requirements.

a. Surface Preparation: Pipe surfaces for straight piping and fittings shall be cleaned by blasting with sand, grit, or shot to achieve a surface preparation equal to that specified in SSPC-SP 7, Brush-Off Blast Cleaning. Field joints shall be free of mud, wax, tar, oil, grease, or any other material prior to preparing the surface in accordance with SSPC-SP 3, Power Tool Cleaning. Use a suitable solvent to remove oil and grease prior to blasting or power tool cleaning. Kerosene shall not be used.

b. Primer: Apply suitable primer to prepared pipe surfaces in accordance with the coating manufacturer’s published application instructions. Encase retainer glands, set screws, bolts, and other surface irregularities by filling voids with butyl rubber filler tape prior to application of wrapping tape.

c. Tape Application: Apply under hand tension or using a hand-wrapping machine in a spiral configuration. Apply tape with a 55 percent overlap to provide two layers with a total final thickness of 70 mils.

2. Wax-Tape Coating System: May be used for buried insulating fittings, straight piping, fittings, and field joints. Apply in strict accordance with the following minimum requirements:

a. Surface Preparation: Prepare surfaces by removing all loose scale, rust, or other foreign matter in accordance with SSPC-SP 2, Hand Tool Cleaning, or SSPC-SP 3, Power Tool Cleaning.

b. Primer: Apply a thin uniform coat of petrolatum primer to entire surface with gloved hand, brush, or rag. Encase retainer glands, set screws, bolts, and other surface irregularities by filling voids with petrolatum molding mastic prior to application of wax tape.

c. Tape Application: Tape shall be spirally wrapped using a minimum 1 inch overlap. While wrapping, press air pockets out and smooth all lap seams.

d. Outer Wrap Application: Tape shall be spirally wrapped using a minimum 1 inch overlap. Apply sufficient tension to provide continuous adhesion of the tape.
e. Coatings shall be tested with an appropriate Holiday Detector. Coating faults shall be repaired and retested prior to backfilling.

f. Insulating Material (1/8 inch thick rubber or polyethylene) shall be installed between coated pipe and solid support (wood blocking, etc.) or between coated pipe and concrete thrust blocks. Rebar shall not be in direct metallic contact with the pipe. Coating piping shall be backfilled with clean, rock free soil to avoid coating damage.

3. Heat Shrink Sleeves: May be used for buried insulating fittings and field joints. Apply in strict accordance with coating manufacturer's published application instructions with the following minimum requirements:

a. If the heat shrink sleeve is a one-piece tubular type, it should be placed over the pipe prior to assembly of flange. If the sleeve is not tubular and has a connecting seam, then the flange can be coated at any time.

b. Clean the uncoated metal surface with a hand or power wire brush to remove dirt, rust, and foreign materials. The portion of adjacent pipe coating that will be coated by the sleeve must also be cleaned.

c. Preheat the joint until hand warm, exercising extreme care not to damage insulating components.

d. Install mastic filler or sealant material (that is recommended by the sleeve manufacturer) in irregular areas of the flange where voids may occur under the shrink sleeve to result in gradual, sloping surfaces, without sharp corners from the external edges of the flange faces to the line pipe.

e. Remove the sleeve's inner protective release paper, if one exists, and center the sleeve over the preheated joint, allowing a minimum of 3 inches overlap on the existing coating.

f. Use an appropriate torch, heat the sleeve as indicated by the manufacturer's instructions. These instructions may vary upon product type. Some manufacturers instruct that the heating should begin in the center of the sleeve, working to the ends, while others suggest working from one end to the other.

4. Coal Tar Epoxy: May be used for straight piping, fittings, and field joints. Do not use on insulating fittings. Apply in strict accordance with coating manufacturer's published application instructions with the following minimum requirements.

a. Environmental Requirements: Air and surface temperature limits provided by the manufacturer shall be strictly adhered to during surface preparation and application and curing of coatings. Surfaces to be coated shall be protected from dust and airborne contaminants during the application and curing phases.

b. Surface Preparation: Pipe surfaces for straight piping and fittings shall be cleaned by blasting with sand, grit, or shot to achieve a surface preparation equal to that specified in SSPC-SP 7, Brush-Off Blast Cleaning. Field joints shall be free of mud, wax, tar, oil, grease, or any other material prior to preparing the surface in accordance with SSPC-SP 3, Power Tool Cleaning. Use a suitable solvent to remove oil and grease prior to blasting or power tool cleaning. Kerosene shall not be used.

c. Coating Application: Thoroughly mix components in strict accordance with manufacturer's written instructions. Apply in sufficient number of coats to achieve a final dry film thickness not less than 35 mils. Consult coating manufacturer's written recommendations for number of coats required, maximum thickness of coats, and allowable timeframe between subsequent coats.

d. Coatings shall be tested with an appropriate Holiday Detector. Coating faults shall be repaired and retested prior to backfilling.

e. Insulating material (1/8 inch thick rubber or polyethylene) shall be installed between coated pipe and solid support (wood blocking, etc.) or between coated pipe and concrete thrust blocks. Rebar shall not be in direct metallic contact with the pipe. Coated piping shall be backfilled with clean, rock free soil to avoid coating damage.

5. Coal Tar Mastic: May be used to coat threaded rods, exothermic welds, and other pipe appurtenances that cannot utilize
aforementioned tape wrapping systems. Do not use on insulating flanges.

a. Surface Preparation: Prepare surfaces by removing all loose scale, rust, or other foreign matter in accordance with SSPC-SP 2, Hand Tool Cleaning. Use a suitable solvent to remove oil and grease prior to hand tool cleaning. Kerosene shall not be used.

b. Apply two 12 mil coats using a brush or gloved hand to achieve a final dry film thickness (DFT) of 24 mils. Allow sufficient curing time between coats as documented in the coating manufacturer's published application instructions.

c. Coatings shall be tested with an appropriate holiday detector. Coating faults shall be repaired and retested prior to backfilling.

6. Handling Coated Pipe in Field or Trench:

a. Pipe shall be stored along trench side, suitable supported off the ground to avoid damage to the coating.

b. Pipe shall be hoisted from the trench side by means of wide, non-metallic canvas or leather belt slings. Chains, cables, tongs, or other equipment likely to cause damage to the coating, shall not be permitted, nor shall dragging or skidding of the pipe. Inspection of the coating on the underside of the pipe is recommended while the pipe section is suspended from the sling. Damage shall be repaired before the pipe is lowered into the trench.

c. The pipe ditch shall be smooth and offer maximum uniform support to the pipe. It shall be free of debris, stones, and clods. Ditch bottom cuts through rock formations shall be panned for adequate pipe protection, and the ditch sides shall be avoided in lowering-in operations to minimize coating damage. Consideration shall be given to extra ditch width in rock areas.

d. During construction of the pipeline, use every precaution to prevent damage to the protective coating on the pipe. No metal tools or heavy objects shall be permitted to come into contact unnecessarily with the finished coating. Workmen will be permitted to walk upon the coating only when necessary, in which case they shall wear shoes with rubber or composition soles and heels. This rule shall apply to surfaces, whether bare, primed or coated. Any damage to the pipe or protective coating, from any cause, during the installation of the pipeline and before final acceptance, shall be repaired as required by the Contracting Officer at no additional cost.

H. Pipeline Casing Insulators: Install in accordance with the manufacturer's published instructions, and with the following requirements:

1. Space one insulator one foot in from each casing end, and every 10 feet (maximum) thereafter.

2. Additionally, place an insulator one foot from each side of each mechanical joint within the casing.

3. Carrier pipe coating shall be tested as required to the satisfaction of the Authority Corrosion Engineer prior to installation inside the casing pipe. Damage to the pipe coating during the installation process shall be repaired to the satisfaction of the Authority Corrosion Engineer.

I. Casing End Seals: Install in accordance with the manufacturer's published instructions. Slide end seals over the carrier pipe at the casing entrance during carrier pipe installation. Remove dirt and debris from the carrier pipe and casing surfaces prior to positioning the seal and tightening the stainless steel bands.

J. Dielectric Modular Penetration Seals: Provide modular mechanical type wall seals, consisting of interlocking synthetic rubber links shaped to continuously fill the annular space between the pipe and wall sleeve. Assemble the links loosely with bolts to form a continuous rubber belt around the pipe with a pressure plate under each bolt head and nut. After the seal assembly is positioned in the sleeve, tighten the bolts so that the rubber sealing elements expand and provide watertight seal between the pipe and wall opening. Construct the seal so as to provide electrical insulation between pipe and wall. Caulking, other types of mastic sealant, or lead oakum joints are not acceptable.

K. DIP fittings installed with non-metallic water supply systems shall be protected in accordance with the following:

1. Isolated, individual DIP fittings installed with PVC water distribution mains shall be installed with polyethylene wrap.

2. If the total continuous length of a DIP pipe and fittings assembly installed with a PVC water distribution main exceeds 20 lineal feet, then the following cathodic protection
measures are required for the DIP assembly:

a. Metallic elements associated with the fitting assembly shall be coated with a coating system as described in Subsection 2.3

b. Metallic pipe joints in the assembly shall be bonded.

c. One 50 pound high potential magnesium anode shall be exothermically welded to the assembly. One additional 50 pound anode shall be exothermically welded to the assembly for each additional twenty lineal feet of DIP piping associated with the assembly.

3.2 QUALITY CONTROL

A. Do not cover anodes, header cables, test wires, bonding wires, and other buried and embedded components of corrosion control systems without inspection of the Authority Corrosion Engineer and approval of the Contracting Officer.

B. Test coatings with coating integrity test equipment (holiday detector) and thickness gauges prior to installation of piping in the trench, using instructions of the test equipment manufacturer. The Authority Corrosion Engineer will witness these tests. Repair coating deficiencies to the satisfaction of the Authority Corrosion Engineer.

C. The Authority Corrosion Engineer will test the corrosion control systems. Tests to include, but not limited to, electrical continuity of bonded structures, including pipes and accessories, wires, splices, test cables; coating and dielectric effectiveness; and anode installations. Repair or replace deficiencies and damaged components to the satisfaction of the Authority Corrosion Engineer.

D. Contractor shall notify the Contracting Officer for scheduling Corrosion Control Quality Inspection of the installation by Authority Corrosion Engineer. Final Corrosion Control Acceptance Tests will be conducted by the Authority Corrosion Engineer. The Contractor shall complete advanced testing and furnish copies of their test data to the Authority’s Corrosion Engineer prior to the final acceptance testing.

PART 4 - MEASUREMENT

4.1 GENERAL

A. Corrosion control will be paid for on a lump sum basis wherein no measurement will be made.

END OF SECTION 13100
PART 1 - GENERAL
1.1 DESCRIPTION
A. Work specified in this Section describes tests to be made on corrosion control measures installed with transit facilities and utilities. The work includes testing of sacrificial anode cathodic protection systems, electrical continuity of piping and reinforcing steel, electrical effectiveness of insulating devices and the effectiveness of protective coatings, and others as defined herein and approved by the Authority Corrosion Engineer.
B. Electrical tests of impressed current cathodic protection system components is not included as part of this work and is covered as part of the section where such related work is to be performed by the Contractor.

1.2 REFERENCED STANDARDS
A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
1. ASTM B1 - Standard Specification for Hard-Drawn Copper Wire
2. ASTM B258 - Standard Specification for Standard Nominal Diameters and Cross-Sectional Areas of AWG Sizes of Solid Round Wires Used as Electrical Conductors

1.3 QUALITY ASSURANCE
A. The number of readings taken to determine an electrical constant or property will be sufficient to assure that random factors due to human error in reading the instruments and transient disturbances in the electrical network have negligible influence on the final results. The adequacy of the data will be established by the tester. The data will be examined to see that removal of either the highest or lowest value will not alter the arithmetic average of the group by more than five percent. If the average is altered by more than five percent, one more set of data will be taken and the results combined with the first set. If the average of the combined data is still altered by more than five percent, by removal of the highest or lowest value, an unstable condition might exist, the contractor will perform additional inspections and tests to determine solutions to the problem, and provide report describing the issue(s) and resolution(s). Report will contain final test report that shows and proves issues are resolved.

PART 2 - PRODUCTS
2.1 VOLTMMETERS
A. Analog dc Voltmeter: Multi-scale (1mV to 10V, or 2mV to 20V), center zero or 10 percent upscale, accurate to within 0.5 percent of full scale.
B. Electronic dc Voltmeter (Digital Readout): Multi-scale (20mV to 20V), accurate to within 1 percent of reading plus or minus 1 digit, minimum input resistance of 10 megohms for ranges above 20mV.

2.2 AMMETERS
A. Analog dc Ammeter: Multi-scale (1mA to 10A, or 2mA to 20A), center zero or 10 percent upscale, accurate to within 0.5 percent of full scale.
B. Electronic dc Ammeter (Digital Readout): Multi-scale (20mA to 20A), accurate to within 1 percent of reading plus or minus digit.

2.3 VOLTAGE RECORDERS
A. Strip Chart Voltage Recorder: Multi-scale, ac/battery powered, with 2.5 megohm input resistance (minimum), 0.5 second response time (full scale (maximum)) and adjustable chart speed control.
B. Digital Voltage Recorder: Multi-scale, ac/battery powered, data logger with 10 megohm input resistance (minimum).

2.4 COATING TEST EQUIPMENT
A. Low Voltage, Wet Sponge Holiday Detector: Portable, battery operated, self-contained unit, with terminal connections for ground wire to the structure, and open cell sponge electrode. Voltage rating shall be between 5 and 90 VDC, providing an audible signal for locating coating faults.
B. High Voltage Holiday Detector: Portable, battery operated, self contained unit, with terminal connections for ground wire to the structure, and exploring electrode with audible signal for locating coating faults. Electrode shall be of the type capable of maintaining continuous contact with the surface being inspected. Voltage rating shall be selectable between 900 volts and 35,000 volts to conform to coating manufacturer's test voltage recommendations.
C. Coating Thickness Gauge: Hand held, battery operated, nondestructive instrument capable of determining non-magnetic coating thickness from 1 to 80 mils on horizontal, vertical, and inverted surfaces.

2.5 MISCELLANEOUS
A. DC Power Source: 12 volt, sealed, rechargeable battery with a minimum 6.5-ampere/hour capacity. For tests requiring additional current magnitudes, use two or more batteries in series, a DC generator, or portable test rectifier.
B. Test Wires: Insulated, single conductor stranded copper test leads of various sizes and lengths, and with appropriate connectors to suite test conditions. At least two hand reels with approximately 500 feet of insulated, stranded copper wire (16 AWG minimum).

C. Cu-CuSO\(_4\) Reference Electrode: 1.25 inches diameter, 6 inches long with solid copper rod contacting a saturated solution of copper sulfate, with porous plug allowing electrical contact with the soil.

PART 3 - EXECUTION

3.1 CORROSION CONTROL MEASURES ON REINFORCING STEEL

A. This section is applicable only for structures utilizing electrically continuous rebar for corrosion control. The purpose of these tests is to determine the longitudinal resistance of welded reinforcing steel in poured concrete aerial structure decks, tunnel inverts, columns, bents and pile shafts. Tests will be made on the following measures:

1. Physical Inspection:
   a. Subsequent to weldment and after weld has cooled, each weld will be tested by striking the connection with a two pound hammer. If the connection separates, the connection shall be rewelded by the Contractor. The Authority Corrosion Engineer will then retest the connection.
   b. Prior to pouring of concrete, visually inspect all welds.

2. Test Station Wire Effectiveness (To be conducted after concrete is poured):
   a. The Contractor shall establish a current (I) and voltage (E) circuit between the structure test wires as shown in Figure 2 (available from the Contracting Officer). With the current circuit closed, the meter ranges will be reduced until the lowest readable scales are reached. The current "on" values for each circuit will be read and recorded.
   b. The current (I) circuit will be opened, and the "off" values for the voltage (E) and current (I) circuits will be immediately read and recorded. This will be repeated a minimum of three times for accuracy.
   c. The change in current, \( \Delta I \), and the change in voltage, \( \Delta E \), for each reading (\( \Delta I = I_{on} - I_{off} \) etc.) will be calculated.
   d. The resistance of the wires will be calculated by dividing the summation of the change on voltage, \( \Sigma \Delta E \), by the summation of the change in current, \( \Sigma \Delta I \).

\[
R_{\text{TEST WIRES}} = \frac{\Sigma \Delta E}{\Sigma \Delta I} = \text{ohms}
\]

e. The theoretical resistance of the test wires will be calculated.

\[
R_{\text{THEOR}} = \left( 2 \times L_{\text{WIRE}} \times R_{\text{WIRE}} \right) + \left( L_{\text{REBAR}} \times R_{\text{REBAR}} \right)
\]

where:

\[
L_{\text{WIRE}} = \text{Length of one test wire from the voltage connection to the rebar (feet) (assumes both wires are equal in length)}.
\]

\[
L_{\text{REBAR}} = \text{Length of rebar between test wires (feet)}.
\]

\[
R_{\text{WIRE}} = \text{Longitudinal resistance of the test wire (ohm/1000 feet) from Table II}.
\]

\[
R_{\text{REBAR}} = \text{Longitudinal resistance of rebar (ohm/1000 feet) from Table I}.
\]

f. Acceptance Criterion: Test wires shall be considered as acceptable provided they meet the following criterion:

\[
R_{\text{TEST WIRES}} < 1.20 \times R_{\text{THEOR}}
\]

g. Failure to meet this criterion will be reported to the Contracting Officer. Corrective action shall be taken, at the Contractor's expense, to remedy the unacceptable condition. Subsequent to corrective action(s), the tests shall be repeated.

3. Reinforcing Steel Electrical Continuity (To be conducted after concrete is poured):

a. The Authority Corrosion Engineer will obtain electrical access to the reinforcing steel through the test stations located on the aerial structure at hinges or on the columns. A current (I) and voltage circuit (E) will be established as shown on Figure 3 (available from the Contracting Officer). With the current "on", the meter ranges will be reduced until the lowest readable scales are reached.
b. The Authority Engineer will read and record "on" values for voltage (E) and current (I). The current (I) circuit will be opened and the "off" values for voltage (E) and current (I) will be immediately recorded. This will be repeated a minimum of three times for accuracy.

c. The change in current, \( \Delta I \), and the change in voltage, \( \Delta E \), will be calculated for each reading (\( \Delta I = I_{on} - I_{off} \) etc.).

d. The longitudinal resistance of the welded reinforcing steel will be calculated by dividing the summation of change in voltage, \( \Sigma \Delta E \), by the summation of change in current, \( \Sigma \Delta I \).

\[
R_{REBAR} = \frac{\Sigma \Delta E}{\Sigma \Delta I} \text{ ohms}
\]

e. Acceptance Criterion: Electrical continuity of reinforcing steel shall be considered as acceptable provided the following criterion is met:

\[
R_{REBAR} \leq 1.20 R_{THEORETICAL}
\]

where:

\[
R_{REBAR} = \text{Measured longitudinal resistance}
\]

\[
R_{THEORETICAL} = \frac{(L_{REBAR} \times R_{REBAR})}{n} \text{ ohms}
\]

\[
L_{REBAR} = \text{Length of welded longitudinal reinforcing steel bars between test facilities (feet)}
\]

\[
R_{REBAR} = \text{Longitudinal resistance of reinforcing steel (ohm/1000 feet) from Table I.}
\]

\[
n = \text{Number of welded longitudinal steel bars connected together at ends of Test Section by collector bars.}
\]

3.2 CORROSION CONTROL MEASURES ON WELDED WIRE FABRIC

A. This section is applicable when welded wire fabric is required. The purpose of this test is to assure the electrical continuity of the welded wire fabric (WWF) that is installed under track on the aerial structures. This test should be conducted prior to installation of the track. Subsequent to installation of the butyl membrane material, the protective covering, the WWF, and test wire connections to the WWF, a visual inspection should be made of the welded wire fabric. Longitudinal continuity of the WWF should be visually verified across longitudinal lap splices in the WWF. The point of connection of each test wire to the WWF should be visually verified. No additional testing is required subsequent to installation of the track.

3.3 The CORROSION CONTROL MEASURES ON PIPING SYSTEMS

A. Electrical tests specified herein shall be performed by the contractor on those piping systems for which electrical continuity and/or cathodic protection has been provided. Tests will be made on the following measures:

1. Physical Inspection: Prior to backfilling and during installation of the piping system, the following items will be tested or inspected.

   a. Each thermite weld will be tested by striking the weld with a two pound sledge hammer, while pulling firmly on the test or bond wire at a forty-five degree angle. Defective welds shall be repaired or replaced at Contractor's expense.

   b. The exposed areas of pipe, weldment and copper wire at exothermic welds will be inspected to assure that bare metal areas are adequately coated.

   c. Pipe coatings will be visually inspected to assure that the coating is free of defects and damage. Subsequent to visual inspection, electrical tests, using a high or low voltage pulse-type detector will be conducted prior to backfilling as specified elsewhere.

   d. Insulating devices shall be visually inspected to assure material specifications are satisfied. A visual inspection of the assembled and installed devices shall be conducted to assure that the components of the insulating device suffered no damage prior to or during installation.
CORROSION CONTROL ACCEPTANCE TESTS

1. Test Station Wire Effectiveness:
   a. The contractor will measure the electrical resistance of test wires at each test station facility in accordance with 3.1 A2 and Figure 2 (available from the Contracting Officer).
   b. Theoretical resistance of the test wires will be calculated.

\[
R_{THEOR} = \frac{2 \times L_{WIRE} \times R_{WIRE}}{L_{STRUCT} \times R_{STRUCT}}
\]

where:

- \(L_{WIRE}\) = Length of one test wire from the structure to the voltage connection assuming both wires are equal in length (feet).
- \(R_{WIRE}\) = Longitudinal resistance of the test wire (ohm/1000 feet), from Table II.
- \(L_{STRUCT}\) = Length of structure between test wires (feet)
- \(R_{STRUCT}\) = Longitudinal resistance of structure (ohm/1000 feet.), from Table III.

   c. Acceptance Criterion: Test wires shall be considered as acceptable provided they meet the following criterion. Failure to meet this criterion will be reported to the Contracting Officer. Corrective action shall be taken at the Contractor's expense.

\[
R_{TEST\ WIREs} < 1.20 R_{THEOR}
\]

b. The current "on" values for voltage and current will be read and recorded. The current circuit will be opened and the "off" values for voltage and current will be immediately read and recorded. A minimum of three readings will be obtained to assure accuracy.

c. The change in voltage, \(\Delta E\), and the change in current, \(\Delta I\), will be calculated for each reading (\(\Delta I = I_{on} - I_{off}\) etc.).

d. The longitudinal resistance of the pipe between the two test facilities will be calculated by dividing the summation of the change in voltage, \(\Sigma \Delta E\), by the summation of the change in current, \(\Sigma \Delta I\).

\[
R_{PIPE} = \frac{\Sigma \Delta E}{\Sigma \Delta I} = \text{ohms}
\]

e. The theoretical resistance of the pipe between the two test facilities will be calculated, using as-built diagrams to determine the number of pipe joints and fittings.

\[
R_{THEOR} = (L \times R_{P}) + (n \times R_{B}) = \text{ohms}
\]

where:

- \(R_{THEOR}\) = Resistance of pipe between test stations
- \(L\) = Length of pipe between test facilities (feet)
- \(R_{P}\) = Longitudinal resistance of pipe (ohm/1000 feet), from Table III
- \(n\) = Number of bond wire pairs between test facilities (based on the number of pipe joints, including fittings)
- \(R_{B}\) = 0.0001922 ohm for one bond pair (two 18-inch long No. 4 wires). \(R_{B}\) will vary, depending upon the length and size of the bond wire and should be calculated if lengths other than 18-inches are used.

\[
R_{B} = \frac{R_{W} \times L_{W}}{n} = \text{ohms}
\]

3. Pipe Continuity
   a. The contractor shall obtain access to the pipe through the test station facilities. Using individual structure test wires in each facility, a current circuit (I) and a voltage circuit (E) will be established as shown on Figure 4 (available from the Contracting Officer). With the current circuit closed, the meter ranges will be

   reduced until the lowest readable scales are reached.
where:

\[ R_W = \text{Longitudinal resistance of bond wire (ohm/1000 feet), from Table II} \]

\[ L_W = \text{Length of bond wire (feet)} \]

\[ n = \text{Number of bond wires} \]

f. **Acceptance Criterion:** The resistance of the pipe section shall be considered as acceptable, indicating effective pipe joint bonding, provided the following criterion is met:

\[ R_{\text{PIPE}} \leq 1.10 R_{\text{THEOR}} \]

g. If the acceptance criterion is not met, the Contracting Officer will be notified and the test procedure will be repeated for a smaller distance, preferably half, within the original section tested. Keeping point A (See Figure 4, available from the Contracting Officer) at the same location and a point C will be selected halfway between points A and B. The above procedures, a to f, will be repeated for the section of pipe between points A and C and B and C.

h. The above procedure will be continued on the pipe section, AC or BC, that does not meet the acceptance criterion. The procedure shall be used by again splitting the defective (i.e. high resistance) section in half and repeating the resistance measurements. A point will be reached when the pipe section being tested includes only a single pipe joint. This pipe joint shall be excavated and the bond wires repaired and/or replaced, as required, at Contractor's expense.

i. Subsequent to repair of the defective bond wires, as located above, the original pipe section (A to B) shall be retested to determine if it meets the acceptance criterion.

4. **Electrical Insulating Devices:**

a. These tests will be made on those devices installed to provide electrical separation between two or more structures for corrosion control purposes. These devices will normally include insulating flange assemblies or couplings, casing sleeve insulators, and non-metallic pipe inserts. These tests must be made on the insulating device prior to backfilling.

b. All insulating devices, other than PVC inserts, will be tested with one side of the device suspended in air, and/or free of earth contact or other connections that will establish a contact to earth.

c. The contractor shall connect an ohmmeter across the insulating device with the positive connection on one side of the device and the negative connection on the other, as shown on Figure 5 (available from the Contracting Officer). The resistance, \( R_J \), will be measured and recorded.

d. The contractor shall connect an ohmmeter between the section of pipe suspended in air, and a low resistance earth contact, i.e. ground rod. The resistance between pipe and earth, \( R_E \), will be measured and recorded.

e. **Acceptance Criteria (Insulating Flanges/Couplings):** The following two criteria must be satisfied for the acceptance of the insulating flange assembly or coupling:

\[ R_E \geq R_J \]

\[ R_J \geq 1 \times 10^6 \text{ ohms} \]

f. If the above acceptance criteria are not satisfied, the insulating device shall be considered ineffective and the Contracting Officer will be notified. Corrective action shall be made at the Contractor's expense.

g. Casing/wall seal insulators will be tested with the side of the carrier pipe inside the casing suspended in air and/or having no earth contact.

h. The contractor shall connect an ohmmeter between the casing or wall sleeve and the section of carrier pipe passing through the casing or wall sleeve, as shown on Figure 6 (available from the Contracting Officer). The resistance between the casing/wall sleeve and pipe, \( R_{CP} \), will be measured and recorded.
i. Acceptance Criteria: Two criteria must be satisfied for the acceptance of the electrical isolation of the carrier pipe from the casing/wall sleeve.

\[ R_J \geq 1 \times 10^6 \text{ ohms} \]

\[ R_{CP} \geq 1 \times 10^6 \text{ ohms} \]

j. If only the first part of the above criteria is satisfied, an electrical path exists between the carrier pipe and casing/wall sleeve. A physical inspection of the casing, the casing seals, and the pipe shall be conducted to determine the cause of the electrical path and the corrective measures required.

5. Magnesium Anode Installation:

a. Instruments will be set up as shown on Figure 7 (available from the Contracting Officer). The current circuit (I) will be located on the outside of the test wire for the magnesium anodes and to either of the test wires from the structure. The copper-copper sulfate reference cell will be positioned one foot from the test station on the side of the test station opposite the magnesium anode(s). The location of the half-cell will be documented.

b. The current (I) circuit will be closed and the meter ranges of both the current and voltage circuits will be reduced until the lowest readable scales are reached. The current “on” values for voltage and current will be read and recorded.

c. The current (I) circuit will be opened and the “off” values for voltage and current will be immediately read and recorded. This will be repeated a minimum of three times for accuracy.

d. The change in current, \( \Delta I \), and the change in voltage, \( \Delta E \), will be calculated for each reading (\( \Delta I = I_{on} - I_{off} \) etc.).

e. Resistance-to-earth of the magnesium anode installation will be calculated by dividing the summation of change in voltage, \( \Sigma \Delta E \), by the summation of the change in current, \( \Sigma \Delta I \).

\[ R_{MAG} = \frac{\Sigma \Delta E}{\Sigma \Delta I} = \text{ohms} \]

f. The theoretical resistance of the magnesium anode installation will be calculated.

\[ R_{TM} = \frac{1}{N} x R_m \times \rho_{soil} \]

where:

\[ R_{TM} = \text{Theoretical resistance-to-earth of magnesium anodes under test} \]

\[ N = \text{Number of magnesium anodes under test} \]

\[ R_m = \text{Resistance of single magnesium anode in 1,000 ohm-cm soil (ohms)} \]

\[ R_m = 4.5 \text{ ohms for 48 lb. anode} \]

\[ \rho_{soil} = \text{Soil resistivity in 1,000 ohm-cm increments} \]

g. Acceptance Criterion: The resistance-to-earth of the magnesium anode installation shall be considered as acceptable provided the following criterion is met:

\[ R_{MAG} \leq 1.5 \times R_{TM} \]

h. If the acceptance criterion is not met, the Contracting Officer will be notified and, with his approval, the following may be required.

1) The resistivity of the soil around each anode shall be measured. This shall be obtained using a single probe soil resistivity measuring device with related instrumentation. The data shall be obtained at a minimum depth of 6 inches below the bottom of the pipe trench and as close as possible to the location(s) of the anode(s). This data shall be used to recalculate the theoretical magnesium anode resistance. At the discretion of the Contracting Officer, additional action may or may not be deemed necessary.

2) If additional action is deemed necessary, the Contractor, at his expense, shall excavate one of the magnesium anodes for physical examination. The examination shall include evaluation of the soil
environment around the anode and the electrical splice of the anode wire to the anode collector wire. At the discretion of the Contracting Officer, additional anodes may be excavated if conditions observed at the first anode indicate material or installation problems.

6. Protective Pipe Coating Evaluation:

a. A current \( I_A \) and a voltage measuring circuit \( E_A \) will be established between the pipe test wires and the anode bus wire as shown on Figure 8 (available from the Contracting Officer). Voltage connection to the anode bus wire will be a minimum of 6-inches below the current connection.

b. The current circuit will be closed and the meter ranges of both circuits will be reduced until the lowest readable scales are reached. The "on" values for voltage and current will be read and recorded.

c. The current circuit, \( I_A \), will be opened and the "off" values for voltage and current will be immediately read and recorded. A minimum of three readings will be obtained to assure accuracy.

d. The change in voltage, \( \Delta E_A \) and the change in current, \( \Delta I_A \), will be calculated for each reading \( \Delta I = I_{on} - I_{off} \) etc.

e. The resistance between the anodes and the pipe will be calculated by dividing the summation of change in voltage, \( \Sigma \Delta E_A \), by the summation of change in current, \( \Sigma \Delta I_A \).

\[
R_{A-A} = \frac{\Sigma \Delta E_A}{\Sigma \Delta I_A} = \text{ohms}
\]

f. Maintaining the current circuit between the anodes and pipe, a voltage measuring circuit, \( V_{gA} \), will be established between the pipe and a copper-copper sulfate reference cell positioned in earth above the pipe.

g. The current circuit, \( I_A \), will be closed and the meter ranges of both circuits will be reduced until the lowest readable scales are reached. The "on" values for the current, \( I_A \) and voltage, \( V_{gA} \) circuits will be read and recorded.

h. The current circuit, \( I_A \), will be opened and the "off" values for current and voltage will be immediately read and recorded. A minimum of three readings will be obtained to assure accuracy.

i. The change \( \Delta V_{gB} \) and the change in current, \( \Delta I_A \), will be calculated for each reading \( \Delta I_A = I_{on} - I_{off} \) etc.

j. The volt per ampere earth coupling between the pipe and the reference cell will be calculated by dividing the summation of the change in voltage, \( \Sigma \Delta V_{gB} \) by the summation of the change in current, \( \Sigma \Delta I_A \).

\[
RV_{gB-A} = \frac{\Sigma \Delta V_{gB}}{\Sigma \Delta I_A} = \text{volts/ampere}
\]

k. Maintaining the current circuit, \( I_A \), a voltage measuring circuit, \( V_{gC} \), will be established between the magnesium anodes and the reference cell and the change in potential and change in current will be measured as described in 6g through 6j above.

l. The volt per ampere earth coupling of the anodes will be calculated.

\[
RV_{gC-A} = \frac{\Sigma \Delta V_{gC}}{\Sigma \Delta I_A} = \text{volts/ampere}
\]

m. The summation of the absolute values of \( RV_{gC-A} \) and \( RV_{gB-A} \) shall be within plus or minus ten percent of the resistance between the anodes and the pipe, \( R_{AA} \). If this criterion is not satisfied, indicating an unstable condition or a failure to follow these procedures, the measurements will be repeated. If the unstable situation still exists, the Contracting Officer will be notified.

n. Maintaining the current circuit, \( I_A \), a pipe to reference cell voltage circuit will be established at test facilities along the pipe, keeping on the front side of any insulating devices as shown on Figure 9 (available from the Contracting Officer). A volt per ampere earth coupling will be obtained as specified above at each test facility; identifying each as follows:

\[
RV_{gD-A} = \frac{\Sigma \Delta V_{gD}}{\Sigma \Delta I_A} = \text{volts/ampere}
\]

\[
RV_{gE-A} = \frac{\Sigma \Delta V_{gE}}{\Sigma \Delta I_A} = \text{volts/ampere}
\]
o. The Authority Corrosion Engineer will average the pipe-to-soil volt per ampere couplings to determine the average pipe-to-soil resistance.

p. A coating resistance will be calculated by using the following equation:

\[ CR = R_{PS} \times \pi \times OD \times L = \text{ohm-sq. feet} \]

where:

\[ R_{PS} = \text{Average pipe-to-soil resistance} \]
\[ OD = \text{Outside diameter of pipe (feet)} \]
\[ L = \text{Length of pipe section (feet)} \]

q. Acceptance Criterion: The pipe coating shall be considered as acceptable provided the following criterion is met:

\[ CR > 10,000 \text{ ohm-sq. feet} \]

r. Failure to satisfy this requirement will be reported to the Contracting Officer and will require a cell-to-cell coating fault survey.

d. Beginning with the highest scales on the voltmeter and ammeter, the current circuit will be closed and meter ranges will be reduced until the lowest readable scales are reached. The current will be limited to a maximum of 10 amperes to prevent damage to the coating or other facilities.

e. The "on" values for voltage and current will be read and recorded. The current circuit will be opened and the "off" values for voltage and current will be immediately read and recorded. The incremental change in current, \( \Delta I \), and potential, \( \Delta E_x \), \( (\Delta E_x = E_{on} - E_{off} \text{ etc.) will be determined} \)

f. Maintaining the current circuit as shown, the reference cells will be moved, each three feet toward the other end of the pipe. The positive reference cell will always be closest to the end of the pipe where current is impressed. Step e above will be repeated. The cells will then be moved another three feet and step e will be repeated once more. This procedure is to be performed over the entire length of pipe.

g. Figure 11 (available from the Contracting Officer) shows an example of typical data for a portion of a cell-to-cell survey. The incremental voltage changes, \( \Delta E_x \), will be summed, starting with the first reading. The resulting summations will be plotted versus distance on rectangular coordinate graph paper. Figure 12 (available from the Contracting Officer) shows a sample plot. Areas of coating defects are indicated by peaks in the resulting plot. It should be noted that if there is a significant variation in test current, then it may be necessary to divide each incremental voltage change, \( \Delta E_x \), by the magnitude of test current, \( \Delta I \), and then obtain the summation of the quotients and plot the quotient summations versus distance.

h. The shape and relative magnitude of the resulting graph will indicate the general condition of the coating system. A graph with many peaks of relatively equal magnitude indicates a general overall coating problem. A
graph with a few large peak effects indicates isolated problem areas. As a general guideline, the relative sizes of the defects can be interpreted from the magnitude of the peaks. Large peak values correlate to large areas of coating faults as compared to lower peak values.

i. The graphical results of the survey will be submitted to the Contracting Officer. Several areas along the main will be selected to be excavated and examined to determine the condition of coating. The entire main at the coating fault locations must be excavated to ensure that all defects are uncovered. Obvious coating defects shall be repaired. Prior to repair of visually obvious coating defects, the entire area shall be inspected using the proper type holiday detector.

j. Subsequent to repair of coating defects, and after the coating has dried, the exposed pipe area will be retested using the coating holiday detector.

k. The Contractor shall backfill the excavation(s) so that the Authority Corrosion Engineer can repeat the electrical resistance test as described in 3.3 6 above at select locations to determine if the resistance level of the main has shown an appreciable increase subsequent to repair of located coating faults.

l. If the calculated coating resistance is now above the acceptable level, no additional excavations are required. However, if no appreciable improvement is observed in the coating resistance, additional excavations may be required at the discretion of the Contracting Officer.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Corrosion control acceptance tests will be paid for on a lump sum basis wherein no measurement will be made.

*Based on Resistivity of Ductile Iron Pipe = $310 \times 10^{-6}$ ohm-in$^2$/feet

END OF SECTION 13101
PART 1 - GENERAL

1.1 DESCRIPTION

A. Work specified in this section describes testing necessary to follow measuring resistance to earth of running rails which are used as the conductors for returning the train operating current to the substation.

B. Procedures presented in this section are general guidelines for the measurement of track-to-earth resistance as construction progresses and may require modification to suit actual field conditions and the electrical networks established by the track work as a result of changing conditions. The Authority’s Corrosion Engineer may modify the procedures, as may be necessary, to suit actual conditions.

C. Final acceptance tests for track-to-earth resistances will be the responsibility of the Authority subsequent to the completion of the in-progress tests specified in this section.

D. Contractor shall coordinate with the Authority to obtain unrestricted access to the track work sections scheduled for Rail-to-Earth (R-T-E) resistance testing. Time required for R-T-E testing will be determined when length of track to be tested is determined, and availability of track access can be scheduled.

1. Contractor shall maintain track work sections clear of debris, prior to scheduled R-T-E resistance testing to prevent problems causing rail-to-ground shorting conditions.

2. Rail-to-earth resistance testing shall be allotted in the Contractor’s Baseline Schedule as a final scheduled requirement prior to acceptance by the Authority.

1.2 REFERENCED STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1.3 QUALITY ASSURANCE

A. Tests specified herein will be made by the Contractor. The number of readings taken to determine an electrical constant or property will be sufficient to assure that random factors due to human error in reading the instruments and transient disturbances in the electrical network have negligible influence on the final results. The adequacy of the data will be established by the testing procedure. The data will be examined to see that removal of either the highest or lowest value will not alter the arithmetic average of the group by more than five percent. If the average is altered by more than five percent, one more set of data will be taken and the results combined with the first set. If the average of the combined data is still altered by more than five percent, by removal of the highest or lowest value, an unstable condition might exist, and the Contractor will perform additional inspections and tests to determine solutions to the problems.

PART 2 - PRODUCTS

Not Used.

PART 3 - EXECUTION

3.1 SCHEDULING OF TESTS

A. Contractors will test individual sections of track as practical to construction sequencing as all major construction work is completed. When only minor work remains to be completed, the Contractor shall schedule this work early so that testing is not delayed. Since the purpose of the testing is to verify the electrical resistance quality of the track as the work proceeds, the Contractor will not be permitted to interfere with Authority testing to consolidate the testing effort.

B. As per DART Design Criteria Manual Volume II – Systems Design, paragraph 8.3.3.C Negative Distribution System, Rail-to-ground resistance shall be continuously monitored by the Contractor during construction to detect variations of decreases in the resistance. The testing shall be performed in accordance with a pre-approved test procedure.

3.2 VISUAL INSPECTION

A. Track work will be visually examined to ensure that there is no appreciable degree of debris, water, dirt, ballast or other conductive material in electrical contact with the track or track components, which could result in lowering of the effective track-to-earth resistance, thus producing incorrect data. It is assumed, unless shown otherwise, that the installation of the track system has been in accordance with material and construction specifications. The Contractor shall be required to clear/clean any problems observed during the visual inspection. The condition of the track section to be tested will be recorded on data sheet.

3.3 ELECTRICAL TESTS MAINLINE TRACKWORK

A. Electrical tests will be performed for all yard and mainline track work including special track work areas in accordance with ASTM G165.
3.4 ACCEPTANCE CRITERIA

A. The following are the minimum acceptable in-service track-to-earth resistances:

1. Mainline track (Concrete & Wood Tie and Ballast): 625 ohms for 1000 feet of single track (two rails) in wet condition.

2. Mainline track (Direct Fixation): 625 ohms for 1000 feet of single track (two rails) in wet condition.

3. Mainline track (Embedded): 150 ohms for 1000 feet of single track (two rails).

B. If the test results show that any section of track work fails to meet the acceptance criteria, the Contractor shall work with the Authority’s Corrosion Engineer to check all instrumentation setups; verify that the equipment is operating properly; inspect the section under test for installation deficiencies; and notify the Contracting Officer of any deficiencies that were found. The Contractor shall correct any problems detected including cleaning of the track work as may be required to assure proper data collection. Following Contractor resolution of the problems, the tests will be repeated as soon as possible and notify the Authority of the test results.

C. Corrections to track work shall be made in accordance with Section 02450, “General Track Construction”; Section 02455, “Track Appurtenances”; Section 02459, “Special Trackwork”; Section 02460, “Ballasted Track Construction”; and Section 02462, “Direct Fixation Track Construction”.

D. If the retest results fail to meet acceptance criteria, the Contractor shall notify the Authority and prepare a nonconformance in accordance with established Quality Control procedures. The adverse condition(s) causing the failure to meet the acceptance criteria shall be corrected by the Contractor. In case of a failed test, the track shall be retested.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Track-to-earth resistance test will be paid for on a lump sum basis wherein no measurement will be made.

END OF SECTION 13102
PART 1 - GENERAL

1.1 DESCRIPTION

A. Work specified in this Section consists of providing a pre-engineered Enclosure for each new Traction Power Substation (TPSS) furnished by this Contract.

B. Design a weatherproof Substation housing in full compliance with the Contract Documents and Referenced Standards.

C. Fabricate the housing to prevent driving rain from entering the enclosures and to provide a dry and condensation-free environment for the installation of electrical equipment. These enclosures are intended for outdoor use and are primarily to provide a degree of protection against rain and sleet. They shall meet rain tests and paint qualification design tests as described in the Referenced Standards.

D. Design and install the housing on a structural steel base frame to withstand stresses caused during transportation, installation and during the maximum specified wind loadings. Provide the base frame with removable lifting lugs to enable lifting fully equipped substation sections.

E. Provide the housing with a rigid non-slip floor, ¼ inch steel plate minimum, suitable for installation of floor insulation.

F. If required by the final design, manufacture the enclosure to accommodate no more than two shipping sections, with the transformer/rectifier in one shipping module.

G. Design double wall and double roof housing to accommodate insulation material to reduce heat transfer. Select the thermal insulation level taking into account the climatic conditions encountered in the Substation location, the installed equipment and the temperature range inside the Substation. Design the insulation to enable satisfactory operation of all the Substation equipment during extreme ambient temperatures.

H. Provide a Substation enclosure with 2 outward opening entry doors for maintenance and personnel access, and as required by the final design, provide an emergency exit behind the DC Switchgear lineup. Locate the personnel doors at the opposite ends of the Substation enclosure. Key all doors alike to a keying system approved by the Authority. Provide doorstops to hold the doors in the open position.

I. Provide hinged, watertight exterior access doors behind each equipment cubicle or other equipment requiring rear access for cable makeup, routine inspection, or maintenance. Provide security head bolts to bolt doors shut. Design the door and hinges to enable the doors to be opened simultaneously.

J. As required by the final design, select aesthetically acceptable roof and wall-mounted vents and exhaust fans. Select vents and fans designed to prevent rain, snow and vermin from entering the Substation. Provide vents with replaceable filters.

K. Provide a Knox box (lock box) to store keys for emergency access; location to be confirmed by FLSC and SSCRT. Refer to Specification Section 10525, “Fire Department Key Keeper”, for details.

L. Contractor shall verify with each local Authority that the final design and Substation will comply with local Codes and Regulations.

### 1.3 SUBMITTALS

A. Contractor shall submit descriptive literature, and fabrication drawings in sufficient detail to enable the Authority to evaluate the enclosure and the enclosure accessories to be in full compliance with the Contract Documents, submit as a minimum:

1. Manufacturer's descriptive literature, catalog data, shop drawings, fabrication drawings and other information as applicable for each installed component.

B. Layout arrangement and detailed shop drawings of the enclosure with installed accessories and Substation equipment.

1. Contractor shall submit layout details in accordance with these specifications.
2. With approval by the Authority, the Contractor may combine drawings and submittals to more clearly indicate the conformance to the Contract Documents.

C. Certificates of Compliance for specified materials.

D. Point to point wiring diagrams for all electrical and communications equipment.

E. A licensed Professional Engineer registered in Texas shall certify structural analysis calculations for roof, wind and seismic loadings.

F. Certified test results for the thermal, electrical, and acoustical insulation.

G. Fabrication and Construction drawings shall include:

1. Enclosure base anchorage locations, shipping sections, lifting and placement instructions, floor loading, uplift and horizontal wind and seismic loadings for anchorages and foundations.
2. Raceway, conduit, cable trays and ductwork arrangements including incoming and exiting conduits and raceways.
3. Enclosure grounding details including connection point to the AC earth ground mat, DC earth ground mat and Utility Ground.
4. Provide a submittal on the enclosure lighting, HVAC/ventilation, fire detection, intrusion detection, and equipment wiring.
5. Shipping section drawings with details on proper re-alignment and re-assembly instructions.

H. Contractor shall furnish other drawings, literature, catalog data that may be requested by the Authority.
I. NLT (60 days after NTP):
   1. Structural Calculations
   2. Enclosure Equipment Layout
   3. Enclosure Details
   4. Enclosure Elevations
   5. Enclosure Base Plan

J. NLT (90 days after NTP):
   1. HVAC Calculations
   2. HVAC Plan and Equipment Arrangement
   3. HVAC Power and Control Wiring
   4. Enclosure AC Power Wiring & Lighting
   5. Enclosure Grounding Drawing

K. NLT (120 days after NTP):
   1. Fire Detection and Alarms
   2. Intrusion Detection and Alarms

L. NLT 15 days after Testing: Enclosure test results

1.4 FABRICATION AND CERTIFICATION

A. Contractor shall perform the following in accordance with the Contract Documents and these Specifications.

B. Fabricate, assemble and test each Substation enclosure.

C. Provide Certification for all materials, components and assemblies used in the construction and manufacturing of the enclosure.

D. Provide Factory Fabrication Control Testing and Certification for all in-progress work performed in house and in supplier’s shops, off site facilities and other factories.

E. Provide Certification of On-Site inspection of specified work elements specified herein or in the Referenced Standards.

F. Electrical installation materials and workmanship shall be as specified in the Contract Documents.

1.5 QUALITY CONTROL

A. Contractor shall perform all work included in this Section in strict accordance with the requirements of the Contractor’s Quality Control Program as specified in these Contract Documents and as approved by the Authority.

PART 2 - PRODUCTS

2.1 GENERAL

A. Contractor shall provide products in accordance with parameters identified here.

2.2 DESIGN

A. Structural Loadings: Enclosure shall be engineered to withstand a vertical line roof loading of 35 lbs/sf, a wind pressure of 25 lbs/sf, a snow load of 25 lbs/sf, and a seismic loading for Zone 1 as defined in IBC, and the stresses caused during transportation.

B. Substation Floor: Shall be designed to support the required equipment loading without buckling, bending or sagging and shall over the life of the Enclosure, maintain a level surface.

C. Doors, Walls, and Roof Panels: Shall be reinforced by braces, stiffeners, and structural members to provide a rigid module. Deflection under the indicated loadings shall not exceed 1/8 inch per 10 feet of span.

D. Supports: Supports, fasteners, structural insulators, and anchorages shall resist seismic loadings in accordance with IBC recommendations, and shall be designed in accordance with recommendations in the referenced standards.

2.3 CONFIGURATION

A. Overall Substation enclosure exterior dimensions shall be as specified herein and as indicated on the Contract Drawings.

B. Overall dimensions of the finished enclosure shall be approximately 16 feet wide, 45 feet in length and 12 feet in height; the highest point of the substation enclosure shall not exceed 12 feet from top of foundation inclusive of all ventilation and auxiliary equipment. If roof mounted air conditioning units are required, height limitations shall be adjusted and approved by the Authority.

C. Any other dimensions must be approved by the authority and coordinated with individual site conditions.
D. Interior working spaces and clearances shall comply with the latest edition of the NEC in both size and arrangement.

2.4 ENCLOSURE

A. Enclosure type shall be an integrated weatherproof unit that will house the TPSS equipment, power assemblies and sub-assemblies.

B. Enclosure shall provide a dry, condensation-free, stable internal ambient temperature environment.

C. Enclosure shall be of Type II-N noncombustible construction and have a Group B, Division 4 occupancy classification in accordance with IBC requirements.

D. Enclosure Construction: Enclosures should be of metal suitably supported, constructed, and assembled so that the enclosure will have the strength and rigidity necessary to meet the requirements of these Specifications and the Referenced Standards.

E. Enclosure Finishes: Unless the enclosure is made of a material that will resist corrosion, both inside and outside surfaces should be finished in accordance with the Referenced Standards. The metal clad switchgear must withstand the applicable coating qualification test.

F. Enclosure Material: The thickness of the enclosure should not be less than that indicated in these specifications and the Referenced Standards. If metals other than steel are used, the thickness should be such that equivalent strength and deflection are provided.

G. Supporting structures: A supporting structure should be formed of ASTM A36 structural steel shapes and plates of sheet metal, or the equivalent, and should be rigidly fastened together and have essentially the same outside dimensions as the enclosure surfaces.

H. Supporting structures and frames:

1. With reference to these specifications, an enclosure is not considered to have a supporting frame if it is:
   a. A single sheet with single formed flanges (formed edges).
   b. A single sheet that is die formed (corrugated or ribbed).
   c. An enclosure surface loosely attached to a frame, i.e., with spring clips.

2. All supporting structures and frames enclosing conduit entrances shall be so constructed as to accommodate cable pulling equipment. Clearly label all such pulling structures for points of attachments and maximum pulling tensions.

I. Weatherproofing:

1. Provide a completely weatherproof enclosure per the referenced standards.

2. All doors, joints, walls, roof, floor, shall be rain proof under conditions of 70 miles per hour winds from any direction and as required by the Referenced Standards.

2.5 ENCLOSURE SHELL

A. Enclosure, including doors, shall be constructed of not less than No. 14 gauge sheet steel mounted on a structural steel base frame to permit jacking, rolling, and skidding.

B. Enclosure walls shall be not less than 3 inches thick including thermal insulation.

C. Removable lifting lugs shall be provided on the base to facilitate a 4 point or 6-point lift on each fully equipped substation assembly or shipping modules.

D. Structural steel, roof, and wall panels shall have a minimum allowable yield as specified in the referenced standards.

E. Grounding pads shall be provided and welded to enclosure base at each corner.

F. Doors and Removable Panels

1. Substation shall have entry doors located as indicated on the Contract documents. Entry doors shall be sized as required to permit removal of the substation equipment.

2. Each entry door shall be equipped with a 3-point crash-bar with safety latches to permit opening from within under all conditions. All entry door hinges shall be concealed from the exterior. Latches shall have tamperproof locks.

3. Door thumb latch for each access door shall have the capability of being deactivated so the door locking mechanism continuously stays locked without a key inserted.

4. Entry doors shall be keyed using a Ruswin/Corbin key-coring system,
compatible with the existing Authority substations or an Authority approved equal. A unique key shall be provided for the substation with provision for re-keying by the Authority after the unit is energized. Refer to the contract documents or the Authority for keying coring system requirements.

5. Door closers and doorstops shall be provided to hold the doors in the open and closed position. Install reinforcement for access doors and door panels at each anchorage point to prevent deformation and to prevent excess stress on the door and panel.

6. Hinged exterior access panels, with 3-point latches and padlocking lugs, shall be provided behind equipment requiring access for cable makeup or maintenance. Hinges shall be concealed from the exterior.

7. Bolted panels with tamper-resistant fasteners shall be furnished to permit removal of rectifier transformers through the side of the enclosure.

8. Removable bolted panels shall also be furnished behind the DC Feeder Breaker section for access for feeder cable installation. Contractor shall provide structure support, "pulling eyes", and other means to attach pulling dollies and equipment for cable installation at each DC Feeder section.

9. Each equipment enclosure shall display an equipment label mounted on the front of the equipment enclosure. The label shall display all basic equipment information relating to the equipment such as; KVA rating, KV, BIL, etc.

10. All enclosure entryways (not access panels) shall have stairs, handrails and platforms in accordance with requirements of OSHA and IBC.

G. Finish

1. Exterior Metal Surfaces, Excluding the Floor Bottom; steel shall be prepared for finish painting with a vinyl wash primer. Apply an electrostatic powder coat baked-on paint for each panel and over the complete enclosure per the manufacturer’s recommendations. Minimum dry film thickness shall be 3 mils. Color shall be Sierra Tan as specified on the Contract Drawings; however the Authority reserves the right to change the color on selected individual units. The finish shall have passed the Salt Spray Test per the referenced standards and shall be certified by an independent laboratory.

2. Exterior Floor Bottom and Base Framing: Steel shall be commercial blast cleaned in accordance with Steel Structures Painting Council (SSPC) Procedure SP-6 and then be prime coated with 3 mil minimum dry film thickness (DFT) of inorganic zinc such as Carbo Zinc II as manufactured by Carbolime Company, Valspar MZ-7 as manufactured by the Valspar Corporation or Authority approved equal. After inorganic zinc has cured as noted in manufacturer’s recommendations, apply top coat(s) of minimum 16 mil DFT of coal tar epoxy such as Carbomastic No. 14 as manufactured by Carbolime Company, Coal Tar-Epoxy No. 64-J-3 as manufactured by Valspar Corporation or an Authority approved. Materials shall be applied and cured in accordance with manufacturer’s recommendations.

3. Interior Metal Surfaces Excluding the Floor and Insulated Areas: Apply electrostatic powder coat paint, baked on per manufacturer’s recommendations. Minimum dry film thickness shall be 2 mils. Color shall be white. The finish shall have passed the Salt Spray Test per ASTM B117 certified by an independent laboratory.

4. Interior Floor Excluding Insulated Areas: Apply 1 coat of alkyd primer and at least 2 coats of alkyd resin industrial enamel for a dry film thickness of 6 mils. Color shall be medium light gray No. 49 in accordance with ANSI Z55.1.

H. Insulation

1. Electrical Insulation:
   a. Minimum dielectric strength of the insulating material for standoff insulating fasteners and flooring shall not be less than 300 volts/mil. Floor insulation thickness shall be a minimum of 1/4 of an inch.
   b. DC switchgear and rectifier sections shall be insulated from the floor in a manner that the equipment will not become grounded under extreme humidity conditions.
c. Extent of floor insulation shall be as required to maintain the integrity of the high-resistance grounding scheme to 50 megohms or greater.

d. Substation walls behind and to the sides of the DC equipment enclosure shall be insulated with flame resistant insulating material that meets Class 1 flame spread requirements of IBC.

e. Insulation system design shall protect against any accidental contact between the DC equipment enclosures and grounded metal surfaces.

2. Acoustical Insulation:

a. Maximum permitted continuous noise level produced by all equipment associated with the substation, as measured at a distance of 50 feet from any point outside of the substation shall not exceed 45 dBA when the substation is operating at its 100 percent rated kW output and all cooling systems are operating at full power.

b. Material used for substation enclosure wall, roof, and floor insulation shall have a noise reduction coefficient of at least 0.6 to meet the above specified allowable noise level.

c. Noise level for the interior of substation shall be less than 80 dBA with all equipment operating at 100 percent load and all cooling and heating systems operating at full power. Interior acoustics shall be coordinated with selection of interior equipment to achieve the desired noise reduction.

3. Thermal Insulation: In each prefabricated substation, the enclosure walls and ceiling cavities shall include insulation, with a minimum rating of:

a. Walls R-12
b. Doors R-12
c. Floor R-12
d. Ceiling R-22

2.6 HEATING AND VENTILATION

A. Enclosure shall include a heating, ventilation and air conditioning (HVAC) system to maintain the substation temperature at a level permitting the traction transformers and the rectifiers to operate at their design load cycle.

B. Provide a Substation Heating-Ventilation-and Air-Conditioning (HVAC) system to control the Substation ambient temperature using multiple HVAC units. The system shall consist of the following:

1. Multiple HVAC units, sized and quantity as required by the final design.

2. System control package with thermostat, relays and programmable logic controller for system operation. Control the units by adjustable thermostat installed in the substation aisle. Design the control circuitry to operate the units alternatively. All the units may operate simultaneously only at ambient temperature above 90 degree F.

3. Conditioned air shall be distributed throughout the building by extruded anodized grilles or register. Air conditioning system filters shall be located in return grilles.

C. Provide self-contained, attached, 240V single-phase 60HZ, HVAC units, with hermetically sealed scroll compressors. Coordinate HVAC operational voltage with the Station Service Equipment.

D. Finished color of the housing shall match the finish color of the enclosure.

E. Contractor shall furnish design calculations (ASHRAE compliant) for the required air conditioning/heating capacity. The HVAC units shall be designed to maintain the enclosure interior temperature under all operating conditions and local ambient temperature ranges.

F. Heating and air conditioning shall be thermostatically controlled and monitored. Provide a field adjustable alarm contacts interconnect to a terminal block in a PLC Interface cabinet, used for remote monitoring of the temperature and humidity extremes.

G. Contractor shall provide the number of units as required by the final design, to provide sufficient redundancy in the event of failure of one unit. In the event of failure of any one unit, the temperature extremes shall not exceed 30 percent of the normal design.
H. Provide units that have a SEER rating of 12 or higher.

I. Provide additional ceiling mounted heaters if the Contractor's calculation determines that inside temperature of the TPSS causes condensation on the structure walls and or equipment and shortens battery life under low temperature conditions.

J. Dehumidification
   1. HVAC system shall at all times maintain humidity levels a minimum of 10 percent below that of the operational ratings for the TPSS equipment and control systems.
   2. Provide dehumidifiers and controls as required by the final design to provide independent operation that will prevent mildew and condensation by controlling humidity in the enclosure.

K. Exterior Equipment Protection
   1. Outside of each wall mounted air conditioner shall be protected with a hinged, heavy gauge, hot-dipped, galvanized vandal-resistant security mesh cage, painted to match the finished enclosure. The cage shall be constructed with a slot on the frame that, when in its closed position, will not pinch the air conditioners condensation drainage tube.
   2. Cage shall be constructed of an angle iron frame and be enclosed with 1-1/2 inch x 10-gauge steel expanded metal to form a 5-sided box.
   3. Cage shall be hinged to swing horizontally open to allow for 90 degrees maintenance access. Two locking hasps shall be provided to hold the cage in the closed position. A mechanical device shall be provided for securing the cage in the 90 degrees opened position. Cage design shall allow a single maintenance technician to gain access and perform maintenance on the HVAC unit.
   4. Cage shall be attached to the exterior wall using tamper-proof screw/bolts. Provide means for disassembly for shipment.
   5. Cage shall be oversized on the hinged side to accommodate air conditioner maintenance. Paint to match enclosure.

2.7 GROUNDING

A. Ground all non-current carrying metal components of the enclosure, (with the exception of the DC ungrounded system).

B. Provide an enclosure ground connection (pad) at each corner of the Enclosure for connection to the station AC ground grid.

C. Provide an interior continuous copper ground loop ("Halo Ground Ring") for each enclosure. Install around all 4 walls, at an elevation of approximately 10 inches below the ceiling on the interior wall; solidly connect to each support channel. Provide grounding sized per the NEC, grounding conductors shall be green with 600-volt insulation. From this loop, make the following connections:
   1. Service and distribution panels.
   2. Equipment enclosures.
   3. Light fixtures.
   5. Cable trays and raceways.
   6. Connect this “Halo” at each corner to the enclosure ground pad.

2.8 ELECTRICAL WORK

A. All Electrical work, products, materials and equipment shall comply with these specifications, contract documents, and the latest edition of the NEC.

B. Lighting
   1. Interior:
      a. Provide interior lighting as specified herein and as indicated on the Contract Drawings.
      b. Minimum interior illumination level for working areas shall not be less than 50-foot candles at 30 inches above the floor.
      c. Provide additional lighting for desk areas and cabinet interior spaces.
      d. Provide interior lighting controlled by a 3-way switch located at each entry door. Illumination levels shall be in accordance with these specifications.
e. Provide self-contained, fluorescent, interior lighting to obtain the illumination levels as specified herein.

f. Provide emergency lighting that will have a minimum illumination level of 5 foot-candles 30 inches above floor level of working space.

g. Emergency lighting units can be provided as individual wall-mounted units, or by fluorescent emergency packs, which consist of an inverter/charger, batteries, and a switching unit.

2. Exterior:

a. Provide a tamper proof exterior 150W, high pressure sodium exterior floodlight for each exterior wall. Control all units by a single photocell.

b. Exterior flood/area lighting fixtures shall have a Polycarbonate type lens.

c. Provide a light refractor design for a distribution pattern for 180-degree luminaire.

d. Provide a lighting control scheme consisting of the following:
   1) Hand-Off-Auto (HOA) switch.
   2) Lighting Contactor.
   3) Photo-cell.

C. Wiring:

1. Provide all required internal wiring for all Substation equipment, station interconnections and enclosure interior and exterior electrical work.

2. Receptacles: Install standard 120 volt and 240 volt receptacle as indicated on the Contract documents for each substation.

3. Provide 120 Volt 20A exterior weatherproof outlet at each end of the enclosure.

D. Conduit and Cable Trays: Provide conduit, cable trays, supports, junction boxes, and related hardware for all control and power circuits.

2.9 FIRE AND INTRUSION DETECTION SYSTEM

A. Fire Detection and Alarming:

1. Fire detection at the TPSS shall be accomplished utilizing heat and smoke detectors to activate inputs to a local fire alarm control panel. Refer to Systems Standard Specification 16854 for additional Fire Alarm Subsystem details.

2. Local fire alarm control panel shall provide alarm indications to the Authority’s Operations Control Center (OCC) via the local RTU and via IP connectivity the OCC.

3. Local fire alarm panel shall also activate an alarm light and horn annunciators within the TPSS.

4. The following equipment shall be provided at the TPSS:
   a. Audio alarms.
   b. Visual alarms.
   c. Heat detectors.
   d. Smoke detectors.
   e. Manual fire alarm pull stations.
   f. Fire alarm control panel.
   g. System power supply.
   h. Control accessories.
   i. Backup Batteries.
   j. Magnetically operated door contact switch.
   k. Intrusion alarm control panel.
   l. A minimum of 6 spare I/O contacts.

5. TPSS fire alarm panel shall interface with an IP Communicator and an RTU. Dry alarm contacts shall be provided for TROUBLE; (problem with fire detection system), ALARM, (fire alarm zone active).
B. IP Communicator

1. Control panel shall be equipped with an IP Communicator that is UL Listed, meets the requirements of the Referenced Standards, and shall be designed for central station and remote monitoring.

2. Acceptable Communication formats include Ademco Contact-ID with 512 bit AES encryption

3. Provisions for Ethernet connectivity and programming of the IP Communicator and IP Alarm Receiver at the OCC shall be provided for by this Contract. Contractor shall coordinate with the Authority for Fire Alarm information such as IP Addresses, zone assignments, VLAN assignments and test time to program the IP Communicators.

C. Intrusion Detection

1. The door to each TPSS shall be equipped with a magnetic switch to detect when the door is opened.

2. After the door is opened, there shall be a delay (30 seconds) before an alarm is signaled. During this delay, the alarm can be deactivated from a keypad by entering a preset valid 4-digit security code.

3. If an alarm is detected by the local control panel, and not deactivated by the local keyboard the system shall send an alarm indication to the OCC via the local RTU and activate a local alarm bell.

D. Heat and Smoke Detectors

1. Detectors shall be arranged in 2 zones.

2. A fully supervised class A circuit shall be utilized for power to all sensors from the control panel power supply.

3. Activation of the alarm indication from the sensor(s) to the control panel and to the OCC shall be provided.

4. Activation of any zone shall:
   a. Activate an alarm indication to the RTU and Fire Alarm IP Communicator.
   b. Shut down the TPSS HVAC system.
   c. Operate the 86-lockout relays to shutdown all the power equipment within the TPSS.

E. Annunciator Alarm Circuits

1. Audio and visual alarm annunciators shall be arranged on separate class A circuits.

2. Indication of alarms from control panel to RTU shall utilize supervised (normally closed) circuits.

F. Control Panel

1. Functions: The fire alarm control panel shall perform the following functions:

3. Controls audio and visual alarm Annunciator activation.

4. Supervise wiring, perform self-tests (including a battery life test), and provide indication of any abnormal system events.

5. Provide summary alarm indications to the RTU and the IP Communicator.

6. Provide remote testing and monitoring of serial port.

G. Control Unit

1. Control unit shall utilize the multiple zone detection concepts to determine the fire/no fire condition.

2. Control unit logic shall be self-checking to ensure that the appropriate fire/no fire decision is made.

3. Control unit shall supervise all input and output modules to verify system integrity.

4. Control unit shall monitor input power and the status of the standby battery.

H. Input/Output Module

1. Input Circuits
   a. Manual pull stations and sensors shall be supervised for activation and power.
   b. Independent modules shall be used for separate zones.
2. Output Circuits
   a. Output circuits shall supervise 19VDC to 24VDC output to audio and visual devices.
   b. Independent modules shall be used for audio and visual devices.

I. Supplemental Relay Module
   1. Four independent single-pole, double-throw, non-supervised relays shall be provided per module.
   2. Relays shall be individually assigned.
   3. Relays shall be activated on any alarm level or trouble condition.
   4. One manual disable switch shall be associated with each relay.

J. Enclosure
   1. Fire alarm control panel shall be housed in a NEMA-3 enclosure with a locking cover.
   2. Front panel LED indications shall show the status of the following:
      a. Each zone.
      b. AC power on.
      c. Battery status.
      d. Output status.
   3. Enclosure shall be designed to be wall mounted.
   4. Enclosure shall include conduit fittings to allow all sensor, annunciator, and power wiring to enter and exit the enclosure.

K. Power
   1. Primary power shall be from the TPSS 125 VDC breaker panel.
   2. A 125 VDC to 24 VDC converter power supply shall power all sensors and output devices.

L. Alarm Units
   1. Audible Alarm Bell
      a. Alarm bells shall be fabricated from a high quality die casting with a baked red enamel finish.
      b. Power shall be 24 VDC.
      c. Typical output shall be 84 dBA at 24 VDC.
      d. Typical output shall not be less than 15 dB above ambient noise level.
      e. Alarm bells shall mount to a standard 4 inch square outlet box.
   2. Alarm Horn
      a. Alarm horns shall be fabricated from a high quality die casting with a baked red enamel finish.
      b. Power shall be at 24 VDC.
      c. Typical output shall be 97 dBA at 24 VDC.
   3. Alarm Strobe Light
      a. Each alarm strobe light shall be a high intensity flashing light, utilizing a Xenon flash tube sealed in silicone and housed in a sturdy lexan lens.
      b. The translucent lens shall be attached to a fire alarm gloss red back plate.
      c. Power shall be 24 VDC.
      d. Strobe shall flash at a rate and duty cycle compliant with ADA requirements current at time of procurement.
      e. Lens shall have “Fire” imprinted on 2 sides.
   4. Strobe Horn
      a. Strobe horn shall be a high intensity flashing (ADA Compliant) light with 97-dBA-horn output.
b. Typical output shall not be less than 15 dB above ambient noise level.

c. Strobe horn shall be housed in a fire alarm, gloss red, die-cast enclosure.

d. Light source shall be sealed in silicone and protected by a sturdy lexan lens.

e. Strobe lens shall be white translucent with the word "FIRE" imprinted upon it in red.

f. Power shall be 24 VDC.

5. Heat Detectors

a. Thermal detector.

b. Thermal detectors shall activate at 194 degrees F nominal temperature setting.

c. Detectors shall be hermetically sealed.

d. Detectors shall be shock and corrosion resistant.

e. Detectors shall automatically reset upon returning to normal temperature.

6. Smoke Detectors

a. Ionization Type.

b. Ionization type smoke detectors shall have relay contact outputs rated for 24 VDC, 1.0 amp minimum.

c. Sensitivity shall be adjustable.

d. A red alarm indication LED shall be provided on the enclosure.

e. Power shall be 18.8 VDC to 27.7 VDC with current draw as follows:

1) Normal: 40 micro amps at 24 VDC.

2) Alarm: 85 milliamps at 24 VDC.

e. Operating temperature shall be 32 degrees F to 140 degrees F.

7. Photoelectric Type Smoke Detector

a. Photoelectric type smoke detectors shall have relay contact outputs rated for 24 VDC, 1.0 amp minimum.

b. Sensitivity shall be adjustable.

c. A red alarm indication LED shall be provided on the enclosure.

d. Power shall be 17.6 to 27.7 VDC with current draw as follows:

1) Normal: 40 micro amps at 24 VDC.

2) Alarm: 85 milliamps at 24 VDC.

e. Detector shall mount on a 3 inch octagonal outlet box utilizing tamper-resistant screws.

f. Operating temperature shall be 32 degrees F to plus 140 degrees F.

8. Manual Fire Alarm Stations

a. Manual fire alarm stations shall be installed within each TPSS at each entrance door.

b. Manual stations shall be double action type, providing for 2 separate and distinct actions to activate an alarm.

c. Enclosure shall be constructed of high impact polycarbonate or metal, red enclosure with raised white lettering and a smooth high gloss finish.

d. A common key shall be provided to reset the station.

9. Intrusion Alarm Control Unit

a. Intrusion alarm control unit shall perform the following functions:

1) Monitor normally closed contacts of magnetic switch assembly.

2) Control local audio alarm annunciator activation.
3) Allow deactivation when valid 4-digit security code is entered via the control keypad within 30 seconds of opening door.

4) Allow reactivation when valid security code is entered.

5) Provide intrusion alarm indication to RTU.

6) Provide for selecting the local 4-digit security code. A key shall be required to set the code.

b. Operation

1) There shall be a 30 second nominal entry/exit period.

2) A low level alert tone shall be activated when the magnetic switch is activated.

3) If the alarm is deactivated by correct entry of a 4-digit security code within 30-second entry period, low-level alert tone shall be deactivated; otherwise, an alarm condition shall be detected.

4) Alarm detection shall cause an output to the RTU and activation of local high-level audio alarms.

5) Alarm shall be armed by correct entry of the 4-digit code. There shall then be a 30 second period for exiting without activating an alarm.

6) If an incorrect or incomplete code is entered, it shall be cleared after 3 seconds. The operator may then reenter the code.

c. Enclosure

1) Intrusion alarm control unit shall be housed in a NEMA-3 enclosure with locking cover.

2) Power shall be from the TPSS 120 VDC breaker panel.

3) Battery backup for 8 hours shall be provided.

4) Power supply shall power the intrusion alarm control unit, keypad, activation circuit, and alarm devices.

5) Provide front panel LED indication for “Power On” and “Battery Status”.

10. Fire Extinguishers

a. Enclosure shall be equipped with 2 Carbon dioxide (CO2) fire extinguishers, intended for Class B and Class C fire hazards. Fire extinguishers shall be portable; wall-mount type with UL rating 10B:C. CO2 containers shall be heavy-duty, seamless, aluminum alloy cylinders, painted red, with instruction label permanently affixed. Discharge mechanism shall have a locking pin to prevent accidental discharge.

b. Fire extinguisher shall have a flexible hose and horn for aiming at the fire. Fire extinguisher shall meet or exceed the following specifications:

1) CO2 Capacity: 15 lbs

2) Weight: 20 lbs maximum

3) Range: 50 feet

2.10 SIGNAGE

A. Identification

1. Each TPSS enclosure shall be provided with signage on each external personnel access door (2 signs) for identification.

2. Sign shall have a white, reflective background with 3 inch black lettering.

3. Sign shall display the location name as described in Contract Documents followed by the letters TPSS (e.g. Pennsylvania TPSS, or Baylor TPSS).
B. Address Sign

1. Provide 1 address sign for each TPSS location. Each sign shall contain 3 lines and shall have a white background and black letters.

2. Provide a sign the same physical size as the identification sign and install below the identification sign on 1 access door.

3. Sign shall be similar to:
   Dallas Area Rapid Transit
   XXXX Dallas Ave.
   Dallas, Texas
   TPSS XXXX

4. The Authority prior to shipment shall provide addresses.

C. Warning Signs

1. Warning signs shall be installed on the exterior entry doors, hinged access panels, and those areas where maintenance personnel will be exposed to high voltage.

2. AC Warning signs shall be made of the materials with lettering and installation as specified in the Contract documents.

D. Knox Box: Provide a sign in accordance with Specification 10525, “Fire Department Key Keeper”.

E. Substation Condensed Single Line Diagram

1. A Substation single line diagram, sized 22 inch by 34 inch in polyvinyl frame, shall be provided for each Substation.

2. The single line diagram shall be mounted in a location to aid maintenance personnel.

F. Desk

1. A metallic fold-down, wall mounted desk shall be provided for drawing review.

2. Additionally, a wall mounted drawing hanger file with a half size set of as-built shop drawings shall be provided for each Substation.

G. Storage: Provide a storage unit for storage of all spare parts; spare fuse’s, “AS-BUILT” drawings, O&M manuals and instruction books.

1. Power provisions for Ethernet switches.

2. Ethernet switches (active and cold standby).

3. TPSS VoIP Telephone and wireless headset.

4. Loud Ringing Bell compatible with VoIP phones.

2.11 FABRICATION

A. Fabricate and test each enclosure as specified herein and in the Referenced Standards.

2.12 INSTALLATION

A. Contractor shall install and wire all Substation equipment per the manufacturer specifications, as specified herein and per the Referenced Standards.

B. Equipment and components shall be mounted in accordance with the shop drawings as accepted by the Authority.

C. Provide basic electrical materials in accordance with the Contract Documents as accepted by the Authority.

D. Factory Testing and verification of each piece of equipment, assembly and sub-assembly shall comply with the provisions of the Contract Documents.

PART 3 - EXECUTION

Not Used.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

A. Work specified in this section will not be measured separately for payment, all costs in connection with this Section will be considered incidental to the furnishing and delivery of the TPSS units.

4.2 PAYMENT

A. Payment is inclusive of all materials, labor, transportation, handling, storage, tools, computer equipment, test equipment, rental
equipment, printing services and incidentals necessary to complete the work as specified in this section, and all other related sections of the Specifications and the Drawings.

END OF SECTION – 13121
PART 1 - GENERAL

1.1 DESCRIPTION

A. Work required for this section includes heavy duty, observation type, direct plunger hydraulic passenger elevators and supplementary items necessary to complete their installation.

B. Refer to Section 05130, “Structural Steel for Buildings” for attachment plates, angle brackets and divider beams for fastening guide-rail brackets.

C. Refer to Section 05500, “Metal Fabrications” for structural-steel shapes for subsills and pit ladders.

D. Refer to Section 08800, “Glass and Glazing” for glazing requirements.

E. Refer to Section 10430, “Specialty Signs” for “In Case of Fire Do Not Use Elevators” signs.

F. Refer to Division 16 Sections for electrical service for elevators to and including fused disconnect switches at machine room door and standby power source, transfer switch, connection from auxiliary contacts in transfer switch to controller and interface with fire alarm system.

1.2 REFERENCED STANDARDS

A. American Society of Mechanical Engineers (ASME):
   2. ASME A17.2 - Guide for Inspection of Elevators, Escalators, and Moving Walks

B. American Welding Society (AWS):
   1. AWS D1.1/D1.1M - Structural Welding Code - Steel
   2. AWS D1.3 - Structural Welding Code - Sheet Steel

C. American National Standards Institute (ANSI)
   1. ANSI C80.1 – Electrical Rigid Steel Conduit (ERSC)
   2. ANSI/NEMA FB1 – Fittings, Cast Metal Boxes, and Conduit Bodies for Conduit, Electrical Metallic Tubing, and Cable

D. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A123/A123M - Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products
   2. ASTM A666 - Standard Specification for Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar
   3. ASTM B209 - Standard Specification for Aluminum and Aluminum-Alloy Sheet and Plate
   4. ASTM B221 - Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes

E. International Code Council (ICC):
   1. ICC/ANSI A117.1 - Accessible and Usable Buildings and Facilities

F. National Fire Protection Association (NFPA):
   1. NFPA 70 - National Electrical Code hereinafter referred to as NEC
   2. NFPA 72 – National Fire Alarm Code
   3. NFPA 130 - Fixed Guideway Transit and Passenger Rail Systems

G. Texas Accessibility Standards (TAS)
   1. Architectural Barriers Act, Article 9102

H. U.S. Architectural & Transportation Barriers Compliance Board's “Americans with Disabilities Act (ADA), Accessibility Guidelines (ADAAG)”.
   1. ADA Standards for Accessible Design, 28 CFR Part 36 Section 4.10.14

I. Underwriters Laboratories, Inc (UL)
   1. UL 486

1.3 DEFINITIONS

A. Defective Elevator Work: Operation or control system failures; performances below specified ratings; excessive wear; unusual deterioration or aging of materials or finishes; unsafe conditions; the need for excessive maintenance; abnormal noise or vibration; and similar unusual, unexpected, and unsatisfactory conditions.
B. Heavy Duty Elevator: An elevator designed specifically for public transportation system usage as specified by American Public Transportation Association (APTA).

C. Final Acceptance: The point at which the Authority accepts the elevator as being complete including submittal requirements and acceptance testing.

D. Interim Maintenance: Maintenance from the point of Final Completion, but prior to Revenue Service.

E. Beneficial Use: When the elevator is placed into service by the Authority, may be prior to the site being ready for public use.

F. Revenue Service: The station or facility opening date to the public.

1.4 DESIGN CRITERIA

A. Systems shall conform to the requirements of ASME A17.1 and Supplements, and ASME A17.2 and Supplements for safety devices, running clearance, testing and maintenance methods. Review Contract Documents for compatibility with respective products.

B. Elevator specifications are intended to cover complete installation of elevator and to broadly outline equipment required, but do not cover details of construction. Such details are recognized to be exclusive responsibility of the Contractor. The Authority has made selections of capacities, speeds, control systems, materials, etc., from devices made available by manufacturers.

C. Design and manufacture elevator car for rated net passenger capacity stated in Part 2 - Products exclusive of dead weight of empty car.

D. Environmental Operational Requirements: Provide elevators capable of operating with full specified performance while exposed to following climatic and environmental conditions:

1. Design exterior installations which open directly to street level, or are otherwise exposed to outdoor environment, to operate while exposed to the natural elements of weather, including sunlight, rain, slush, snow and ice; all conditions of relative humidity while exposed to salt, de-icing chemicals, airborne dust, and debris, and corrosive elements; and in a drybulb temperature range of negative 25 to 120 degrees Fahrenheit.

2. Elevator Equipment Rooms - Design machinery to operate in temperatures ranging from 35 degrees F to 104 degrees F dry bulb and all conditions of relative humidity while exposed to airborne dust.

E. Corrosion Protection: Design elevator assemblies in manner to avoid corrosion by galvanic action due to physical contact between dissimilar metals or other causes.

F. Hours of Operation: 24 hours per day, 7 days per week.

G. Allowable Tolerances for Elevator Travel - Secure guide rails plumb within overall tolerance of 1/16 inch maximum lateral movement, measured with no wind or solar load on building, and within 0.01 inch joint offset on rail surfaces. Limit short-span tolerance, continuously measured between upper and lower car guides, to 1/8 inch plumb tolerance.

H. Comply with ASME A17.1 for laboratory testing of elevator component parts, including buffers, interlocks, door contacts, connectors, fasteners and other materials and products used in elevator work. Label products and materials to indicate testing and certification by laboratory.

I. Design, fabricate and install elevator and parts, subject to repair and replacement, readily and easily removable and replaceable without requiring modification of hoist way structure, equipment room or elevator equipment.

1. Power unit, silencer, controller, electrical control panel, automatic door operator, operating fixtures, signals, limit and safety switches and other parts subject to wear - Contractor’s standard interchangeable production items.

2. Precisely identify replacement parts, whether produced in Contractor’s factories or secured from commercial factories and distributors. Make replacement parts available to the Authority without prejudice. Provide required quantities, uniform price and delivery time of replacement parts - On same basis as Contractor’s most favored maintenance consumer.

J. Bearings:

1. Machine and motor bearing housings shall be provided with a drilled, tapped and spot faced area in the vertical and axial axis to accommodate a transducer that a Fast Fourier Transform (FFT) analyzer requires. Permanently mount transducers on the drive bearings and run the wires into the controller to a panel with BNC connectors on the ends to accommodate the FFT analyzer.

   a. Motor limit:

      1) Rigid mount: 0.15 ips
      2) Flex mount: 0.2 ips
2. Bearings shall be rated for an AFBMA L10 life as specified, under a fluctuating bearing load. Bearings shall have basic dynamic load ratings.

K. Fasteners:
1. Fasteners shall be compatible with materials being fastened.
2. Fasteners shall be furnished with self locking nuts or retaining rings (spring washers, toothed disks).
3. Fasteners shall be equal to or of greater corrosion resistance than the most corrosion resistant metals being fastened.

L. Noise: Elevators shall have a maximum decibel reading of 70 with the doors closed during a run in the up direction.

M. Ride Quality: Elevators shall have a ride quality of;
1. A95 raw 35 mill-g, peak to peak in the x, y and z axis during a full load run in the up direction.
2. Vibration readings shall be verified in the field with an EVA-625 (as manufactured by PMT, Inc. or approved equal) placed in the center of the cab floor.

N. Car frame: No cantilevered car frames are permitted.

O. Seismic Zone: Design elevators to comply with seismic zone 2 requirements of ASME A17.1.

1.5 DOCUMENT VERIFICATION

A. In order to discover and resolve conflicts or lack of definition which might create problems, elevator manufacturer must review contract documents for compatibility with its product prior to bidding. Review structural, architectural, electrical, mechanical documents, and elevator specification.
1. Confirm hoist way size and rise prior to fabrication.

B. Authority will not pay for change to structural, mechanical, electrical, or other systems required to accommodate manufacturer’s equipment.

1.6 SUBMITTALS

A. Product Data: Submit manufacturer’s product data for each system proposed for use. Include the following:
1. Electrical characteristics and connection requirements.
2. Expected heat dissipation of elevator equipment in machine room BTU based on 120 round trip cycles per hour.
3. Maintenance programs: Submit detailed interim and revenue service maintenance programs, showing functions to be performed and their scheduled frequency.
4. Oil performance data sheets including operating temperatures.
5. Coordinated delivery schedule
6. Manufacturers recommended preventive maintenance plan, including interim maintenance procedures where applicable.
7. Pre-acceptance test forms.

B. Shop Drawings: Submit approval layout drawings to scale. Include the following:
1. Car, guide rails, buffers and other components in hoistway.
3. Maximum loads imposed on guide rails or racks requiring load transfer to building structure.
4. Loads on hoisting beams.
5. Clearances and travel of car runby
6. Clear inside hoistway and pit by
7. Location and sizes of access doors, hoistway entrances and frames.
8. Remote hydraulic piping layouts specific to each elevator.
9. Refuge space on top of car and pit.
11. Signal and operating fixtures, operating panels and indicators.
12. Cab design, dimensions and layout.
13. Hoistway-door and frame details.

C. Samples: For exposed finishes of cars, hoistway doors and frames, and signal equipment; 3 inch square samples of sheet materials; and 4 inch lengths of running trim members.

D. Calculations: Submit calculations of cab lighting and ventilation.

E. Keys to Doors: Furnish 3 keys for each elevator.
F. Manufacturer Certificates: Signed by elevator manufacturer certifying that hoistway, pit, and machine room layout and dimensions, as shown on Drawings, and mechanical and electrical service, as shown and specified, are adequate and in accordance with manufacturer’s recommendations and are as required and recommended by governing regulations and agencies for elevator system being provided.

G. Inspection and Acceptance Certificates and Operating Permits: As required by authorities having jurisdiction for normal, unrestricted elevator use.

H. Field Testing:
   1. SCADA Alarm Testing: Refer to Section 16030, “Testing of Electrical Systems”.

I. Training Program: Submit training program and resume of training instructor for review.

1.7 OPERATING AND MAINTENANCE MANUALS

A. Operation and Maintenance Manuals: Provide manuals as specified in Section 01786, “Operation and Maintenance Instructions”. Manuals shall include the following:
   1. Complete table of contents.
   2. Complete instructions regarding operation and maintenance of equipment. Included will be complete illustrated, exploded views of all assemblies, and a complete, illustrated, exploded view for identifying all system parts.
   3. Complete nomenclature, lead time and location of replaceable parts, OEM and installer part numbers, current cost, and warehouse location. If product source is another vendor, contractor shall include name and address of other vendor.
   5. Descriptions of safety devices.
   6. Safety rules, tests, and procedures, including testing of all systems and subsystems.
   7. Troubleshooting techniques.
   8. Detailed lubrication and cleaning schedule indicating weekly, monthly, quarterly, semiannual, and annual lubrication; and a description of each lubrication point, lubrication type, and specification.

B. Certification:
   1. The OEM shall provide, to the Authority, certification that the owner of the elevator(s) shall be provided with copies of all documents related to maintenance, safety, operations, design changes, modifications, retrofits, etc., which relate to any part, component, equipment, system, subsystem, or material and services applicable to the elevator provided.
   2. All of the above referenced shall be provided by the installer as it pertains to the original installation through the end of the warranty period.
   3. Referenced material shall be provided within 30 days of publication or internal distribution by the OEM. The material, even if labeled PROPRIETARY, shall be delivered to the Authority without prejudice or delay and at no additional cost.

C. Electronic Material: Provide material on CD-ROM or DVD in a format approved by the Contracting Officer.

D. MSDS and product data sheets: Shall be submitted with an index listing each product, along with the application method of the product, approximate quantity of product per elevator, and the component the product is applied to or associated with. Contractor shall allow 6 weeks for review of MSDS by Contracting Officer.

1.8 QUALITY ASSURANCE

A. Manufacturer: Provide elevators manufactured by a firm with a minimum of 10 years experience in fabrication of elevators.
HYDRAULIC ELEVATORS

B. Installer: lead mechanics with a minimum of 10 years experience in installation of elevators. Documentation shall be required to document this requirement.

C. Regulatory Requirements: In addition to local governing regulations, comply with applicable provisions in ASME A17.1.

D. Accessibility Requirements: In addition to local governing regulations, comply with Section 4.10 in the U.S. Architectural & Transportation Barriers Compliance Board’s “Americans with Disabilities Act (ADA), Accessibility Guidelines (ADAAG)” and Texas Accessibility Standards (TAS) of the Architectural Barriers Act, Article 9102, Texas Civil Statutes.

E. Comply with NEC.

F. Comply with NFPA 72.

G. Comply with NFPA 130.

H. Qualifications of Welding Personnel:
   1. Employ welders whose qualification is certified in accordance with AWS D1.1/D1.1M and AWI D1.3.
   2. Inspection personnel shall be an AWS CWI.
   3. Certification shall remain in force for the duration of the welding operations under this Contract.

1.9 COORDINATION

A. Coordinate installation of sleeves, block outs, and items that are embedded in concrete or masonry for elevator equipment. Furnish templates and installation instructions and deliver to Project site in time for installation.

B. Coordinate locations and dimensions of other work relating to hydraulic elevators including pit ladders, sumps, and floor drains in pits; entrance subsills; and electrical service, electrical outlets, lights, and switches in pits and machine rooms.
   1. Pit Drainage: Contractor shall coordinate location of sump pits, pumps, pipes and related wiring with elevator installer.
   2. Electrical: Installer shall coordinate with the contractor and appropriate trade in relation to CCTV, communications, smoke detectors, shunt trip breakers, CCTV, power and cab lighting and ventilation requirements.

1.10 WARRANTY

A. Special Manufacturer's Warranty: Written warranty, signed by manufacturer agreeing to repair, restore, or replace defective elevator work within specified warranty period.

   1. Warranty Period: 1 year from date of Revenue Service.

1.11 MAINTENANCE SERVICE

A. Interim Maintenance Service: Provide maintenance service for a period prior to Revenue Service.
   1. Include regular examination of installation; adjustment; greasing; oiling; cleaning, supplies and replacements of parts to keep the equipment in operating condition, except such parts made necessary by negligent use after acceptance by the Authority.
   2. Maintenance Program - Include following tasks:
      a. Periodic testing of completed installation to maintain elevators in completely operable condition.
      b. Running elevators for minimum 6 hours per month.
      c. Lubrication of parts as required.
      d. Repairs as needed.
      e. Adjusting and cleaning.
   3. Documentation: Submit documentation to show that Maintenance Program was done.

B. Initial Maintenance Service: Beginning at Revenue Service, provide 1 year full maintenance service by skilled employees of the elevator Installer. Include monthly preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as required for proper elevator operation at rated speed and capacity. Provide parts and supplies as used in the manufacture and installation of original equipment.
   1. Include 24-hour-per-day, 7-day-per-week emergency callback service with 1 hour or less response time.
   2. Documentation: Submit documentation to show that maintenance service was performed and detailing maintenance action taken.

C. Continuing Maintenance Proposal: Provide a continuing maintenance proposal from Installer to Authority, in the form of a 4 year maintenance agreement, starting on date initial maintenance service is concluded. State services, obligations, conditions, and terms for agreement period and for future renewal options.
HYDRAULIC ELEVATORS

1. Proposal shall be based on DART's Exhibit H - Statement of Work.

PART 2 - PRODUCTS

2.1 SUMMARY OF FEATURES

A. Elevators:
   1. Function: Passenger
   2. Type: Under-the-car single cylinder.
   4. Rated Speed: Minimum 80 fpm, maximum 100 fpm.
   6. Car Enclosures:
      b. Inside Clear Depth: 84 inches.
      c. Inside Clear Height: 96 inches.
   7. Hoistway Entrances:
      a. Width: 42 inches.
      b. Height: 84 inches.
      c. Type: Single-speed center opening.
      d. Car and Hoistway Door Operation: Power High-speed, heavy duty (Minimum opening speed 3.0 FPS)
   8. Hall Fixtures: Satin No. 4 stainless steel.

2.2 MATERIALS AND COMPONENTS

A. Inserts: Furnish required concrete and masonry inserts and similar anchorage devices for installing guide rails, machinery, and other components of elevator work where installation of devices is specified in another Specification Section.

B. Protective Cylinder Casings: PVC pipe casings complying with ASME A17.1, of sufficient size to provide not less than 1 inch clearance from cylinder, and extending above pit floor.

C. Corrosion Protective Filler: A solventless, petroleum-based gel formulated for filling the space between hydraulic cylinders and protective casings. Filler is heavier than water, electrically nonconductive, and liquefies at approximately 150 degrees F.

1. Products: Subject to compliance with requirements, provide 1 of the following:
   a. Diversified Enterprises; No-Ox-Id R-R #6110A.
   c. Or approved equal.

D. Finish Materials: Provide the following materials and finishes for exposed parts of elevator car enclosures, car doors, hoistway entrance doors and frames, and signal equipment as indicated:
   1. Stainless Steel: ASTM A 666, Type 316, No. 4 finish unless scheduled otherwise.
   2. Aluminum: Extrusions per ASTM B 221; sheet and plate per ASTM B 209.

2.3 MACHINE ROOM COMPONENTS

A. Hydraulic system shall be of compact design suitable for operation under the required working pressure, not to exceed 400 p.s.i. measured at the pump. Pump unit shall not be mounted in the hydraulic-fluid storage tank. Pump shall be driven with a 1 piece multi-groove V-belt. The direction valve shall control flow for up and down directions hydraulically and shall include an integral check valve. A control section including control solenoids shall direct the main valve and control: up and down starting, acceleration, transition from full speed to leveling speed, up and down stops, pressure relief and manual lowering. All of these functions shall be fully adjustable for maximum smoothness and to meet contract conditions. System to be provided with a muffler and a low-pressure switch. Provide a single lever ball type shut-off valve in both the machine room and the elevator pit.
   1. Included in the reservoir shall be an oil fill strainer with air filter and a self-cleaning strainer in the suction line.
   2. Tank shall have a reserve capacity of not less than 10 gallon and sight glass with markings for minimum and maximum oil level.
      a. Mount sight glass so that it is visible and protected from accidental contact.

B. Provide 2 panel mounted run-time meters or hour meters on each elevator. Meters shall be viewable without opening panel door.
   1. One meter shall record hour unit is running in revenue service mode (not in fault mode).
2. Other meter shall only record hours the motor is running (includes viscosity control and normal revenue service operations).

2.4 CONTROLLER

A. PLC-based controller shall be provided, governing starting and stopping, as well as preventing damage to the motor from overload or excessive current. It shall automatically cut off the motor current and bring the car to rest in the event any of the safety devices are activated. Controller shall be mounted in a vented cabinet within the machine room. Controller shall utilize soft start characteristics.

1. Two Car Group: Provide “group automatic operation” as defined in ASME A17.1.

2. Provide intermittent automatic operation, once every 3 hours through the entire run of the hoistway. Cycling shall be the full 24 hours each day throughout the year.

3. Low-oil control shall turn off the elevator if a low oil condition is detected.

B. Emergency power shall be from an Uninterruptible Power System (UPS) located in the elevator equipment room.

1. Upon the failure of the normal power, the elevator shall be lowered to the lowest landing. Upon arrival at the lowest landing, the elevator doors shall open automatically and remain open until the regular door time has expired. The elevator will then become inactivated.

2. Upon restoration of normal power, the elevator shall then become activated.

C. SCADA Alarm Contacts: Provide 2 sets of fail-safe, closed loop logic, Form C normally open and normally closed dry contacts in each of elevator controller. The normally open contacts to be connected to the Station Demarcation Terminal Cabinet for the following alarm functions:

1. Elevator failure alarm.

D. Tank Cooler: Cooling unit Specifications:

1. Heat removal: to comply with expected heat dissipation of elevator equipment in machine room BTU based on 120 round trip cycles per hour.

2. Adjustable thermostat control

3. 10 micron filter

4. Must be capable of remote installation

E. Hydraulic piping: Piping shall use a minimum of schedule 80 pipe. No victaulic fittings are permitted. Buried piping shall be welded and left uncovered until accepted and approved by the Contracting Officer.

2.5 SAFETY DEVICES

A. Provide a pipe rupture valve on the main cylinder line in the pit.

2.6 JACK HOLE AND CASING

A. Jack hole shall be drilled by using a rotary drill. No hammer drilling or blasting shall be allowed. The hole shall be located within 1 inch of the approved shop drawing location.

B. Schedule 80 steel drill casing shall be provided. Drill casing shall be installed plumb so that the hydraulic jack can be installed perfectly plumb.

C. Prior to the installation of the drill casing, the Contractor shall submit a drawing showing the details of installation of hydraulic jack unit inside of the drill casing for approval. The drawing shall show all dimensions of the hydraulic jack, PVC liner, sand fill, drill casing, all couplings and the details for securing the PVC liner to the elevator pit.

2.7 HYDRAULIC JACK UNIT

A. It shall be of sufficient size to lift the gross load to the height specified at the rated oil pressure and speed, and be factory tested to ensure adequate strength and freedom from leakage. No brittle material, such as gray cast iron, shall be used in the jack construction. All pipe sections shall be secured to each other with threaded connections.

B. Jack shall consist of the following parts: a non telescoping plunger of heavy seamless steel tubing accurately turned and polished; a stop ring electrically welded to the plunger to positively prevent plunger leaving its cylinder; an internal babbitt-lined, guide bearing; packing or seal of suitable design and quality; a drip ring around cylinder top; a cylinder made of steel pipes and provided with a pipe connection, air bleeder valve and oil drain plugs all positioned above the pit floor. The cylinder shall be furnished at the bottom with a safety bulkhead with an orifice to limit the speed of the car’s descent to 15 feet per minute in the event that the outer case fails. Weld brackets to the cylinder for supporting the jack on pit channels. A platen plate shall be mounted with neoprene rubber sound dampeners designed to isolate the platen plate from the car frame with a safety factor of 4.

C. Jack shall be provided with a caged primary seal and secondary seal so that weep oil can be drained via tubing to the scavenger pump tank.
HYDRAULIC ELEVATORS

D. If the jack must be supplied in Sections, the Sections shall be threaded. The cylinder shall also be welded and then polished at the threaded joint. The joints shall have any pipe coatings reapplied as per manufacturer’s Specifications.

2.8 HOLE TYPE JACKS

A. The jack shall be fabricated with an integral sleeve for connection to the PVC liner. The interstitial space between the PVC liner and the jack shall be capable of being monitored by a port on the pit plate.

B. Complete outer cylinder shall be waterproofed with a factory applied extruded pipe coating to protect the casing from corrosion. Pipe coating shall consist of 10 mills of Butyl Rubber or approved equal adhesive and 40 mils of heat applied polyethylene over coating. Coated pipe shall be protected during shipment with sheet steel wrap. The jack unit shall be installed accurately centered and plumb.

C. Install the jack unit in separate PVC outer liner constructed from Schedule 80 PVC pipe. The liner shall have a dished seamless bottom, a water stop ring attached to the liner and embedded in the pit floor, and sealed joints to prevent moisture seeping into the annular space between the liner and cylinder. The top of the liner shall be attached to the integral sleeve on the hydraulic jack.

D. For the drill casing, see Structural Contract Drawings and Paragraph 2.11.

E. After centering jack unit, affix it to the pit channels. Use stainless steel shims to level the pit channels. Fill the space between the steel casing and the PVC liner with clean dry sand to maintain plumbness and support PVC liner.

2.9 HOISTWAY

A. Provide manufacturer’s standard components complying with Code, except as otherwise indicated.

B. Guide Guides Shoes - Provide adjustable, spring-loaded guides appropriate for specific applications, using minimum of 3 rollers per guide, with a minimum 6 inch nominal roller diameter.

C. Buffers - Provide buffers with necessary blocking and support under elevator car as required by ASME A17.1.

2.10 WIRING

A. Conduits:

1. Unless otherwise specified, electrical conductors in the pits and hoistways, except traveling cable connections to the car shall be provided in rigid steel conduit with steel outlet boxes, except that a small amount of flexible conduit may be used where conduit is not subject to moisture or embedded in concrete

2. Rigid steel conduit shall be full weight, threaded, hot-dip galvanized, inside enameled, conforming to ANSI C80.1.

3. Conduit fittings and bodies shall meet ANSI/NEMA FB 1; threaded type, material to match conduit.

4. Terminal boxes, pull boxes and other similar items, shall be of approved construction, thoroughly reinforced, and shall meet ANSI/NEMA FB 1.

5. Electrical boxes exceeding 150 cubic inches shall be supported independently of the conduits.

6. Raceways shall be threaded rigid steel conduit complying with ANSI/NEMA FB 1.

7. Where permitted flexible heavy-duty service cord, type SO, may be used between fixed car wiring and switches on car doors for safety edges and light ray devices for reversal devices.

8. Where permitted, flexible metal conduit shall be fabricated in continuous length from galvanized steel strip, spirally wound and formed to provide an interlocking design with a gray XLPO Thermoset Type 2 outer jacket.

9. Conduit terminating in steel cabinets, junction boxes, wireways, switch boxes, outlet boxes and similar locations shall have approved insulation bushings. If the bushings are constructed completely of insulation material, a steel locknut shall be installed under the bushing. At ends of conduits not terminating in steel cabinets or boxes, the conductors shall be protected by terminal fittings having an insulated opening for the conductors.

10. Conduits terminating in NEMA 4X boxes shall be backed up with flat rust resistant steel plates to fit the entire area where the conduit penetrated the box.

11. Conduit fittings and connections shall be compression type. The use of set screw or indentations as a means of attachment is not permitted.

12. Connect motors and other components subject to movement or vibration, to the conduit systems with flexible conduit.

13. Contractor shall furnish all materials and completely wire all parts of the electrical equipment of the elevators including...
electrical devices on hatch doors. All car wiring and conduit shall be replaced with new including car junction boxes.

14. Solid state and electrical components located on top of the car enclosure or in the hoistway shall be installed within NEMA 4X enclosures.

15. Conduits shall be brought and connected to suitable approved connection boxes at all outlets, apparatus and panels.

16. Conduit Sizing, Arrangement, And Support:
   a. Size conduit per NEC for conductor type installed or for Type THW conductors, whichever is larger; 3/4 inch minimum size for conduit.
   b. Conduits for small devices such as door switches, interlocks, etc. shall be permitted at 1/2 inch.
   c. The total overall cross sectional area of the wires contained in any conduit shall not exceed 40 percent of the internal area of the conduit.
   d. Arrange conduit to maintain headroom and present a neat appearance.
   e. Route exposed conduit parallel and perpendicular to walls and adjacent piping.
   f. Maintain minimum 6 inch clearance between conduit and piping. Maintain 12 inch clearance between conduit and heat sources such as flues, steam pipes, and heating appliances.
   g. Arrange conduit supports to prevent distortion of alignment by wire pulling operations. Fasten conduit using galvanized straps, lay-in adjustable hangers, clevis hangers, or bolted split stamped galvanized hangers.
   h. Group conduit in parallel runs where practical and use conduit rack constructed of steel channel with conduit straps or clamps. Provide space for 25 percent additional conduit on racks.
   i. Do not fasten conduit with wire or perforated pipe straps. Remove all wire used for temporary conduit support during construction, before conductors are pulled.

j. No conduit shall be attached to a cable tray or installed within 6 inches of a cable tray or light fitting except for termination.

k. Approved strain boxes shall be installed for all vertical runs in accordance with Code.

17. Where conduit penetrates fire-rated walls and floors, seal opening around conduit with UL listed through penetration firestop system to maintain wall or floor rating.

18. Interlock, hall button and limit switch branch wiring shall be enclosed in flexible steel conduit with covering of liquid tight Type "EF" with connectors having nylon insulated throat.

19. Screws used for terminal connections of all wiring (machine room, hoistway and pit) shall be provided with "star washers" of proper size and type.

B. Conductors:

1. Unless otherwise specified, conductors, exclusive of traveling cables, shall be 98% conductivity copper, solid, for size 10 AWG and smaller, and stranded for size 8 AWG and larger shall be stranded or solid coated annealed copper in accordance with the NEC for Type THHW.

2. Where 16 and 18 AWG are permitted by Code, either single conductor cable in accordance with Code for Type TF, or multiple conductor cable may be used provided the insulation of single conductor cable and outer jacket of multiple conductor cable is flame retardant and moisture resistant.

4. Insulation: ANSI/NEC, type THHN/THWN, XHHW or THW.

5. The use of PVC insulation shall not be permitted.

6. Color Coding: Power conductors identified as to phase and voltage by means of color impregnated insulation, as follows:
   a. 120/208 Volts:
      1) ØA: Black
      2) ØB: Red
      3) ØC: Blue
      4) Neutral: White
HYDRAULIC ELEVATORS

5) Ground: Green

b. 277/480 Volts:

1) ØA: Brown
2) ØB: Orange
3) ØC: Yellow
4) Neutral: White
5) Ground: Green

c. For wire sizes No. 8 AWG and larger, color banding tape, minimum 2 inches wide, may be used at accessible locations in lieu of colored insulation.

7. Multiple conductor cable shall have color coding or other suitable identification for each conductor. Conductors for control boards shall be in accordance with Code.

8. No joints or splices shall be permitted in wiring except at outlets. Tap connectors may be used in wireways provided they meet UL requirements.

9. Wiring shall test free from short circuits or grounds. Insulation resistance between individual external conductors and between conductors and ground shall be not less than 1 meg-ohm.

10. Where size of conductors is not given, capacity shall be such that maximum current shall not exceed limits prescribed by Code.

11. Equipment grounding shall be furnished and installed. Ground conduits, supports, controller enclosures, motors, platform and car frames, and other non-current conducting metal enclosures for electrical equipment in accordance with Code. The ground wires shall be copper, green, insulated and sized as required.

12. Terminal connections for conductors used for external wiring between various items of elevator equipment shall be solderless pressure wire connectors in accordance with Code. Contractor may at his option make these terminal connections on No. 10 or smaller conductors with approved terminal eyelets set on the conductor with a special setting tool, or with an approved pressure type terminal block. Terminal blocks using pierce-through serrated washers are not acceptable.

13. Provide necessary conduit and wiring between remote machine room and hoistway.

C. Traveling Cables:

1. Traveling cables from junction box on car to junction box in hoistway shall consist of flexible traveling cables conforming to the requirements of Code.

2. Junction boxes in hoistway and on car shall be equipped with terminal blocks. Connections to terminal blocks shall be made with either terminal eyelet connections or pressure wire connectors of the clamp type that meet UL 486 requirements for stranded wire.

3. Terminal blocks shall have permanent indelible identifying numbers for each connection. The outer covering must remain intact between junction boxes. Abrupt bending or twisting producing distortion of cable is not permitted.

4. Cables shall be free from any possible contact with hoistway structure, car or other equipment. Furnish and install shields or pads to protect the cables.

5. Travel cables shall include, as a minimum:

a. 2 coaxial cables shielded for the CCTV system.

b. 4 cat 5 twisted shielded pairs for security and telephone systems

6. Provide 10 percent but not less than 2 spare conductors in each traveling cable.

7. Provide separate traveling cables for car lighting and fan control circuits.

8. Provide traveling cable for telephone in the elevator car. Cable shall extend from junction box in hoistway to telephone box in car.

9. Provide traveling cable for car work lights. Cable shall extend from junction box in hoistway to car junction box.

10. Car and hoistway junction boxes shall be provided for on the top of the elevator cab.

11. Cables shall include 10 percent spare wires between each controller, selector, and hoistway junction box, all spares to be properly tagged or otherwise identified with clear and indelible markings.

12. Insulated wiring, control wiring and wiring in traveling cables shall be tag coded at their
terminals in the motor room, and hoistway junction box, elevator cab junction box, and push-button stations within the cab, and shall agree with the approved wiring diagrams.

13. Traveling cable shall be wired directly from the controller to the elevator with no hoistway junction box.

14. Emergency stop switch in the car shall be connected to all alarm bells in a manner that will cause the bells to ring when the emergency stop switch is in the "On" position.

D. Motor Circuits:

1. Contacts in elevator motor circuits that are to be opened by governors or other safety devices shall be copper to carbon or other approved of the non-fusing type. Contacts on control and signal relays and switches shall be commercially pure silver. Contacts on switches breaking heavy motor circuits shall be copper to carbon or, if of metal, shall have supplementary breaking contacts and shall operate with suitable wiping action, or shall be of approved equivalent design and construction. They shall be equipped with suitable blowout coils, vanes, barriers, etc., where necessary to prevent undue arcing and heating.

2. Car and hall operating signal circuits shall not exceed 48 volts.

3. Each major component of equipment shall have the manufacturers name, type, class or catalog number on a metal plate securely attached to the item of equipment in a conspicuous location.

4. Cabinets containing motor drives, filter boxes, transformers and power reactors shall be supported on rails and isolated from the base building structure with elastomer pads having a minimum static deflection of 3/8 inch (Mason Type N, or equivalent). All connections to and from the cabinetry shall be flexible in order not to compromise the isolation system. Use non-rigid conduit for the final electrical connection, with all other conduit supports and clamps provided on a neoprene sponge insert.

5. Provide connections of fused main line disconnect switch of the lockable type for the elevators in the machine rooms.

6. Signal to the controller in the machine room to indicate special emergency condition due to lobby smoke detector activation; and smoke detectors in the elevator lobby and machine room in accordance with the ASME A17.1 code. Furnish and install means to automatically disconnect the main line power supply to the elevator prior to the application of water.

7. Car lighting and fan circuit for the elevators shall be located in circuit breaker panel in the machine rooms.

8. Permanent light fixtures with switches and duplex-grounded receptacles in the elevator machine room and elevator pit. Receptacles in the pit shall be ground fault circuit interrupter type.

2.11 EQUIPMENT: SIGNAL DEVICES AND FIXTURES

A. Car-Operating Panel: Stainless steel No. 4 vertical finish panel shall be provided with vandal resistant push buttons designed to bottom out against the panel plate and not the contacts, key switches.

B. Provide 1 car operating panel integral with a stationary return panel.

C. Braille/Arabic designations shall be flush with inconspicuous mechanical mounting.

D. Provide a service cabinet with a locked flush hinged or sliding door and integral certificate frame. Certificate Frame shall have durable Plexiglas window and be accessible from backside of locked door. Minimum window size to be approved by the Owner. Cabinet shall contain the following key type controls:

1. A light switch.
2. Two speed fan switch.
3. Inspection switch, conforming with the Code.
4. Independent service switch.
5. A duplex 120 volt, A.C. GFI convenience outlet.
7. Keying to match sample provided by Authority.

E. Engrave the car operating panels with the following:

1. No Smoking. Minimum 1 inch high lettering and graphic symbol
2. Elevator Number over operating buttons. Minimum 1/4 inch high lettering.
F. Car Position Indicator: A vandal resistant car position indicator shall be provided integral with the car operating panel.

G. Communication Device: Provide hands free communication device recessed in operating panel in each elevator cab as specified in Section 16851, “Telephone Subsystem – Communications System”, for PEC devices with following additional requirements:

   1. No blue light beacon is required.

   2. Telephone assembly shall be flush mounted into a recessed area in the elevator control panel, with brushed stainless faceplate finish or a finish to match the elevator panel. Alternatively, the unit may be mounted without faceplate behind an existing control panel that is integral to the elevator cab assembly, so long as the speaker and microphone cutouts match, the elevator control panel labeling satisfies ADA standards, and specified features and functions of the telephone are made available. Mounting height shall be in accordance with ADA Standards for Accessible Design, 28 CFR Part 36, Section 4.10.14.

   3. A readily identifiable location marker plate indicating station name, address, and telephone location (ie. south elevator) shall be installed on or adjacent to the faceplate of each telephone.

   4. Operating instructions shall be incorporated with or adjacent to the telephone and shall conform to ASME A17.1a-2002 Section 2.27.7.3.

H. Car Lantern and Chime: A stainless steel vandal resistant directional lantern visible from the corridor shall be provided in the car entrance. When the car stops and the doors are opening, the lantern shall indicate the direction in which the car is to travel and an adjustable electronic chime will sound.

I. Hall Fixtures: Hall fixtures shall be provided with necessary stainless steel vandal resistant push buttons and key switches for elevator operation. Raised markings shall be provided for each push-button

J. Landing Passing Signal: An adjustable electronic chime bell shall sound in the car to tell a passenger that the car is either stopping at or passing a floor served by the elevator.

2.12 DOOR OPERATOR EQUIPMENT

A. Provide a GAL MOVFR-HSL or equal door operator with encoderless VVVF drive and the following features:

   1. 1/2 hp motor and heavy duty sprocket, chain, belt, and sheaves.

   3. Hand-held keypad programming.

   4. Adjustments can be stored in the keypad and downloaded to another operator.

   5. Adjustable door obstruction reversal.

   6. Optical cams with LED indicators.

   7. Test switches for open, close, nudging and speed zone set up.

   8. Universal inputs for open, close, and nudging.

   9. Reversing switch to back up the door reversal device.

B. Provide a non contact door reversal device with light immunity: The Door Reopening Device shall cause both the car and hoistway doors to reverse, should they detect an obstruction in the elevator entrance and shall be Tri-Tronics, “W” Series Door Edge, or approved equal. The device electrical wiring shall be supplied with quick disconnects terminals to facilitate replacement. The infrared curtain detector shall include the following:

   1. Protective infrared detector field extending from 1-1/2 inches above the car sill to a height of 68 inches.

   2. Fail-safe control system to prevent the doors from closing in case of power loss to the detector.

   3. One-piece full door height protective lens cover designed to be completely waterproof and to withstand impact, abrasion and vandalism.

2.13 CAR FRAME

A. Car Frame: A suitable car frame shall be provided with adequate bracing to support the platform and car enclosure. The buffer striking plate on the underside of the car-frame platform assembly must fully compress the spring buffer mounted in the pit before the plunger reaches its lower limit of travel. Provide welded or bolted ASTM A123/A123M galvanized or stainless steel channel uprights affixed to crosshead and plank channels with welded or bolted bracing members and gusset plates which will remove strain from car enclosure.

B. Platform, Heavy Loading Type: The car platform shall be arranged to accommodate 1-piece loads weighing up to 25 percent of the rated load, such as wheeled food carts, hand trucks, etc. The platform shall be stainless steel.
2.14 CAR ENCLOSURES

A. General: Provide car enclosures with glazing, suspended ceiling, trim, accessories, access doors, doors, power door operators, sills (thresholds), lighting, emergency lighting and ventilation.

1. Fabricate car with recesses and cutouts for signal equipment.

2. Fabricate car door frame integrally with front wall of car.

B. The clear height under the ceiling canopy shall be a minimum of 8 foot. Ceiling canopies shall be stainless steel not less than 0.109 inch nominal thickness.

C. Ventilation: Provide 2-speed heavy duty blower. Finish and material of fan enclosure and blade shall match the finish and material of the ceiling having a NEMA 4X rating. Exhaust blowers shall be designed with a hood. Air handling capacity of blower shall be 1 air change per minute based on net inside car volume. Provide auxiliary power source capable of providing minimum air handling capacity for continuous period of at least 1 hour on each elevator car.

D. Finishes:

1. Front Walls: Satin No. 4 stainless steel with integral car door frames.

2. Car Fixtures: Satin No. 4 stainless steel.

4. Reveals: Satin No. 4 stainless steel.

5. Door Faces (Interior): Satin No. 4 stainless steel.

6. Door Sills: Stainless steel, with grooved surface, 1/4 inch thick.

7. Ceiling: Satin No. 4 stainless steel.

8. Handrails: 1-1/2 inches outside diameter satin No. 4 stainless steel, at side and rear walls. Wall connectors shall have security type fastenings and shall be the same material and finish as the handrail. Handrail height shall confirm with Code requirements.

9. Floor recessed and prepared to receive a heavy gauge stainless steel with Diamond Plate as a finished floor. Provide cementitious backer units applied over 5/8-inch underlayment grade, exterior plywood, screwed to car platform.

2.15 HOISTWAY ENTRANCES

A. Door Frames: Entrance frames shall be of bolted construction for complete 1-piece unit assembly. Frames shall be securely fastened to fixing angles mounted in the hoistway and shall be of 2 mm stainless steel. Provide an additional stainless steel sill angle support. The sill shall be stainless steel.

B. Doors: Entrance doors shall be of hollow metal construction with vertical internal channel reinforcements. Panels front and rear, framing, operating levers, and integral hardware shall be stainless steel; panel shall be 2mm and have a No. 4 finish.

C. Entrance Finish: Finish shall be stainless steel No.4 finish.

D. Sight Guards: Stainless steel

E. Provide a sill mounted closer at landings.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine elevator areas, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance. Verify critical dimensions including accessibility for maintenance, and examine supporting structure and other conditions under which elevator work is to be installed. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General: Comply with referenced standard and manufacturer’s instructions and recommendations for work required during installation.

B. Excavation for Jack: Drill excavation in each elevator pit to accommodate installation of protective casings and cylinders.

1. Provide waterproof well casings as necessary to retain walls of well hole.

2. Remove and dispose of drilling spoils.

C. Install cylinders in protective casings within well hole or casing. Before installing protective casing, remove water and debris from well hole or casing and provide permanent waterproof seal at bottom of well casing. Fill void space between protective casing and cylinder with corrosion-protective filler.

1. Align cylinders and fill space between well casing and protective casing with fine sand unless otherwise required by authorities having jurisdiction.
D. Install cylinders plumb and accurately centered for elevator car position and travel. Anchor securely in place, supported at pit floor. Seal between protective casing and pit floor with 4 inches of nonshrink, nonmetallic grout.

E. Welded Construction: Provide welded connections for installing elevator work where bolted connections are not required for subsequent removal or for normal operation, adjustment, inspection, maintenance, and replacement of worn parts. Comply with AWS standards for workmanship and for qualifications of welding operators.

F. Sound Isolation: Mount rotating and vibrating equipment on vibration-isolating mounts designed to effectively prevent transmission of vibrations to structure and thereby eliminate sources of structure-borne noise from elevator system.

G. Install piping above the floor, where possible. Where not possible, install underground piping in Schedule 40 PVC pipe casing assembled with solvent-cement fittings.

H. Lubricate operating parts of systems as recommended by manufacturer.

I. Alignment: Coordinate installation of hoistway entrances with installation of elevator guide rails for accurate alignment of entrances with cars. Delay installation of sills and frames until car is operable in shaft. Reduce clearances to minimum, safe, workable dimension at each landing.

J. Leveling Tolerance: 1/2 inch, up or down, regardless of load and direction of travel.

K. Set sills flush with finished floor surface at landing. Fill space under sill solidly with nonshrink, nonmetallic grout.

L. Program elevators to set at lower level.

3.3 FIELD QUALITY CONTROL

A. General:

1. Notify the Contracting Officer 7 days prior to each scheduled test. Contractor shall perform testing in the presence of Contracting Officer’s representative.

2. Notify the appropriate local authorities having jurisdiction a minimum of 7 days in advance of final acceptance tests.

3. Provide instruments, materials, and labor required for tests specified herein.

4. Pre-test devices within his control and provide documentation to prove compliance prior to jurisdictional inspection.

B. Acceptance Testing: On completion of elevator installation and before permitting use (either temporary or permanent) of elevators, perform acceptance tests as required and recommended by ASME A17.1 and by governing regulations and agencies.

C. Test Period: The elevator shall be subjected to a test for a period of 1 hour continuous run, with full specified load in the car. During the test run, the car shall be stopped at all floors in both directions of travel for a standing period of 10 seconds per floor.

D. Speed Load Tests: The actual speed of the elevator car shall be determined in both directions of travel with full contract load and with no load in the elevator car. Speed shall be determined by a tachometer. The actual measured speed of elevator car with full load shall be within 10 percent of rated speed. The maximum difference in actual measured speeds obtained under the various conditions outlined between the “UP” and the “DOWN” directions shall be checked.

E. Post Acceptance Inspection: After the elevator is accepted by the local jurisdiction, a second inspection will be conducted (without weights) to determine specification compliance above and beyond the code requirements of the acceptance inspection.

F. Test interface with fire alarm system with COR and Fire Marshal’s representative present. Test Phase 2 recall functions and communications.

G. Reinspection: If any equipment is found to be damaged or defective, or if the performance of the elevator does not conform with the requirements of the contract specifications or the Safety Code, no approval or acceptance of elevators shall be issued until all defects have been corrected. When the repairs and adjustments have been completed and the discrepancies corrected, the Owner shall be notified and the elevator will be reinspected. Rejected elevators shall not be used until they have been reinspected and approved.

1. Reinspection Penalty: In addition to any additional fees imposed by the local jurisdictional authority for repeated inspections. Liquidated damages of $1,000 per reinspection will be imposed if any punch list items are not completed within 1 follow up inspection.

3.4 FINAL ADJUSTMENTS

A. Align guide rails vertically within tolerance of 1/16 inch in 100 feet. Secure joints without gaps and file irregularities to smooth surface.

B. Balance cars to equalize pressure of roller guide on rails.

C. Lubricate equipment in accordance with manufacturer’s instructions.
D. Adjust motors, brakes, controllers, leveling switches, door switches, stopping switches, door operators, door gap, interlocks and safety devices, to achieve required performance levels.

E. Fabricate and assemble various parts in shop insofar as practicable to minimize field assembly. Parts which cannot be shop assembled and require close field fit - Trial assemble in shop and mark for field erection.

3.5 DEMONSTRATION

A. Provide 40 hours of local training for Authority’s personnel in proper use, operations, and daily maintenance of elevators. Review emergency provisions, including emergency access and procedures to be followed at time of operational failure and other building emergencies. Train Authority’s personnel in procedures to follow in identifying sources of operational failures or malfunctions. Provide manuals for material covered in the training program. Confer with Authority on requirements for a complete elevator maintenance program.

1. Provide a 60 minute (minimum) DVD describing and demonstrating daily maintenance, emergency procedures and troubleshoot techniques for electrical and mechanical failures and malfunctions.

B. Make a final check of each elevator operation with Authority’s personnel present and before date of Substantial Completion. Determine that operation systems and devices are functioning properly. Re-check non-compliant items.

3.6 PROTECTION

A. Temporary Use: Do not use elevators for construction purposes unless cars are provided with temporary enclosures, either within finished cars or in place of finished cars, to protect finishes from damage.

1. Provide full maintenance service by skilled, competent employees of elevator Installer for elevators used for construction purposes. Include preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as required for proper elevator operation at rated speed and capacity. Use same parts and supplies as used in the manufacture and installation of original equipment.

2. Provide protective coverings, barriers, devices, signs, and other procedures to protect elevators. If, despite such protection, elevators become damaged, engage elevator Installer to restore damaged work so that no evidence remains of correction work. Return items that cannot be refinished in the field to the shop, make required repairs and refinish entire unit, or provide new units as required.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work described in this section will be paid for on a lump sum basis for hydraulic elevators per location (station) indicated wherein no measurement will be made.

B. The Interim Maintenance Service will be measured by and paid for at the unit price for “Interim Maintenance Service” per month per location (station).

C. The Initial Maintenance Service will be measured by and paid for at the unit price for “Initial Maintenance Service” per month per location (station) for one year.

END OF SECTION 14240
PART 1 - GENERAL

1.1 DESCRIPTION

A. The work described in this section generally refers to pertinent sections under Division 15, "MECHANICAL".

B. This Division specifies work required to provide complete heating, ventilating, air conditioning systems, compressed air systems, complete systems for potable water, drainage systems for sanitary waste disposal and storm drainage, sump pumps, and standpipe and sprinkler systems for fire suppression, as indicated and specified. In addition, this Division specifies the complete installation of systems as specified herein and as shown, and the provision of special devices, fittings, fabrications, cutting and patching, and items incidental required to fit the respective systems into the construction.

C. The Drawings are diagrammatic and not intended for use in determining the exact locations of the components of the mechanical systems, except where specifically dimensioned, nor do the Drawings indicate fittings, devices, and accessories required for the complete installation. Refer to the Drawings of all trades of this Contract, and the drawings of other contracts as referenced in Section 01010, "Summary of the Work" to determine the location of equipment to be furnished by this Contract, and by other Contracts as referenced.

1.2 REFERENCED STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM A153/A153M - Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware
2. ASTM A563 - Standard Specification for Carbon and Alloy Steel Nuts
3. ASTM F436 - Standard Specification for Hardened Steel Washers
4. ASTM F1554 - Standard Specification for Anchor Bolts, Steel, 36, 55, and 105-ksi Yield Strength

1.3 DEFINITIONS

A. Where the word "concealed" is used in connection with insulating, painting, piping, ducts and the like, the word is understood to mean hidden from sight as in chases, furred spaces or suspended ceilings. "Exposed" is understood to mean open to view.

1.4 SUBMITTALS

A. See submittal of details of testing and startup procedures in Paragraph 1.14B/1/b.

1.5 QUALITY ASSURANCE

A. Comply with the requirements of Section 01430, "Contractor's Quality Assurance" and Section 01450, "Quality Control".

B. Perform work in accordance with the most recent edition of the following codes:

1. State and city building, plumbing, mechanical and energy codes.
5. Authorities having jurisdiction.

1.6 EXISTING UTILITIES AND TEMPORARY SERVICES FOR CONSTRUCTION

A. Verify the location and capacity of existing utility services pertaining to work of Division 15, "MECHANICAL".

B. Temporary Services for Construction: Provide temporary services for those existing or new systems specified within this Division in accordance with the provisions of these Specifications.

1.7 EXCAVATION AND BACKFILLING

A. Perform excavation and backfilling necessary, including compaction as specified, for the installation of Division 15 work.

B. Perform excavation and backfilling associated with the work of Division 15 in accordance with the provisions of Division 2 including trench safety requirements.

1.8 PROJECT CONDITIONS

A. Examine the areas and conditions under which work of this Section will be performed.

B. Where ducts, pipes other mechanical items are shown in conflict with locations of structural members and other equipment, include labor and materials required for extensions, offsets, and supports to clear the encroachment.
C. Although such work is not specifically indicated, furnish and install supplementary or miscellaneous items, appurtenances, and devices incidental to or necessary for a sound, secure and complete installation.

D. Verify dimensions and distances. No additional compensation will be allowed because of differences between work shown on the Drawings and actual dimensions and distances at the jobsite.

1.9 PREPARATION AND COORDINATION WITH OTHER TRADES

A. Perform coordination work associated with work of Division 15, "MECHANICAL":

1. Coordinate as necessary with other trades to assure proper and adequate interface with the Work.

2. Coordinate accepted equipment changes from those scheduled or specified with other trades affected. Additional compensation to other trades for equipment changes are the responsibility of the contractor making the change.

B. The Mechanical Drawings are diagrammatic, but are required to be followed as closely as actual construction and work of other trades will permit. Duct and piping arrangement have been designed for maximum economy consistent with good practice and other considerations. Install the systems arranged as shown on the drawings, except as otherwise approved in advance by the Contracting Officer.

C. Where items such as diffusers, thermostats, switches, and control panels are not specifically located on the Drawings, locate as determined in the field by the Contracting Officer. When such items are installed without such specific direction, relocate as directed by the Contracting Officer and at no additional cost to the Authority.

1.10 CUTTING AND PATCHING

A. Cutting and patching associated with the work of Division 15, "MECHANICAL" shall be in accordance with Section 01731, "Cutting and Patching" and other pertinent provisions of these Specifications.

1.11 PROJECT RECORD DOCUMENTS

A. Provide project record documents associated with the work of Division 15 in accordance with Section 01785, "Project Record Documents".

B. Provide final record documents per Section 01785, "Project Record Documents".

1.12 OPERATION AND MAINTENANCE DATA AND TRAINING

A. Operation and Maintenance Manuals: Provide manuals as specified in Section 01786, "Operation and Maintenance Instructions".

B. Operation and Maintenance Training: Provide training as specified in Section 01786, "Operation and Maintenance Instructions".

1.13 EQUIPMENT FOUNDATIONS

A. Provide equipment foundations and concrete bases for floor-mounted mechanical equipment associated with the work of Division 15, "MECHANICAL" in accordance with the provisions of Division 3, "CONCRETE":

1. Reinforcing: As specified in Section 03200, "Concrete Reinforcement".

2. Concrete: Mix S-7, as specified in Section 03305, "Portland Cement Concrete".

3. Anchor bolts (Bolts, nuts, and washers):

   a. Anchor Bolts: ASTM F1554, Grade 55, unless noted otherwise on drawings. ASTM A563, Grade A for nuts. ASTM F436, Type 1 for washers.

   b. Galvanized per ASTM A153/A153M

   c. Bolts hooked, unless otherwise shown or recommended by manufacturer of structure being anchored.

   d. Two nuts and 1 washer for each anchor bolt for plumbing pole or leveling structure.

4. Bases shall be 4 inches high above finished floors or grades (unless otherwise noted) and shall protrude 2 inches beyond sides of equipment.

5. Provide chamfer of 1/2 inch on edges. Obtain dimensions for bases by certified and approved shop drawings, or by measuring the equipment to be installed.

6. Provide method of anchoring bases to concrete floor construction as shown on approved shop drawings. Anchor pads to prevent lateral movement under conditions of vibration.

7. Set anchor bolts to template as required in accordance with details provided by the equipment manufacturer.
8. Remove and reset any anchor bolt that is set out of plumb, or has been displaced after installation.

1.14 PAINTING

A. Equipment shall be delivered to the Worksite with specified factory finish. Should the finish be damaged in transit or during the installation, it shall be finished to present a neat workmanlike appearance to the satisfaction of the Contracting Officer.

1.15 TESTING AND INSPECTION

A. General: Provide complete startup, testing, and operator training services to ensure operability of equipment supplied.

B. Field Tests and Adjustments.

1. General:

a. Mechanical and electrical equipment including the interfaces with the supervisory and control system and communication system and alarm and operating modes for each such piece of equipment shall be tested by the Contractor to the satisfaction of the Contracting Officer before any facility is put into operation. Tests shall be as specified in these specifications and shall be made to determine whether the equipment has been properly assembled, aligned and connected. Changes, adjustments or replacements required to make the equipment operate as specified shall be carried out by the Contractor as part of the work. At least 15 days prior to tests, submit SCADA control points list.

1) Normal SCADA Alarm Contacts: Two sets of Form C normally open and normally closed dry contacts. See individual sections for exact requirements.

b. At least 30 days before the time allowed in his construction schedule for commencing testing and startup procedures, the Contractor shall identify if any additional support will be required from other contractors of the Authority and/or the Authority: and shall submit his request to the Contracting Officer together with, in duplicate, details of the procedure he proposes to adopt for testing and startup mechanical and electrical equipment, except when such procedures have been covered in the specifications. These procedures are to be submitted for review and acceptance.

c. Contractor's testing and startup procedures shall include detailed descriptions of pre-operational electrical, mechanical and instrumentation testing work. Each control device, item of mechanical, electrical and instrumentation equipment, and control circuits shall be considered in the testing procedures, which shall be designed, in a stepwise, logical sequence to ensure that equipment has been properly serviced, aligned, connected, calibrated and adjusted prior to operation. Contractor is advised that failure to observe these precautions may place the acceptability of the subject equipment in question; and he may be required by the Contracting Officer to demonstrate that the equipment has not been damaged; or replace it if unable to do so. Testing procedures shall be designed to duplicate as nearly as possible conditions of operations including emergency situations, and shall be carefully selected to ensure that the equipment is not damaged. Once the testing procedures have been accepted by the Contracting Officer the Contractor shall produce checkout, alignment and adjustment, and calibration sign off forms for each item of equipment, which shall be used in the field by the Contractor and Contracting Officer jointly, to ensure that each item of electrical, mechanical, and instrumentation equipment has been properly installed and tested. Cooperate with project-wide systems contractors startup and testing to be conducted concurrently where applicable.

2. Equipment Testing:

a. Before startup, the Contractor shall properly service equipment and other items which normally require service in accordance with the maintenance instructions. Contractor shall be responsible for operation and maintenance of equipment throughout the entire equipment "break-in" period.

b. Contractor shall be responsible for the startup, adjustment, preliminary maintenance and checkout of equipment and instrumentation. Systems shall be carefully checked for conformance with the design criteria.
c. If any equipment or system does not operate properly, the Contractor shall immediately replace or repair components until it operates properly.

d. When the equipment startup is complete, the Contractor shall submit a test report, including checklists, original copies of observation records with observers initials and log sheets, to the Contracting Officer.

3. Contractor shall provide support as required during the "systems startup"

C. Systems Startup:

1. Contractor shall be responsible for a 30 day startup period, during which time electrical and mechanical equipment, fixtures and associated devices shall be energized and operated under local and automatic controls. Contractor shall be present during the startup period with adequate labor and support personnel to adjust equipment and troubleshoot system failures that might arise. The startup time shall be renewed after repair made during the startup period.

2. When a piece of mechanical or electrical equipment fails to perform in accordance with specifications, an adjustment shall be made to the item by an experienced authorized representative of the manufacturer.

3. If adjustments fail to correct the operation of a piece of equipment or fixture, remove the equipment or fixture from the Project Site and replace it with a workable replacement that will meet the specification requirements.

1.16 WARRANTY

A. Unless otherwise noted, the Contractor shall guarantee mechanical equipment and workmanship for a period of 1 year in accordance with the warranty clause of the GENERAL PROVISIONS after date of final completion and replace or repair any faulty equipment or installation at no cost to the Authority for such service during this period, in accordance with requirements of the GENERAL PROVISIONS.

B. This guarantee shall not void specific guarantees issued by manufacturers for greater periods of time. Nor shall it void any rights guaranteed to the Authority by law.

C. Warranties shall be in writing in a form satisfactory to the Authority, and shall be delivered to the Authority before the final acceptance of the work in accordance with Division 1, "GENERAL REQUIREMENTS".
PART 3 - EXECUTION

3.1 INSTALLATION

A. Comply with requirements for installation, field testing and balancing as specified in the material and system installation paragraphs of this division.

B. Work in Place: Inspect the work in place and verify ability to make connections to the work in place or being installed under other current contracts. Work in place generally consists of: support inserts embedded in the construction, piping embedded in the construction and below the base slab, penetrations through floors, walls, roof, or other structural elements, and cast-in-place concrete duct systems and shafts.

C. Connections to Existing Facilities: Make connections to existing facilities in accordance with details as shown or as approved by the Contracting Officer. Where material specified under this Contract differs from material in place, provide adapters, dielectric fittings, or special connectors as required. Use the requirements of applicable codes and recommendations of material manufacturers as a basis for determining exact type of adapters and fittings to be provided under this Contract.

D. Connections to Work by Others: Connect new work provided under this Contract to work installed under other contracts, or required for equipment furnished by other contractors. Make required connections of this Contract to work by others in a proper and workmanlike manner. Refer to the drawings and specifications for other Contracts as referenced, in the WORK BY OTHERS Article of Section 01010, "Summary of the Work" of the General Requirements and to utilities drawings for services to this Worksite, to determine the number and types of connections required.

E. Alterations to Existing Facilities: If it is determined that, in order to make proper connections to existing duct and piping systems existing facilities must be altered, make such alterations in accordance with Section 01731, "Cutting and Patching", or a manner as directed by the Contracting Officer, using materials identical to and compatible with existing materials and as approved.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The work specified under the individual sections under Division 15, "MECHANICAL", will be paid under the Contract lump sum price for Mechanical Work wherein no measurement will be made.
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies requirements for electric motors, motor starters, control devices, disconnect switches and supporting devices for motorized equipment, furnished under Division 15, "MECHANICAL".

B. Work Allocation:

1. Except as specified herein, provide motors, motor starters, control devices, thermostats, control relays, pilot lights, control panels and similar equipment specified under other Sections of Division 15, "MECHANICAL". Motor control centers and associated motor starters shall be furnished, installed, and wired under Division 16, "ELECTRICAL".

2. Wiring: Division 16, "ELECTRICAL", to furnish and install power wiring including connections to the line side terminals of the motor starter.

1.2 SUBMITTALS

A. Product Data: Complete catalog information.

B. Shop Drawings: Material and equipment.

C. List of Work Items: As specified in Paragraph 2.1.A of this section.

D. Motor Characteristic Curves.

E. Submit the following for all motors:

1. Manufacturer's name.

2. Voltage/Frequency.

3. Horsepower/Service factor.

4. Frame number.

5. NEMA design letter.

6. Power factor at full load.

7. Enclosure type.

8. Insulation class.

10. No load current.

11. Full load input in kilowatts.

12. Full load speed.

13. Locked rotor current.

14. Locked rotor input in kilowatts.

15. Bearing type, temperature limit and rated life.

16. Motor winding heaters wattage and voltage, provided if recommended by manufacturer.

17. Efficiency at full load.

18. Built-in-thermal protection (type and material) where provided.

1.3 QUALITY ASSURANCE

A. The applicable Codes, Regulations, Reference Standards, and Specifications sections referenced in Section 15001, "Mechanical Systems - General" also apply to this section. Provide the Contracting Officer with manufacturer's certification that materials meet or exceed minimum requirements to comply with NEC, NFPA, NEMA, and all other applicable standards.

B. Manufacturer's Qualifications:

1. Select manufacturing firms regularly engaged in the manufacture of heavy-duty, industrial grade equipment of the type specified.

2. The equipment incorporated into the work shall essentially duplicate equipment that has been in satisfactory use for a period of five years, prior to the Bid Opening of this Project.

C. Source Quality Control:

1. Performance Certification: Certify that the equipment meets the performance specified.

2. Factory Testing: Test motors in accordance with the procedures specified in IEEE Publication 112A. Test two speed motors on each winding connection. Test reversible motors in both forward and reverse directions of rotation. Test motors to determine efficiency, power factor, rated load, slip and vibration.
PART 2 - PRODUCTS

2.1 GENERAL

A. Starters and disconnect switches, (except those starters and disconnect switches furnished as integral parts of mechanical equipment,) will be provided under Division 16, "ELECTRICAL".

B. Deliver starters, (other than those mounted in equipment) specified in the work of this division to Project Site, for installation under Division 16, "ELECTRICAL".

C. Provide each motor starter with approved nameplate to indicate equipment being controlled in accordance with Section 15055, "Identification of Equipment and Piping".

D. Furnish and install control wiring in conduits, minimum conductor size 16 AWG or as indicated; two conductor, balanced pair and in accordance with Division 16, "ELECTRICAL". Provide twisted and shielded conductors where indicated.

E. Provide SCADA alarm contacts, typically, two sets of Form C normally open and normally closed dry contacts. See individual sections for exact requirements.

2.2 MOTORS

A. Provide motors of sufficient size for the duty to be performed and not exceeding the full-load rating when the driven equipment is operating at specified capacity under the most severe conditions likely to be encountered. Provide motors suitable to operate the rated load when the ambient temperature is 115 deg. F. When electrically driven equipment to be furnished under Division 15, "MECHANICAL", differs from that shown on the Drawings, submit shop drawings for approval by the Contracting Officer prior to installation, in accordance with the General Requirements, with necessary adjustments to the wiring and conduit systems, disconnect devices, and circuit protection devices, required to accommodate the equipment actually installed.

B. Application:

1. Motors:
   a. Select motors with torque characteristics which will satisfactorily accelerate the driven equipment, within the starting time as specified.
   b. Select motors such that the operation at maximum load will not require the motor to operate at greater than its full load rating.

2. Drives:
   a. Provide belt guards for all belt drives in accordance with OSHA requirements.
   b. Install drives with single or multiple belts as required to properly transmit load. Provide multibelts that are matched sets.
   c. Select drive sheaves to allow an adjustment of plus or minus 20 percent from driven speed to meet the designed capacity.

C. Voltage: Unless indicated otherwise, use motors designed for continuous duty at the following voltages:
   1. 120 volts, single-phase, 60 hertz (Hz) - for motors 1/2 (HP) horsepower and smaller.
   2. 480 volt, three-phase, 60 Hz - for motors larger than 1/2 HP.
   3. Suitable for operation at variations of frequency and voltage of plus or minus 10 percent of nameplate rating without damage.

D. Motor Enclosures:
   1. Unless otherwise shown, Provide enclosures for motors located indoors of drip-proof type with drain plugs or other openings for condensate drainage.
   2. Provide weatherproof enclosures, or covers, for motors located outdoors
   3. For enclosures for motors installed in hazardous areas provide from NEMA group and class approved for the type of hazard in which they are located.

E. Bearings: Provide motors with sealed bearings unless otherwise shown. Provide bearing life as specified in other sections of this Division.

F. Accessories:
   1. Provide V-belts of heavy duty, heat, and static dissipating and oil resistant type.
   2. Fabricate sheaves of machine cast iron or steel with zero clearance tapered key
attachment to shaft. Provide drive sheave of the adjustable type.

3. Construct belt guards of minimum 16-gauge steel which completely enclose all moving parts (sheaves, shafts, belts, etc.). Provide face of guard of solid sheet steel or expanded steel mesh. Construct guard to permit easy access to moving parts and openings for shaft speed measurements without removing the guard. Construct guards in accordance with OSHA requirements.

2.3 MOTOR STARTERS

A. Refer to Section 16915, "Motor Control Centers and Starters" for requirements for electric motor starters serving Division 15, "MECHANICAL" equipment.

2.4 VARIABLE FREQUENCY DRIVES/ SPEED CONTROLLERS

A. The adjustable frequency controller shall convert 460 volts 5 percent 3-phase, 60 hertz utility power to adjustable voltage (0-460 volts) and frequency (0-60 Hz) 3-phase, AC power for stepless motor speed control with a capability of 10:1 speed range. General options and modifications shall mount within an enclosure.

B. The adjustable frequency controller shall be a voltage source or current source. Drives shall be supplied by one manufacturer. Note: Pulse-width modulated designs are not acceptable.

C. The controller(s) shall be suitable for use with new standard NEMA B squirrel-cage induction motor(s) with a 1.15 sf or with existing standard NEMA B squirrel-cage induction motor(s).

D. The controller shall have a continuous output current rating of 100 percent. Output current capability shall be 1.1 times the connected motor full load current rating. Average efficiency at one-fourth load shall be not less than 84 percent.

E. The VFD controller shall have the following basic features:

1. The converter section of the VFD will be a full wave, 3-phase converter to change the AC input power to DC power.

2. The inverter section will convert the DC output to adjustable frequency power to the motor. The VFD shall not induce excessive power losses in the motor and shall not feed electrical noise back into the electrical system of the building.

5. Door-mounted ammeter and speed meter.

6. Independent adjustable linear acceleration and deceleration rates.

7. Minimum 10:1 (6-60 Hz) controlled speed range capability.

8. Auxiliary contact for remote indication of controller fault condition.

9. VFD components shall be factory mounted and wired on a dead front, grounded, wall mounted, NEMA 1 enclosure.

10. The VFD shall provide automatic restart after a trip condition resulting from overcurrent, overvoltage, undervoltage, overtemperature or power outage. Two unsuccessful restart attempts will result in drive shutdown and require manual reset. The automatic restart feature will be capable of being defeated if VFD trip is desired upon first occurrence of a fault condition.

11. Duct static pressure to electrical transducer shall be provided. The pressure to electrical transducer will interface with controller internal speed reference voltage proportionally with change in pressure signal.

12. An EMS interface port shall be provided to allow future remote control.

F. The VFD Controller shall have the following protective features:

1. Single phase fault or 3-phase short circuit on VFD output terminals without damage to any power component.

2. Static instantaneous overcurrent and overvoltage trip.

3. Static overspeed (overfrequency) protection.

4. Line or fuse loss and undervoltage protection.

5. Power unit overtemperature protection.

G. The VFD shall operate as follows:

1. Selector Switch in the Off Position: The VFD run circuit will be open and the system will not operate.

2. Selector Switch in the Manual Position: The speed of the motor will be controlled by the manual speed potentiometer.

3. Selector Switch in the Auto Position: Operation will be from the input signal with motor speed being linearly proportional between minimum and maximum speeds selected.

H. The variable frequency drive manufacturer shall be able to provide as a minimum the following services:

1. Factory coordinated start-up service.

2. Training of user personnel in basic troubleshooting.

3. Training shall be on site and shall be a minimum of four hours duration and shall be performed in addition to start-up of system.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Motors and Controls:

1. Install, align, and couple motors supplied as separate items under this Section.

2. Recheck alignment of all motors after installation of all connections and drives and after operation for a minimum of 48 hours.

3. Wire controls as specified under applicable mechanical and electrical sections of this Specification to provide proper operation of the connected equipment.

3.2 TESTING-STARTUP

A. Following procedures in accordance with Section 16030, "Testing of Electrical Systems", perform field tests on starters and disconnects provided as part of Division 15, "MECHANICAL" work and submit test report for approval.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 15001, "Mechanical Systems - General".

END OF SECTION 15040
SECTION 15055
IDENTIFICATION OF EQUIPMENT AND PIPING

PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies furnishing and installing nameplates, signs and tags on mechanical equipment, piping, and apparatus, and supporting devices.

1.2 SUBMITTALS
A. Certification.
B. Samples: Labels and tags in each size.
C. Documentation: Charts for valves; include valve identification number, location, and purpose.

1.3 QUALITY ASSURANCE
A. The Codes, Regulations, Reference Standards, and Specifications, sections referenced in Section 15001, "Mechanical Systems - General" also apply to this section. When requested, provide the Contracting Officer with manufacturer's certificate that materials met or exceed minimum requirements to comply with AISI, NEMA, and other applicable standards.

PART 2 - PRODUCTS

2.1 NAMEPLATES
A. Furnish nameplates fabricated either from laminated plastic, or 18-gauge, stainless steel.

2.2 TAGS
A. Fabricated from 18-gauge stainless steel or 18 gauge brass.

2.3 IDENTIFICATION PLATES
A. Furnish bronze plates for equipment identification with numbers.

2.4 IDENTIFICATION LABELS FOR PIPING
A. Furnish permanent type labels; painted color bands with stenciled letters, or prefabricated pressure-adhesive cloth tape color labels with color lettering, manufactured for piping identification.

B. Provide labels with painted color bands with stenciled letters.
   1. Provide stenciled letters and flow arrows in the sizes as indicated in Table 15055 - 1. Dimensions are in inches.

PART 3 - EXECUTION

3.1 IDENTIFICATION
A. Equipment and Apparatus:
   1. Label equipment and apparatus with one inch high white letters engraved on 1-1/2 inch high black laminated plastic or manufacturers standard nameplates securely fastened to metal panels, showing function and unit number of item.
   2. Use 1/2 inch high white letters engraved on 1 inch high, black, laminated plastic nameplates identifying manufacturer and function of equipment to identify devices including controls and switches. Provide same type nameplates on front cover for each pilot light and for mode of operation selector switches. Label positions of mode selector switches AUTOMATIC/OFF/MANUAL.
   3. Provide nameplates for components located in control cabinets to show symbol used on schematic diagram to represent component. Label control cabinet terminals using same symbols and identification corresponding to that shown on schematic diagram.

B. Piping:
   1. General:
      a. Identify exposed piping systems by means of colored, stenciled, or prefabricated legends with flow arrows. Apply after painting and cleaning of piping and insulation is completed.
      b. Apply legend and flow arrow at valve locations; at points where piping enters or leaves wall, partition, bulkhead, cluster or piping, or similar obstruction; and at approximately 20 foot intervals on pipe runs.
      c. Make no changes in location and spacing without prior approval of the Contracting Officer.
d. Wherever two or more pipes run parallel, apply printed legend and other markings in close proximity, in either vertical or horizontal linearity, as appropriate.

e. Locate identifications so as to be conspicuous and legible at all times.

2. Stencil legends and bands on piping showing service and direction of flow as specified in Section 01086, "Color Codes and Color Standards".

3. Painting and Color coding of exposed piping and termination of piping is specified in Section 01086, "Color Codes and Color Standards" and Section 09920, "Interior Painting".

C. Valves:

1. Identify valves with 1-1/2 inch diameter, 18 gauge, AISI, stainless steel tags.

2. Designate appropriate service on each tag with 1/4 inch stamped black-filled letters and valve number with 1/2 inch stamped black-filled numbers.

D. Orifice Flange and Venturi Tube:

1. Identify each orifice or venturi tube with integral tab or stainless steel tag.

2. Stamp on tag differential multiplier, orifice bore, rate of flow, and equipment served.

3.2 INSTALLATION

A. Cement nameplates with epoxy type adhesive on equipment and apparatus.

B. Install labels to adhere tightly and neatly to pipe. Remove completely and reapply any labels that do not adhere, using manufacturer’s recommended adhesive.

C. Affix labels to surface of control and switch boxes by means of sheet metal rivets. Cement labels to surface with permanent adhesive when rivets cannot be used.

D. Fasten tags securely to valves, orifice flange, venturi tube with brass jack chain, so as to permit easy reading.

E. Mount valve charts in aluminum frames with clear Lucite front cover in locations as directed.

F. Fire Protection and Suppression System:

1. Stencil legends on piping as shown to identify service and direction of flow.

2. Stencil vent shaft and fan shaft identification as shown on piping adjacent to angle hose valves in tunnels.

3. Stamp information on identification plates as shown and fasten to sleeve on Siamese fire department connections for tunnel systems as shown.

3.3 FIELD PAINTING

A. Piping systems shall be color coded as per Section 01086, “Color Codes and Color Standards”.

B. Field painting of piping systems shall be per Section 09920, “Interior Painting" for interior locations and Section 09970, “Coatings for Steel” for exterior locations.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 15001, “Mechanical Systems - General”.

END OF SECTION 15055
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section specifies the furnishing and installing of piping, fittings, valves, drains, piping specialties for sanitary drain, waste, vent piping, storm, subsoil, underdrain, domestic hot and cold piping, equipment drains, natural gas piping, heating, chilled, condenser piping, steam piping, refrigerant piping, and supporting devices.

1.2 REFERENCED STANDARDS

A. American Society of Mechanical Engineers (ASME):

1. ASME B16.5 - Pipe Flanges and Flanged Fittings NPS 1/2 Through NPS 24 Metric/Inch Standard
2. ASME B31.5 - Refrigeration Piping and Heat Transfer Components

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM A53/A53M - Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless
2. ASTM A74 - Standard Specification for Cast Iron Soil Pipe and Fittings
3. ASTM B8 - Standard Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft
5. ASTM D2000 - Standard Classification System for Rubber Products in Automotive Applications
6. ASTM D2513 - Standard Specification for Thermoplastic Gas Pressure Pipe, Tubing, and Fittings
7. ASTM F1476 - Standard Specification for Performance of Gasketed Mechanical Couplings for Use in Piping Applications

C. Plumbing & Drainage Institute (PDI):

1. PDI/PLUMB WH 201 - Water Hammer Arrester Standard

1.3 SUBMITTALS

A. Shop Drawings: Shop drawings to include, but not be limited to indicate the following: Pipes and piping layout, locations and types of pipe hangers and supports, valves, clean-out deck plates and wall plates, escutcheons, gauges, expansion joints, guides and anchors, air eliminators, pipe sleeves, and drains.

B. Product Data: Include complete manufacturer's literature for material and equipment including manufacturer's recommendations for use and installation.

C. Certification.

1.4 QUALITY ASSURANCE

A. The following applicable Codes, Regulations, Reference Standards, and Specification sections referenced in Section 15001, "Mechanical Systems - General" also apply to this section. When requested provide the contracting officer with manufacturer's certificate that materials meet or exceed minimum requirements to comply with ASME, ASTM, AISI, and other applicable standards.

B. Qualify and certify welders employed in the Work in accordance with the standards of the American Welding Society or, if applicable, to be NCPWS qualified welders under rules established in the Welding Qualifications of the ASME Boiler and Pressure Vessel Code.

C. Test and sterilize piping as specified in Section 15990, "Testing and Balancing".

PART 2 - PRODUCTS

2.1 PIPE AND PIPE FITTINGS

A. General:

B. Sanitary Drain, Waste, and Vent Piping:

1. Piping underground shall be service weight hub and spigot cast iron pipe and shall extend to above the floor. Joints shall be positive double seal elastomeric compression joints.

2. Piping above grade, 1-1/2 inches or smaller and vent piping, may be threaded galvanized schedule 40 steel or DWV copper. 2 inch and larger pipe shall be service weight cast iron hub and spigot or hubless.
3. Fittings shall be galvanized cast iron drainage fittings for threaded piping, cast iron soil fittings for hub and spigot piping, and hubless piping, DWV copper for DWV copper piping.

C. Storm, Subsoil and Underdrain Drainage Piping:

1. Piping below grade - Service weight hub and spigot cast iron soil pipe and fittings with elastomeric joints as specified above.

2. Piping above grade - Service weight hub and spigot or hubless cast iron pipe and fitting.

3. Subsoil piping shall be corrugated polyethylene perforated tubing with snap-on fittings or perforated schedule 40 PVC sewer pipe with solvent weld fittings.

4. Track drainage piping shall be schedule 40 PVC sewer pipe.

D. Domestic Hot and Cold Water Piping:

1. Piping below grade, 2-1/2 inches and smaller, shall be Type K copper with wrought copper fittings; piping 3 inches and larger shall be cast iron AWWA class 150 water main with mechanical joint fittings.

2. Piping above grade shall be Type L copper with wrought copper fittings; piping 3 inches and larger may be schedule 40 galvanized pipe with threaded or grooved couplings and fittings. No sharp edged orifice type reducers shall be used in grooved pipe systems.

3. Provide lead-free solder for soldered joints.

E. Equipment Drains and Relief Valve Piping:

1. Drain piping from air dryers, automatic air vents, pump bases, air handling units, etc., shall be Type L hard drawn copper, not less than 3/4 inch diameter or the connection size, whichever is larger. Condensate drains shall be trapped. Extend equipment drain piping to a suitable drain.

2. Relief valve piping shall be Type L hard drawn copper or Schedule 40 steel, not less than valve outlet size. Extend discharge piping to a hub drain or floor receptor as required by local codes.

F. Natural Gas Piping:

1. Piping below grade - Schedule 40 black steel pipe conforming to ASTM A53 with factory fabricated steel fittings, threaded or welded. Buried piping shall be protected against corrosion by a factory applied wrapping, following the recommendations of the local gas company. Field-fabricated joints shall be similarly protected. Non-ferrous pipe with tracer wire may be used if approved by local governing authorities.

2. Underground gas distribution piping may be polyethylene plastic gas pipe SDR 11 conforming to ASTM D2513 only when approved for use with 5 psi medium pressure distribution by both the Gas Utility Company and local building officials, and shall be listed by IAPMO.

   a. Plastic pipe shall be buried in its entirety and shall not run under or within any structure and be furnished with a copper trace wire.

   b. Connection of such plastic pipe to metallic pipe shall be by means of an approved compression coupling with insert.

   c. Joints in such plastic pipe of 1-1/2 inches and smaller shall be made by a approved coupling socket weld fitting or compression fitting, if approved by local code; 2 inches and larger may be joined as described above or by heat fusion method, but such work shall be in accordance with the manufacturer's recommendations.

   d. Meter and regulator risers shall be made with pre-bent factory coated steel piping joined as described in (b) above. Such steel piping shall be a 3 foot steel riser and approximately 1 foot long horizontal steel section with compression coupling to attach to the polyethylene pipe.

   e. Where plastic pipe joins to building, exposed pipe shall be steel. Exposed metal on compression couplings shall be wrapped and sealed to prevent corrosion.

   f. Pipe shall be permanently marked at maximum 2 foot intervals with the following minimum information:

      1) Manufacturer's name and the word "Natural Gas".

      2) Material designation.

      3) SDR 11.

      4) IAPMO listing.
3. Piping above grade - Schedule 40 black steel pipe conforming to ASTM A53 with threaded black malleable iron fittings. Piping 2-1/2 inches and larger shall be welded. Welded fittings shall be factory fabricated schedule 40 black steel.

G. Heating, Chilled and Condenser Water Piping:
1. Piping above grade - Scheduled 40 black steel pipe, threaded, welded or with grooved fittings, 150 pound flanges, or 150 pound malleable iron screwed fittings; or Type L hard drawn copper with wrought copper fittings.
2. Steel Piping 2-1/2 inches and below shall be threaded, piping 3 inches and above shall be flanged, welded or grooved. No sharp edged orifice type reducers shall be used in grooved pipe systems.
3. Piping below grade: AWWA Class 150 cast iron mechanical joint pipe and fittings.

H. Low Pressure Steam Piping:
1. Piping above grade - Schedule 40 black steel pipe, welded, 150 pound flanges, or 150 pound malleable iron screwed fittings.
2. Piping 2-1/2 inches and below shall be threaded, piping 3 inches and above shall be welded.

I. Condensate Piping: Schedule 80 seamless black piping.

J. Refrigerant Piping: Seamless ACR copper tubing, Type L, hard drawn with wrought or bronze solder joint fittings.

2.2 VALVES, COCKS, AND SPECIALTIES
A. Materials: Bronze or cast iron per local codes with screwed or flanged ends for steel pipe and solder ends for copper pipe.

B. Gate Valves: Rated for 200 psig WOG:
1. 2-1/2 inches and below - Threaded for steel pipe, and solder for copper pipe.
2. 3 inches and above - Flanged.

C. Ball Valves: Rated for 200 psig WOG. 2-1/2 inches and below, - Threaded.

D. Check Valves (Domestic Water System):
1. Swing check valve with bronze or composition disc rated for 200 psig WOG.
2. 2-1/2 inches and below - Threaded.

3. 3 inches and above - Flanged.

E. Water Balancing Cocks: Provide cocks with memory stop.

F. Backflow Preventer:
1. Double check valve assembly consisting of two independently operating, spring loaded check valves, two gate valves, and four test cocks for field testing.
2. Provide reduced pressured type as indicated on Contract Drawings.

G. Water Hammer Arrestor: Provide arrestors sized in accordance with PDI/PLUMB WH 201.

H. Butterfly Valves: Butterfly valves may be used in lieu of gate valves on chilled water and hot water heating lines rated to 150 psig.

I. Backwater Valves: Bronze swing check assembly, offset type, with sheargate and removable handle.

J. Refrigerant Valves:
1. Globe and Angle Valves: Forged brass or bronze alloy with packed stem and seal cap.
2. Check Valves: Spring-loaded, forged brass or bronze alloy body with solder connections.
3. Relief Valves: Forged brass bodies with nonferrous corrosion resistant internal working parts.
4. Solenoid Valves: Two-position, direct acting or pilot operated type, UL listed, with manual opening stem and constructed for servicing without removal from lines. Valves shall have coil housing, stainless steel enclosing tube, replaceable seat, and proper inlet and outlet connections for the type of pipe containing the valve.

K. Gas Cocks:
1. Cocks on 2 inch lines and smaller shall be threaded.
2. Cocks on 2-1/2 inch lines and larger shall be flanged pattern.
3. Gas cocks at boilers shall be lubricated plug type.
4. Provide removable handles for plug cocks.
5. Other special type valves or patterns shall be used where required.
L. Gauge Cocks and Manual Air Vents: Provide brass, lever handle cock, 1/4 inch FPT, as shown on the drawings or as specified herein.

M. Dielectric Unions: Provide dielectric unions at piping connections (except not to valves) between dissimilar metals. Dielectric nipples may be used in place of dielectric unions. Bronze and brass valves are not acceptable substitutes for dielectric unions.

2.3 TEST AND MEASURING DEVICES

A. Thermometers:
1. Thermometers shall be red reading mercury type with 9 inch scale and 3-1/2 inch stem, nonferrous case, bypass separable socket, and glass front. Style shall be straight, angle, or adjustable as required for easy reading from normal eye level.

2. Range shall be appropriate for the temperature of the measured fluid, and accuracy shall be within 1 percent over entire scale.

B. Test Plugs:
1. Test plugs shall be provided where shown on the drawings and at other locations required for testing and balancing purposes. Fittings shall be 1/4 inch MPT to receive a temperature probe 1/8 inch o.d. Fittings shall be solid brass with valve core of Nordel fitted with a cap and gasket.

2. Provide the Authority with six 5 inch stem pocket testing thermometers, 25 degrees F to 125 degrees F for chilled water and 30 degrees F to 220 degrees F for hot water. Also provide a pressure gauge with a fitting compatible with test plugs.

C. Pressure Gauges:
1. Gauges shall be Bourdon tube type with 4-1/2 inch dial, metal case, glass front, and bronze or brass tube and mechanism. Connection shall be 1/4 inch bottom or back as required for easy reading from normal eye level.

2. Range shall be appropriate for the pressure of the measured fluid, and accuracy shall be within 1 percent over entire scale.

3. A lever handle cock, as specified above, and snubber shall be installed at each pressure gauge.

D. Flow Sensors and Flow Meters: Flow sensors shall be capable of measuring total pressure and static pressure of the fluid being conveyed with an appropriate range for the flows expected to be encountered. Use in conjunction with a remote meter having the capability of measuring the resultant velocity pressure for conversion into flow.

2.4 FLANGES

A. Unless otherwise shown, Flanges shall be 150 pounds, A.S.A. forged steel, raised face, weld neck or slip-on.

2.5 HEATING, CHILLED AND CONDENSER WATER SPECIALTIES

A. Strainers: Cast iron, Y-pattern, 125 psi ANSI, 125 psi working pressure WOG, with brass or stainless steel screen and tapped for blowdown connection. Provide per the following:

<table>
<thead>
<tr>
<th>Size (inches)</th>
<th>Perforations</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/4 to 2-1/2</td>
<td>0 mesh screen</td>
</tr>
<tr>
<td>2-1/2 to 4</td>
<td>0.057</td>
</tr>
<tr>
<td>5 and up</td>
<td>0.125</td>
</tr>
</tbody>
</table>

B. Check Valves: Cast iron body, non-slam design.

C. Dual Units: Bronze body, with check valve, stainless steel spring, test lever, strainer, 30 psi relief setting, 12 psi regulator setting.

D. Automatic Air Vents: Instant acting float actuated, valved to isolate for service, discharge piped to drain.

E. Expansion Tanks: Welded steel, ASME coded and stamped for 125 psig working pressure, as shown on the Contract Drawings.

2.6 FLEXIBLE PIPE CONNECTORS

A. Corrugated inner tube of 321 stainless steel with outer braided cover of same material, flanged, and with the following minimum overall lengths:

<table>
<thead>
<tr>
<th>Pipe Size (inches)</th>
<th>Minimum Length (inches)</th>
</tr>
</thead>
<tbody>
<tr>
<td>5 and less</td>
<td>18</td>
</tr>
<tr>
<td>6 and 8</td>
<td>22</td>
</tr>
<tr>
<td>10 and 12</td>
<td>26</td>
</tr>
<tr>
<td>12 and 14</td>
<td>28</td>
</tr>
</tbody>
</table>

2.7 HANGERS AND SUPPORTS

A. Pipe Hangers, Upper Attachments:

1. Individual expansion bolts.
2. Self-drilling expansion shells for 3 inch pipe and smaller may be used in existing concrete structures.

B. Hanger Rods: Galvanized or cadmium plated steel, thread rods, with locknuts.

C. Pipe Hangers, Lower Attachments: Use lower attachments for individual runs of pipe as follows, unless indicated otherwise:
   1. Steel piping up to 5 inches: steel clevis.
   2. Steel piping 6 inches and larger, not subject to thermal expansion: steel clevis and saddle.
   3. Cast iron pipe, sizes: Steel clevis.

D. Vertical Pipe Supports:
   1. Intermediate floors use extension pipe clamps.
   2. At top of risers, use hangers as specified above.

E. Trapeze Hangers:
   1. Where numerous pipes are run in parallel to one another, they may be supported from a trapeze type hanger arrangement. Use roller supports to support each run of piping on trapeze hangers to permit independent movement of individual pipes.
   2. Piping supports: Consist of channels, fittings, pipe brackets, pipe rollers, pipe clamps, post bases, stud nuts, as required to properly support and hang piping.

F. Stiff-legs or Stanchions: Provide stiff-legs or two-leg stanchion supports in cases where support from overhead structure is not possible. Provide pipe rollers for pipe rigidly supported from floor.

G. Alignment Guides: Guides to be constructed with steel base and T-bar with teflon or graphite plates bonded to the steel components to allow minimum static friction and self-lubrication for unlimited movement. Factory paint units in accordance with the specified requirements. Weld guide base to the pipe.

H. Hanger and Support Rust-Proofing: For materials exposed to weather use galvanized steel parts unless otherwise noted.

2.9 PIPE GUIDES

A. Guides: Factory made cast semi-steel or heavy fabricated galvanized steel, consisting of two bolted outer cylinder sections and base with a two section guiding spider bolted or wedged tight to pipe.

B. Design guides to clear pipe insulation and to prevent over travel of spider and cylinder.

C. Minimum 8 inches long and spiders not less than the following:

<table>
<thead>
<tr>
<th>Pipe Size (inches)</th>
<th>Spider length (inches)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-1/2 and smaller</td>
<td>2</td>
</tr>
<tr>
<td>2 to 3</td>
<td>2-1/2</td>
</tr>
<tr>
<td>4</td>
<td>3</td>
</tr>
<tr>
<td>5 and larger</td>
<td>3-1/2</td>
</tr>
</tbody>
</table>

2.10 EXPANSION BOLT ANCHORS

A. Anchors: Consist of bolt, expander, star lock washer, and nut.

B. Fabricated of stainless steel, including expander and star lock washer.

2.11 SELF-DRILLING ANCHORS

A. Self-drilling expansion type with self cutting annular broaching grooves.

2.12 PIPE SLEEVES

A. Minimum two sizes larger than pipe size or large enough to accommodate the carrier and covering, and long enough to project 2 inches beyond walls, roof, or floor slabs.

B. Through interior masonry unit walls, use black steel or formed galvanized sheet steel.

C. Through poured concrete interior walls and ceilings, use cast iron with anchor flanges.

D. Pipe sleeves through exterior walls with waterproofing or dampproofing: Cast iron, pressure sealing with membrane clamp; cast body with external fins, internal pressure rings and grommet, and pressure clamp with stainless steel bolts; oversize steel sleeve with neoprene sealing rings. Schedule 40 steel pipe sleeves with waterstop rings may be used for below grade exterior wall with waterproofing or dampproofing. Use “Thunderline Link Seal” or approved equal to waterproof the joint between the sleeve and concrete where hole must be core drilled through exterior waterproofed wall.
2.13 ESCUTCHEON PLATES

A. Finished Area: Chromium plated, pressed or stamped brass, one piece, or split pattern, held in place by internal-spring or set screw.

B. Unfinished Areas: Galvanized metal disk or plates.

2.14 SEALANTS FOR SEALING OF SLEEVES

A. Sealant materials: Single or double compound, primerless, non-sagging type in neutral color.

B. Sealants are specified in Section 07900, “Seals and Sealants”.

C. Butyl: One-part, gun grade, suitable for both horizontal and vertical joints for exterior sleeve penetrations.

D. Use high temperature sealant where indicated on Contract Drawings.

2.15 ACCESS PANELS

A. General: Provide prefabricated wall and ceiling panels for service access to equipment.

B. Access doors are specified in Section 08313, “Access Doors and Frames”.

2.16 CORROSION CONTROL

A. Where shown, underground ferrous pressure pipe and steel encasement for pressure pipes shall be bonded for electrical continuity and provided with test stations.

B. Insulating connections shall be in accordance with Section 13100, "Corrosion Control".

PART 3 - EXECUTION

3.1 GENERAL

A. Materials and equipment shall be installed in accordance with the approved recommendations of the manufacturer and Drawings.

3.2 EXCAVATING AND BACKFILLING FOR PIPING

A. Excavation: Excavate trenching for underground piping to the required depth to insure sufficient cover over the pipe.

1. Cut the bottom of the trench or excavation to uniform grade so that pipe will bear on undisturbed soil.

2. Should rock be encountered, excavate 6 inches below pipe, fill with pea gravel and tamp well.

3. Carefully lay out alignment of pipe trenches to avoid obstructions. Secure approval of proposed route of pipe before any cutting is begun.

4. The bottom of trench shall be shaped to give substantially uniform support to the lower third of each pipe.

B. Backfill: After pipe lines have been inspected, tested, and approved, backfill trenches or excavation with material as recommended by the manufacturer of the type of pipe used. Backfill under buildings and driveways with selected materials as specified in Section 02220, ”Grading, Excavating, and Backfilling”.

C. Restoration: Compact backfill where trenching or excavation is required in improved areas such as pavements, walks, lawns, and similar areas, to a condition equal to undisturbed earth, and restore surface of the area to the condition existing prior to the trenching or excavating operation.

D. Backfilling and excavating shall be in accordance with Section 02220, ”Grading, Excavating, and Backfilling”.

3.3 GENERAL PIPING INSTALLATION

A. Installation of Underground Pipe: Each pipe shall be laid true to line and grade and in such manner as to form a concentric joint with adjoining pipe and to prevent sudden offsets to flow line. As work progresses, the interior of the pipe shall be cleaned of dirt and foreign materials of any kind. Where cleaning after laying is difficult, a suitable swab or drag shall be kept in the pipe and pulled forward past each joint immediately after joining has been completed. Trenches shall be kept free from water during pipe joining work. When work is not in progress, open ends of pipe fittings shall be securely closed to the satisfaction of the Contracting Officer so that no water, earth or other substance will enter pipe or fittings.

B. Erection of Pipe above Grade:

1. Piping shall be properly supported and adequate provisions shall be made for flashing, expansion, contraction, slope and anchorage. Piping shall be cut accurately for fabrication to measurements established at the construction site. Pipe shall be worked into place without springing and/or forcing, properly clearing structural elements, finished rooms, windows, doors, and other openings and equipment. Cutting or other weakening of the building structure to facilitate installation will not be permitted.

2. Changes in direction shall be made with fittings, except that bending of pipe will be permitted providing a hydraulic pipe bender is used. Bent pipe showing kinks, wrinkles or other malformation will not be acceptable.

15060 - 6

DART Standard Specifications – May 2016
C. Joints:

1. Screwed. Make screwed joints using machine-cut USASI taper pipe threads. Apply a suitable joint compound to the male threads only. Ream the pipe to full inside diameter after cutting. All-thread nipples are not permitted.

2. Dissimilar Metals. Make joints between copper and steel pipe and equipment using insulating unions such as Crane Company No. 1259; EPCO as manufactured by EPCO Sales, Inc.; or an approved substitution.

   a. Prior to making joints, cut pipe square and ream to full diameter. Clean exterior of pipe and socket. Apply a thin coat of suitable fluxing compound to both pipe and socket, and fit parts together immediately.
   b. Heat assembled joint only as required to cause the solder to flow. Run the joint full, slightly beaded on the outside, and wipe to remove excess solder.
   c. Use silver brazing alloy or Sil-Fos on refrigerant piping and on underground piping. Use 95.5 solder on other nonpotable water piping. For domestic water piping, use lead-free solder.

5. Flanged.
   a. Prior to installation of bolts, accurately center and align flanged joints to prevent mechanical prestressing of flanges, pipe and equipment. Align bolt holes to straddle the vertical, horizontal or north-south centerline. Do not exceed 3/64 inch per foot inclination of the flange face from true alignment.
   b. Use flat-face companion flanges only with flat-faced fittings, valves or equipment. Otherwise, use raised-face flanges.
   c. Install proper gaskets, suitable for intended service and factory cut to proper dimensions. Secure with a suitable gasket cement.
   d. Use ANSI nuts and bolts, galvanized or black to match flange material. Use 316 stainless steel nuts and bolts underground. Tighten bolts progressively to prevent unbalanced stress. Draw bolts tight to ensure proper seating of gaskets.
   e. Use carbon steel flanges conforming to ASME B16.5. Use slip-on type flanges on pipe only. Use welding neck type flanges on fittings. Weld slip-on flanges inside and outside.
   f. Keep flange covers on equipment and shop-fabricated piping until ready to install in system.

6. Hubless. Install according to manufacturer’s recommendations, using recommended tools.

7. Mechanical Joints. Provide a stuffing box type mechanical joint adapted to use gasket, cast iron gland and bolts. Coat bolts with bitumastic enamel. Use one of the following or approved equal.
   a. Doublex Simplex Joint manufactured by the American Cast Iron Pipe Company, Birmingham, Alabama.
   c. Boltite Joint manufactured by the McWane Cast Iron Pipe Company, Birmingham, Alabama.
   d. Flexklamp manufactured by the National Cast Iron Pipe Company, Birmingham, Alabama.

8. Compression Joints for Cast Iron Water Pipe. Use Beltite, Tyton or Grip-Tite compression joints. Install in accordance with the manufacturer’s recommendations and with ASTM C443. Use only with pipe and fittings designed for compression gaskets. Provide adequate concrete thrust blocks at changes of direction, as recommended by manufacturer.

10. Ring-Tite Joints. Furnish joints for installation according to manufacturer’s recommendations. Provide adequate concrete thrust blocks at changes in direction, as recommended by manufacturer.
PIPING AND ACCESSORIES

   a. With Schedule 80 or heavier, use threaded joints. Provide sharp, clean pipe dies and Teflon thread tape. Make joints in strict accordance with manufacturer’s recommendations.
   b. With Schedule 40 or lighter, use solvent cement method in strict accordance with manufacturer’s recommendations.

13. Ball Joints. Where shown, provide flexible ball joints, made of carbon steel. Ball joints must have 15 degrees of angular flexibility. Use welded or flanged ends, as required. Furnish with 11N gaskets.

D. Branch Connections:

1. For Pipe 2-1/2 Inches and Smaller: For threaded piping, use straight size of reducing tee. When branch is smaller than header, a nipple and reducing coupling or swaged nipple may be used.

2. For 3 Inches Through 36 Inches: For welding piping, when branch size is the same as header size, use welding tee. Use Weldolet when branch is smaller than header. For threaded branch connections, use 3000-pound full coupling welded to header.

E. Arrangement: Piping shall be run parallel to building lines and shall be arranged so as not to interfere with removal of other equipment or devices nor to block access to doors, windows, manholes or other access openings. Piping shall be arranged so as to facilitate maintenance and operation and adhere to code required clearances and positioning. Piping shall be placed and installed so that there will be no interference with the installation of the equipment, ducts, etc. Piping shall be installed to ensure noiseless circulation. Valves and specialties shall be placed to permit easy operation and access. Piping shall be erected and pitched to ensure proper draining. Piping shall be installed so as to avoid liquid or air pockets throughout the piping system. Eccentric reducers with flat side up shall be used wherever changes in pipe size would cause an air trap. Manual air vents shall be installed at high points in chilled water and hot water heating systems with piping to drains. Provide automatic air vents in condenser water piping. Drain valves shall be installed in low points or traps in the piping system. Expansion and contraction of piping shall be provided by expansion loops, bends or expansion joints to prevent injury to connection, piping, equipment or the building.

F. Slope: Minimum slope of piping shall be in accordance with Table 15060 - 1 unless otherwise specifically shown on the drawings or specified.

G. Connections for Removal: Install flanged connections or unions on bypasses, ahead of traps and at connections to equipment, where shown on the drawings and where required to facilitate convenient removal of equipment.

H. Sleeves: Provide sleeves around pipes passing through walls, floors, ceiling, partitions, structural members, or other building parts.

I. Natural Gas Piping:

1. Gas piping within the building shall be run exposed or enclosed in a sleeve vented to the outdoors, if required by local codes.

2. Piping shall be run straight without sags or traps and shall be pitched as to drain back to the riser and from the riser to the system low points. A dirt pocket consisting of a nipple and a cap shall be provided at the bottom of each riser and at low points of the gas distribution system. Provide access for cleaning of same dirt pocket.

3. Provide connections throughout the system to allow for adequate horizontal and vertical expansion and contraction of piping.

4. Provide a pressure regulator, with relief piping routed to the outdoors, at each gas consuming device or group of devices, where such devices operate at a pressure less than that of the gas supply line. Refer to the Drawings for additional required regulators with others furnishing gas burning equipment.

J. Refrigerant Piping:

1. Refrigerant piping shall not be run concealed in walls or partitions nor underground or under the floor except as indicated on the drawings. Where pipe passes through building structure, pipe joints shall not be concealed, but shall be located where they may be readily inspected.

2. Refrigerant piping shall be brazed with silver solder or “Sil-Fos”. The inside of tubing and fittings shall be free of flux. The parts to be joined shall be cleaned bright with emery cloth and shall be heated to a temperature slightly greater than the solder flow point, and shall be kept hot until the solder has penetrated the full depth of the fitting. Joints
3. Refrigerant lines shall be installed so that the gas velocity in the evaporator suction line is sufficient to move the oils along with the gas to the compressor. Where equipment location requires a vertical riser, the line size shall be as shown and installed to provide sufficient gas velocity or a double riser shall be installed as shown on the drawings. The larger riser shall have a trap, of minimum volume, formed by the use of 90 degree and 45 degree ells. The small riser shall be located with its inlet just upstream of the trap and shall connect to top of the horizontal line. Valves shall not be installed in risers except as shown on the Contract Drawings.

4. Refrigerant driers, sight glass liquid and moisture indicators, and strainers shall be provided in refrigerant piping for remote installations when not furnished by the manufacturer as part of the equipment. Driers shall be installed in liquid line with service valves and a valved bypass line which are the same size as liquid line in which the drier is installed. Drier of 50 cubic inches and larger shall be installed with the cover and the full cartridge being easily removable.

5. Sight glass liquid and moisture indicators shall be installed in the liquid line downstream of the drier. Connections shall be the same size as the liquid line in which it is installed, up to 7/8 inch; 1-1/8 inches and larger shall have a 1/4 inch indicator installed in the "By-pass" position.

6. Strainers shall be located close to equipment they are to protect. A strainer shall be provided in the refrigerant liquid supply to expansion valves. Strainers shall be installed with screen down and in direction of flow as indicated on the strainer's body.

7. Refrigerant Charging Valve: A valved refrigerant charging connection shall be provided for each field piped refrigeration system when not provided as part of the condensing unit. The valve shall be located on the reducing outlet of a full size tee in the liquid line, upstream from the refrigerant drier and sight glass moisture indicator. Valves shall be of the seal cap type, 1/2 inch minimum port size.

8. Solenoid valves shall be installed in horizontal lines with the stem vertical and with flow in direction indicated on the valve. If not incorporated as an integral part of the valve, strainers shall be provided upstream of each solenoid valve, with a service valve upstream of the solenoid valve. The solenoid valve shall be disassembled according to the manufacturers’ recommendations when brazing the valve into the piping.

K. Plates: Provide spring clamp plates (escutcheons) where pipes are exposed in finished locations of the building and run through walls, floors or ceilings. Plates shall be set tight on the pipe and to the building surface.

L. Protection: Properly cap or plug open ends of pipes and equipment to keep dirt and other foreign materials out of the system.

3.4 HANGERS, SUPPORTS, ANCHORS, AND GUIDES

A. Supports, hangers, anchors, and guides shall be provided for horizontal and vertical piping.

B. The Contractor shall be responsible for structural integrity of supports. Structural hanging materials shall have a factor of safety of 5.

C. Anchor points and pipe guides, as shown on drawings or as required, shall be located and constructed to permit the piping system to take up its expansion and contraction freely in opposite directions away from the anchored points.

D. Guide points for expansion joints shall be located and constructed wherever required or shown on drawings, and at each side of an expansion joint or loop, to permit only free axial movement in piping systems, but shall not be further than 3 pipe diameters on each side of joint. Guides for pipe with expansion joints shall be of the roller type securely welded to structural steel.

E. Maximum spacing between pipe supports for steel, cast iron, plastic or copper pipe shall be per local code to prevent excessive stress (this does not apply where there are concentrated loads between supports).

F. For copper tubing, supports shall be especially designed for copper tubing, and shall be of exact O.D. diameter of tubing and shall be copper plated.

G. Roller type supports shall be used for pipes subject to axial movement. They shall be braced so that movement occurs in roller rather than support rods.

H. Provide steel required for support of pipes other than steel shown on structural engineer's drawings.
I. In general, piping shall be supported from only structural building members or approved steel insert embedded in concrete. Where structural members must be increased in strength and/or additional members added to provide for piping support as shown on plans, the mechanical contractor shall include such anticipated costs in his pricing.

3.5 SUPPORT OF VERTICAL RISERS

A. Vertical piping shall be installed in such manner that its weight plus the weight of its contents, covering, and appurtenances cannot be concentrated at locations on slabs, beam, and other structural elements to exceed the carrying capacity of those members as approved by the Contracting Officer.

B. Riser clamps at each floor may be used only for risers which are constructed in segments, with joints capable of taking up longitudinal expansion and contraction, such as cast iron soil piping and storm drainage risers. Steel or copper water risers 2-1/2 inches and smaller may also be supported on riser clamps at each floor when provided with expansion loops or expansion joints, such that no straight rise exceeds 10 floors in structural members which in turn are supported directly from the building structure.

C. Risers having solid joints shall be capable of standing on the lowest available support when expanded and hanging from the highest available support when contracted. The weight of liquid content of a riser shall rest on a vertical “stiff leg” support at the bottom of the riser. Such risers 3 inches and larger shall be supported by one of the following methods:

1. If the riser turns upward at a single elbow and rises straight from that point, and if the elbow is so located that it can be supported by a pipe “stiff leg” to a foundation ongrade or from a suitably designed structural element, this preferred method of riser support shall be used. Such risers shall be guided only, not clamped, at floor penetrations above the support point. Horizontal piping connected to each such riser shall be supported 3 hangers distant from the riser on spring hangers to take up vertical riser movement.

2. Where risers are offset horizontally above the first turn-up and then rise again, each rise must be supported as a separate riser, either at its turned-up elbow or at a single anchor point at some level of the riser. The building structure at the point of support shall be capable of supporting the weight of the riser and its contents. Horizontal piping connected to each such riser shall be supported 3 hangers distant from the riser on spring hangers to take up vertical riser movement, as determined by the location of the main riser support.

3. For tall pipe risers, each rise may be broken into segments by expansion joints and anchored to suitably designed building structure individually. The weight of liquid content, however, can only be supported at the segment which includes the turned-up elbow.

4. In buildings where added structural supports for large riser weights cannot be provided economically, the Contractor shall support each riser with welded clamps resting on springs at sufficient numbers of floors so that weight distribution is not concentrated by expansion or contraction.

D. The Contractor shall coordinate the riser support design with the Contracting Officer. He shall submit drawings showing weights, points of support, and details of support or anchoring for approval. The Contracting Officer must approve the proposed method of support before work is started. The Contractor shall bear responsibility for materials and workmanship described in this section and shall ensure that hangers and supports are properly installed.

3.6 CORROSION CONTROL

A. Install insulating devices at connections with non-Authority owned piping, and on each service connection into a structure or building within five feet of the point of entry inside the structure. Locate insulating devices in meter vaults whenever possible.

B. Install insulating devices in accordance with Section 13100, "Corrosion Control".

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 15001, "Mechanical Systems - General".

END OF SECTION 15060
SECTION 15075
VIBRATION ISOLATION AND SOUND CONTROL

PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies furnishing and installing vibration isolation and sound control for mechanical equipment and piping, and supporting devices.

B. Work Included:
1. Support isolation for motor-driven mechanical equipment.
2. Rails or beams for distribution of equipment loading to isolation units.
3. Inertia base frames in conjunction with equipment isolation.
4. Duct sound attenuators.
5. Flexible pipe connectors, refer to Section 15060, “Piping and Accessories”.
6. Pipe sleeves.
7. Flexible ductwork connectors.

1.2 REFERENCE STANDARDS
A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
1. ASTM A36/A36M - Standard Specification for Carbon Structural Steel

B. National Fire Protection Association (NFPA):
1. NFPA 255 - Standard Method of Test of Surface Burning Characteristics of Building Materials

C. Sheet Metal & AC Contractors National Association (SMACNA):
1. SMACNA 1481 - HVAC Duct Construction Standards - Metal and Flexible

D. Underwriters Laboratories, Inc. (UL):
1. UL 723 - UL Standard for Safety Test for Surface Burning Characteristics of Building Materials

1.3 PERFORMANCE CRITERIA
A. Vibration isolation for vibration producing equipment shall be selected on the minimum static deflection recommended by the manufacturer for the specific installation.

B. Sound levels within finished spaces shall fall within the recommended ASHRAE Room Criteria (RC) range for each room type, unless noted otherwise.

C. Sound levels shall be measured four feet above the finished floor with normal occupancy of the space and with equipment operating at full capacity or its normal point of operation which creates the highest noise level. The Contractor shall, when required, verify that equipment noise levels meet the ASHRAE - recommended RC range.

1.4 SUBMITTALS
A. Shop Drawings:
1. Design for concrete inertia block and structural steel bases. Include tabulation of design data on isolators including actual deflection; outside diameter; free, operating and solid heights of isolators; method of attachment; bolt sizes; and type and sizes of anchor plates.
2. Shop drawings for materials and equipment.

B. Product Data: Complete catalog information.
C. Certification.
D. Deflection Measurements: Upon completion of vibration isolation work, prepare and submit to the Contracting Officer a report showing measured equipment deflections for each major item of equipment as indicated.
E. Operation and Maintenance Manuals: Section 15001, "Mechanical Systems".

1.5 QUALITY ASSURANCE
A. The Codes, Regulations, Reference Standards, and Specifications, sections referenced in Section 15001, "Mechanical Systems - General" also apply to this section. When requested, provide the
Contracting Officer with manufacturer's certificate that materials meet or exceed minimum requirements to comply with ASTM, UL, and other applicable standards.

B. Isolating materials shall be supplied by a single supplier to ensure total responsibility. The isolation supplier shall submit for formal approval necessary drawings and installation instructions required for the Project and shall verify vibration and sound levels. Prior to acceptance of the work by the Contracting Officer, the isolation supplier shall inspect the work and furnish the Contracting Officer with written certification that isolation materials furnished by him are installed in a proper manner.

PART 2 - PRODUCTS

2.1 ISOLATION MATERIALS

A. Neoprene Pads: Oil-resistant neoprene sheets, of manufacturer's standard hardness and cross-ribbed pattern, designed for neoprene-in-shear type vibration isolation, and in the thickness required.

B. Cork/Neoprene Pads: Close grained composition cork sheet, laminated between 2 sheets of ribbed, oil-resistant neoprene, in the thickness required.

C. Vibration Isolation Springs: Wound-steel compression springs, of high strength, heated-treated, spring alloy steel; with outside diameter not less than 0.8 times operating height; with lateral stiffness not less than vertical stiffness; and designed to reach the solid height before exceeding the rated fatigue point of the steel.

D. Isolators and Bases:

1. Type 1 Isolators: Precompressed molded fiberglass isolation pads, neoprene-jacketed and stabilized during manufacturer. Pads shall be sized for 40 to 60 psi loading and shall be made of glass fibers produced by a multiple frame attenuation process which generates nominal fiber diameters not to exceed 0.00018 inches. Where the equipment base does not provide a uniform load surface, steel plates shall be bonded to the top of the pads. Neoprene mounts, incorporating completely enclosed metal inserts to permit bolting to the support unit.

2. Type 2 Isolators: Freestanding unhoused, laterally stable spring mounts, incorporating leveling bolts and 1/4 inch thick noise isolation pads. To assure stability, the outside spring diameter shall be equal to or greater than the designed spring operating height, and the horizontal stiffness shall be at least 30 percent greater than the vertical stiffness. Springs shall have a minimum additional travel of 50 percent between the designed operating height and the solid height.

3. Type 3 Isolators: Freestanding, stable spring mounts, shall incorporate vertical limit stops to assure a constant height if the supported weight is removed, and to reduce movement due to wind loads. The limit stops shall be isolated.

4. Type 2 Hangers: Combination spring and fiberglass hangers, incorporating 2 inch thick neoprene-jacketed precompressed molded fiberglass inserts in series with springs, encased in welded steel brackets. The outside spring diameter shall have a minimum of 0.8 times the designed spring operating height, and shall have a minimum additional travel of 50 percent between the design height and solid weight.

5. Type 4 Base: Equipment manufacturers base required, isolators directly attached to equipment.

6. Type 5 & 6 Bases: Structural steel bases, designed and supplied by the isolator manufacturer. The bases are designed with isolator brackets to reduce the mounting height of the equipment. To assure adequate stiffness, the height of the members shall be a minimum of 8 percent of the longest span between isolators, or at least 6 inches.

7. Type 7 Bases: Reinforced concrete inertia bases, the steel members of which are designed and supplied by the isolator manufacturer. The concrete shall be poured into a welded steel channel frame, incorporating relocated equipment anchor bolts, 1/2 inch diameter reinforcing bars on 8 inch centers each way, and isolator mounting brackets to reduce the mounting height of the equipment but yet remain within the confines of the base. The thickness of the bases between isolators, at least 6 inches, or as indicated on the drawings. Where the inertia bases are used to mount pumps, the bases shall be large enough to support the pipe elbow(s).

8. Type 8 Base: Isolation Rail System: Two parallel aluminum rail systems with a continuous neoprene seal shall provide up to 1 inch static deflection. Mount over roof curb on free-standing stable springs.
2.2 DUCT SOUND ATTENUATORS

A. Outer casings of rectangular silencers shall be made of 22-gauge galvanized steel in accordance with SMACNA 1481 and ASHRAE GUIDE recommended construction for high pressure rectangular ductwork. Seams shall be lock formed and mastic filled.

B. Outer casings of tubular silencers shall be made of galvanized steel in the following gauges:

<table>
<thead>
<tr>
<th>Outside Dia.-Inches</th>
<th>Metal Gauge</th>
</tr>
</thead>
<tbody>
<tr>
<td>12 - 22</td>
<td>22</td>
</tr>
<tr>
<td>24 - 40</td>
<td>18</td>
</tr>
<tr>
<td>44 - 48</td>
<td>18</td>
</tr>
<tr>
<td>48+</td>
<td>14</td>
</tr>
</tbody>
</table>

C. Interior partitions for rectangular silencers shall be of not less than 26 gauge galvanized perforated steel.

D. Interior construction of tubular silencers shall be compatible with the outside casings.

E. Filler material shall be of inorganic mineral or glass fiber of a density sufficient to obtain the specified acoustic performance and be packed under not less than 5 percent compression to eliminate voids due to vibration and settling. Material shall be inert, vermin resistant and non-absorbent.

F. Combustion rating for the silencer acoustic fill shall be not less than the following when tested in accordance with ASTM E84, NFPA 255 or UL 723:

1. Flamespread Classification - 25.
2. Smoke Development Rating - 50 (vertical construction) and 0 (tunnel applications).

G. Silencers shall not fail structurally when subjected to a differential air pressure of 8 inches w.c. in positive and negative operating modes.

H. Silencer ratings shall be determined in a duct-to-reverberant room test facility which provides for airflow in both directions through the test silencer in accordance with ASTM E477. The test set-up and procedures shall be such that effects due to end reflection, directivity, flanking transmission, standing waves and test chamber sound absorption are eliminated. Acoustic ratings shall include Dynamic Insertion Loss (DIL) and Self Noise (SN) Power Levels both for FORWARD FLOW (air and noise in the same direction) and REVERSE FLOW (air and noise in opposite directions) with airflow of at least 2000 fpm entering face velocity. Data for rectangular and tubular type silencers shall be presented for tests conducted using silencers no smaller than the following cross-sections:

1. Rectangular - 24 inches by 24 inches by 30 inches, or 24 inches by 36 inches.
2. Tubular - 12 inches, 24 inches, 36 inches and 48 inches.

I. Silencers shall provide dynamic insertion loss and self-noise power levels according to the schedules as indicated in Table 15075 - 1.

J. Static pressure loss of silencers shall not exceed those listed in the silencer schedule as the airflow indicates. Airflow measurements shall be made in accordance with ASTM E477 and with applicable portions of ASME, AMCA and airflow test codes. Tests shall be reported on the identical units for which acoustic data is presented.

2.3 PIPE SLEEVES

A. Sleeves shall be formed of 24 gauge sheet metal, pack void areas with 3 pcf density fiberglass and seal ends with resilient mastic. Sleeves shall be 3 inches larger in diameter than pipe.

2.4 FLEXIBLE DUCT CONNECTIONS: TYPE-1

A. Factory assemble fire retardant flexible material bordered on each side with a mechanically bonded three inch wide galvanized steel edging.

B. Flexible material: 32 ounce fiberglass cloth reinforced neoprene sheet, fire resistant, with a tensile strength rating of not less than 450 psi.

C. Neoprene compound: suitable for continuous operation at 300 deg. F, with deformation limited to 10 percent, shrinkage 0 percent, and loss of tensile strength not to exceed 25 percent.

D. Unclamped width of fabric:

1. Not less than three inches for ducts with perimeter length of 150 inches.
2. Not less than four inches for ducts with perimeter greater than 150 inches.

E. Flexible material: Flute crimped to metal edging, with sufficient material lap to prevent loss of bond. Rivet reinforcement of attachment will be permitted.
2.5 **FLEXIBLE DUCT CONNECTIONS: TYPE-2**

A. Flexible connection consisting of two angle frames, fabric connector material, and fabric securing bars; fabricated from material capable of operating for one hour without failure in an ambient temperature 300 deg. F.

B. Flexible connections designed to allow sufficient radial, axial, rotational and lateral movement of fan-motor unit assembly resulting for expansion, contraction and dynamics of air moving unit operation, without unnecessary slack in fabric connector material.

C. Flexible connections and components thereof designed to be airtight and provided in accordance with the code requirements of the National Fire Protection Association.

D. Fabric Material: Not less than 1/8 inch thick; flexible, flame retardant, abrasion resistant; and, able to withstand, without deleterious effect, saturation with grease and oil. Fabricate the fabric material with one longitudinal seam only. Do not use tap bolts for fastening fabric to securing bars. Flexible portion: minimum of 4 inches wide.

E. Fabricate connection frames from structural steel angle sections conforming to ASTM A36/A36M. Companion angle sections: not less than 3 inches by 2 inches by 1/4 inch. Weld frames with full penetration butt welds.

**PART 3 - EXECUTION**

3.1 **INSTALLATION**

A. Except as otherwise indicated, comply with manufacturer's recommendations for selection and application of vibration isolation materials and units. Adjust to ensure that units do not exceed rated operating deflections or bottom out under loading, and are not short-circuited by other contact or bearing points. Remove space blocks and similar devices (if any) intended for temporary protection against overloading during installation.

B. Anchor and attach units to subbases and equipment as required for secure operation and to prevent displacement by normal forces.

C. Adjust leveling devices as required to distribute loading uniformly onto isolators. Shim units as required where leveling devices cannot be used to distribute loading properly.

D. Install inertia base frames on isolator units as indicated, so that a minimum of 2 inch clearance below base will result when frame is filled with concrete and supported equipment has been installed and loaded for operation.

E. Locate isolation hangers as near the overhead support structure as possible.

F. Duct Sound Attenuators: Install in accord with manufacturer's recommendations.

G. Bond flanges of flexible duct collars to ducts and housings to provide airtight connections. Seal seams and penetrations to prevent air leakage.

H. Flexible Pipe Connectors: Install in accordance with manufacturer's recommendations.

I. Piping shall be installed to be concentric with sleeve.

3.2 **EXAMINATION OF RELATED WORK**

A. The installer of vibration isolation materials shall observe the installation of other work related to the vibration isolation work, including other work connected to vibration/isolation work, and, after completion of other related work, but before equipment start-up, shall furnish a written report to the Contracting Officer listing any observed inadequacies for proper operation and performance of vibration isolation materials. The equipment shall not be started until inadequacies have been corrected in manner acceptable to the Contracting Officer. The report shall cover, but not necessarily be limited to the following:

1. Equipment installation (performed as work of other sections) on vibration isolators.

2. Piping connections including flexible connections.

3. Ductwork connections including flexible connections.

4. Passage of piping and ductwork which is to be isolated through walls and floors.

B. Ductwork Treatment:

1. **Noise within the ductwork of the air handling system shall be satisfactorily controlled by the installation of prefabricated duct sound attenuators as recommended by the manufacturer.**

2. **Flexible Connections shall be installed in the ductwork adjacent to air-moving equipment such that when the unit deflects, the inside edges of the connections do not touch.**
3. Install duct sound attenuators as recommended by the manufacturer.

C. Piping Treatment: Piping three supports away from isolated mechanical equipment of inertia bases and AHU mounted on spring isolators shall be isolated from the structure by means of spring hangers in the supporting rods. Hangers shall be Type 2 as specified. Floor mounted piping shall be supported directly on Type 2 spring mounts, as described above. Flexible connectors shall be incorporated in the piping adjacent to isolated equipment where piping swing arm lengths do not provide required freedom of movement.

D. Equipment Room Penetrations: Piping, conduit, ductwork, etc., penetrating floors, ceiling, or partitions of equipment rooms shall be isolated using sleeves as specified herein. Penetrations shall be airtight. Sleeves through floors shall be extended 3 inches above the floor in mechanical rooms in rooms where water piping is installed.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 15001, “Mechanical Systems - General”.

END OF SECTION 15075
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies the furnishing and installing of pumps except for fire pumps, complete with motor drives, and controls and supporting devices.

1.2 SUBMITTALS

A. Shop Drawings.
B. Product Data:
   1. Catalog Cuts.
   2. Performance Curves: Pump performance curves (total dynamic head vs. flow) showing, brake horsepower, KW input, and full load efficiency.
C. Field Testing:
   1. SCADA: Refer to Section 16030, “Testing of Electrical Systems”.
D. Manufacturer's Data: Equipment mounting instructions.
E. Operation and Maintenance Manuals: Section 15001, "Mechanical Systems - General".

1.3 QUALITY ASSURANCE

A. The Codes, Regulations, Reference Standards, and Specifications sections referenced in Section 15001, "Mechanical Systems - General", also apply to this section. When requested, provide the Contracting Officer with manufacturer's certificate that materials meet or exceed minimum requirements to comply with ASTM, NEMA, and other applicable standards.

B. Experience:
   1. Manufacturer: Select a firm regularly engaged in the manufacture of industrial-grade equipment of the type specified herein.
   2. Equipment: Provide documentation that the equipment incorporated into the work duplicates equipment that has been in satisfactory use for a period of five years prior to the Bid Opening of this Project.

1.4 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Temporarily cover the inlet and discharge openings of equipment until final connections are completed.

B. During the construction, store, and protect equipment from being damaged.

PART 2 - PRODUCTS

2.1 GENERAL

A. Select pumps to operate at or near their point of peak efficiency thus allowing for operation at capacities of approximately 25 percent beyond design capacity. In addition, select design impeller diameter so that the design capacity of each pump (GPM and THD) do not exceed 90 percent of the capacity obtainable with maximum impeller diameter at the design speed for that model.

2.2 PUMPS FOR HOT WATER, CHILLED WATER, CONDENSER WATER, AND PLUMBING

A. General Construction:
   1. Pumps shall be centrifugal, frame or in-line mounted with cast iron casings rated for the submersion pressures of the systems which they are to serve and be tested to 150 percent of rated pressure.
   2. Unless otherwise shown, pumps shall be equipped with mechanical seals, with stainless steel shaft mounted on ball or sleeve bearings. Pumps shall be bronze fitted, including bronze impeller. Pumps 3 inch x 4 inch and larger shall be provided so that the impeller furnished shall not exceed 85 percent of the maximum impeller diameter which the casing will accept.
   3. Each pump shall be flexibly coupled to an open, drip-proof motor which shall operate on the appropriate electrical service, at the scheduled rpm. Each pump and motor combination shall be provided so that, with the impeller furnished, the motor will not operate in excess of its nameplate horsepower. Each pump shall be thoroughly cleaned, primed, and then painted with a high quality machine enamel prior to shipment.
   4. Each frame mounted pump and/or motor assembly shall be mounted on a single cast iron or welded steel foundation which, in turn, shall be set and leveled on a housekeeping pad with a mounting base as required in Section 15075, “Vibration and Sound Control”. Each chilled water pump shall be provided with drainage piping to extend over the edge of the concrete base and spill directly into an adjacent floor drain.
2.3 DOMESTIC WATER PUMP UNIT

A. Provide a factory-assembled Constant Pressure Booster System with total flow and head capacity as scheduled.

B. Each unit shall be a duplex unit (unless restricted by local codes) completely assembled on a fabricated steel base with galvanized welded steel or stainless steel suction and discharge header piping, pump suction and discharge gate valves, non-slam check valves, a pressure regulating valve station, bladder-type compression tank sized for design flow and Flow Control with pump sequencing switches and visual flow indicator.

C. The unit shall have a single control cabinet in a NEMA-1 enclosure (NEMA 4 or 4X for exposed or damp or wet locations) with individual pump circuit breakers, magnetic motor starters with temperature compensated overload protection on each phase, pilot lights, HOA selector switches, 120 volts control circuit with separate circuit breakers, and necessary relays cabinet shall be provided with a single point of electrical connection.

D. The individual pump capacities shall be rated at 40 percent and 60 percent of total system demand. The pumps shall be in-line, bronze fitted, single stage with dynamically balanced bronze, enclosed impellers, bronze replaceable wear rings, and bronze shaft sleeves and mechanical shaft seals. Motors shall be close-coupled type, and selected so that they do not operate over their nameplate HP rating throughout the sequence of pump capacity rating.

E. The pumps shall be programmed so that the lead pump shall operate up to 33 percent of the system capacity, the main pump replaces the lead pump at 33 percent to 67 percent of system capacity. For capacities 67 percent to 100 percent the lead pump is restarted.

F. Provide inlet strainer at common inlet to unit, see Section 15060, "Piping and Accessories", or provide as a factory option with the unit.

G. The system pressure shall be stabilized and controlled by a pressure reducing valve station, using a small reducing valve for low flow requirements and a large valve for medium to large capacities.

H. A gauge board with three 3-1/2 inch face pressure gauges and stopcocks shall be provided for suction pressure, pump discharge, pump discharge pressure and system pressure, each gauge shall also be fitted with a pressure snubber.

I. A reliable shutdown system shall be provided to automatically stop the unit during periods of no flow.

J. Provide a low suction pressure shutdown switch on units connection to city mains. Provide a low suction level switch on level/pressure.

K. The unit shall be factory assembled and tested at simulated design conditions. The unit shall be thoroughly cleaned and painted with high quality machine enamel prior to shipment.

2.4 SEWAGE PUMPS AND SUMP PUMPS (VERTICAL WET PIT)

A. Duplex pumps shall be vertical wet pit submerged electric pumps of capacities, arrangement, horsepower, type, speed, and with accessories as scheduled or indicated. Pump units shall be factory assembled and tested.

B. Casing shall be cast iron volute type with flanged suction and discharge. The support column connections shall be cast integral with the casing. Impeller shall be screenless, non-clog type, accurately machined, statically and dynamically balanced, keyed and locked to pump shaft.
C. Pump shafts shall be heat treated, ground and polished and with a replaceable stainless steel stub shaft or shall be stainless steel through the rubber lower bearing. Intermediate bearings, as required, shall be of replaceable bronze bushing type, grease lubricated, and shall be no more than 4 feet apart.

D. Each pump shall be mounted on a sub-plate and shall include a motor support bracket with a sealed thrust bearing located above the floor plate. The shaft shall be sealed where it extends through the sub-plate in order to eliminate escape of moisture and gases. The motor shall be connected to the pump by a flexible coupling.

E. Pumps shall be operated by encapsulated primary and standby float switches. A high water alarm shall be furnished with remote mounted alarm horn. The pump manufacturer shall furnish magnetic starters, disconnect switches, HOA selector switches and electric alternator mounted in one enclosure for wall mounting.

F. Basin covers shall be steel, suitable for use with concrete basin, complete with 12 inch x 16 inch manhole, flanged and gas-tight connections and suitable curb ring for mounting in concrete sump.

G. SCADA Alarm Contacts: Provide two sets of fail-safe, closed loop logic, Form C normally open and normally closed dry contacts in the pump controller. The normally open contacts to be connected to the Station Demarcation Terminal Cabinet for the following alarm functions:

1. Sump high water level alarm.
2. Sump pump failure alarm.

2.6 SEWAGE PUMPS (SUBMERSIBLE)

A. Duplex pumps shall be factory tested, heavy duty, submersible, screenless, electric pumps of capacities, arrangement, horsepower, type, speed, electrical characteristics, and accessories as scheduled or indicated.

B. The motors shall be in a cast iron housing with double sealed bearings, integral motor shaft shall be stainless steel with keyway.

C. The impeller shall be two-vane type accurately machined to the proper diameter to pass 3 inch diameter spheres, statically and dynamically balanced.

D. Mechanical seals, carbon and ceramic, shall prevent leakage into motor and shall not come into contact with pumping media.

E. The pumps shall be operated by polyurethane float switches. The pump manufacturer shall furnish magnetic starters, disconnect switches, HOA switches and electrical alternator mounted in one enclosure for wall mounting. A high water alarm shall be furnished with remote mounting alarm horn.

F. The pumps shall be provided with proper removal systems to allow pumps to be removed from the wet pits without unbolting pumps or disconnecting piping.

G. SCADA Alarm Contacts: Provide two sets of fail-safe, closed loop logic, Form C normally open and normally closed dry contacts in the pump controller. The normally open contacts to be connected to the Station Demarcation Terminal Cabinet for the following alarm functions:

1. Sump high water level alarm.
2. Sump pump failure alarm.
2.7 PNEUMATIC SEWAGE EJECTORS

A. Provide duplex pneumatic sewage ejectors with a stored air system and consisting of grease-lubricated non-clogging type with high-water alarm. Provide internal piping with gate valve, check valve, strainer, and fittings between the basin inlet and the discharge at the pump floor plate. Provide strainer of self-cleaning type and which will automatically flush clean on each discharge cycle. Provide ejector with factory coat of rust resistant paint.

B. Fabricate receiver from cast iron for 50 pounds per square inch gauge (psig) operating pressure; and from steel for higher pressures. Provide units hermetically sealed, and with a minimum of 16 inch diameter manhole in the top.

C. Provide encapsulated float switch controls.

D. SCADA Alarm Contacts: Provide two sets of fail-safe, closed loop logic, Form C normally open and normally closed dry contacts in the pump controller. The normally open contacts to be connected to the Station Demarcation Terminal Cabinet for the following alarm functions:

1. Sump high water level alarm.
2. Sump pump failure alarm.

E. Provide package type air compressor assembly having components factory assembled in a cabinet on a common base. Components include compressor, motor drive, motor controller, oil cooler, oil separator, air storage tank, air filter, moisture separator, automatic drain trap, automatic controls, instrument panel, and pressure gauge. Factory install interconnecting piping and wiring.

1. Provide compressors designed for continuous operation with an automatic capacity regulation. Directly connect compressor to a 3 phase continuous duty electric motor having ball bearings and built-in overload protection. Provide bearings designed for a L50 life of 100,000 hours or a L10 life of 20,000 hours as defined by the Anti-Friction Bearing Manufacturers Association.

2. Provide air storage tank of welded steel, ASME construction, and with ASME stamp of certification. Provide tank with blow-off cock, pressure gauge, low pressure alarm, and low pressure remote indicator.

3. Provide relief valves of combination pressure and temperature dip tube, factory set and having automatic reseating. Provide valve with the ASME and AGA label or stamp. Extend drain piping to a drain.

4. Provide pressure-reducing valve assembly as specified in Section 15060, "Piping and Accessories" and consisting of reducing valve, strainer, 3-valve bypass, ASME relief valve with piped discharge and upstream and downstream pressure gauges. Provide pressure - reducing valve of spring-loaded, self-contained type having bolted spring chamber, bronze body, and nylon diaphragm inserts, and suitable for tight shut-off under dead-ended conditions.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Pumps:

1. Pumps shall be located as shown or indicated on the drawings and installed as recommended by the manufacturer.

2. Base mounted pump couplings shall be field checked for proper alignment prior to operation and rechecked following operation of approximately 48 hours. Alignment shall be within pump manufacturer’s tolerances.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 15001, "Mechanical Systems - General".

END OF SECTION 15160
PART 1 - GENERAL

1.1 DESCRIPTION

A. The work specified under this section consist of furnishing and installing thermal insulation and appurtenances for piping, pipe fittings, pipe accessories, equipment, ductwork, and supporting devices as indicated.

B. Factory insulated equipment is excluded from this section of the specification except that the insulating material characteristics shall equal or exceed those of specified materials for similar service.

C. Work Includes:
   1. Piping:
      a. Above ground and below ground domestic hot and above ground cold water piping.
      b. Traps, tailpieces, and supply piping of drinking fountains providing refrigerated water.
      c. Above ground horizontal roof drain and overflow drain piping, and horizontal sanitary drains handling cooling coil condensate.
      d. Interior and exterior, above ground and underground heating, condenser water, steam, steam condensate and chilled water piping. Insulation of pumps is not required except chilled water booster pumps above ceilings.
      e. Plumbing items requiring insulation due to rules and regulations for the handicapped.
      f. Cooling coil condensate drain lines.
      g. Refrigerant suction lines.
      h. Wet-pipe sprinkler systems where freeze protection is required.

   2. Ductwork:
      a. Supply air:
         1) Primary ductwork shall be externally insulated with thermal duct wrap.

2) Secondary ductwork shall be internally lined with acoustic duct liner maximum of 10 feet in every direction downstream of all terminal units and fan coil units.

3) Remaining secondary supply air ductwork shall be insulated externally with thermal duct wrap.

4) Return air: Externally insulated.

b. Exhaust and outside air ductwork: Shall be externally insulated unless indicated otherwise.

3. Equipment:
   a. Chiller Evaporators (factory insulation optional).
   b. Expansion Tanks.
   c. Domestic Hot Water Storage Tank (factory insulation optional).
   d. Heat Exchangers.
   e. Suction Accumulators.

1.2 REFERENCE STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

B. National Fire Protection Association (NFPA):
   1. NFPA 90A – Standard for the Installation of Air Conditioning and Ventilating Systems
   2. NFPA 90B - Standard for the Installation of Warm Air Heating and Air - Conditioning Systems

C. Sheet Metal & Air Conditioning Contractors National Association (SMACNA):
   1. SMACNA 1481 - HVAC Duct Construction Standards - Metal and Flexible

1.3 SUBMITTALS

A. Certification.
B. Product Data: Including Thermal Performance Test Data.

C. Operation and Maintenance Manuals: Section 15001, "Mechanical Systems - General".

1.4 QUALITY ASSURANCE

A. The following Codes, Regulations, Reference Standards, and Specifications sections referenced in Section 15001, "Mechanical Systems - General" also apply to this section. When requested, provide the Contracting Officer with manufacturer’s certificate that materials meet or exceed minimum requirements to comply with ASTM, UL, NFPA, and all other applicable standards.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Keep the inlet and discharge openings of units covered until the units are ready to run.

B. During the erection protect all ductwork, piping, and equipment from dirt and debris. Temporarily cap the open top of vertical ductwork and piping.

PART 2 - PRODUCTS

2.1 INSULATION MATERIALS

A. Unless otherwise noted, Fire rating of all above ground insulation including jackets, adhesives, coatings, mastics, etc., not to exceed 25 flame spread or smoke developed under ASTM E84 procedure. Fire resistance rating shall meet the requirements of NFPA 90A and 90B.

B. Insulation shall be vermin resistant.

C. Pipe Insulation: Above ground fiberglass type, ASJ/SSL-II. Piping exposed to the weather shall have 0.016 smooth or corrugated aluminum jacket with vapor barrier. Attachment shall be made by 1/2 inch by 0.020 aluminum bands with approved closure system. Armaflex type insulation shall be used, in thermally equivalent thicknesses, for refrigerant suction lines where codes permit.

D. Duct Insulation:

1. External insulation for Metal Ductwork (Flexible Blanket): Foil reinforced kraft (FRK) faced fiberglass Duct Wrap, conforming to the requirements of NFPA 90A and 90B and applicable energy codes.

2. External Insulation for Metal Ductwork (Semi-Rigid Board): Where indicated, provide fiberglass FRK faced board, 3.00pcf density, conforming to NFPA 90A and 90B and applicable energy codes.

3. Internal Acoustical Duct Liner for Metal Ductwork: Duct liner, 3 pcf density with a black neoprene fire-resistant coating, conforming to the requirements of NFPA 90A and 90B and applicable energy codes.

4. Duct liner products shall avoid air erosion up to velocities of 4,000 feet per minute.

E. Chiller Insulation: Armaflex type insulation shall be used.

F. Expansion Tank Insulation: Armaflex type insulation shall be used.

2.2 INSULATION THICKNESS

A. Insulation thickness based on a minimum R value that is the greater of 4.6 square feet per hour per deg. F divided by BTU by inches or that required by the applicable energy codes.

B. Piping Insulation Thickness as indicated in Table 15260 - 1.

C. Duct Liner: Supply acoustic duct liner shall be 1 inch thick unless noted otherwise.

D. Duct Insulation: Supply and return air ductwork, 2 inches thick, with an installed R value of 5.0 minimum.

E. Chiller insulation shall be 3/4 inch thick.

F. Expansion tank insulation shall be 1/2 inch thick.

G. EWC traps and tailpieces insulation shall be 1 inch thick.

PART 3 - EXECUTION

3.1 GENERAL

A. The installation of insulation shall be made by experienced craftsmen in a neat, workmanlike manner and shall be in accordance with the manufacturer's published recommendations for service intended, as interpreted by the Contracting Officer.

B. Adhesives used in conjunction with insulation shall be compatible with the insulation and vapor barrier used and be vermin-proof and mildew resistant.
3.2 PIPE INSULATION

A. Insulation shall be the full specified thickness, continuous through walls, floors, ceilings, etc. Reducing thickness or cutting back of insulation to pass obstructions or through sleeves will not be permitted.

B. Valve and fitting insulation shall be factory prefabricated units with PVC jacket.

C. Any painting of pipe insulation shall be accomplished under the Section 09920, “Interior Painting”. Before finish painting, any insulation showing splits or other signs of poor workmanship shall be replaced.

D. No part of any system shall be insulated until required tests have been completed.

E. Insulation shall be installed so that it does not interfere with the functions of thermometer wells, gage connections and/or cocks, unions, access panels, hand holes, manholes, sight glasses, etc., or obscure serial numbers or other nameplate data.

F. Insulation shall be extended to include stiff leg supports as required to prevent sweating.

G. Continuous vapor barriers to prevent sweating shall be installed on all cold systems and equipment. If a single tape adhesive system or staples are used for closure of the longitudinal lap, a vapor barrier mastic must be used to ensure a vaporproof closure. Edges and abutments shall be sealed, waterproof and vaporproof. Supplier of jacket materials shall certify that the material proposed is approved for use in return air plenums, where applicable.

H. Piping supports shall pass completely around the exterior of the finished insulation. Rigid blocks of insulation material shall be provided at support points. In addition, sheet metal saddles shall be provided at support points in accordance with the following table:

<table>
<thead>
<tr>
<th>Pipe Size (inches)</th>
<th>Gauge Metal (inches)</th>
<th>Saddle Length (inches)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up to 2-1/2</td>
<td>18</td>

<tr>
<td>6 to 8</td>
<td>16</td>
<td>14</td>
</tr>
<tr>
<td>10 and Over</td>
<td>16</td>
<td>18</td>
</tr>
</tbody>
</table>

I. Saddles shall cover the bottom of the insulation, and saddle edges shall be hemmed or suitably covered to prevent damage to the insulation material.

M. The vapor barrier and finish shall be continuous at all support points.

N. Exposed piping lower than 8 feet above the finished floor subject to injury by personnel traffic shall receive an aluminum jacket as specified herein.

3.3 DUCT INSULATION

A. Internal Duct Liner: Insulation shall be installed such that it does not interfere with access panels, damper quadrants, or any other movable component of the ductwork. The duct liner shall be applied to the inside of the duct with the faced side to the airstream and shall be secured to the duct with adhesive, pins, and washers. Adhesives shall completely coat the metal. Joints shall be firmly butt together. Duct liner shall also be installed in accordance with the requirements of SMACNA 1481.

B. External Duct Insulation: External duct shall be installed without sagging or loose fitting sections. Outerjacket shall be sealed with mastic to form a continuous vapor barrier. Install as recommended by the insulation manufacturer.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 15001, “Mechanical Systems - General”.

PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies furnishing and installing of dry standpipes, wet standpipes, wet sprinklers, pre-action dry sprinklers, exterior fire protection, fire department Siamese connections, valves, control, and supporting devices.

1.2 REFERENCED STANDARDS

A. National Fire Protection Association (NFPA):
   1. NFPA 13 - Installation of Sprinkler Systems
   2. NFPA 14 - Standard for the Installation of Standpipe, Private Hydrant, and Hose Systems
   3. NFPA 24 - Standard for the Installation of Private Fire Service Mains and Their Appurtenances
   4. NFPA 130 - Standard for Fixed Guideway Transit and Passenger Rail Systems

1.3 SYSTEM DESCRIPTION

A. Provide a complete fire protection system for the areas, buildings, tunnels, or aerial structures, as specified, as indicated on the drawings, and as required by all authorities having jurisdiction. The drawings show the general arrangement of plumbing, air conditioning, piping, ductwork, and other apparatus. The Contractor shall coordinate this work with all other construction so that there shall be no conflict as to space required. The mechanical and electrical work shall, in general, take precedence over sprinkler work, except where it is absolutely necessary to maintain required coverage.

B. Dry standpipe system: Consists of fire department connection, dry fire line, check valves, automatic air vents, drain valves, and hose valves.

C. Wet standpipe system: Consists of fire department connection, wet fire line, check valves, drain valves, fire water line surveillance valve, hose valves, and capped branch connections for sprinkler systems where shown.

D. Fire suppression system for escalators: Consists of fire line to point inside escalator pit/machine room capped for future extension by escalator contractor, supplied from wet or dry standpipe system.

E. Sprinkler system, other than escalator: Consists of sprinkler lines, fire water line surveillance valve, flow alarm check valve, drain valve, and sprinkler heads as well as heating tracers in areas subject to freezing temperatures, supplied from wet standpipe system or from domestic water line.

F. Exterior fire protection system: Consists of lead-ins to wet standpipe system, valves and accessories, supplied from the City water main.

1.4 SUBMITTALS

A. Certification: Submit certified copies of materials test reports.

B. Product Data: Materials and equipment.

C. Shop Drawings:
   1. Identify methods of joining, welding, fastenings, and anchoring.
   2. Indicate materials and locations for wet standpipe, dry standpipe, sprinkler, and external systems.
   3. Show pipes and piping layout, including pipe hangers, and supports.
   4. Indicate valves, escutcheons, gauges, automatic air vents, pipe sleeves, and mechanical couplings.
   5. Show layout of sprinkler systems.
   6. Submit detail drawings approved by Fire Marshall of jurisdiction in which work is performed. Drawings shall be prepared by State of Texas licensed fire protection engineer. Also include any notes or letters that accompany the approval.
   7. ISO approvals.
   8. Perform flow test on existing city water system and submit results.

1.5 QUALITY ASSURANCE

A. The Codes, Regulations, Reference Standards and Specifications sections referenced in Section 15001, "Mechanical Systems - General", also apply to this section. When required, provide the Contracting Officer with the manufacturer’s certificate that materials meet or exceed minimum requirements to comply with ANSI, NFPA, UL, ASTM, ASME, OSHA, AISI and other applicable standards.

B. Design and installation shall meet requirements of NFPA 13, NFPA 14, International Building Code, International Fire Code and local authorities. Approval of sprinkler system is based, generally, on Light Hazard Requirements; except Sprinkler Systems installed in janitorial spaces, trash rooms,
and similar areas are sized for Ordinary Hazard Requirements.

1.6 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. During the erection protect and store piping and equipment from dirt and damage. Temporarily cap the open top of piping installed.

1.7 OPERATION AND MAINTENANCE TRAINING

A. Provide Operation and Maintenance Manuals and Training in accordance with Section 15001, "Mechanical Systems - General".

PART 2 - PRODUCTS

2.1 PIPING

A. Underground pipe to the inside of the building shall be cement lined cast iron or P.V.C. Class 150 (SDR 17) with cast iron Class 250 fittings.

2.2 FIRE DEPARTMENT CONNECTIONS

A. Furnish and install fire department connections conforming to the requirements of NFPA, Siamese type, either polished brass or bronze. Connections shall have either a polished or a chromium plated finish with inlet plugs and chains or caps to match with check valve and approved automatic drip. Fire department connections, unless otherwise noted, shall be Potter Roemer No. 5780 or Authority approved equal, 4 inch x 2-1/2 inch polished brass with caps and chains or approved alternate. Provide complete with escutcheon plate and lettered, as appropriate, "DART AUTO SPRINKLER", "DART DRY STANDPIPE" or "DART WET STANDPIPE". Letters shall be 1 inch high and in raised cast form on the surface of the fitting or the escutcheon. Connections shall contain a self-closing clapper valve in each inlet and inlet hose threads conforming to the local fire department thread specifications and either flush or wall-mounted. Provide escutcheon finish to match body of Siamese. Threads, mounting height and distance to nearest fire lane shall conform to the local fire department standards.

B. Provide UL labeled rack assembly of enameled steel, and of the semi automatic type which automatically releases water as the last fold of hose is pulled from the rack after the valve has been opened. Provide rack with 100 feet of 1-1/2 inch unlined linen hose having a cast brass nipple, drain vent valve, and nozzle. Provide UL listed nozzle and adjustable for Class A, B and C fires. Include with rack a 1-1/2 inch cast brass angle hose valve, escutcheon plate, and spanner wrench.

C. Install at each floor level and in subway tunnel, not more than 5 feet from finished floor and indicating control valve on each standpipe, and a 2-1/2 inch fire department connection with a 2-1/2 inch x 1-1/2 inch reducer with cap and chain. Threads shall conform to the local fire protection district standards.

2.4 FIRE HOSE CABINET

A. Provide cabinet with 2-1/2 inch fire department valve, rack assembly, and provisions for mounting a portable 10 pound dry chemical fire extinguisher. Fabricate side, top, bottom, and back of cabinet from 18-gauge steel having two coats of white baked enamel finish on the inside and a prime coat on the outside. Apply manufacturer's red enamel finish, prime coat and finish paint in accordance with manufacturer's standard procedure. Fabricate door and hollow trim from stainless steel with #4 finish. Provide continuous piano type hinge door with break glass and door lock operator; locks keyed alike. Provide signs on doors not fully glazed with the message "FIRE HOSE" and "FIRE EXTINGUISHER" affixed on the top half of the door where indicated. Furnish each cabinet with a 1-1/2 inch cast brass angle hose valve, escutcheon plate, and spanner wrench.

B. Provide UL approved, 1-1/2 inch rough brass 300 pounds per square inch, (psi) angle hose type with cap, chain, and hose threads conforming to the local Fire Department thread specifications.

2.5 FIRE HOSE VALVE CABINET

A. Provide cabinet with 1-1/2 inch and 2-1/2 inch fire department angle hose valves, and provisions for mounting a portable 10 pound dry chemical fire extinguisher; as indicated. Sides, top, bottom, and back of cabinet of 18-gauge steel having two coats white baked enamel finish on the inside and a prime coat on the outside. Apply manufacturer's red enamel finish, prime coat and finish paint in accordance with his standard procedure. Fabricate door and hollow trim from stainless steel with #4 finish. Provide continuous piano type hinge door with break glass and door lock operator; locks keyed alike. Provide signs on doors with the message "FIRE DEPARTMENT VALVE" and "FIRE EXTINGUISHER" affixed on the top half of the door where indicated. Furnish each cabinet with a 1-1/2 inch x 2-1/2 inch double spanner wrench.
2.6 VALVES

A. Control valves inside buildings shall be listed 175 pound W.O.G. approved indicating type valve.

B. Check valves shall be Listed, 175 pound W.O.G., horizontal swing check valves or approved equivalent such as wafer check valves.

C. Drain and test valves shall be 175 pound W.O.G., bronze threaded globe valves with renewable composition disc.

2.7 WATER FLOW SWITCHES

A. Water Flow Switches: Vane-Type Waterflow Detectors shall be installed on the deluge main and sprinkler mains. Detector shall be designed for mounting on either vertical or horizontal piping, but shall not be mounted in fitting or within 12 inches of any fitting that changes the direction of water flow, and shall have a sensitivity setting to signal any flow water that equals or exceeds 10 gpm. Detector switch mechanisms shall incorporate an instantly recycling pneumatic retard element with an adjustable range of 0 to 60 second. Switches shall be suitable for operation on 24 volts D.C., and shall be actuated by a vane extended into the waterway of piping. Detectors shall be of dust tight construction. Detector switch enclosures shall be secured with a tamper proof bolt that requires the use of a special wrench for removal. Van-Type Waterflow Detectors shall be Underwriters’ Laboratories listed. The detector shall be furnished and installed under this section and wired completely under Section 16721, “Fire Alarm and Detection Systems”.

2.8 TAMPER SWITCHES

A. Tamper switches shall be installed on each valve inside the building. Switches shall be mounted so as not to interfere with the normal operation of the valve control or when the stem has moved no more than one-fifth of the distance from its normal position. The mechanism shall be contained in a weather-proof die cast aluminum housing which shall provide a 3/4 inch tapped conduit entrance and incorporate the necessary facilities for attachment to the valve. Switch housings shall be furnished in red baked enamel. The switch mechanism shall have a minimum rated capacity of one amp, 125 A.C. to 0.25 amps, 24 volts D.C. The entire installed assembly shall be tamper proof and arranged to cause a switch operation if the housing cover is removed or if the unit is removed from its mounting. Supervisory Switches and Gate Valve Switches shall be Underwriters’ Laboratories listed. Supervisory Switches shall be furnished and installed under this section and wired completely under Section 16721, “Fire Alarm and Detection Systems”.

B. Tamper switches shall be Factory Mutual approved.

2.9 SIGNS AND IDENTIFICATION

A. Approved enameled metal signs shall be securely attached at all main drains, auxiliary drains, inspectors' test connections, and control valves, as specified in Section 15055, “Identification of Equipment and Piping”.

B. Provide labeling of piping, valves and accessories as specified in Section 15055, “Identification of Equipment and Piping” and in accordance with code requirements.

2.10 SPRINKLER SYSTEM

A. Automatic Sprinklers: The automatic sprinkler system shall be a wet pipe or dry pipe system. In locations where the system is susceptible to freezing temperatures, a dry pipe system shall be installed with all necessary equipment. Other areas shall have a wet pipe system. Sprinkler heads of proper temperature rating shall be installed throughout the building as required by approving authorities. Where furred of finished ceilings occur, the piping shall be installed above the ceiling with the sprinkler heads nippled through the ceiling and set in metal escutcheon plates. Where lay-in ceilings occur, center the sprinkler heads on each tile. Sprinkler heads shall be provided as follows, unless otherwise shown:

<table>
<thead>
<tr>
<th>Area Served</th>
<th>Type Head Trim</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fully finished area with</td>
<td>Fully recessed Trim</td>
</tr>
<tr>
<td>gypsum board and/or lay-in</td>
<td>w/factory painted cover</td>
</tr>
<tr>
<td>ceilings</td>
<td>(color by Contracting Officer)</td>
</tr>
<tr>
<td>Semi-finished areas, kitchens</td>
<td>Semi-recessed head</td>
</tr>
<tr>
<td>work areas</td>
<td>w/chrome Escutcheon</td>
</tr>
<tr>
<td>Non-finished areas</td>
<td>Pendant heads, with cage cover</td>
</tr>
<tr>
<td></td>
<td>where head is less than 7 feet FF and in janitor closets.</td>
</tr>
</tbody>
</table>

B. Sprinkler Risers: Shall be equipped with a variable pressure alarm valve including retarding chamber, drain valve, standard trim, and gauges.

C. Water Motor Gongs: Shall be furnished for alarm valve and dry pipe valves and located as required.

D. Drains: Shall be piped to the outside of buildings as part of this work, except in locations where a drain is provided by the plumbing design, specifically for sprinkler system use.
E. Piping System Valves: Shall be approved for fire protection piping systems and shall be installed as required by the NFPA (NFPA 13, NFPA 130 or other applicable NFPA Standards).

F. Fire Hoses: Hose shall be 100 ft. length, hose valves shall be a 2-1/2 inch polished brass valve, with cap, chain and wall escutcheon, when furnished as fire department connection only.

G. Roof Outlets: Shall be a brass double hydrant valve 2-1/2 inches by 2-1/2 inches by 4 inches with two caps and chains.

H. Hangers: Shall be installed as required and shall be listed by the Underwriters' Laboratories for use in a sprinkler system.

I. Sprinkler Cabinet: One cabinet with 6 sprinklers and a head wrench shall be installed as directed by the Contracting Officer.

K. Automatic Dry Pipe Air Compressor System:
   1. In conformance with NFPA 13, NFPA 130 or other applicable NFPA Standards.
   2. Provide air compressor with sufficient capacity to pressurize the dry-pipe system, to a pressure as recommended by the dry-pipe valve manufacturer in conjunction with the local available water pressure, within a period of 30 minutes, and have 25 percent additional air capacity.
   3. Furnish each air compressor complete with motor V-belts, ASME Code air receiver, pressure gauge, high and low pressure switches, starting devices, receiver drain, air intake filter, and belt guards.
   4. Furnish air compressor and receiver with rails or guards.
   5. Compressed air piping:
      b. Black, standard weight, screw-jointed, malleable iron fittings.
      c. Bronze angle, globe, and check valves.
      d. Furnish suitable drips with automatic drain valves provided on the low points of the compressed air mains.

L. Automatic Dry Pipe Valve Assemblies: Furnish automatic dry pipe valve assemblies for the dry-pipe sprinkler system, in conformance with NFPA 13, NFPA 130 or other applicable NFPA Standards, complete with:
   1. Gate and check valves,
   2. Quick-opening device (accelerator),
   3. Air maintenance device,
   4. Pressure alarm switch,
   5. Water motor local alarm,
   6. Air pressure regulating alarm,
   7. Relief valve, and
   8. Pressure gauges.

PART 3 - EXECUTION

3.1 EXCAVATION AND BACKFILL

A. Pipe trenches shall be dug to a line and the bottom cleaned and shaped to provide support of the pipe through its entire length.

B. For requirements for above grade or underground fire main, comply with NFPA 24 Private Fire Service Mains.

C. If plastic pipe (PVC) is installed underground, manufacturer’s instructions shall be strictly followed in regard to cover and backfilling materials and procedures.

D. Comply with requirements of Section 02221, “Utility Excavation and Backfill”.

3.2 SPRINKLER PIPING

A. It shall be installed per NFPA 13, NFPA 130 or other applicable NFPA Standards and insofar as possible, all sprinkler system mains and branches shall be installed as close as possible below structural concrete slabs.

B. Piping for systems shall be coordinated with lighting fixtures, air conditioning ducts, piping, air handling units, and all other obstructions.

3.3 FREEZE PROTECTION

A. Where shown, Install freeze protection for wet-pipe systems as specified in Section 15060, “Piping and Accessories”. Locate heating cable as a spiral around pipe trace for cold water piping, and secure the heat cable to the pipe with full wrap of high temperature pressure sensitive tape at intervals not to exceed two feet.
3.4 **HANGERS AND SLEEVES**

A. Hangers shall be installed and spaced in accordance with NFPA 13, NFPA 130 or other applicable NFPA Standards.

B. Sleeves shall be set for pipes passing through concrete floors and masonry walls.

C. Provide chrome plated escutcheon plates at wall penetrations.

3.5 **AUXILIARY DRAINS**

A. Auxiliary drains consisting of plugs, or globe valves and plugs where the capacity of a trapped pipe section exceeds 5 gallons, shall be provided to drain points in the system that cannot be drained back to a main riser. Field conditions may dictate additional drains which could not be determined for bidding purposes which shall be provided as required by NFPA 13, NFPA 130 or other applicable NFPA Standards.

3.6 **INSPECTORS’ TEST CONNECTIONS**

A. Furnish and install inspectors’ test connections per NFPA 13, NFPA 130 or other applicable NFPA Standards.

3.7 **CONCEALED WORK**

A. No work shall be concealed unless first inspected and approved by the authority having jurisdiction.

3.8 **TESTING**

A. Piping shall be tested per NFPA 13, NFPA 130 or other applicable NFPA Standards in the presence of the Authority's representative and other approving authority and shall be proved tight. Unsatisfactory workmanship shall be corrected to the satisfaction of the above mentioned persons. Defective materials shall be replaced with new materials and defective materials removed from the premises.

**PART 4 - MEASUREMENT AND PAYMENT**

4.1 **GENERAL**

A. In accordance with Section 15001, “Mechanical Systems - General”.

END OF SECTION 15300
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies furnishing and installing of fire pumps, jockey pumps, and supporting devices as shown.

1.2 REFERENCED STANDARDS

A. National Fire Protection Association (NFPA):
   1. NFPA 20 - Standard for the Installation of Stationary Pumps for Fire Protection

1.3 SUBMITTALS

A. Product Data:
   1. Include manufacturer's literature and data for all equipment and material.
   2. Performance Curves:
      a. Pump performance curves (total dynamic head vs. flow rate) showing brake horsepower, KW input and full load efficiency.
      b. Motor performance curves in accordance with Section 15060, "Piping and Accessories.

B. Shop Drawings:
   1. Indicate pipes and piping layout, pipe hangers and supports, valves, and gauges.

C. Certification: Submit certified copies of the field test reports.

D. Field Testing: Submit a detailed plan of the proposed method of and scheduling of the required field testing at least 30 calendar days prior to initiating the tests.

E. Operation and Maintenance Manuals and Training: Section 15001, "Mechanical Systems - General".

1.4 QUALITY ASSURANCE

A. The Codes, Regulations, Reference Standards, and Specifications sections referenced in Section 15001, "Mechanical Systems - General" also apply to this section. When requested, provide the Contracting Officer with manufacturer's certificate that materials meet or exceed minimum requirements to comply with NFPA, NEC, UL, FM, NEMA, and other applicable standards.

B. Experience:
   1. Manufacturer: Select a firm regularly engaged in the manufacturer of fire pump systems of the type specified herein.
   2. Equipment: Incorporate in the work fire pump systems that essentially duplicate fire pump systems that have been in satisfactory use for a period of ten years prior to the Bid Opening of this Project.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. During the erection protect and store piping and equipment from dirt and damage. Temporarily cap the open top of piping installed vertically.

1.6 WARRANTY

A. Provide a parts and labor warranty for a period of 4 years in addition to the 1 year requirement of the General Provisions for a total of 5 years.

PART 2 - PRODUCTS

2.1 GENERAL

A. In the selection of equipment provide for interchangeability of piping subassemblies, parts, motors, starters and relays.

B. Provide the pump, driver, controller, and accessories in strict compliance with the latest edition of NFPA 20. Provide for proper operation of the unit assembly, as indicated by field test.

2.2 FIRE PUMPS

A. Pump capacity shall be as scheduled with minimum scheduled suction pressure. The pump shall also be designed to deliver not less than 150 percent of rated capacity at a pressure not less than 65 percent of the rated head. The shut-off pressure shall not exceed 120 percent of the rated pressure.

B. The pump shall be hydrostatically tested to twice the working pressure but in no case to be less than 250 psi.

C. Included with pump shall be the following fittings and/or accessories.
   1. Suction and discharge gages.
   2. Casing relief valve.
   3. Automatic air release valve.
   4. Hose manifold.
5. Three hose valves with caps and chains.

6. Approved fire pump flow meter, orifice plate type or pilot tube type.

D. The pump and driver shall be mounted on a common base plate of fabricated steel and directly connected through a flexible coupling.

E. The driver shall be a horizontal ball bearing, part winding squirrel cage induction motor of open drip proof type, (see Division 16, “Electrical Systems” for voltage) with an ambient temperature not exceeding 104 degrees F, and to be of such capacity that at rated voltage and frequency pump will not exceed the full load ampere rating under any conditions of pump load.

F. Locked rotor motor current shall not exceed the values specified in NFPA 20.

G. The pump unit shall be given a flow test in accordance with NFPA 20.

H. Controls: The motor control shall be specifically approved for fire pump purposes and shall be marked “Fire Pump Controller”. The control equipment shall be completely assembled, wired and tested at the factory. The controller shall alarm in the operations control center (O.C.C.) when the pump starts.

I. Equipment shall be enclosed in one or more approved drip tight enclosures.

J. The controller shall be of the combined manual and automatic type and incorporating the following:

1. Disconnect switch - externally operable, quick break type.

2. Time delay type circuit breaker with trips on all phases set for 300 percent of the motor full-load current. Capacity of the circuit breaker shall be as indicated in Division 16, “Electrical Systems”.

3. Fire Pump Controller: Underwriters' listed, combined manual and automatic reduced voltage, two step closed transition part winding type starter. The part winding starter shall limit the in-rush current to 60 percent of the maximum full voltage locked rotor current of a standard motor per NEC tables. Control equipment with front operated circuit breaker and disconnect switch. Circuit breaker to be approved for use by the Underwriters' Laboratories, Inc. Pressure regulator to have a range of 0 to 300 psi, with pressure settings established at time of field acceptance test. An instantaneous recycling running period timer set to keep the motor in operation for six minutes on automatic start, to be interwired with pressure regulator. Controller shall be provided under this section. Fire pump shall be interconnected with emergency generator as shown on Contract Drawings. Comply with requirements of NFPA 20. Power wiring to be under Division 16, “ELECTRICAL”.

4. Running period timer set to keep motor in operation when started automatically, for a minimum period of one minute for each 10 HP of motor rating, but not to exceed seven minutes.

5. Pilot lamp to indicate circuit breaker closed and power available.

6. Alarm relay to energize an audible or visible alarm through an independent source of power to indicate circuit breaker open or lower failure.

7. Ammeter test link and voltmeter test studs.

8. Manual Selector Station: A two position station shall be provided on the enclosure marked "Automatic" and "Non-automatic".

9. An alarm signal shall operate continuously while the pump is running.

K. Jockey Pump and Controller: Jockey pump shall be close coupled centrifugal type having a capacity as scheduled.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Pumps:

1. Pumps shall be located as shown or indicated on the drawings and installed as recommended by the manufacturer.

2. Base mounted pump couplings shall be field checked for proper alignment prior to operation and rechecked following operation of approximately 48 hours. Alignment shall be within pump manufacturer's tolerances.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 15001, “Mechanical Systems - General”.

END OF SECTION 15380
PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies the furnishing and installing of plumbing fixtures, and equipment as indicated and supporting devices as shown.

1.2 REFERENCED STANDARDS
A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A74 - Standard Specification for Cast Iron Soil Pipe and Fittings

B. Industrial Safety Equipment Association (ISEA):
   1. ISEA Z358.1 - Emergency Eyewash and Shower Equipment

C. American Society of Mechanical Engineers (ASME):
   1. ASME A112.19.2M – Vitreous China Plumbing Fixtures

1.3 SUBMITTALS
A. Certifications: Submit certified copies of field test reports.

B. Training Plans and Operation and Maintenance Manuals: Section 15001, “Mechanical Systems – General”.

C. Product Data: Catalog Cuts.

D. Field Testing: Submit a detailed plan of the proposed methods and scheduling of the required field testing at least 30 calendar days before initiating the test.

E. Submit copies of necessary permits and originals of inspection tags.

1.4 QUALITY ASSURANCE
A. The Codes, Regulations, Reference Standards, and Specifications sections referenced in Section 15001, “Mechanical Systems - General” also apply to this section. When requested, provide the Contracting Officer with manufacturer’s certificate that materials meet or exceed minimum requirements to comply with ANSI, ASME, and all other applicable standards.

B. Experience:
   1. Manufacturer: Select a firm regularly engaged in the manufacture of plumbing fixtures of the type specified herein.

2. Equipment: Incorporate into the work plumbing fixtures that have been in satisfactory use for a period of ten years prior to the Bid Opening of this Project.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING
A. Keep the inlet and discharge openings of fixtures covered until final connections are completed.

B. During the erection protect and store all fixtures and appurtenances from dirt and damage.

PART 2 - PRODUCTS

2.1 FIXTURES
A. Water Closet (Non-Public Areas) - Item P-1 and P-1A for the physically-handicapped:
   1. Bowl: Wall-hung siphon jet vitreous china closet bowl, with elongated rim, 1-1/2 inch spud, and china bolt caps.

   2. Flush Valve: Exposed chrome plated, diaphragm type with oscillating handle, escutcheon, seat bumper, integral screwdriver stop and vacuum breaker.

   4. Wall Mounted Carrier: Adjustable cast iron frame, integral drain hub and vent, adjustable spud. Lugs for floor and wall attachment, threaded fixture studs with nuts and washers.

B. Urinal (Non-Public Areas) - Item P-2 and P-2A for the physically-handicapped:
   1. Urinal: Vitreous china, wall-hung washout urinal with shields, integral trap, 3/4 inch top spud, and steel supporting hanger.

   2. Flush Valve: Exposed chrome plated diaphragm type with oscillating handle, escutcheon, integral screwdriver stop, and vacuum breaker.

   3. Wall Mounted Carrier: Cast iron and steel frame with tubular legs, lugs for floor and wall attachment, and threaded fixture studs for fixture hanger.
C. Lavatory (Non-Public Areas) - Item P-3 and P-3A for the physically-handicapped:

2. Trim: Chrome plated supply fittings with open grid strainer, water economy aerator, indexed handles, chrome plated brass P-trap and arm with escutcheon.

3. Wall Mounted Carrier: Cast iron and steel frame with tubular legs, lugs for floor and wall attachment, bearing plate, and studs.

D. Service Sink:

1. Bowl: Porcelain enameled cast iron roll-rim sink, a stainless steel rim guard, 12 inch high back, concealed hanger, chrome plated strainer, and cast iron P-trap with adjustable floor flange.

2. Trim: Exposed wall type supply with lever handles, spout wall brace, vacuum breaker, hose end spout, eccentric adjustable inlets, integral screwdriver stops with cover caps and adjustable threaded wall flanges.

E. Mop Receptor:

1. Bowl: Molded stone, floor mounted, with not lower than 10 inches and narrower than 2 inches shoulders with stainless steel rim guard and stainless steel strainer.

2. Trim: Exposed wall type supply with lever handles, spout wall brace, vacuum breaker, hose end spout, eccentric adjustable inlets, strainers, integral screwdriver stops with covering caps, and adjustable threaded wall flanges.

F. Self-Contained Emergency Eye-Wash: Gravity flow type with eye/face wash spray; factory assembled complete with Food and Drug Administration rated 16 gallon capacity polyethylene tank with carrying handle, removable fill cap, mounting bracket, anti-bacteria additive, and retainer strap across nozzle.

G. Combination emergency shower/eye wash: Drench shower and eye wash fountain. Emergency shower pull chain which, when pulled down, will activate the water supply. Eye-wash is hand lever-operated. Provide emergency shower with a 3 inch diameter drain below shower head. Provide tempered water supply per requirements of ISEA 2358.1.

H. Electric Water Cooler (EWC) - Item P-5 and P-5A for the physically-handicapped: Wall mounted electric water cooler with stainless steel top, vandalism proof design elevated anti-squirt bubbler with stream guard, automatic stream regulator. Anti-splash basin with non-removable drain strainer, a self-closing lever or push bar. A 120 volts, single-phase, 60 Hz power source. Capacity 7.5 gph.

2.2 STOPES, BIBBS AND HYDRANTS

A. Angle, Straight, and Integral Stops: Lock-shield, loose-key pattern type with supplies. Exposed fixture fittings and trim: Chromium-plated or nickel-plated brass with polished, bright surfaces.

C. Flush Wall Hydrant (WH-1): Encased flush, anti-siphon, complete with vacuum breaker, non-freeze type, nickel bronze casing, bronze interior parts, hose thread spout, and non-turning operating rod with free floating compression closure valve; Box face and hinged cover: Polished nickel bronze complete with operating key lock.

D. Yard Hydrant (YH-1): 3/4 inch loose key type, non-freeze type having an extra deep bronze box for vacuum breaker. Box top: Rough bronze, hinged with internal lock and the word "WATER" cast into the cover.

2.3 DRAINS

A. Floor Drains: Provide floor drains fabricated from cast iron and of double drainage pattern, integral seepage pan, and connection for trap primer where required and with clamping collar for waterproofing membrane. Provide strainer fabricated from chromium-plated cast brass with chromium-plated finish and attached to a brass threaded collar for adjustment to varying floor thickness.

B. Area Drains (AD): Galvanized cast iron body with sump, round nickel-bronze strainer, membrane flange, and membrane clamp with integral gravel stop and waterproofing flange.

C. Planter Drains (PD-1): Galvanized cast iron body with sump; removable cast bronze dome strainer with bronze screen, membrane flange, and membrane clamp with integral gravel stop; waterproofing flange.

D. Trench Drain (TD): Provide trench drain with heavy duty body sections and integral anchor flange, heavy duty loose-set grates with perimeter drainage slots and bottom outlet inside caulk or threaded connection.

E. Roof Drains for Flat Roofs (RD-1): Provide galvanized cast iron body with sump drains of size shown, with large area cast iron dome, combined flashing collar and gravel stop, under deck clamp, spigot, inside caulk or threaded outlet as detailed. Provide for expansion and contraction of piping system as required.
F. Roof Drains for Sloped Roof (RD-2): Provide galvanized cast iron body roof drains of size shown with connections for cast iron hubless pipe or threaded side outlet. Provide drain with a secured bronze dome strainer having integral flashing clamp and flashing flange as required to prevent leaves, paper, or other deleterious material from entering the piping system.

G. Roof Drains Parapet Type (RD-3): Provide galvanized cast iron body roof drains of size shown with secured angle grate integral with flashing clamp shallow sump with flashing flange and 45 or horizontal side outlet threaded connection.

H. Overflow Drain (OD): Provide galvanized cast iron body overflow drain of size shown with flashing flange, threaded bottom outlet, adjustable chrome-plated bronze strainer and standpipe assembly including adjustable collar with ground insert, ground joint adaptor, standpipe and removable dome.

I. Pit Drain (PD-2): Provide pit drain backwater valve of size shown, pit type with bronze swing-check assembly, vertical inlet grate and spigot connection.

2.4 VALVES, INTERCEPTORS, CLEANOUTS AND BOXES

A. Backwater Valve:
   1. Provide swing-check type of size shown, flanged, coated cast iron and bronze swing check assembly and bronze seat.
   2. Provide ball float adapter fabricated from coated cast iron, plastic ball and renewable seat.

B. Sand and Oil Interceptors: Provide epoxy coated sand and oil interceptor, flow rate and oil capacity as indicated; equipped with inlet, outlet, and vent connections (types and sizes as shown), cascade bottom, double wall trap, removable baffle, and sediment bucket adjustable gravity draw-off connections, gasketed non-skid cover and flow control fitting; and constructed with the following additional construction features: concrete body, and flush with floor (recessed) installation.

C. Grease Interceptors: Provide acid resistant grease interceptors of size shown with automatic grease draw-off feature; flow-rate and grease capacity as indicated; equipped with inlet, outlet, and vent connections (types and sized shown), cascade bottom, internal air relief, visible double wall trap, removable baffles, and gasketed non-skid cover; equipped with low pressure chamber (grease accumulating cone), draw-off piping and valve; and constructed with the following additional construction features:
   1. Body: Concrete.

D. Cleanouts:
   1. Provide cleanouts of the sizes indicated, and of cast iron conforming to ASTM A74.
   2. Provide cleanouts in vertical piping where located within finish walls with standard cast iron hubs or no hub with cast brass threaded cleanout plug, with plug drilled and tapped to receive 8 inch diameter chrome or bronze plated as selected cleanout cover plate and vandalproof screw for attachment. Provide cleanout plug with lead seal in sanitary drainage piping.
   3. Provide floor cleanouts of adjustable type, and with lead seal, heavy duty scoriated nickel-bronze cover and, if for membraned floors, a clamping device. Secure cover with vandalproof screws.
   4. Provide exposed cleanouts with tapered caulking ferrule and raised or countersunk brass head cleanout plug.
   5. Provide grade cleanouts with cast iron ferrule countersunk or raised threaded brass plug, and cast iron access frame with anchor flanges and heavy duty scoriated cover secured with vandalproof screws. Provide cleanout plug with lead seal in sanitary drainage piping.

E. Access Boxes (coordinate all locations with Contracting Officer prior to installation):
   1. Walls and Ceilings: Access doors are specified in Section 08313, "Access Doors and Frames".
   2. Floors: Provide plain steel frame with plain nickel-bronze scoriated cover.
   3. Yard Boxes:
      a. Provide cast concrete boxes with cast iron rim and hinged self-closing cast iron lid marked for appropriate service, size as required.
      b. Set flush with finished grades with 4 inch thick concrete pad under perimeter (but not under interior) of box.
PLUMBING

PART 3 - EXECUTION

3.1 INSPECTION

A. Review millwork and other related shop drawings. Confirm location and size of fixture and/or opening before rough-in and installation.

B. Verify adjacent construction is ready to receive rough-in and finish work of this Section.

3.2 INSTALLATION OF PLUMBING PIPING

A. The plumbing piping system shall be installed as specified in Section 15060, "Piping and Accessories", and as specified herein.

B. Lubricate threaded cleanout plugs. Provide clearance at cleanout for rodding of drainage system.

C. Encase exterior cleanouts in concrete flush with grade.

3.3 INSTALLATION OF PLUMBING FIXTURES

A. Install each fixture with trap, easily removable for servicing and cleaning.

B. Provide chrome plated rigid or flexible supplies to fixtures with stops, reducers, and escutcheons to make a watertight finished connection.

C. Install components level and plumb.

D. Install and secure fixtures in place with wall carriers and bolts. Stop-nuts shall be installed in a flat plane to prevent fixture loading from applying any force to the wall.

E. Seal fixtures to wall and floor surfaces with sealant. Use sanitary sealant as specified in Section 07900, "Seals and Sealants".

F. Install fixtures per the schedules shown in Table 15400 - 1.

G. Install fixtures per current State of Texas Accessibility Standards (TAS).

3.4 ADJUSTING AND CLEANING

A. Adjust stops and regulating valves for intended water flow rate to fixtures without splashing, noise, or overflow.

B. At completion, clean plumbing fixtures and equipment.

C. Adjust flow of pumps, setting of tempering valves, and all other items to require flows and temperatures as indicated on the drawings for equipment and accessories furnished under this Section.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 15001, "Mechanical Systems - General".

END OF SECTION 15400
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies the furnishing and installing of water heaters as shown. Include the related work - pipe, pipe fittings, valves and specialties and supporting devices as shown.

1.2 REFERENCE STANDARDS

A. American Society of Heating, Refrigeration & AC Engineers (ASHRAE):
   2. ASHRAE 90.2 – Energy-Efficient Design of Low-Rise Residential Buildings

B. American Society of Mechanical Engineers (ASME):
   1. ASME Boiler and Pressure Vessel Code

1.3 SUBMITTALS

A. Certifications.

B. Operation and Maintenance Manuals: Section 15001, "Mechanical Systems - General”.

C. Product Data: Catalog Cuts.

1.4 QUALITY ASSURANCE

A. The Codes, Regulations, Reference Standards, and Specification sections referenced in Section 15001, "Mechanical Systems - General”, also apply to this section. When requested, provide the Contracting Officer with manufacturer's certificate that materials meet or exceed minimum requirements to comply with ASME, UL, CSA, and all other applicable standards.

B. Experience:
   1. Manufacturer: Select a firm regularly engaged in the manufacture of industrial water heaters of the type specified herein.
   2. Product: Incorporate into the work water heaters that essentially duplicate water heaters that have been in satisfactory use for a period of ten years prior to the Bid Opening of this Project.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Keep the openings of all water heaters covered until final connections are completed.

B. During the erection, protect, and store all equipment from dirt and damage.

PART 2 - PRODUCTS

2.1 ELECTRIC WATER HEATERS

A. Storage type water heater and accessories for 20 gallon capacity and less.
   1. Water heater fabricated of steel in accordance with the ASME Code.
   2. Storage capacity - as scheduled.
   3. Water heater recovery - as scheduled.
   4. Comply with ASHRAE/IESNA 90.1 or ASHRAE 90.2.
   5. ASME rated temperature-pressure relief valve on the tank, piped to indirect waste.
   6. Heating elements of the double rod type, 2000 watts or 1500 watts as shown. Voltage as indicated.
   7. Anode rods for cathodic protection of all internal tank surfaces.
   8. Furnished with complete automatic controls, including a temperature protector designed to shut off the power supply if water temperature in tank rises to high limit of temperature range, single temperature control adjustable for a range of 110 degrees F to 170 degrees F, and junction box with terminal block connection.
   9. Provide water heater UL listed and labeled.

B. Capacity of storage-type water heaters and accessories larger than 20 gallons.
   1. Water heaters fabricated of steel in accordance with ASME Code and applicable local plumbing code.
   2. Minimum storage capacity: As scheduled.
   3. Water heaters designed for heat recovery capacity as scheduled.
4. Comply with ASHRAE/IESNA 90.1 or ASHRAE 90.2.

5. ASME rated temperature-pressure relief valve on tank, piped to indirect waste.

6. Provide heating elements for electric heaters of double rod type for operation at voltage shown.

7. Provide cathodic protection for all internal tank surfaces.

8. Furnished with complete automatic controls, including temperature protector designed to shut off power supply if water temperature in tank rises to 194 degrees F.

9. Provide low-water cut off to prevent electric powered water system from operating when water level drops below probe level.

10. Immersion-type thermostats and dial-indicating temperature gauge.

11. In-line hot water recirculating pump: Section 15160, “Pumps”.

2.2 GAS WATER HEATERS

A. Storage type water heater, self contained, fully automatic.

B. Water heater fabricated of steel shall be 150 psi rated, CSA and UL approved and labeled.

C. Storage capacity - as scheduled.

D. Water heater recovery - as scheduled.

E. Glass lined tank with high density blanket type insulation.

F. ASME rated combination temperature and pressure relief valve installed directly into the storage tank. Pipe to nearest indirect waste.

G. Provide burner to evenly distribute heat to the tank bottom and flue ways. Unit efficiency shall be 80% minimum based on flue gas analysis and standby losses per ASHRAE 90.1 I-P standard.

H. 100 percent shut-off safety pilot and main burner.

I. Pilot shall be of the automatic type, will not burn constantly.

J. Operating controls, to include programmed prepurge cycle spark ignition flame monitoring and normal burner control shall be by an adjustable operating thermostat.

K. Accessories shall include gate and check valves in the cold water supply.

L. Furnished with automatic control to shut off gas if water temperature in tank rises to 180 degrees F.

M. In-line hot water recirculating pump: In accordance with Section 15160, "Pumps".

N. Provide flue piping in accordance with Section 15600, "Heating Systems".

O. Unit shall meet current emissions standards of Texas Commission on Environmental Quality (TCEQ).

2.3 NAMEPLATES

A. Securely attach plate on each water heater showing manufacturer's name, model number, and serial number.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Fit equipment and appurtenances to the space provided and make ready for service. Make installation free from obstructions around any part of the heater.

B. Provide supports, concrete pads, hangers, and anchor bolts necessary for proper installation of equipment as recommended by manufacturer.

C. Install complete domestic cold water supply in accordance with Section 15060, "Piping and Accessories".

D. Provide heaters ASME approved and with labeled temperature and pressure relief valve set to relieve full BTU/hr. capacity of heater at 210 degrees F and 125 pounds per square inch gauge (psig).

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 15001, "Mechanical Systems - General".

END OF SECTION 15458
SECTION 15493
HEAT TRACING

PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies the furnishing and installing of a complete system of freeze protection for domestic water piping systems, roof drains, and supporting devices shown on the Drawings and specified herein.

1.2 SUBMITTALS

A. Certification: Submit certified copies of field test reports.

B. Operation and Maintenance Manuals: Section 15001, “Mechanical Systems - General”.

C. Shop Drawings: Provide locations of pipe, appurtenances, and fixtures where heat tracing is applied.

D. Product Data: Catalog Cuts.

E. Field Testing: Submit a detailed plan of the proposed methods and scheduling of the required field testing at least 30 calendar days before initiating the test.

1.3 QUALITY ASSURANCE

A. The Codes, Regulations, Reference Standards, and Specifications sections referenced in Section 15001, “Mechanical Systems - General”, also apply to this section. When requested, provide the Contracting Officer with manufacturer’s certificate that materials meet or exceed minimum requirements to comply with UL, NEC, and all other applicable standards.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Provide electric self-regulating heat tape for the purpose of freeze protection made up with copper bus bars embedded in a semi-conductor polymer jacket. Insulation for piping is specified in Section 15260, “Insulation”.

B. Provide heat tracing capable of maintaining a minimum water temperature in the pipe of 40 deg. F at an ambient temperature of minus 10 deg. F. Provide for automatic heater response to temperature conditions at any point along its length without reliance on thermostats or external control devices.

C. Provide self regulating feature to limit current consumption to actual current required to maintain temperature, and to consume no power, when water temperatures are above specified conditions.

D. Provide electric heat tracing consisting of a flat, flexible, low heat density electric tape made up with two 16 AWG copper bus wires with a continuous inner core of self-regulating conductive polymer material. Insulate core with a polyolefin jacket.

E. Electrical characteristics: 120 volts, single-phase, 60 Hz power.

F. For each continuous system of heat tracing, proper sized circuit breaker and enclosure will be provided under Division 16, “ELECTRICAL” as per the requirements of Section 15040, “Electrical Requirements of Mechanical Work”.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Generally, install heat tracing wrapped around the pipe to be protected, under the pipe insulation as specified in Section 15260, “Insulation”.

B. Provide connections to and connections between elements by means of special fittings as recommended by the manufacturer.

C. Install the electric heat tracing system in strict accordance with the manufacturers installation drawings and printed installation instructions.

3.2 TESTING

A. Before heat tracing is covered, confirm operation by means of application of dry ice packs alternatively placed at three points along the tape run. Prove current flow by means of a clamp-on ammeter applied at the secondary side of the control circuit breaker. When dry ice pack is removed the current shall be reduced to match the resistance indicated by the manufacturer for the ambient temperature at the time of testing.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 15001, “Mechanical Systems - General”.

END OF SECTION 15493
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies the furnishing and installing of heating systems and electric unit heaters and supporting devices, as shown, or as specified herein.

B. Work Included:
   1. Boilers.
   2. Steam cleaner.
   3. Flue pipe.
   4. Radiant heating panels.
   5. Gas furnaces.
   6. Infrared heaters.
   7. Electric duct heaters.
   8. Unit heaters.

1.2 REFERENCED STANDARDS

A. American Society of Heating, Refrigeration & AC Engineers (ASHRAE):

B. American Society of Mechanical Engineers (ASME):
   1. ASME Boiler and Pressure Vessel Code

C. CSA America (CSA):
   1. CSA/AM CSA/ANSI Z83.19 - Gas-Fired High-Intensity Infrared Heaters

D. National Fire Protection Association (NFPA):
   1. NFPA 70 - National Electrical Code (hereinafter referred to as NEC)
   2. NFPA 211 - Standard for Chimneys, Fireplaces, Vents, and Solid Fuel-Burning Appliances

1.3 SUBMITTALS

A. Shop Drawings.

B. Certification: Design certification for gas-fired radiant heating systems.

C. Test Reports.

D. Training Plans and Operation and Maintenance Manuals: Section 15001, “Mechanical Systems - General” and Section 01786, “Operation and Maintenance Instructions”.

E. Product Data: Catalog Cuts.

1.4 QUALITY ASSURANCE

A. The Codes, Regulations, Reference Standards, and Specification sections referenced in Section 15001, "Mechanical Systems - General", also apply to this section. When requested, provide the Contracting Officer with manufacturer's certificate that materials meet or exceed minimum requirements to comply with UL, ASHRAE, AGA, standards.

B. Experience:
   1. Manufacturer: Select a firm regularly engaged in the manufacture of heating equipment of the type specified herein.
   2. Equipment: Incorporate equipment into the work which essentially duplicates equipment that has been in satisfactory use for a period of five years prior to the Bid Opening of this Project.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Keep the inlet and discharge openings of all units covered until the units are ready to run.

B. Store and protect all ductwork, piping and equipment from dirt and damage prior to and during erection. Temporarily cap the open top of all ductwork and piping installed vertically.

PART 2 - PRODUCTS

2.1 GAS FIRED WATER BOILER

A. Boiler shall be a gas fired, fire-tube type with force draft burner. Output shall be as scheduled. Unit efficiency based on flue gas analysis shall be not less than 80 percent.

B. Boiler shall be in compliance with the applicable provisions of the State Boiler Rules and Regulations, ASME Boiler and Pressure Vessel Code and UL listed.

C. Boiler shall be constructed to ASME standards for 60 psig, hot water boilers.
D. Boiler shall be furnished complete with, but not limited to:

1. Handholes and washout openings per ASME code requirements.
2. Dual low water cutouts.
3. Combination altitude-temperature gauge.
4. ASME code safety valve.
5. Bottom drain valve connection.
6. Safety high limit control.
7. Gas train with accessories.
8. Power indicating light.
10. Modulating type firing control when available as an optional feature.
11. Low fire hold aquastat.
12. Meter and control board on operating floor.

2.2 ELECTRIC BOILER

A. Electric boiler shall be self-contained, electric, and immersion type.
B. Boiler shall be in compliance with the applicable provisions of the State Boiler Rules and Regulations, ASME Boiler and Pressure Vessel Code and UL listed.
C. Boiler shall be constructed to ASME standards for 125 psig steam working pressure.
D. Boiler shall consist of the following:
   1. UL listed.
   2. 4 inch fiberglass insulation minimum on all sides of vessel.
   5. Drain/blowdown connection.
   6. Gauges: 3-1/2 inch steam pressure gauge and water column gauge glass with dry cocks.

2.3 STEAM CLEANER

A. Provide gas fired steam cleaner unit capable of producing steam vapor at 100 pounds per square inch (psig). Arrange for stationary mounting, with provision for leveling the unit.
B. For the steam cleaner, include an inlet float tank and a detergent tank. Features to be included are temperature control, pressure relief valve, steam pressure gage, and pulsation dampener. Provide steam hose 3/4 inch diameter by 50 foot long two wire braid; steam gun easily attached to the hose and equipped with swivel grips.
C. Equip the steam cleaner with an electric motor of adequate size in accordance with Section 15040, “Electrical Requirements of Mechanical Work”.
D. Provide water inlet pipe connection and gas pipe connection of adequate size on the machine. Furnish and install as indicated, a natural gas regulator, designed to provide a seven to nine inch water column gas pressure from a two inch gas pipe.
E. Provide steam cleaner with quality equal to equipment made by the Sioux Corporation, Beresford, South Dakota.

2.4 BOILER AND WATER HEATER FLUE FOR POWER BURNERS

A. Flue system components shall be UL listed for use with building heating equipment as described in NFPA 211.
B. Flue shall be double wall with stainless steel inner wall and aluminized steel outer wall.
2.5 WATER HEATER FLUE FOR ATMOSPHERIC BURNERS

A. Flue shall be double wall with galvanized finish, UL listed Typed B with AGA approved vent cap, roof flashing and storm collar.

2.6 RADIANT HEATING PANELS - ELECTRIC

A. The required panels shall be constructed of a 24 gauge galvanized steel back overlapping and riveted to a 22 gauge galvanized steel front. The panel heating element shall be a carbon (graphite) element. The surface shall be a multifaceted crystalline type which will demonstrate a watt density of 0.72 watts per square foot at a distance of six feet down from the center of the panel, if a low density panel (62.5 watts/sq.ft.) or 1.00 watt per square foot, if a high density panel (95 watts/sq. ft.). The rated input shall be: 62.5 watts/sq.ft. with a surface temperature of not more than 165 degrees F or 95 watts/sq.ft. with a surface panel heating capacity and voltage shall be as scheduled. All panels shall be provided with not less than a ten year warranty.

2.7 RADIANT UNIT HEATERS - GAS FIRED TUBE TYPE

A. The total heating system supplied shall be design certified by the American Gas Association and CSA/AM CSA/ANSI Z83.19.

B. Each burner shall have affixed a name plate that bears the seal of the American Gas Association.

C. Burners shall be designed for firing in tandem without adverse effects from combustion gases from upstream burners.

D. Burners shall be capable of firing without physical changes either propane or natural gas (Dual Fuel).

E. Burners shall be supplied to fire at the input firing rates as shown on the Drawings.

F. The design of the burners supplied shall provide for maintaining a constant proportion of fuel gas to filtered combustion air.

G. To assure a high degree of fail safe operation, the design shall preclude main flow of gas if any or all of the following abnormal conditions occur in the non-firing mode.

1. Main valve fails in open position.
2. Vacuum pump motor fails to operate.
3. Power fails.

H. To further assure a high degree of safety, the system will be under negative pressure at all times during operation to preclude the possibility of the escape of combustion gases inside the building.
HEATING SYSTEMS

U. Burners shall be pre-wired with a three conductor electrical cord and plug with the third wire for ground circuit.

V. Pre-wired system control circuits shall be supplied in a panel box with each vacuum pump. The panel box for the standard burners shall provide relays and terminals to accommodate up to four temperature zones with a thermostat and associated control circuits for the burners for each temperature zone. The panel box and terminals to accommodate up to two temperature zones with a thermostat and associated control circuits for the burners for each temperature zone.

2.8 GAS FIRED FURNACE

A. Furnish and install gas fired furnaces in the location and the capacity as scheduled. Furnace section shall be AGA approved. Furnace shall have efficiency rating of 80 percent, minimum.

B. Fan section shall have forward-curved blades, double-inlet fan mounted on the motor shaft. Fans shall be statically and dynamically balanced and motor shall have permanently lubricated bearings.

C. Casing shall be made of galvanized steel, bonderized and finished with baked enamel.

D. Heat exchanger shall be cold rolled steel and sectional in design.

E. Burners shall be aluminized steel and tapered for even gas distribution; ignition shall be accomplished by means of an electronic ignition system.

F. Cooling coils, when scheduled, shall be nonferrous construction with mechanically bonded smooth plate fins. Tube joints shall be brazed with phosphorus copper or silver alloy.

G. Controls shall include: Gas valve, with 100 percent automatic main burner and pilot shutoff; fan and limit control, prewired indoor fan relay with transformer; and a low-voltage automatic heating/cooling thermostat.

H. Install 1 inch extended surface disposable panel filters with minimum 20 percent efficiency in units and provide to Authority, one complete set of extra filters.

2.9 INFRARED HEATERS - GAS-FIRED CERAMIC

A. Heaters shall be equipped with a 120 volts AC, 60 Hz, single-phase, spark pilot ignition control system. Heaters shall be Design Certified by A.G.A., comply with current OSHA requirements, accepted by FIA/FM and be listed by UL.

B. The heater's combustion surface shall be made of perforated ceramic refractory, shall be capable of operating continuously at 1810 degrees F. and shall withstand thermal shock when water quenched. Heaters shall have secondary radiating surfaces.

C. The manufacturer shall warrant the heater's infrared element assembly for a period of ten years. The secondary radiating surface (rods or screens) shall be warranted for ten years against deterioration and failure, and manufacturer shall warrant its original position from the ceramic by providing a ten year warranty on the (rod or screen) retaining device. Heaters shall operate satisfactorily on natural gas at an inlet pressure of 4 ounces.

2.10 ELECTRIC HEATING COILS, DUCT INSERTION TYPE

A. Heaters shall be slip-in type heaters. Heaters shall be suitable for installation in lined ducts with up to 1 inch of interior insulation.

B. Heaters shall have 80 percent nickel, 20 percent chromium resistance coils, insulated by floating ceramic bushings and supported in aluminized steel frames. Bushings shall be recessed into embossed openings and staked into supporting brackets spaced 3-1/2 inches maximum center-to-center. Coils shall be machine crimped in stainless steel terminals which are insulated with high temperature phenolic bushings.

C. Heaters shall be furnished:

1. With one disk type, automatic reset thermal cutout for primary over-temperature protection. Heaters shall also be furnished with disk type, load-carrying manual reset thermal cutout factory-wired in series with each heater stage for secondary protection. Heat limiters or other fusible over-temperature protection devices shall not be acceptable.

2. At rated voltage indicated on the Electrical Drawings. Internal wiring shall be suitable for 221 degrees F.

3. With thermal cutouts, Mercury contactors and fuses.

D. Provide a differential pressure type airflow switch with each heating coil to verify air flow before energizing coil.

E. Terminal blocks shall be sized for installation of 167 degrees F. copper wire of the appropriate gauge to handle 125 percent of the total heater load.

F. Heaters shall be listed by Underwriters' Laboratories and shall meet the requirements of the National Electrical Code. UL listing shall allow installation with zero clearance to combustible surfaces.
HEATING SYSTEMS

G. Heaters shall be furnished with the following steps of control, unless otherwise noted:

1. Single stage 0-10 kW
2. Two stage 11-20 kW
3. Three stage 21 kW and larger

2.11 ELECTRIC UNIT HEATERS

A. Unit heaters shall have steel housing, adjustable discharge louvers, mounting bracket, fan and motors with guard, enclosed finned tube type heating element, safety controls and wiring per NEC. Provide 24 volt thermostat for remote mounting. Provide capacity as scheduled.

2.12 HOT WATER UNIT HEATERS

A. Unit heaters shall have steel housing, mounting bracket, fan motor, heating coil, safety controls, with control as noted on the schedule or provision for control of fan by a thermostat by controls contractor. Provide capacity as scheduled. Heaters shall be in accordance with ASHRAE standards.

B. Fan shall have aluminum blades, factory balanced.

C. Coils shall be single or multiple circuits, with aluminum fins mechanically bonded to seamless copper tubing. Coils to be tested at 200 psig. Supply and return connections to be threaded steel or malleable iron pipe.

D. Motors shall be totally enclosed, permanent split capacitor type with permanently lubricated bearings.

E. Louver diffuser shall be adjustable steel blades held in set position by spring steel clips.

2.13 GRAVITY VENTED GAS-FIRED UNIT HEATERS

A. Provide natural gas fired unit heater(s) of the capacity as scheduled.

B. Heat exchanger shall be aluminized steel, die-formed burners shall be of same construction, with stainless steel inserts.

C. Unit shall have combination redundant gas valve with intermittent spark pilot and electronic flame supervision with timed lockout. Unit shall bear AGA and UL label.

D. Units shall have propeller fan and motor with internal overload and safety fan guard.

E. Horizontal and vertical louvers shall be provided for directing air flow.

F. The unit must be arranged for ceiling suspension with threaded hanger connections and provided with hanger kits.

G. The unit shall be constructed of cold-rolled steel and finished with bake-on enamel.

2.14 SEPARATED COMBUSTION GAS-FIRED UNIT HEATERS

A. Provide high-efficiency, separated combustion, gas-fired unit heaters of the capacity as scheduled with a factory-supplied vertical vent terminal assembly. The vent terminal assembly shall be arranged to provide preheating of the combustion supply air and to allow a single wall or roof penetration.

B. Each unit shall be equipped for use with natural gas. The heat exchanger shall be of aluminized steel and include burner air shutters and a stainless steel insert.

C. Unit shall have combination redundant gas valve with intermittent spark pilot and electronic flame supervision with timed lockout. Unit shall bear AGA and UL label.

D. Units shall have propeller fan and motor with internal overload and safety fan guard.

E. Horizontal and vertical louvers shall be provided for directing air flow.

F. The unit must be arranged for ceiling suspension with threaded hanger connections and provided with hanger kits.

G. The cabinet shall be constructed of cold-rolled steel and finished with baked-on enamel.

H. Provide factory furnished single stage thermostat.

I. Gas-fired unit heaters must bear the AGA label.

2.15 SEPARATED COMBUSTION GAS-FIRED DUCT FURNACE

A. Provide high-efficiency, separated combustion, gas-fired duct furnaces of the capacity as scheduled.

B. The combustion air supply pipe and flue exhaust pipe shall be run parallel to a factory-supplied horizontal or vertical vent terminal assembly. The vent terminal assembly shall be arranged to provide preheating of the combustion supply air and to allow a single wall of roof penetration.

C. Each unit shall be equipped for use with natural gas. The heat exchanger shall be of aluminized steel and include burner air shutters and a stainless steel insert.

D. The unit shall be provided with a 24 volt control transformer, a single-stage electronic modulation with ductstat and remote set-point adjustment gas control system with a regulated combination redundant gas valve and an intermittent spark pilot with electronic flame supervision and timed lockout. Also provide all limit and safety controls, including a
combustion air pressure differential switch to verify proper vent flow before allowing operation of the gas valve.

2.16 BASEBOARD HEATERS

A. Furnish heating unit assemblies consisting of a minimum 14 gauge, two side, aluminum cabinet with a minimum 14 gauge extruded bar-type louvers for intake air at the front or bottom and discharge air at the top.

B. Ensure that the heating element and wiring is accessible from the front cabinet by the removal of a minimum 14 gauge front assembly. Secure the front cover to the cabinet by tamperproof locking devices. Furnish front covers without visible screws.

C. Where cabinets are to be installed continuously from end to end, ensure that they form neat, butt joints and that they are fastened to each other internally by the use of screw-type fasteners.

D. Furnish heaters with an aluminum tube and fin element assembly for corrosion resistance and with full thermal overheating protection. Provide elements free to expand without objectionable noises.

E. Furnish the heating element and enclosure protected from overheating by a linear type high temperature limit switch, with automatic reset. Locate switch in the heater cabinet. Provide high temperature type wiring, suitable for the wattage capacity of the unit. Wire the heating element in series with high temperature limit switch and terminate wires at each end of the cabinet.

F. Factory wire the heaters at each cabinet to permit easy field power wiring from either end of the cabinet. When cabinets are installed end to end, provide for possible field interconnecting adjacent cabinets through a chase nipple supplied with each cabinet. Provide for possible interconnection of up to 30 ampere branches in any individual heater. Furnish individual heaters available for single-phase electrical supply.

G. Accessories to include: end caps; inside and outside corner pieces; sleeves; blank sections; conduit risers; and control sections.

H. Control sections with factory mounted and wired components consisting of:

1. Mechanical contactors rated at the proper value for the heater (silent operating relays optional).

I. Integral Thermostats and Disconnect Switches: Factory installed in the individual heaters. Provide for tamperproof setting of the thermostat, with access to the thermostat accomplished through the discharge grille at the top of the heater.

J. Provide UL approved and listed components and heating assemblies.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Equipment shall be installed in accordance with the manufacturer's recommendations.

3.2 EQUIPMENT START-UP

A. Prior to operation, the factory start-up representative shall, in the presence of the Contracting Officer, perform system and equipment checks for electrical and gas-fired boilers as prescribed by the manufacturer in his written start-up procedures.

B. The factory authorized start-up representative shall place the equipment in operation and record all start-up data. Three copies of data shall be given to the Contracting Officer.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 15001, “Mechanical Systems - General”.

END OF SECTION 15600
SECTION 15780
SELF-CONTAINED AIR CONDITIONING UNITS

PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies the furnishing and installing of self-contained air conditioning units and supporting devices as shown on the drawings and/or specified herein.

1.2 REFERENCED STANDARDS
A. Air-Conditioning And Refrigeration Institute (ARI):
   1. ARI 270 - Sound Rating of Outdoor Unitary Equipment

B. American Society of Heating, Refrigeration & AC Engineers (ASHRAE):

C. National Fire Protection Association (NFPA):
   1. NFPA 70 - National Electrical Code (hereinafter referred to as NEC)

1.3 SUBMITTALS
A. Certification.
B. Shop Drawings.
C. Test Reports.
D. Product Data: Design Data and Calculations.
E. Operation and Maintenance Manuals: Section 15001, "Mechanical Systems - General".
F. Performance Statement: From the Manufacturer submit EER (Energy Efficiency Rating) or C.O.P. (Coefficient of Performance) in accordance with ARI applicable standards.

1.4 QUALITY ASSURANCE
A. The Codes, Regulations, Reference Standards, and Specifications sections referenced in Section 15001 "Mechanical Systems - General" also apply to this section. When requested, provide the Contracting Officer with manufacturer's certificate that materials meet or exceed minimum requirements to comply with NEC, ASHRAE, and all other applicable standards.
B. Experience:
   1. Manufacturer: Select a firm regularly engaged in the manufacture of industrial-grade equipment of the type specified herein.

2. Equipment: Provide that the equipment incorporated into the work essentially duplicates equipment that has been in satisfactory use for a period of five years prior to the Bid Opening of this Project.

C. Source Quality Control: Factory testing of assembled unit for capacity, control sequencing, and performance as specified on drawings.

1.5 PRODUCT DELIVERY, STORAGE AND HANDLING
A. Keep the inlet and discharge openings of units covered until the units are ready to run.
B. During the construction store and protect ductwork, piping and equipment from dirt and damage. Temporarily cap the open top of ductwork and piping installed vertically.

1.6 WARRANTY
A. Guarantee mechanical equipment and workmanship for a period of one year in accordance with the warranty clause of the GENERAL PROVISIONS.

PART 2 - PRODUCTS

2.1 ROOFTOP AIR CONDITIONING UNIT
A. Furnish and install a self-contained single package air conditioning unit as scheduled. The unit shall be completely factory assembled and tested and shall include hermetic compressor, condenser coil, evaporator coil, fans and motors, heating section (if scheduled) interconnecting wiring, low voltage control transformer, prewired control panel and other necessary components mounted in weather-resistant steel cabinet with baked-on enamel finish. The unit shall be A.G.A. listed and labeled accordingly. Units shall be ARI certified and listed. Unit shall be noise rated per ARI 270. Unit shall have a minimum E.E.R. in accordance with ASHRAE 90.1 I-P.

B. Compressor System: The unit shall contain a hermetic compressor. The compressor shall have a high and low pressure protection, sump heat and internal line break overload protection. Refrigerant circuit shall include service pressure tap ports, refrigerant liquid line filter-dryer and factory furnished operating charge of R-22. Compressor shall be designed, manufactured and warranted by the air conditioning unit manufacturer for a minimum of five years. Provide units with compressor short-cycling protection.
C. Condenser Section: The condenser (outdoor) coils shall be constructed of aluminum plate fins mechanically bonded to seamless refrigerant tubes. There shall be single speed, direct drive, vertical air discharge outdoor fans. Unit shall, as factory shipped, cycle one fan motor on outdoor thermostat for low ambient cooling down of 20 deg. F outdoor temperature.

D. Evaporator Section: The evaporator (indoor) coil shall be constructed of plate fins mechanically bonded to seamless refrigerant tubes. The evaporator coil shall have expansion valve refrigerant control and be equipped with evaporator defrost control. Evaporator (indoor) fan shall be of the centrifugal type forward curved and shall be driven by a belt drive, adjustable pulley and motor.

E. Electric Heating Section: Electric heat (if scheduled on Contract Drawings) shall be provided by electric heat modules for installation within basic unit and be UL approved. Provide nickel chromium elements. Each heater shall have its own line break high limit control. Each heater package shall have automatic reset high limit control. Heaters shall be individually fused from the factory when required, and meet NEC requirements. Provide assemblies with single-point wiring connection.

F. Gas Heating Section: The unit gas heating exchanger (if scheduled on Contract Drawings) shall be heavy gauge, aluminized steel with stainless steel burner tubes. Combustion blower shall provide positive pressure, forced combustion air with of combustion chamber. Ignition shall be by electronic igniter for direct electric ignition and flame detection. Controls shall include automatic fan and limit controls and two stage gas valve.

G. Roof Curb: Shall be 8 inch factory fabricated, aluminum, insulated unit.

H. Duct Hood shall be completely factory assembled, lined with 1 inch insulation and have baked enamel finish to match unit. Duct hood shall include filter racks and section for easy installation of 0-25 percent fresh air damper kit.

I. Manual 0-25 percent Make-Up Air Damper: Shall be provided (if used) for installation in duct hood. Kit shall consist of one damper assembly, bug screen and rain hood.

J. Provide factory furnished economizer cycle components and controls to operate as a fully integrated economizer cycle.

K. Provide programmable thermostat assembly with clear plastic locking cover. Assembly shall provide staged heating and cooling with:
   1. Two programmable energy saving periods available each 24 hours.
   2. Seven day programmable.

3. Occupied and unoccupied dual setpoints.

4. Automatic heat/cool change over.

5. Digital clock.

7. Function LCD’s.

8. Subbase compatible with units furnished.

9. Provide remote sensor, as located on the Contract Drawings, for thermostat.

L. Install with 1 inch extended surface disposable filters with 20 percent minimum efficiency in unit and provide to the Contracting Officer, one complete set of extra filters.

M. Install duct type smoke detectors per NFPA 90A, 4.3 in units of 15,000 cfm or greater. Install a detector in the supply air stream of RACU’s of less than 15,000 cfm capacity. Detector is furnished and wired by Division 16, “ELECTRICAL”.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Equipment shall be installed as shown or indicated on the Drawings and as recommended by the manufacturer.

3.2 EQUIPMENT START-UP

A. Provide start-up service by factory certified technician.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 15001, “Mechanical Systems - General”.

END OF SECTION 15780
PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies the furnishing and installing of self-contained air to air heat pumps and supporting devices as shown.

1.2 REFERENCED STANDARDS
A. American Society of Heating, Refrigeration & Air-Conditioning Engineers (ASHRAE):
   1. ASHRAE 15 – Refrigeration.
   2. ASHRAE/IESNA 99.1 – Minimum COP/Efficiency Levels.
B. Underwriters Laboratory (UL):
   1. UL 484 – Room Air Conditioners.

1.3 SUBMITTALS
A. Shop Drawings.
B. Product Data.
C. Certification.
D. Test Reports.
E. Operation and Maintenance Manuals: Section 15001, "Mechanical Systems - General".

1.4 QUALITY ASSURANCE
A. The Codes, Regulations, Reference Standards, and Specifications sections referenced in Section 15001, "Mechanical Systems - General" also apply to this section. When requested, provide the Contracting Officer with manufacturer's certificate that materials meet or exceed minimum requirements to comply UL, ASHRAE, and other applicable standards.
B. Experience:
   1. Manufacturer: Select a firm regularly engaged in the manufacture of industrial-grade equipment of the type specified herein.
   2. Equipment: The equipment incorporated into the work shall essentially duplicate equipment that has been in satisfactory use for a period of five years prior to the Bid Opening of this Project.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING
A. The inlet and discharge openings of all units shall be kept covered until the units are ready to run.
B. Store and protect ductwork, piping, and equipment from the dirt and damage prior to and during erection. Cap the open top of ductwork and piping installed vertically.

1.6 WARRANTY
A. Provide a parts and labor warranty for a period of four years on compressors in addition to the 1 year requirements of the General Provisions for a total of five years.

PART 2 - PRODUCTS

2.1 SINGLE PACKAGE UNITS
A. Cabinets: Unit cabinet shall be constructed of galvanized steel, bonderized and coated with a baked enamel finish. Cabinet interior shall be insulated with one-inch thick neoprene coated fiberglass. Cabinet panels shall be easily removable for service to all operating components. A condensate drain for the cooling coil shall be provided.

B. Controls:
   1. Protect the heat pump cooling/heating system with high pressure-stat, low pressure-stats, loss-of-charge protection, indoor coil freezestats, and current and temperature sensitive overload devices.
   2. Wire each of these devices through the control circuit to prevent compressor restart until reset at the thermostat. The standard room thermostat to contain a COMPRESSOR MALFUNCTION LIGHT designed to illuminate if any of the before mentioned safety controls trip out the compressor through the lockout circuit. Units to have separate and independent refrigeration and control systems designed to allow for standby operation of either compressor if one is locked out.
   3. Units to have 2-stage compressor heat and cool with built-in electric strip heat lockout to prevent resistance heat operation above 40 deg. F ambient, except in emergency situations.
C. Defrost Control: Incorporate an outdoor coil defrost control system into the base unit to prevent frost accumulation during heating cycle. The defrost cycle to function on the basis of time and coil temperature. Provide a 90 minute timer to actuate a defrost mode only if coil temperature is low enough to indicate a heavy frost condition. Defrost to have a positive termination time of a maximum of 10 minutes, or when the defrost thermostat is satisfied, to prevent prolonged operation on a defrost cycle. Electric resistance heaters to operate automatically during the defrost cycle.

D. Unit Electrical Connections: Provide unit with factory-installed electric heat with single point power connection to a terminal block. Cabinet to contain suitable openings for routing of utility connections. The base unit to contain a terminal strip in the control compartment to allow for terminal-to-terminal connection of room thermostat and field-installed accessories.

E. Roof Curb: Provide roof curb of the same manufacture as unit and include an insulated panel under compressor section to prevent condensation from forming on the bottom. Allow for easy duct location and connection to roof curb prior to unit placement. Roof curb to be a minimum of 14 inches high to allow for proper defrost meltage runoff. Design curb design to comply with National Roofing Contractors Association requirements.

F. Economizer control: Provide economizer control including return air and outside air dampers, outdoor air filter and hood, and fully modulating electric control system with outside air thermostat and adjustable mixed air stat. Economizer control to be capable of introducing up to 100 percent outdoor air. Provide a control changeover from mechanical cooling to economizer operation to be fully automatic through an adjustable outdoor air changeover thermostat.

G. Electric Heaters: Provide electric resistance heaters with 4 selections (low, 0.75:1, 1:1, 1.5:1 heat-to-cool ratio) with open wire nichrome elements for all necessary safety and operating controls. Provide factory installed, UL listed and approved heaters. Units with factory-installed heat to have single power entry by terminal blocks suitable for copper or aluminum wires.

H. Controls Accessories:
1. Provide thermostat assembly to allow staged heating and cooling, manual or automatic changeover and fan control. Standard subbase to include COMPRESSOR MALFUNCTION light designed to illuminate if compressor lockout is activated.
2. Provide emergency heat control consisting of emergency heat control box complete with emergency heat relays and outdoor thermostat(s); and an emergency heat thermostat subbase (with warning light). Control to allow for manual bypass of compressor and outdoor thermostats if compressor becomes inoperative or for service. Subbase light to illuminate if compressor lockout is activated. Provide outdoor thermostats to allow for staging of electric resistance heat according to outdoor temperature. Wire thermostats into the electric heater contactors and have an adjustable set point to provide economical resistance heat staging.
3. Provide remote control panel to allow central unit control of heating, cooling, indoor fan and outdoor air damper. Panel to contain indicator lights for up to 6 unit functions.
4. Provide time Guard circuit to prevent compressor from short cycling as a result of a rapid change in thermostat setting, and to automatically prevent compressor restart at least 5 minutes after shutdown.
5. Head pressure control: Provide a solid-state outdoor fan speed control to maintain head pressure control down to design outside air temperature on cooling cycle.

I. Install duct type smoke detectors per NFPA 90A, 4.3 in units of 15,000 cfm or greater. Install a detector in the supply air stream of HP's of less than 15,000 cfm capacity. Detector is furnished and wired by Division 16, "ELECTRICAL".

J. SCADA Alarm Contacts: Provide two sets of fail-safe, closed loop logic, Form C normally open and normally closed dry contacts in the pump controller. The normally open contacts to be connected to the Station Demarcation Terminal Cabinet for the following alarm functions:
1. Compressor malfunction alarm.
2. Emergency heat alarm.
3. Heat pump unit failure alarm.

PART 3 - EXECUTION

3.1 INSTALLATION
A. Install in accordance with manufacturer's printed recommendations, and referenced standards and details shown on drawings.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL
A. In accordance with Section 15001, "Mechanical Systems - General".

END OF SECTION 15840
PART 1 - GENERAL

1.1 DESCRIPTION

A. The work specified under this section consist of the furnishing and installing of air handling units (factory assembled), cooling and heating coils, fan coil units, air curtains, filters, relief and intake hoods, and supporting devices.

B. Variable speed drives/controllers are specified in Section 15040, "Electrical Requirements of Mechanical Work".

1.2 REFERENCED STANDARDS

A. Air-Conditioning and Refrigeration Institute (ARI):
   1. ARI 410 - Forced-Circulation Air-Cooling and Air-Heating Coils
   2. ARI 430 - Central Station Air-Handling Units

B. American Society of Heating, Refrigeration & AC Engineers (ASHRAE):
   1. ASHRAE 52.1 - Gravimetric and Dust-Spot Procedures for Testing Air-Cleaning Devices Used in General Ventilation for Removing Particulate Matter

C. National Fire Protection Association (NFPA):
   1. NFPA 90A - Standard for the Installation of Air Conditioning and Ventilating Systems

D. Air Movement & Control Association (AMCA):
   1. AMCA 210 – Laboratory Methods of Testing Fans for Rating.
   3. AMCA 301 – Methods for Calculating Fan Sound Ratings from Laboratory Test Data.

1.3 SUBMITTALS

A. Shop Drawings.

B. Certification.

C. Test Reports.

D. Operation and Maintenance Manuals: Section 15001, "Mechanical Systems - General".

E. Product Data: Catalog Cuts.

1.4 QUALITY ASSURANCE

A. The Codes, Regulations, Reference Standards, and Specifications sections referenced in Section 15001, "Mechanical Systems - General" also apply to this section. When requested, provide the Contracting Officer with manufacturer's certificate that materials meet or exceed minimum requirements to comply with UL, ASHRAE, NFPA, and other applicable standards.

B. Experience:
   1. Manufacturer: Select a firm regularly engaged in the manufacture of industrial grade equipment of the type specified herein.
   2. Equipment: Incorporate equipment into the work which essentially duplicates equipment that has been in satisfactory use for a period of five years prior to the Bid Opening of this Project.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Keep the inlet and discharge openings of all units covered until the units are ready to run.

B. Store and protect ductwork, piping, and equipment from dirt and damage prior to and during erection. Temporarily cap the open top of all ductwork and piping installed vertically.

PART 2 - PRODUCTS

2.1 AIR HANDLING UNITS; FACTORY ASSEMBLED

A. Units shall be furnished complete with water coils as scheduled, centrifugal fan, adjustable V-belt drive, insulated drain pan extending under the complete fan and coil section, and filter boxes. Fans shall be AMCA rated and units shall be rated in accordance with ARI 430.

B. Unit casings shall be 18 gauge minimum with removable panels or access panels. All sheets shall be provided with an approved rust resisting finish on all interior and exterior surfaces. Casing shall be reinforced with heavy welded structural steel framework. Casings shall have 1 inch mineral fiberglass insulation.

C. Filter box sections shall be serviceable from either side or from the top or bottom as required by access restrictions.
D. Fans shall be double-inlet multi-blade centrifugal type. Fan shaft shall be supported by a minimum of two bearings of self-aligning type. Exposed drives shall have belt guard.

E. Each fan shall be dynamically balanced and run tested while installed in fan casing. Fans shall not pass through their first critical speed at any cataloged rpm.

F. Bearings shall be provided with extended tubing to grease fittings.

G. Coils shall be as specified within and shall be easily removed from the unit. When the air handling unit employs two or more stacked cooling coils, the upper coil shall be provided with a drain channel to prevent condensation runoff from the upper coil from passing through lower coil air stream.

H. Draw-Through and Blow-Through Units:
   1. Units shall be standard cataloged, sectional air handling units of the vertical or horizontal type as indicated, complete with coils as scheduled. Components shall be as specified above.
   2. Variable air volume units shall be provided with a variable frequency drive as specified below.
   3. Multizone units shall be furnished with low leakage zone damper assemblies. Actuators shall be by controls contractor.

2.2 HOT WATER COILS

A. Tubes: Seamless deoxidized round copper tubes, minimum 0.025 inch thick wall; provide connections on the same end. Expand tubes into fin collars for permanent fin-tube bond and expand into header for permanent leak proof joints. Circuit tubes for maximum water velocity of six feet per second and maximum pressure drop of 15 feet water gauge (6.491 psi).

B. Fins: Continuous aluminum or copper, configured plate fin type with full fin collars for accurate spacing and maximum fin-tube contact. Space fins not closer than 8 per inch of tube.

C. Headers: Round seamless copper tubes or close-grained cast iron; designed with continuous circuits from inlet header to outlet header, self venting type. Inlet and outlet headers internally threaded for direct pipe connections. Headers removable bolted to flat steel plates and gasketed. Tubes rolled into steel plates and headers to form permanent pressure tight mechanical joints.

D. Casing: Continuous zinc-coated, rust resistant steel, 16 gauge for width up to 33 inches and 14 gauge for width of more than 33 inches, with formed end supports, and top and bottom channels. Furnish casing for coils mounted inside duct where shown.

E. U-Bends: Round seamless copper tubes, machine die-formed on each end to provide accurate fit. Mount coils for counter-flow service.

F. Testing: Proof test each coil at 300 psig and leak test at 200 psig air under water. Certify water coil capacities, pressure drop and selection procedures in accordance with ARI 410.

G. Capacity: Cooling capacity of each coil as scheduled.

2.4 DIRECT EXPANSION COILS

A. Tubes: Seamless deoxidized copper tubes, minimum 0.025 inch thick wall, arranged in parallel pattern with respect to maximum air velocity of 550 fpm through coil face.
B. Fins: Continuous copper or aluminum, plate type producing identical capacities. Fins either mechanically bonded or soldered to tubes for lasting reliability. Fins spaced not closer than 8 per inch of tube.

C. Headers: The refrigerant distributor of Venturi type of low pressure drop design, arranged for down feed with male sweat connections. Provide two distributors when more than 12 circuits are required or for the system requiring a split evaporator. Suction headers of either seamless copper or brass tubes. Distributors of either seamless copper or brass tubes.

D. Casing: Continuous zinc-coated, rust resistant steel, 16 gauge for coil width up to 33 inches and 14 gauge for coil width of more than 33 inches; with formed end supports, and top and bottom channels. Furnish casing for coils mounted inside duct where shown.

E. U-Bends: Round seamless copper tubes, machine die-formed on each end to provide accurate fit.

F. Testing: Proof test each coil at 300 psig and leak test at 200 psig air under water. Certify coil capacities, pressure drop and selection procedure in accordance with ARI 410.

G. Capacity: Cooling capacity of each coil as scheduled.

2.5 ELECTRIC HEATING COILS

A. Casings:

1. Frame members, casings, terminal box, terminal box cover and similar sheet metal parts fabricated of minimum 18 gauge, die-formed steel with integral corrosion-resistant coating.

2. Casing assembled into rigid structure by means of welding or threaded fastenings.

3. Flanged-in-line heater for inclusion in duct or ventilating unit.

B. Coil section panels factory-insulated.

C. Heating element:

1. Heating elements composed of individual flange-mounted finned tube heating elements with nickel-chromium alloy resistor wire centered within tubes and embedded in compacted insulating material.

2. Flanges and fins permanently furnace-brazed to elements for rigid support and rapid heat transfer.

3. Finned tubes of copper-plated or ceramic-coated steel.

2.6 FAN COIL UNITS

A. Each unit shall be complete with casing, coils, fan, drive, motor and filter section.

B. Motors shall be 3-speed, tap wound type with thermal overload protection. Motor bearings shall be of the sleeve type with oil tubes and oil reservoirs. Permanent split capacitor motors shall be provided.

C. Fans shall be centrifugal, forward curved type. Fan wheels shall be statically and dynamically balanced. Fan wheels and housing shall be steel.

D. Units shall have drain pans lined with 1/2 inch fire retardant closed cell foam.

E. Cabinet shall be of 18 gauge galvanized steel acoustically and thermally insulated with 1/2 inch coated glass fiber insulation. Panels shall be removable for access.

F. Units shall be provided with necessary transformers and wiring to allow single point electrical connection.

G. Install duct type smoke detectors per NFPA 90A, 4.3 in units of 15,000 cfm or greater. Install a detector in the supply air stream of FCU's of less than 15,000 cfm capacity. Detector is furnished and wired by Division 16, “ELECTRICAL”.

4. Ceramic coating suitable to be fired at minimum of 1,500 deg. F and capable of continuous resistance to corrosion without cracking, checking, or spalling under operating conditions.

D. Controls:

1. In accordance with Section 15950, “Control Equipment”, with the following additional requirements:

a. Heaters provided with built-in step controllers.

b. Heaters of 30 KW or less with manufacturer's standard steps.

c. Heaters larger than 30 KW having six equal steps.

d. An automatic reset snap-action thermal overheat switch provided to instantly de-energize heating coil when safe operating temperatures are exceeded.

e. Heating coil interlocked with fan to prevent energization of heating coil while fan is not running.
2.7 AIR CURTAINS

A. Provide a self-contained unit, direct fired automatically controlled heater having an air handling capacity as schedule. Provide for ambient air at 70 degrees F delivered against an external static pressure as shown by gauge. Provide an automatically controlled air damper to prevent the flow of air through the unit during non-operating periods. Provide fan of the double width, double inlet centrifugal type, belt driven on a shaft designed to place the first critical speed at 125 percent or more above maximum rpm.

B. Design unit for use with natural gas as a fuel delivered to the unit. Provide the burner of the nozzle mixing type using no other air than that delivered by the main blowers to effect complete combustion of the fuel. Provide a burner capable of a 30:1 turndown ratio and gas pilot ignited at all input rates. Design the unit for a temperature rise through the unit of 50 degrees F with an outside design temperature of 18 degrees F. Provide the unit with a remote operating panel.

C. Integrate the control system to provide all functions listed below. Complete all wiring at the factory except the wiring to the remote control panel. Mount and wire all controls. The control system to include the following:

1. Furnish remote, panel mounted, Selector Switch to provide selection of VENT, OFF and HEAT operation.

2. Provide remote, panel mounted, Indicating Light to indicate operation of FAN, HEAT and ALARM.

3. Furnish Air Flow Sensing Switch and Blower Motor Starter interlock to prove air flow through unit, prior to, and during burning operation.

4. Provide rectification type of flame safety control with spark glow plug gas pilot ignition of the main flame.

5. Design for Outside Air Thermostat to start burner when outside temperature drops below set point.

7. Provide Modulating Gas Valve to maintain discharge air temperature by varying the burner firing rate through its 30:1 turndown range.

8. Provide Main and Pilot Gas Controls including manual shutoff valves, main and pilot gas pressure regulators, pilot solenoid valve, main gas valve, and high and low gas pressure switches.

9. Furnish and install starters, overloads, and control circuit fuse.

10. Accessories: Provide main power disconnect switch, IRI controls, filters, control transformer, weatherproofing, air nozzles, intake hoods, and high gas pressure regulator.

2.8 FILTERS

A. Air filters for air handlers shall be 2 inches, medium efficiency, pleated, disposable type. Each filter shall consist of a non-woven cotton fabric media, media support grid and enclosing frame. Filters shall be installed in the factory fabricated boxes furnished by the unit manufacturer. In each unit there shall be the size and number of filters that are standard with the manufacturer for that size unit and of the thickness specified.

B. Filter media shall be of the non-woven cotton fabric type and shall be reinforced by a woven scrim backing.

C. The filter media shall have an average efficiency of 30-35 percent an average arrestance of not less than 92 percent in accordance with ASHRAE 52.1. The filter shall be listed by Underwriters' Laboratories as Class 2.

D. The effective filter media shall be not less than 4.5 square feet of media per 1.0 square feet of filter face area and shall contain not less than 16 pleates per linear foot. Initial resistance at 500 fpm approach velocity shall not exceed .30 inches w.g.

E. Filters for fan coil units and other air moving equipment, except fan powered boxes, shall be 1 inch thick throwaway fiberglass media type.

F. Filters shall be installed in the factory fabricated boxes furnished by the unit manufacturer. In each unit there shall be the size and number of filters that are standard with the manufacturer for that size unit and of the thickness specified.

G. At the time of construction and until final acceptance by the Contracting Officer, filter sections shall be loaded with filters to fully protect all coils and air distribution systems from dirt and debris, roll media prefilters may be used to protect the unit filters during the construction period. Also, replace such filters as directed by the Contracting Officer during construction period. Provide clean specified filters for final acceptance at a time as directed by the Contracting Officer and remove all used filter media from premises.

2.9 INTAKE/RELIEF HOOD

A. Penthouse shall be extruded aluminum ventilator with welded construction. Ventilator top shall have an anti-condensate insulative coating, and be removable from the exterior. Birdscreen shall be provided on all openings.
B. Provide 8 inch factory fabricated, aluminum, insulated curb.

C. Each roof mounted intake or relief hood shall be provided with a motorized, low leakage, control quality damper, as specified and furnished under Section 15950, “Control Equipment”.

2.10 DRAIN PAN

A. Provide a secondary drain pan under air handler condensate pans and surfaces subject to sweating. Pipe the drain to a point where its discharge can be observed without causing damage. Comply with applicable codes and ordinances.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Equipment shall be installed as shown or indicated on the drawings and in accordance with the recommendations of the manufacturer.

3.2 VAV AIR HANDLERS

A. Mount the speed control panel near the AHU in such a location that will allow the manual adjustment of the fan speed at the panel while observing the fan pulley.

B. Install the duct static pressure sensor approximately 2/3 distant from the AHU and 15 feet away from any turn or upstream transition.

C. Install fan speed control components as recommended by the manufacturer.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 15001, “Mechanical Systems - General”.

END OF SECTION 15850
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies the manufacture, testing, delivery, installation, and lubrication of all axial-flow and centrifugal fans except those for cooling towers, furnaces, and fan coil units.

1.2 REFERENCE STANDARDS

A. Air Movement and Control Association (AMCA):

1. AMCA 210 - Laboratory Methods of Testing Fans for Aerodynamic Performance Rating.
2. AMCA 300 - Reverberant Room Method of Sound Testing of Fans.
3. AMCA 301 - Methods for Calculating Fan Sound Ratings from Laboratory Test Data.

1.3 SUBMITTALS

A. Shop Drawings.
B. Product Data.
C. Certified Test Results:
   1. Required for each fan type and diameter above 5,000 cfm.
   2. Notify the Contracting Officer of the factory test date not less than 21 calendar days prior to the factory test.
   3. Furnish three certified and two uncertified copies of each test result to the Contracting Officer within 10 calendar days of the completion of the tests, stating the test standard used and that the test has been carried out in accordance with that standard. Provide copies of the raw test data to the Contracting Officer as requested.
   4. Do not ship fan until test results are accepted by the Contracting Officer.
   5. Previous certified test results of similar fans, will be accepted by the Contracting Officer in lieu of new tests, providing that:
      a. The casing diameter is the same,
      b. The hub and blading configuration are identical,
      c. The rpm and operational modes are same, and
      d. Both the fan capacity and the total pressure of the fan previously tested are equal to or greater than those required for the project fan.

1.4 QUALITY ASSURANCE

A. The Codes, Regulations, Reference Standards, and Specifications sections referenced in Section 15001, "Mechanical Systems - General" also apply to this section. When requested, provide the contracting officer with manufacturer's certificate that materials meet or exceed minimum requirements to comply with all applicable standards.

B. Factory Standards: Test factory fan performance in accordance with AMCA 210, 300 and 301, except as noted herein:

C. Factory Testing:
   1. Plot a minimum of eight points on each performance curve. Include plots for fan total pressure, fan static pressure, efficiency and input power required as a function of flow rate. Plot the curves from zero airflow (shutoff) to free delivery. Plot the forward flow mode of operation. If the fan is reversible, plot the reverse flow mode of operation.
   2. Develop and provide this performance data for fan blade angles two and four degrees greater than and two and four degrees less than the design point fan blade angle.
   3. Present results in inch-pound units, referenced to an air density of 0.075 lb/cu.ft.
   4. Fan speed within five percent of that of the actual fan application.
   5. Conduct performance tests for one typical fan of each type and diameter. Test the fan which requires the greatest input power and current plotted as a function of airflow delivered. The selection of the fans to be tested is subject to the approval of the Contracting Officer.
   6. Make certified Sound Power Level measurements at the design operating points (all modes of operation) for each fan tested. For all fans except propeller fans,
take measurements in decibels based on 10 to 12 watts for the following octave bands:

<table>
<thead>
<tr>
<th>Band Number</th>
<th>Center Frequency (Hz)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>63</td>
</tr>
<tr>
<td>2</td>
<td>125</td>

</tbody>
</table>

7. Fans tested: (1) equal or exceed the pressure versus capacity requirements shown on the drawings; (2) will not exceed the operating point input power requirements or the operating point sound power levels shown on the drawings.

D. Experience:

1. Manufacturer: Select a firm regularly engaged in the manufacture of industrial-grade fans of the type specified herein.

2. Equipment: Incorporate into the work fans that essentially duplicate fans that have been in satisfactory use for a period of five years prior to the Bid Opening of this Project.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Keep the inlet and discharge openings of all fans, and other terminal units covered until the units are ready to run.

B. During the erection, store and protect ductwork, piping, and equipment from dirt and damage. Cap the open top of all ductwork and piping.

1.6 JOB CONDITIONS

A. Safety Requirements: Properly guard belts, pulleys, chains, gears, couplings, projecting set screws, keys, and other rotating parts to prevent danger to personnel.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

A. Nameplates:

1. Attach nameplates to each fan showing the following:
   a. Manufacturer's Name.
   b. Model Number.
   c. Serial Number.
   d. Fan rpm.
   e. Nominal Airflow (cfm) and Total Pressure (in. wg).
   f. Motor kW.
   g. Number of Phases.
   h. Rated Voltage.
   i. Frequency.
   j. Phase Current or Power Factor.

2. Provide the nameplate in a conspicuous location for convenient maintenance access.

B. Indicate the forward direction of operation of the fan on the nameplate or by painting it on the outside of the fan housing in a location that provides convenient maintenance access.

C. Finishes:

1. Standard Finishes: Supply fans and appurtenances having a factory applied zinc-rich primer and two finish coats of baked enamel providing a total dry film thickness (DFT) of at least 0.006 inch applied in accordance with the shop painting procedures in Section 05120, "Structural Steel - Bridges".

2. High temperature finish: Tunnel ventilation fans having a factory-applied cured silicone-acrylic enamel over zinc-rich primer providing a DFT of at least 0.004 inch applied in accordance with the shop painting procedure in Section 05120, "Structural Steel - Bridges".

2.2 AXIAL FLOW FANS (EXCLUDING PROPELLER FANS)

A. Whirl-test all axial flow fans having a diameter greater than or equal to 24 inches at 125 percent of maximum rated RPM for 3 minutes duration.

B. Design, test and certify fans to have operating characteristics which enable them to pass between zero air delivery and the specified delivery in either direction without appreciable increase in the specified amplitude of vibration, or damage to the fan assembly or any component thereof for the layouts, ducting and fan arrangements shown on the drawings.
C. Weld end flanges continuously around the entire periphery of the fan housing or roll directly from the fan housing. Provide end flanges with bolt holes for bolting to a transition or inlet bell.

D. Manufacture housings to provide true circular sections, with joints continuously welded.

E. For fans having a diameter greater than 18 inches provide a tapped drain fitting at the low point of the fan housing.

F. Provide lifting eyes of the fan housing and motor.

G. Provide bolts, nuts, and washers of high strength steel with cadmium plating.

H. Fabricate fan hubs from high strength, heat treated aluminum alloy or ferrous metal.

I. Provide fan blades of high strength aluminum alloy or ferrous metal, suitable airfoil configuration and accurately fitted to fan hub and securely held in position by a positive means. The means of securing the blades shall not be subject to loosening due to torque, vibration or operational stresses.

J. Provide all fans having a diameter greater than or equal to 24 inches with manually adjustable blades. Adjust the blades without removing the impeller from the fan and measure the blade angle settings by either index marks on the blades and hubs or templates. The gradation of the blade angle adjustment not to exceed a maximum of two degrees. If index marks are used, do not stamp or engrave them on a high-stress area of the blade or hub. If templates are used, provide two metal or durable plastic templates for each size and type of fan. Provide a minimum of seven blade angle settings with at least two of these on either side of the design blade angle.

K. Provide direct drive fans. Attach rotor to the motor shaft extension by means of a zero-clearance key and a positive locking device to ensure it will not loosen during operation.

L. Dynamically balance the fan rotating assembly to peak-to-peak vibration amplitude less than 0.0016 inch at the motor shaft when operating at the specified rotational speeds.

M. Totally enclose motor and impeller within the fan housing so as not to protrude at either end of the housing, exclusive of attached end bells or transitions.

N. Design fan bearings for a L50 life of 200,000 hours or a L10 life of 40,000 hours, as defined by the Anti-Friction Bearing Manufacturers Association.

O. Use 15 seconds or less for fan start-up time.

P. The Tunnel Ventilation Fan shall meet the following requirements:

1. Provide reversible fans with a reverse capacity not less than 90 percent of the forward capacity and capable of reversing from full speed forward to full speed reverse and vice versa within 45 seconds.

2. Perform reversibility tests for each size of reversible fan. Demonstrate that the fan can operate for four full reversals during a 10 minute period from full speed forward to full speed reverse and vice versa within 45 seconds, with 300 deg. F air flowing through the fan having a density of not be less than 0.045 lbs. per cu. ft.

3. Perform a high-temperature test for each size of fan. Demonstrate that the fan can operate for one hour with 300 deg. F air flowing through it, having a density of not be less than 0.045 lbs. per cu. ft.

4. Ensure that fans, motors and cables will not suffer mechanical, electrical, or structural failure when operating at full capacity at an ambient air temperature of 300 deg. F for one hour. Certify that the design meets this requirement.

5. Provide adequate clearance between blade tips and housing at points to allow for expansion and contraction over a temperature range of from 0 deg. F to 300 deg. F without developing interference. Show the clearance on the shop drawings at 0 deg. F and 300 deg. F as well as any point of minimum clearance in between.

6. Integrate weld guide vanes to the fan housing or vane section. Locate on the discharge side of the impeller to straighten the flow of the air leaving the blades. If the manufacturer can demonstrate that guide vanes do not increase the efficiency of the fan, then guide vanes are not required.

2.3 PROPELLER FANS

A. Provide fans of the sizes, capacities, and with the accessories as scheduled.

B. Direct-drive or belt-driven fans.

C. Fan wheels shall have steel or aluminum blades; statically and dynamically balanced at the factory to operate within the stable range on its performance curbs.
D. Fans shall be provided with fan guards.
E. Wall mounted fans shall be provided with wall collars and backdraft dampers, unless otherwise indicated.
F. Fans shall carry the certified rating seal authorized by AMCA.

2.4 CENTRIFUGAL FANS
A. Fan shall carry the certified rating seal authorized by AMCA.
B. Provide regreasable antifriction bearings with readily accessible inlet fittings and outlet plugs for in service grease metering and protection against over greasing.
C. Dynamically balance all fans to an amplitude of less than 0.0016 inches at the fan shaft when operating at required speeds.
D. V-belt drives:
   1. Provide with belt tension adjustment devices.
   2. Provide guards.
   3. Furnish adjustable sheaves on motor allowing a plus or minus 20 percent adjustment in fan speed, with design capacity setting at approximately midpoint of adjustment.
E. Provide spark-proof motors on battery room fans.
F. Provide fans with a backward inclined airfoil blade and a non-overloading characteristic.
G. Split housings to facilitate assembly and disassembly of fans having an impeller diameter greater than 48 inches.
H. Fans having an impeller diameter less than 12 inches or utility fans having a total pressure requirement less than 0.75 inch WG may have forward curved blades, providing the fan motor is selected to prevent overloading.
I. Design fan bearings for a L50 life of 200,000 hours or a L10 life of 40,000 hours, as defined by the Anti-Friction Bearing Manufacturers Association. As the basis of design use maximum radial and thrust loads anticipated for the application.
J. Provide smoke extract fans capable of operating with an inlet air temperature of 300 deg. F for two hours.

K. Either test one smoke extract fan to confirm 300 deg F operation for two hours or provide previous certified test results.

2.5 TUBULAR CENTRIFUGAL FANS
A. Housing: Manufacturer's standard heavy-gauge steel construction.
   1. Flanged inlet and outlet for connection to ductwork, with inlet and outlet identical in size.
   2. Welded, cylindrical construction, braced to prevent vibration.
   3. Fan bearings and drive enclosed and isolated from airstream.
B. Fan wheels:
   1. Welded construction, centrifugal wheel, with backward inclined blades.
   2. Fan wheels 27 inches in diameter or larger supplied with double thickness, air foil blades.
   3. Fan wheels less than 27 inches in diameter supplied with plate-type blades.
   4. Fan wheels statically and dynamically balanced.
C. Fans supplied with stationary conversion vanes on discharge side of wheel designed to reduce turbulence.
D. Fan shaft accurately machined and ground for proper fit to wheel hub and bearing and designed to operate well below first critical speed.
E. Fan driven by V-belt rated at 150 percent of driving motor brake horsepower. Adjustable sheaves furnished on motor allowing 20 percent adjustment in fan speed, with design capacity setting at approximately midpoint of adjustment.
F. Fan wheels and sheaves splined or keyed and fastened to the shaft with set screws.
G. Internal and exterior belt guards as necessary for complete protection.

2.6 LUBRICATION LINES AND LUBRICANTS
A. Lubrication Lines: High tensile strength, seamless metallic tubing.
B. Lubricants: Type recommended by the bearing or motor manufacturer.
PART 3 - EXECUTION

3.1 INSTALLATION

A. Fit fans and appurtenances within space provided and make readily accessible.

B. Provide support beams, concrete pads, support legs, platforms, hangers, and anchor bolts required for proper installation of equipment as recommended by the manufacturer.

3.2 LUBRICATION LINES AND LUBRICATION

A. Bring lubrication lines from each bearing to fittings located on the exterior of the fan housing. Fabricate the lines of high tensile strength, seamless metallic tubing. Do not crush or score the tubing during installation and do not allow lines to be installed with kinks or sharp bends. Where the lines penetrate the fan housings, rigidly secure lines to the housings in a secure manner, so as to prevent vibration of the lines and the leakage of air. Terminate grease-supply lines in straight lubrication fittings. Terminate grease-release lines, where used, in spring-loaded relief fittings. Provide grease fittings with covers which exclude water and dirt between lubrications.

B. Lubricate in accordance with the recommendations of the bearing or motor manufacturer.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 15001, "Mechanical Systems - General".

END OF SECTION 15860
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies the furnishing and installing of air distribution equipment including turning vanes and dampers, sheet metal splitter dampers, transitions, air devices, and accessories and supporting devices, as shown.

B. Duct-mounted photoelectric smoke detectors are specified in Section 16721, “Fire Alarm and Detection Systems”.

1.2 REFERENCED STANDARDS

A. American Association of State Highway and Transportation Officials (AASHTO):
   1. AASHTO M36 - Standard Specification for Corrugated Steel Pipe, Metallic-Coated, for Sewers and Drains

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM C361 - Standard Specification for Reinforced Concrete Low-Head Pressure Pipe

C. National Fire Protection Association (NFPA):
   1. NFPA 90A - Standard for the Installation of Air Conditioning and Ventilating Systems
   2. NFPA 90B - Standard for the Installation of Warm Air Heating and Air - Conditioning Systems

D. Sheet Metal & AC Contractors National Association (SMACNA):
   1. SMACNA 1481 - HVAC Duct Construction Standards - Metal and Flexible

E. Underwriters Laboratories, Inc. (UL):
   1. UL 181 - UL Standard for Safety Factory-Made Air Ducts and Connectors

1.3 SUBMITTALS

A. Shop Drawings.
   1. Plans, elevations, and sections.
   2. Duct connections to equipment with duct sizes indicates.

B. Product Data: Include Manufacturer's equipment data and installation instructions.

C. Certification.

D. Operation and Maintenance Manuals: Section 15001, "Mechanical Systems - General".

1.4 QUALITY ASSURANCE

A. The Codes, Regulations, Reference Standards, and Specification sections referenced in Section 15001, "Mechanical Systems - General" also apply to this section. When requested, provide the Contracting Officer with manufacturer’s certificate that materials meet or exceed minimum requirements to comply with ASHRAE, NFPA, UL, SMACNA, and all other applicable standards.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Keep the inlet and discharge openings of all terminal units covered during construction.

B. Store and protect all piping and equipment from dirt and damage. During construction, cap the open top of all ductwork and piping when such work is installed vertically.

PART 2 - PRODUCTS

2.1 SUPPLY GRILLES AND REGISTERS

A. Type: Removable core, adjustable.

B. Size, capacity and airflow pattern as scheduled.

C. Horizontal adjustment: By means of individual adjustable vertical bars or vanes.

D. Vertical adjustment: By means of individually adjustable horizontal bars or vanes placed behind the vertical bars.

E. Horizontal bars or vanes space 3/4 inch apart maximum.

F. Grilles, frames and dampers constructed of aluminum or steel.

G. Supply grilles and registers provided with airtight felt, neoprene or plastic sealing strips at edges, designed to prevent leakage.

H. Corner joints finished to provide neat, trim appearance.

1. All grilles and registers provided with factory-fabricated volume control damper.
2. Volume dampers: Group-operated, opposed-blade, key adjustable.
3. Volume adjustment: By inserting key through face of grille.
4. Operating mechanism not projecting through grille face.

2.2 RETURN GRILLE AND REGISTER
A. Fabricated in accordance with the requirements specified for supply grilles and registers except for the following: Single set of nonadjustable horizontal face bars or vanes having a maximum of 3/4 inch spacing.

2.3 EXHAUST GRILLE AND REGISTER
A. Fabricated in accordance with the requirements specified for supply grilles and registers except for the following: Single set of nonadjustable horizontal face bars or vanes having a maximum of 3/4 inch spacing.
B. Furnish integral volume control dampers where shown.

2.4 TRANSFER GRILE AND REGISTER
A. Fabricated in accordance with the requirements specified for supply grilles and registers except for the following:
   1. Single set of non-directional, non-adjustable and non-see-through bars or vanes.
   2. Provide one grille face on both sides of openings through walls or partitions without duct connections.

2.5 CEILING DIFFUSERS
A. Types: Circular, square, rectangular, or linear as shown.
B. Diffuser ring or frame: Compatible with ceiling construction in which they are installed.
C. Diffusers fabricated to meet sizes and capacities as scheduled.
D. Transitions provided where necessary to connect ducts to diffusers.
E. Equip diffusers with baffles or other devices necessary to achieve uniform distribution of air unless indicated otherwise.
F. Turning vanes factory-fabricated, furnished by diffuser manufacturer, at each diffuser or take off except where flexible ductwork is used.
G. Single-key, opposed-blade volume damper factory-fabricated for each diffuser, furnished by diffuser manufacturer.
H. Fabricate diffusers of aluminum or steel, with edges exposed to view rolled or otherwise stiffened and rounded.
   1. Internal parts removable as unit to permit cleaning of diffuser and provide access to ducts.
   2. Removable parts constructed to prevent reassembly so as to produce incorrect air distribution pattern.
   3. Internal assembly fastened to permit removal and reassembly without special tools.
I. Omit air pattern control from diffusers used for return air or exhaust air.
J. Air duct or plenum connections secured to diffusers in accordance with manufacturer’s recommendations.
K. Circular ceiling diffusers provided with two or more concentric circular elements designed to delivery air radially, in a generally horizontal direction.
L. Square and rectangular ceiling diffusers provided similar to circular diffusers, except that outer elements to be square or rectangular.
M. Where diffuser is located at end of rectangular duct, duct extended minimum one neck diameter beyond centerline of neck.

2.6 LINEAR AIR DIFFUSERS
A. Size and capacity: As scheduled.
B. Diffusers and components parts constructed of extruded aluminum, internally lined, and finished as specified.
C. Where diffuser length necessitates sectional installation, provide alignment slots with insertion key strips or with other concealed means to align exposed butt edges of diffuser.
   1. Joints between diffuser sections to appear as hairline.
   2. Corner joints of frames and flanges exposed below ceiling or sidewall to appear as hairline cracks with unexposed sides or corner joints welded or secured with alignment keys.
D. Air delivery patterns: Manually adjustable from face of diffuser after installation. Full 180 deg. air pattern, from horizontal left or right, vertical, or
intermediate pattern for each slot independent of other slots.

E. Damper blades:
   1. Independent of pattern blades.
   2. Damper designed for manual adjustment from face of diffuser.

F. Screws or bolts prohibited in exposed face of diffused flames or flanges.

2.7 FINISHES

A. Items exposed to public view, unless otherwise shown: Two coats factory-finished in white baked enamel or color as approved by Contracting Officer.

2.8 SHEET METAL DUCTWORK

A. Ducts shall be constructed of new galvanized steel sheets and erected in a first class manner, straight and smooth, with joints neatly finished, anchored securely to the building and free from vibration.

B. Curved elbows shall have a centerline radius equal to 1-1/2 times the width of the duct. Air turns consisting of curved metal vanes, arranged to permit the air to follow abrupt turns without appreciable turbulence shall be installed in square elbows. Air turns shall be the manufacturer's standard products, and shall be quiet and free from vibration.

C. Primary and secondary ductwork of variable air volume systems shall be fabricated in accordance with the SMACNA1481, and the ASHRAE Guide. Primary ductwork upstream of air terminals shall be fabricated to withstand static pressures which the system fan is capable of producing at zero air flow, with no credit for coil, filters, or other system dynamic losses. Secondary ductwork downstream of air terminals shall be fabricated to withstand the maximum static pressure that can be developed downstream of any wide open terminal unit with the system air handling unit fan operating at its maximum external static pressure. The requirements for the seal class corresponding to the above static pressures shall be met.

D. Primary and secondary ductwork of constant volume systems shall be fabricated in accordance with the SMACNA 1481. The duct static pressure rating for this duct shall be equal to or greater than the external static pressure of the system fan as scheduled plus 0.35 inch w.c. The requirements for the seal class corresponding to the above static pressure shall be met.

E. Longitudinal joints shall be Pittsburgh lock or Acme grooved seam. Side panels greater than 10 inches in depth shall be cross-broken for added stiffness.

F. At each major branch from a primary rectangular or square trunk duct, and where shown on the drawings, install a splitter damper or multiblade adjustable air pickup. Splitter damper shall have end bearings and consist of a blade constructed of 20 gauge galvanized steel securely riveted or welded to a square operating rod. The length of the splitter blade shall be 1-1/2 times the width of the split in the main duct, but in no case less than 12 inches. Multi-blade adjustable pickup shall be with operator adjustable from the duct exterior.

G. Each individual air supply duct tap shall be equipped with a volume control device for the manual adjustment of air flow in each tap. Face bars, blanks, and equalizing grids shall not be used to regulate air flow.

H. Volume dampers shall be installed within ducts or plenums where shown on the drawings. Volume dampers shall have end bearings and be multi-blade type with opposed acting blades linked together and controlled by a single operator. Multi-blade dampers shall be not less than 16 gauge galvanized steel mounted to plenum or ductwork per SMACNA 1481 requirements.

I. Round or oval ductwork shall be fastened together with a minimum of three sheet metal screws equally spaced around the perimeter of the duct and sealed with an approved duct sealer. Ductwork shall be furnished complete with all factory fabricated starting collars, Y shaped branch takeoffs, adjustable elbows, etc.

J. Where ducts are in mechanical rooms or unfinished areas, or where dampers operate above lift out ceilings, regulators shall be stamped galvanized steel, lever type with locking screw mounted on face of ductwork. For all other areas, where damper adjustments cannot be accessed through the ceiling, regulators shall be the concealed type with adjustable cover plate, a 2-1/4 inch diameter cover plate.

K. On the inlet and outlet of each piece of air moving equipment or terminal unit, unless noted otherwise, install a flexible connection made with sufficient slack to render it flexible. Refer to Section 15075, "Vibration Isolation and Sound Control".

L. Where air intakes and/or discharges are indicated on the drawings and no air device is indicated, install 1/4 inch bird screens over each duct opening set in galvanized steel frames and securely attach to the openings.

M. Furnish and install 26 gauge galvanized steel counterflashings for all ducts penetrating roofs and for all roof mounted equipment unless directed otherwise by the Contracting Officer.

N. Install a manual volume control damper in each zone duct at the discharge of each multi-zone AHU.
2.9 DUCT ACCESS DOORS

A. Provide stamped steel duct access doors at each fire damper, fire and smoke damper, where control devices occur within ductwork, and as indicated on the drawings. Duct access doors shall be fully insulated where duct is lined internally. Provide with mounting flange, double thickness door with cam latch, gasket and retaining wire. No tools shall be required to open the duct access door.

B. The minimum size of each duct access door shall be sufficient to provide adequate access for the intended purpose of installation.

2.10 ACCESS DOORS

A. Access doors in walls and inaccessible ceilings are specified in Section 08313, “Access Doors and Frames”.

2.11 FLEXIBLE DUCTWORK

A. Flexible duct shall be factory insulated and secured with metal draw-bands. Duct shall meet the requirements of NFPA 90A and 90B and UL 181.

B. Duct shall be suitable for the various temperatures and pressures where used in the duct system.

2.12 BELOW GRADE DUCTWORK

A. Below grade ductwork shall be aluminum coated continuous welded seam helically corrugated steel pipe. The pipe exterior shall be coated with a bituminous coating. Pipe shall be 12 gauge construction with 2-2/3 pitch by 1/2 inch deep corrugations. Pipe shall be fabricated in accordance with the AASHTO Specification M36 for aluminum coated welded seam helically corrugated steel pipe. Pipe shall be joined using coupling bands (with plugs and lugs) constructed of the same base metal and coating as the pipe. Bands shall be 0.064 inch thick and 10-1/2 inches wide with corrugations 7-5/8 inches center to center. Between the corrugations the band shall be flat to allow seating of two O-ring gaskets to be installed in the first corrugation of each pipe to be joined. O-rings shall conform to ASTM C361. Band laps shall be joined with two galvanized bar, bolt and strap connectors. The installed ductwork assembly shall be tested in accordance with Section 15990, “Testing and Balancing”.

2.13 VARIABLE AIR VOLUME BOXES

A. Boxes shall be normally closed, pressure independent, single duct, variable volume units complete with primary air variable volume damper designed for complete shut-off but factory set for minimum 5 percent of nominal flow. Provide two flow measuring taps, and flow chart affixed to the box. Dampers shall incorporate a velocity reset controller which shall hold delivered CFM to plus or minus 5 percent of the set point regardless of duct inlet configuration, or of upstream or downstream pressure variation. Provide factory installed and calibrated operator capable of control to 5 percent of nominal air flow. The device shall be controlled by room thermostat furnished by temperature control contractor.

B. Unit and accessory interior surfaces shall be acoustically and thermally insulated with a minimum of 1/2 inch acoustic liner of 1-1/2 pounds per cubic foot density, coated to prevent erosion, complying with the requirements of NFPA 90A and 90B.

C. At scheduled capacities and under installed conditions, room sound level shall not exceed sound levels per requirements in the following subsection.

D. actuators shall be provided to the box manufacturer by the temperature controls manufacturer for installation on the box at the factory.

E. Maximum primary air valve pressure drop shall not exceed 0.3 inch W.C. at full flow.

2.14 FAN POWERED VAV BOXES

A. Provide units of types and capacities as scheduled. Coordinate with electrical controls sections.

B. Blower powered section shall consist of a three speed, permanent split capacitor electric motor directly connected to a forward curved centrifugal fan mounted in an acoustically lined metal cabinet section. Blower shall operate at medium speed flowing approximately 2/3 of the cooling CFM. The electric motor shall be of a permanently lubricated design, and shall have integral overload protection. Blower/motor assembly shall be resiliently isolated from acoustically lined cabinet section. Blower cabinet section shall be factory constructed of galvanized steel. Acoustic lining shall be factory applied to all interior surfaces of cabinet. Exposed surfaces and edges of lining shall be coated to prevent erosion. Lining shall be a minimum of 1/2 inch thickness and 1-1/2 pounds per cubic foot density fiberglass and comply with the requirements of NFPA 90A and 90B and UL 181.

C. Heating elements or coils shall comply with the requirements of Section 15850, “Air Handling”, and shall not be located upstream of the fan motor. A backdraft damper shall be factory installed to prevent back flow through the blower. Damper shall not require periodic maintenance.

D. Mixing plenum section shall be of similar construction to blower cabinet section to include acoustical lining.

E. As an integral part of the fan powered box, provide a primary air valve complying with all requirements for Variable Air Volume Boxes as specified herein.

F. Each unit shall be sound rated in accordance with the following criteria and shall be capable of being
tested to demonstrate such rating. Rating and tests shall be based upon a 1200 CFM unit (cooling), fan on medium speed, 800 CFM at 0.4 inch w.c. ESP. Sound power levels, given in dB re: 10 to 12 watts, shall not exceed the following values:

<table>
<thead>
<tr>
<th>Octave Band</th>
<th>Frequency, HZ</th>
<th>Sound Power Level</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>125</td>
<td>68</td>
</tr>
<tr>
<td>3</td>
<td>250</td>
<td>61</td>
</tr>
<tr>
<td>4</td>
<td>500</td>
<td>55</td>

<tr>
<td>6</td>
<td>2000</td>
<td>49</td>
</tr>
<tr>
<td>7</td>
<td>4000</td>
<td>48</td>
</tr>
</tbody>
</table>

G. The fan of each unit shall be set at the required fan speed, and the space noise level is not to exceed NC values.

H. In those cases where sound levels exceed the above criteria, provide factory fabricated sound attenuation furnished by the box manufacturer and provide documentation that the box then complies with the above requirements.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Ductwork accessories shall be provided as specified or shown or indicated on the drawings, install as recommended by SMACNA 1481 and the manufacturer.

B. Ductwork shall be installed as recommended by SMACNA 1481 and as shown or indicated on the Drawings. Coordinate ductwork with Other trades and elements of the building construction.

C. Install duct-mounted photoelectric smoke detectors furnished and wired by Section 16721, “Fire Alarm and Detection Systems”.

D. Ductwork shall be installed in a neat, workmanlike manner with ducts generally parallel to structure and tops of ducts as high as possible against building construction. Provide offsets as necessary to avoid obstructions, piping, or structural members.

E. Flexible ductwork shall be installed and supported as recommended by SMACNA 1481 and the manufacturer.

F. Below grade ductwork is not to be installed in direct contact with soil. Concrete or other means is to be provided for keeping water away from below grade ductwork.
THIS PAGE INTENTIONALLY LEFT BLANK
SECTION 15911
LOUVERS AND DAMPERS

PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies furnishing and installing fixed louvers, gravity dampers, motorized dampers, control dampers, fire dampers, splitters, tunnel and ventilation dampers, and supporting devices.

1.2 REFERENCED STANDARDS
A. Air Movement and Control Association (AMCA):
   1. AMCA 500 - Test Methods for Louvers, Dampers and Shutters
B. National Fire Protection Association (NFPA):
   1. NFPA 90A - Standard for the Installation of Air Conditioning and Ventilating Systems
C. Sheet Metal & AC Contractors National Association (SMACNA):
   1. SMACNA Architectural Sheet Metal Manual
D. The Society for Protective Coatings (Formerly known as Steel Structures Painting Council) (SSPC):
   1. SSPC SP 6 - Commercial Blast Cleaning NACE No. 3
   2. SSPC SP 1 - Solvent Cleaning
E. Underwriters Laboratories, Inc. (UL):
   1. UL 555 - UL Standard for Safety Fire Dampers

1.3 SUBMITTALS
A. Product Data: Complete catalog information for material and equipment.
B. Shop Drawings:
   1. Submittals include, but are not limited to, the installation details for weather louvers, air intake louvers and motorized dampers to be installed in wall openings.
   2. Verify size of each opening prior to ordering louvers and dampers.
C. Certification.
D. Operations and Maintenance Manuals: Section 15001, "Mechanical Systems - General".

1.4 QUALITY ASSURANCE
A. The Codes, Regulations, Reference Standards, and Specification sections referenced in Section 15001, "Mechanical Systems - General", also apply to this section. When requested, provide the Contracting Officer with manufacturer's certificate that materials meet or exceed minimum requirements to comply with ASHRAE, AMCA, NFPA, UL and all other applicable standards.
B. Manufacturer's Qualifications:
   1. Select a damper manufacturing firm regularly engaged in the manufacture of heavy duty, industrial grade dampers of the type specified.
   2. The dampers incorporated into the work shall essentially duplicate dampers that have been in satisfactory use for a period of five years, prior to the Notice To Proceed of this Contract.
C. Source Quality Control:
   1. Performance Certification: Certify that the dampers meet the following performance requirements specified herein:
      a. Leakage.
      b. Pressure drop.
      c. Pressure reversals.
   2. Factory Testing for Tunnel Ventilation Dampers. Prior to the manufacture of any of the dampers furnished under this Contract, subject one complete damper, measuring not less than 48 inches square, to a performance test; or submit the results of a factory certified test of a similar unit. Conduct the test in a test facility located either at the manufacturer's plant, or at a suitably equipped testing laboratory. Have the test facility approved by the Contracting Officer prior to the start of tests.
      a. Test the damper in accordance with the "Test Method for louvers, dampers and shutters" of AMCA 500, using a test setup approved by the Contracting Officer as appropriate for the intended installation of the dampers. Record test data on AMCA data submittal forms, or the equivalent thereof as approved by the Contracting Officer. Submit certified test data, and certified performance curves for all of the coordinates indicated to the Contracting Officer for approval.
b. Conduct tests to determine the following:

1) Maximum leakage at shut-off in percentage of flow with 10 inches water gauge pressure differential across closed damper;

2) Maximum pressure drop across damper in full open position with a uniform face velocity of 2000 feet per minute.

c. Plot damper performance curves as follows:

1) Curve plotted with ordinate as pressure drop across fully open damper in inches of water versus velocity in feet per minute.

2) Curve plotted with ordinate as duct pressure in inches of water versus leakage across closed damper in percentage of maximum flow.

B. Each damper shall be furnished complete with 18-gauge galvanized factory sleeve and damper operator (pneumatic or electric to conform to control system) factory installed on exterior of sleeve and properly linked to damper operating shaft. Operators shall be UL listed and labeled as Fire Damper Operators.

C. Each damper shall be activated by a duct smoke detector provided by Division 16, "ELECTRICAL" and installed under Division 15, "MECHANICAL".

2.4 EXTERIOR LOUVERS

A. Exterior louvers are specified in Section 10210, "Wall Louvers".

2.5 LOUVERS FOR VENTILATION FANS FOR TUNNELS

A. Furnish and install air-intake louvers for tunnel ventilation as indicated on Contract Drawings and as specified hereinafter.

B. Louvers shall be stationary type entirely contained within a 6 inch wide frame, constructed from extruded aluminum alloy.

C. Louver components such as heads, jambs, sills, blades and mullions shall be factory assembled by the louver manufacturer.

D. Field assemble louver sizes too large for shipping from factory assembled sections to provide overall sizes required.

E. For louver design, incorporate structural supports required to withstand a wind load of 20 pounds per square foot.

F. For pressure loss through louvers at 1000 fpm air velocity do not exceed 0.25 inch of water gauge.

G. Provide louvers of architectural style with continuous appearing stationary blades. Provide intermediate support mullions which do not interrupt blade appearance when viewed from outside.

H. Louver construction:

1. Frame: 0.125 inch wall thickness minimum.

2. Blades minimum: 0.125 inch wall thickness on approximately 4-3/4 inch centers.

3. Screen: 1/2 inch mesh expanded flattened aluminum in removable frame.

I. Submit louver performance data for approval prior to construction.

J. Furnish louvers ferrous metal surfaces with SSPC SP 6 surface preparation and non-ferrous metal extrusioned surfaces a SSPC SP 1 surface preparation with a prime coat of vinyl wash primer
applied and top coat of silicone Alkyd Enamel (gloss finish) applied DFT 1 to 2 mils.

2.6 CONTROL DAMPERS

A. Furnished and installed under this Section.
B. Factory fabricated, opposed blade, balanced type with factory assembled linkages, mounted in galvanized steel frames.
C. Rectangular dampers 12 inches or larger: Multi-blades.
D. Blades: Flat or formed galvanized steel constructed of double thickness of 22 gauge. Install butyl rubber seals on all blade edges, as well as the sides, top and bottom stops of all dampers.
   1. Air temperature range of seals: Suitable for operation from zero degrees F to 200 degrees F.
   2. Supported by thrust bearings for vertically mounted blades.
   3. Length of blades between bearings maximum 48 inches.
   4. Multi-blades maximum 8 inches wide.
   5. Opposed blade dampers: Adjoining blades rotate in opposite directions so that the air stream is not over 8 inches wide.
E. Leakage when closed: Maximum 20 cfm per square foot at a static pressure of 4 inches water gauge.
F. Frames: Bar or channel, galvanized steel constructed of 16-gauge solid sheets, with corner bracing for rectangular dampers larger than 4 square feet in area.
G. Damper Operating Linkage:
   1. Adjustable length galvanized steel rods capable of withstanding load of at least twice the maximum operating force of the damper operator without deflection.
   2. Joints: Brass pins and clevises or brass ball and socket joints.
H. Steel parts: Hot dip galvanized after fabrication.
I. Damper operator mounting provisions designed for outside of the damper frames.
J. Motor mounting supported so that the operator will not deflect from its normal path when operating under load.
K. Valve and Damper Electric Operators:
   1. Spring return type.
   2. Two-position motor operation.
   3. Spring returns valve or damper to power off in the event of a power failure, either in the normally open or normally closed position as required for freeze, moisture, smoke or fire protection.
   4. Adjustment provisions: Adjustable stops to control the open and closed positions of damper operators.
   5. Opening time no greater than 5 seconds.

2.7 MOTORIZED DAMPERS

A. Factory fabricated automatic dampers as indicated. Provide gaskets at blade-ends and at sides to provide airtight construction.
B. Provide modulating dampers having opposed blades; two position dampers having parallel blades; unless otherwise specified, or shown.
C. Provide self-lubricated bearings. Externally mounted damper operators; unless otherwise specified or shown.

2.8 BACK DRAFT DAMPERS

A. Provide factory fabricated back draft dampers of the counter-balanced automatic construction.
B. Provide axles fabricated of 3/16 inch diameter rod steel with a maximum panel width of 30 inches.
C. Provide bearings of oil impregnated bronze. Provide blades with felt cushions to insure adequate sealing.
D. Locate blade linkage outside the air stream of galvanized steel, or extruded aluminum same as that specified for ductwork or fan housing.

2.9 TUNNEL VENTILATION DAMPERS

A. General:
   1. In selecting equipment, provide for interchangeability of items of dampers and parts.
   2. Ventilation dampers to be the product of a single manufacturer and like components furnished by a single supplier.
   3. Each damper assembly to consist of one or more damper modules assembled together by means of intermediate structural
supports. Design dampers with frames for mounting in concrete openings, as shown.

4. Furnish damper assemblies and damper modules in accordance with Ventilation Damper Schedule. Damper dimensions shown on drawings include damper frames. Construct modules complete with frames, mullions, blades, shafts, bearings, and interconnecting linkage for blade operation. Furnish electric damper operators, damper operator mounting plates, brackets for damper frame mounting, jack shafts, and linkage between the operator and damper blades.

5. Fully assemble each damper operator, mounting bracket and linkage, and have operation tested at the factory. If necessary, the damper operator and linkages may be removed for shipment, provided adequate written instructions for the reassembly in the field are furnished.

6. Install complete damper assemblies including damper operators, operator mounting brackets, linkages and connections to electric power and control wiring. Furnish intermediate structural supports required between damper modules as part of the damper assembly. Provide structural members required to mount the damper assembly within framed concrete openings, as required.

7. Structural opening dimensions and damper module sizes given on the Drawings are nominal. Install dampers listed in the schedule in these openings and size the assembly 1 inch smaller at all sides than the nominal structural opening dimensions. Prior to the fabrication of damper assemblies, verify in-place all dimensions and configuration of structural openings in the field.

8. Provide temporary supports and bracing to maintain dampers and damper companion flanges square and rigid at all times during shipping, handling and erection.

B. Damper Requirements:

1. Provide ventilation dampers suitable for installation in a vertical or horizontal plane as shown.

2. Design dampers to be assembled in the field from modular panels. Each damper panel to be of the multiple-parallel-blade type, with an independent channel frame, and factory-assembled complete with frames, blades, shafts, bearings, seals, linkage, and accessories required to erect the panels into composite dampers which are functional as indicated.

3. Multiple modular panel dampers may be operated by use of jack shafting.

4. Arrange dampers for electric-motor operation in two blade positions: fully-open, and fully-closed. Furnish each damper complete with electric-motor operators sufficient in number and capacity to actuate all modular panels of the damper in unison under the operating conditions indicated, and end switches to indicate the fully open and fully closed position of each damper module.

5. Dampers to have a net free face area of not less than 80 percent measured to the inside of the damper frame clear opening when blades are fully open.

6. Upon a loss of power, ensure dampers move to the "power-off position" (open or closed) as indicated.

7. Design dampers so the dampers will be fully operational in accordance with the performance requirements specified after exposure for a period of one hour to an airstream temperature of 300 degrees F. Demonstrate dampers and components capable of withstanding the stresses caused by reversal of air flow and thermal shock caused by temperature changes of from 300 degrees F to zero degrees F.

C. Damper Performance Requirements:

1. Performance requirements as specified herein are based on standard air having a density of 0.075 pounds per cubic foot.

2. When the dampers are fully-closed and holding against a maximum differential pressure of 10 inches-water-gauge, leakage through the damper is not to exceed two percent of the flow encountered in the fully open position for damper size of 48 inches square, with a face velocity of 2000 feet per minute.

3. With the dampers of 48 inches square size in the fully-open position, and air flowing across the damper at a uniform velocity of 2000 feet per minute, the static-pressure drop across the dampers is not to exceed 0.15 inches water gauge.

4. Ensure the dampers and their associated structural supporting systems are capable of withstanding the following loads when in the fully closed position and installed in accordance with the published directions of the manufacturer:

   a. Maximum differential static pressure of 16 inches water gauge in either direction.
D. Damper Components and Construction:

1. Fabricate damper blades having an airfoil cross-section of aluminum alloy, extruded to a minimum thickness of 0.08 inch. The width of the blades measured in the direction of airflow is not to be less than 4 inches, and not greater than 8 inches. Ensure damper blades in the full open position do not extend beyond the damper frame and the blades have metal to metal overlap in the closed position. Do not substitute blade edge sealing strip overlap for blade to blade overlap, regardless of the blade edge sealing strip composition.

2. Fabricate damper-blade shafts and jack shafts of aluminum alloy or stainless steel, except for drive shafts. Drive shafts to be stainless steel and not less than 1/2 inch in diameter. Incorporate in the design of the damper-blade shafts, the devices required for locking the blades onto the shafts and ensure damper blade shaft axis are always horizontal.

3. Damper blade deflection, with blade supported by shaft, not to exceed 1/180th of the span length between centers of shaft bearings with damper in closed position, while withstanding the maximum combined differential pressure and the maximum temperature as indicated.

4. Support the damper blade and shaft assemblies at each end by means of double bearings consisting of an inner bearing rotating inside an outer bearing; design the bearings so there are neither metal-to-metal nor metal-to-polymer riding surfaces. Secure the outer bearings mounted in the damper frames so as not to rotate, and fabricate of fibrous-glass-reinforced thermoplastic, or stainless steel as approved by the Contracting Officer. Secure the inner bearings fitted to the damper-blade shafts to rotate with the shafts, and fabricate of fibrous-glass-reinforced polyphenylene sulphide. Other bearing materials suitable for the specified operating conditions may be used, subject to the approval of the Contracting Officer.

5. Fabricate damper-blade seals and damper-frame seals of an extruded silicone compound, or other material suitable for the specified operating conditions, as approved by the Contracting Officer. Factory install the seal in dove-tail grooves of the blades and frames and make easily replaceable in the field. Provide damper blades with end seals.

6. Fabricate damper linkage of stainless steel rods not less than 1/4 inch in diameter. Interconnect linkage from damper blade shaft to crank arms. Fabricate damper blade crank arms of stainless steel or aluminum alloy of equal strength, as approved by the Contracting Officer. Fabricate linkage bearings of polytetrafluoroethylene or other material suitable for the specified operating conditions, as approved by the Contracting Officer. Attach linkage brackets either to the damper-blade shafts or side-mounted and mechanically interconnected with the shafts. Center mounted hardware may be provided if approved by the Contracting Officer. Linkage to be capable of transmitting a minimum of 150 percent of operator load.

7. Fabricate damper frames having a channel cross-section with not less than a 4 inch and not more than 8 inch web and 1-1/2 inch flanges of aluminum alloy extruded to a minimum thickness of 1/8 inch. Weld to mounting sides of damper frames, built-up flanges of aluminum alloy not less than 3 inches in width and not less than 1/4 inch thick unless otherwise indicated. In lieu of 3 inch welded built-up flanges, the Contracting Officer will accept damper frames extruded to 3 inch width with 3/8 inch thickness on mounting sides. Provide reinforcing bosses and dovetail grooves for mounting frame seals as integral parts of the channel configuration. Weld or reinforce the corners of the frames by means of riveted gusset plates. Provide damper assembly flanges with 3/4 inch diameter slotted holes equally spaced not more than 12 inches on centers.

8. Furnish damper modules complete with structural support elements necessary for assembly of the damper modules, including but not necessarily limited to the following: intermediate supports, both horizontal and vertical; clip angles and other framing members required at the head, sill, and jambs of each damper assembly; screws, bolts, nuts, washers, and other hardware required to complete the assembly. Fabricate intermediate supports, framing members, and hardware required for assembly of the damper modules of aluminum or stainless steel.

9. Reinforce damper modules corners by gusset plates.

10. Provide lifting lugs of similar material as damper frame and weld on exterior of damper frame to facilitate future on-site installation and removal of damper frames.

E. Damper Operator Requirements:

1. Capable of actuating the dampers, as indicated, against a differential pressure of
10 inches water-gauge across the dampers; capable of changing the position of the dampers from fully-closed to fully-open, or from fully-open to fully-closed within a period of not more than ten seconds; select to provide a capacity of not less than 50 percent in excess of normal duty requirements; and to operate under the ambient temperature conditions, as indicated.

2. Connect linkage from the damper operator to the inter-connecting blade linkage, such that full force of operator is applied to the blade-connecting linkage.

3. Motors: Not larger than 1/2 horsepower, totally enclosed and wound for 120 volts AC, single-phase, 60 Hertz. Provide motor windings and motor leads of copper and insulated so the temperature rise of the insulated motor windings does not exceed 176 degrees F, measured by resistance method, above an ambient temperature of 104 degrees F.

4. Equip motors with factory installed resistance space heaters within the motor enclosure to prevent condensation of moisture in the motor windings. Provide heaters with leads terminated in the conduit box. Operate the heaters on 120 volts, single-phase.

5. Furnish motor-operators with spring-actuated devices capable of driving the dampers to their "power-off" positions within a period of 15 seconds after the operators are deenergized. The "fail safe" position of a damper (normally open, or normally closed) is defined as the position which the damper assumes when its operators are deenergized. The spring return devices shall be fully operational as indicated throughout exposure to ambient and airstream temperatures of 300 degrees F for a period of one hour. The "power-off" position of each damper assembly is shown on the Drawings.

6. Furnish motor-operators with auxiliary limit switches at both ends of the motor travel. Provide these switches in addition to end switches specified in Paragraph 2.9.B.4. of this section having a minimum of two sets of single-pole contacts, one normally-open and one normally-closed; single-pole, double-throw contacts will be acceptable, provided that the circuits are electrically separate and fully insulated to permit their use on opposite polarities. The contacts to have an electrical rating of not less than 5 amperes at 120 volts, 60 Hertz alternating current.

7. Factory-wire motor leads and limit-switch contacts in cast iron weatherproof conduit boxes. Provide conduit boxes with tight-fitting, gasketed covers designed to resist the entrance of dust and fluids, and with threaded conduit openings.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Verify size of each opening prior to ordering dampers and/or louvers.

B. Install dampers with stainless steel hardware.

C. Where dampers are installed on steel frames, provide solid neoprene gasket of 1/4 inch thickness between the two dissimilar metals.

D. Install dampers and/or louvers in walls to completely fill the opening. Install gasket and caulk frame to make dampers and/or louvers air tight.

3.2 TESTING

A. Field Testing. Upon completion of the installation of the motor operated dampers, perform field tests as indicated under the technical guidance and supervision of the manufacturer’s field representative as follows:

1. Subject each damper to rotation reversal tests. A cycle of rotation reversal is defined as reversal from fully-open to fully-closed position, and then back to fully-open position. Each fan, isolation and bypass damper requires five cycles of rotation reversal.

2. Upon completion of reversal tests to each damper, and and the damper has been de-energized by the operator; check to ensure that it is driven to its "power-off" position within 15 seconds after being deenergized.

3. Report and correct any defect that develops within the damper equipment during the test at no additional cost to the Authority.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 15001, “Mechanical Systems - General”.

END OF SECTION 15911
SECTION 15950
CONTROL EQUIPMENT

PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies providing automatic temperature controls, remote surveillance and control and local control systems.

1.2 REFERENCED STANDARDS
A. American Society for Quality (ASQ):
   1. ASQ Z1.11 - Quality Assurance Standards - Guidelines for the Application of ANSI/ISO/ASQC Q9001 or Q9002 to Education and Training Institutions

B. American Society of Mechanical Engineers (ASME):
   1. ASME Boiler and Pressure Vessel Code

1.3 SUBMITTALS
A. Product Data:
   1. Complete catalog information and shop drawings for material and equipment including wiring and control diagrams.

B. Shop Drawings:
   1. Submittals include, but are not limited to the equipment needed for a pneumatic or electric control system.
   2. Complete set of floor plans of rooms showing by means of graphic coding actual location and mounting heights of thermostats and zone served by each thermostat.

C. Operation and Maintenance Manuals:
   1. Submit Operation and Maintenance Manuals in accordance with the requirements of Section 15001, "Mechanical Systems - General" with the additional requirements specified herein.
   2. Complete electrical schematic of each system showing and identifying each internal and external component and internal and external wiring.
   3. Detailed piping and/or wiring diagrams showing graphic coding.
   4. Terminal numbers for wire or pipe connections.
   5. Complete parts list of internal and external components.

D. Training Plan in accordance with Section 15001, "Mechanical Systems - General".

1.4 QUALITY ASSURANCE
A. The Codes, Regulations, Reference Standards, and Specification sections referenced in Section 15001, "Mechanical Systems - General" also apply to this section. When requested, provide the Contracting Officer with manufacturer's certificate that materials meet or exceed minimum requirements to comply with ASME, ASTM, NEC, NEMA, and all other applicable standards.

B. Manufacturer's Qualifications:
   1. Select a control system manufacturer regularly engaged in the manufacture of control systems of the type specified herein for a period of five years prior to the Bid Opening in this Project.
   2. Ensure that the Control System Manufacturer has a full-time organization for installation and service in the Dallas/Fort Worth Metroplex area.
   3. Have instruments, piping, and wiring installed by authorized representatives of the control equipment manufacturer.
   4. Ensure that the equipment manufacturers have a quality assurance program which meets the requirements of ASQ Z1.11 and which satisfies safety related quality requirements imposed by the local regulating agencies.

C. Source Quality Control:
   1. Test and stamp air storage tank in accordance with ASME Boiler and Pressure Vessel Code, Section VIII.
   2. Identify each transducer according to type, sensitivity, accuracy, and operating range.
   3. Install each remote indication system with accuracy as specified.

PART 2 - PRODUCTS

2.1 GENERAL
A. Automatic Temperature Control Systems:
   1. Design systems to perform functions and operate in sequence as shown or specified for air conditioning, heating and ventilation of buildings, ancillary rooms, tie breaker stations, power substations, and chilled water systems.
2. Maintain the design conditions shown or specified.

3. Supervise and control operation of chilled water plant including chilled water pumps, chiller, condenser water pumps and cooling tower as shown or specified.

4. Operate and control motor-operated dampers.

5. Design control system to interface with fire and smoke detection system as specified in other sections to shut off the following fans on activation of fire and smoke detection system.
   a. Battery room fans.
   b. Air-conditioning and ancillary area fans, except the following:
      1) Tunnel ventilation fans.
      2) Emergency power generator room ventilation system.
      3) Rooftop exhaust fans.

B. Remote Surveillance and Control Systems:

1. Continuously measure parameters, as required, including pressure, temperature and flow. Convert analog values of sensing transducer into seven-bit binary code and transfer to designated interface data transmission system (DTS) terminals by relays.

2. Monitor abnormal operations, such as high and low limits on pressure, temperature, humidity water level, water flow, damper position, mode selector switch position and air flow as shown.

3. Design system to compensate for electrical losses in wiring. Design DC power supplies and signal amplifiers, as necessary.

C. Interchangeability: In design and purchase of equipment, provide for interchangeability of items of piping equipment, subassemblies, parts, motors, starters, relays, and transducers.

D. Wherever possible, control system shall be full Direct Digital Controls (DDC), fully compatible and functional with existing central monitoring and control systems currently employed by DART. See mechanical schedule for central monitoring requirements.

2.2 MATERIALS

A. Room Thermostats: Thermostats shall be of the gradual acting type with adjustable set points. Pneumatic thermostats shall have a bi-metal sensing element capable of responding to a temperature change of one-tenth of one degree, and shall control the space temperature to plus or minus 1 degree F. Electric thermostats shall have an electronic sensing element to respond to temperature changes, and should control the space temperature plus or minus 1 degree F.

1. Covers for the thermostats shall include tamperproof socket head screws.

2. Calibration shall be possible from the front of the thermostat without removing the thermostat body from the wall mounting plate.

3. Temperature setpoint adjustment shall be concealed.

4. Space thermostats shall be without exposed thermometers.

5. Temperature in each space or zone shall be controlled by a single thermostat.

6. For zones with heating and cooling capacity provide a thermostat dead band of at least 2 degrees F.

7. Provide thermostats with a heating mode shall have a night setback feature.

B. Transmitters: Temperature, relative humidity and pressure transmitters shall be direct acting instruments capable of transmitting a proportional [pneumatic, electric] signal in direct proportion to the change in input. Pneumatic transmitter output shall change from 3 psi to 15 psi or other suitable pressure range over the stated range of the transmitter. Humidity transmitters shall incorporate inorganic film or solid state sensing element.

C. Receiver-Controllers: Receiver-controllers shall be of the single, dual or three input models as required to meet the specified sequence of operation. They shall have mechanical setpoint adjustment, proportional band adjustment and authority adjustment. Provide a locking device for set point adjuster. Proportional band shall be adjustable from 2 percent to a maximum of 170 percent and authority adjustment shall be a minimum of 0 to 200 percent. Provide direct or reverse acting controllers as required, with temperature ranges to match the respective transmitters. Receiver-controllers shall be capable of receiving signals from either bleed type or relay type transmitters. Field adjust each controller to prevent temperature variation in controlled fluid from exceeding plus or minus 1 degree F from set point.

D. Pneumatic Temperature Sensors: Sensors shall employ pneumatic feedback and shall be capable of transmitting a linear signal over the required span. Sensors shall be designed for wall, pipe or duct mounting as required by the application. Insertion
CONTROL EQUIPMENT

DART Standard Specifications – July 2014

CONTROL EQUIPMENT

A. Controls shall be installed as recommended by the manufacturer to accomplish the implied or intended functions of the following described sequence of operation.

B. Control devices accessible to building occupants shall be mounted to conform to all applicable sections of the state program for the elimination of architectural barriers for the handicapped.

WIRING

A. Provide control wiring required to interconnect all control components furnished under this Section, all interlocks to components furnished by others, and to accomplish the control functions described in the sequence of operation.

B. Wiring shall be run in conduit.

SEQUENCE OF OPERATION

A. Chilled Water System: Chillers shall operate with their respective condenser water and chilled water pumps simultaneously. Proof of flow switches as specified herein will prove water flow before chillers can be started. An automatic controller shall sequence the chillers, by using a sensor in the return chilled water.

1. Provide a means of manually selecting any chiller or chillers to operate.

2. Automatic butterfly valves shall close to prevent water flow through an idle chiller. These valves shall be opened to allow full flow when chiller is operated.

3. A pilot differential pressure controller shall control a chilled water bypass valve.
CONTROL EQUIPMENT

B. Hot Water System: Provide the following control for the hot water heating system:

1. Interlock boiler recirculation pump with the burner to only operate the pump with the burner.
2. Provide flow switch to prove system hot water pump flow prior to firing burner.
3. Provide diverting valve controlled by temperature sensor in boiler return piping.

C. Terminal Units:

1. Typical interior zone temperature control shall be maintained by use of a modulating variable air volume valve. Each valve shall be controlled by an individual thermostat, by opening upon a call for more cooling and closing to a minimum position of 5 percent nominal flow upon a decreasing demand for cooling.
2. Typical exterior zone temperature controls shall be maintained by use of modulating a fan powered box with an electric heating coil. The air valve in the box shall modulate in a cooling mode to maintain the respective thermostat setting. As the zone calls for less cooling, the air valve shall throttle down to 5 percent of nominal flow. At that point, when the zone requires heat to satisfy the thermostat setting, the fan will start and draw return air from the ceiling plenum and discharge it into the space. If additional heat is needed, the heating coil shall, if flow is proven by a flow switch (for electric heating coils), cycle as required to maintain the thermostat setting. Upon a call for cooling the reverse will occur. There shall be a dead band between heating and cooling actions of at least 2 degrees F. Each zone shall be controlled by a single thermostat. Hot water coils shall use 2-way control valves except the last box on each major branch which will use a 3-way valve.

D. VAV Air Handling Units: These AHU shall be provided with an automatic fan speed control system furnished and installed by the Mechanical Contractor. Provide a manual reset high duct static pressure shut down switch for each unit. Set 3 inches WC (adjustable).

E. Multi-Zone Air Handling Units: For each MZ unit, provide all zone damper actuators selected for the duty required. Provide 2-way control valve for hot/cold deck, each controlled by a deck air temperature sensor to the scheduled temperature (adjustable).

F. Fan Coil Units and Constant Volume Air Handling Units: Each shall be controlled by a space thermostat.

G. Unit Heaters: Provide controls for unit heaters when not noted otherwise on the unit heater schedule.

1. Electric Unit Heaters; provide relay, wiring, and accessories for control by remote 24 volts wall thermostat.
2. Hot Water Unit Heaters; provide PE switch and pneumatic wall thermostat or speed controller for control of unit fan.

H. Bypass Valve: Provide a bypass valve between the chilled water supply and return mains. The valve shall respond to a pilot signal sampling the differential pressure of the mains and shall maintain the differential pressure of the mains within plus or minus 0.5 psig.

I. Enthalpy Economizer Cycles: Provide outdoor enthalpy sensor, mixed air sensor and controller, minimum outdoor air positioner, and all required control dampers and accessories. The O/A damper shall assume its minimum position during heating operation and shall close completely when the AHU is shut down. The motorized damper in the building relief hood(s) shall open fully when the economizer cycle is in operation.

J. Elevator Relief Damper: A motorized damper behind the relief louver shall open fully upon activation of the fire alarm.

K. Alarms: Within the main mechanical room or central plant, provide an alarm panel with the following features:

1. Each alarm point listed below shall be identified and displayed as a red light mounted in the front of the panel. Also, an alarm horn with silencing button shall be provided. Separate cooling/heating alarms through a summer/winter switch.
   a. Low cooling tower sump level.
   b. High condenser water return temperature (90 degrees F) (adjustable).
   c. High chilled water supply temperature (50 degrees F) (adjustable).
   d. Low heating water temperature (150 degrees F) (adjustable).
   e. Low control air pressure (15 psig) (adjustable).

L. SCADA Alarm Contacts: Provide two sets of fail-safe, closed loop logic, Form C normally open and normally closed dry contacts in the generator control panel. The normally open contacts to be
connected to the Station Demarcation Terminal Cabinet for the following alarm functions:

1. Separate cooling/heating alarms through a summer/winter switch.
   a. Low cooling tower sump level.
   b. High condenser water return temperature (90 degrees F) (adjustable).
   c. High chilled water supply temperature (50 degrees F) (adjustable).
   d. Low heating water temperature (150 degrees F) (adjustable).
   e. Low control air pressure (15 psig) (adjustable).

M. Traction Power Substation and Auxiliary Power Room Ventilating Unit Controls:

1. Two-stage thermostat, selector switch and automatic alternator.
2. Control sequence:
   a. When room temperature rises to 85 degrees F: Open lead-fan dampers and start lead fan.
   b. When room temperature rises to 95 degrees F: Open lag-fan dampers and start lag fan.
   c. Reverse control process on falling temperature.
   d. Automatic alternator reverses lead-lag sequence after each lead fan operating cycle.

N. AC Switch Gear Room Ventilating Fan Controls:

1. Two-stage thermostat, flow switches, time-delay relay, selector switch, and automatic alternator.
2. During each operating cycle, one fan to serve as primary fan and second fan as stand-by.
3. Control sequence:
   a. When room temperature rises to 85 degrees F, relief damper(s) open, and lead fan starts.
   b. When temperature rises to 95 degrees F: Open lag-fan dampers and start lag fan.
   c. Control sequence to reverse when room temperature falls.
   d. After each operating cycle, automatic alternator to reverse functions of lead and lag fans.

O. DC Breaker Room and Tie Breaker Station Ventilating Fan Controls:

1. Single-stage space thermostat.
2. Switch labeled HAND/OFF/AUTOMATIC.
3. Operation:
   b. Off: Fan off, dampers closed.
   c. Automatic:
      1) When room temperature rises to 90 degrees F, open dampers and start fan.
      2) Reverse control process on falling temperature.

P. Battery Room Fan Controls:

1. Battery room exhaust fan to operate continuously.

3.4 INSTALLATION

A. Upon completion of the installation, the equipment supplier and contractor shall start-up the system and perform necessary testing and debugging operations. An acceptance test in the presence of the Authority’s representative, the Contracting Officer, and the Engineer shall be performed.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 15001, “Mechanical Systems - General”.

END OF SECTION 15950
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies work required to provide complete and balanced heating, ventilating, air conditioning systems, and plumbing systems.

1.2 REFERENCED STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM E1120 - Standard Specification for Liquid Chlorine
   2. ASTM E1229 - Standard Specification for Calcium Hypochlorite

B. Associated Air Balance Council (AABC):
   1. AABC MN-1 - National Standards.

C. National Environmental Balancing Bureau (NEBB):
   1. NEBB - Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems.

D. Sheet Metal & Air Conditioning Contractors National Association (SMACNA):

1.3 SYSTEM DESCRIPTION

A. Plumbing:
   1. Perform tests of plumbing systems and plumbing equipment as specified herein and as required to obtain approvals from authorities having jurisdiction.
   2. Provide instruments, materials and labor to perform the testing and balancing and to obtain and record measurements.

B. Mechanical:
   1. The balancing, testing, and adjusting of the heating, ventilating, and air conditioning systems will be performed by an independent technical firm or balancing agency with a minimum of five years specialized experience in testing and balancing the system, a licensed Engineer overseeing the work, and equipment furnished under Division 15. The testing and balancing agency shall possess calibrated instruments, qualified engineers, and skilled technicians to perform required tests, and shall be fully certified member of the Associated Air Balance Council whose business is limited to testing and balancing the system and equipment furnished under Division 15, “MECHANICAL”.

2. The Contracting Officer and the Authority will approve selection of independent technical balancing agency.

3. The testing and balancing firm is to be an independent firm separate and distinct from; not be associated with, or be subsidiary of a firm performing work under other Sections of Division 15, “MECHANICAL”.

4. The testing and balancing firm will not instruct or direct the Contractor in any way of the work but will make such reports as are necessary directly to the Contracting Officer. The plans and specifications have indicated valves, damper, and other adjustment devices for the purpose of responsibility of the Contractor to install those devices in a manner that will leave them accessible and readily adjustable.

5. The test and balance firm is to guarantee that the test and balance work will be performed in accordance with the latest NEBB and AABC standards and procedures.
   a. NEBB - Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems.
   b. SMACNA 1143.
   c. AABC MN-1.

6. Prepare and submit to the Contracting Officer, applicable certificates of firm and personnel and report format and forms proposed for use in testing and balancing.

7. Prepare and submit to the Contracting Officer the complete reports on the balance and operations of systems. Forms shall comply with NEBB standards.

8. Make a total of three inspections within 90 days after occupancy of the building to insure that satisfactory conditions are being maintained.

9. Make an inspection in the building during the opposite season from that in which the initial adjustments were made. At that time, make any necessary modifications to the initial adjustments required to produce optimum operation of the system for all seasons.
C. Corrosion Control: Perform tests in accordance with Section 15060, “Piping and Accessories” and Section 13100, “Corrosion Control”.

1.4 QUALITY ASSURANCE

A. The Codes, Regulations, Reference Standards, and Specifications sections referenced in Section 15001, “Mechanical Systems - General” also apply to this section.

PART 2 - PRODUCTS

Not used.

PART 3 - EXECUTION

3.1 PIPING AND EQUIPMENT TESTS

A. Plumbing:

1. Soil, waste, vent, and water piping shall be tested by the Contractor and approved by the Contracting Officer and all approving authorities before acceptance. Underground soil and waste piping shall be tested before backfilling.

   a. Drainage and venting system piping shall be tested with water or air before the fixtures are installed and as required by local authorities. After the plumbing fixtures have been set and their traps filled with water, the entire drainage and venting system shall be submitted to a final test if required by the local authorities.

   b. The water test shall be applied to the drainage venting system either in its entirety or in sections. If the entire system is tested, all openings in the pipe shall be tightly closed except the highest opening, and the system shall be filled with water to the point of overflow. If the system is tested in sections, each opening except the highest opening of the section under test shall be tightly plugged, and each section shall be filled with water and tested with at least 10 feet of head of water.

   c. In testing successive sections, at least the upper 10 feet of the next preceding section shall be tested so that each joint or pipe in the building except the uppermost 10 feet of the system has been submitted to a test of at least a 10 feet of head of water. The water shall be kept in the system, or in the portion under test, for at least 15 minutes before the inspection starts; the system shall then be shown to be watertight.

   d. Air Test: If tests are made with air, a pressure of not less than 5 pounds per square inch shall be applied with a force pump and maintained at least 15 minutes without leakage.

   e. Final Test: When the smoke test is employed, the smoke shall be produced by a smoke machine, and a pressure equal to 1 inch water column shall be maintained for 15 minutes before inspection starts. When the peppermint test is used, 2 ounces of peppermint shall be introduced into each line or stack.

2. Domestic Water System: When the roughing-in is completed and before insulation is applied or fixtures are set, each pressure zone of the hot and cold water piping system shall be tested at a hydrostatic pressure of not less than 100 pounds per square inch gauge at its top, and proved tight at this pressure for not less than 30 minutes in order to permit inspection of all joints.

   a. Where a portion of the water piping system is to be concealed before system completion, this portion shall be tested separately to the pressure which would be imposed upon it if it were tested as part of a zone, as specified above.

3. Roof Drains - Downspouts: Test in the same manner as the drainage system.

4. Natural Gas System: The complete gas piping system shall be tested with air at a pressure of fifteen psi and proved tight at such pressure for twenty-four hours. Test may be done in segments as dictated by construction requirements. Peppermint fumes or soap bubbles shall be used to locate leaks. All tests shall be approved by the local authorities and also by the Contracting Officer before the test are removed.

5. Defective Work: If inspections or tests reveal defects, such defective work or material shall be replaced or repaired as necessary and inspections and tests shall be repeated. Repairs to piping shall be made with new materials. Patching of screwed joint or holes shall not be acceptable.

6. Cleaning, Testing, and Adjusting:

   a. Equipment, piping, valves, fittings, and fixtures shall be cleaned of grease, metal cuttings, and foreign matter that may have accumulated from operation of the system during
b. When the work is complete, the water systems shall be adjusted for all required flows. Flush valves and automatic control devices shall be adjusted for proper operation. Hot water heaters shall be tested for proper operation of safety and operating controls as recommended by the manufacturer. Demonstrate that supply and recirculating systems are balanced for specified flows and temperatures as shown on the drawings.

7. Sterilization: After pressure tests have been made, the entire domestic water distribution system shall be thoroughly flushed with water until all entrained dirt and mud have been removed, and shall be sterilized by chlorinating material. The chlorinating material shall be either liquid chlorine conforming to ASTM E1120 or hypochlorite conforming to ASTM E1229. The chlorinating material shall provide a dosage of not less than 50 parts per million shall be introduced into the system in an approved manner. The treatment water shall be retained in the pipe long enough to destroy all non-spore forming bacteria. Except where a shorter period is approved, the retention time shall be at least 24 hours and shall produce not less than 10 ppm of residual chorine at the extreme end of the system at the end of the retention period.

8. Valves and faucets in the system being sterilized shall be opened and closed several times during the contact period. The system shall then be flushed with clean water until the residual chlorine is reduced to less that 1.0 ppm. Samples of water shall be taken from several points in the system in properly sterilized containers for bacterial examination. The sterilizing shall be repeated until tests indicate the absence of pollution for at least two full days. The system will not be accepted until satisfactory bacteriological results have been obtained.

B. Corrosion Control: Perform tests in accordance with Section 15060, “Piping and Accessories” and Section 13100, “Corrosion Control”.

3.2 PIPING TESTS

A. Chilled Water, Heating Water, Steam, Condensate Return, and Condenser Water Piping:

1. Air Testing: Test welded piping for leaks, under air pressure with soap bubbles; this test shall be precede the specified hydrostatic test.

2. Hydrostatic Pressure Test: Test piping hydrostatically to one and one-half times the maximum working pressure, but in no case to less than 100 psi at the top of the system, for at least 4 consecutive hours, during which time pressure shall remain constant without pumping. Subject welded joints to hammer test while under hydrostatic pressure.

3.3 EQUIPMENT AND SYSTEM TESTS

A. General: The Test and Balance firm shall test equipment and systems and make all final adjustments and corrections necessary to place the system in proper operating condition.

B. Air Handling and Air Distribution: Adjust individual air handling unit speed, air terminals, dampers, registers, and diffusers so that air distribution will be as scheduled for the entire system with tests showing air quantities indicated for each inlet and outlet that do not vary by more than plus or minus 10 percent from those indicated on the drawings. Air handlers shall be tested and balanced to deliver total flow that varies from 0 to plus 10 percent.

1. Determine air velocity at outlets with a velometer or anemometer and using air devices manufacturer’s data, calculate the delivery cfm, or determine cubic feet per minute flow with a test hood.

2. Obtain approval of the desired method of taking velocity readings before starting balancing or tests.

3. Instruments shall be calibrated accurately before use.

4. Submit report of final tests using approved forms.

C. Secondary air distribution from each variable volume system air control terminal shall be balanced to achieve the air quantity shown for each outlet, with flow through the air valve equaling the sum of outlets.

D. Variable volume air systems shall be proportionally balanced with the air handling unit at its specified speed, delivering an air quantity equal to or not exceeding 5 percent of the scheduled air quantity. Each individual air terminal shall simultaneously deliver air quantity equal to the zone peak air flow.
for the terminal as noted on the drawings; divided by the sum of the individual flows as noted for air terminal units in the system times the actual air quantity being delivered by the system air handling unit at the completion of the balancing operation.

E. Constant volume air systems shall be balanced to provide the scheduled cfm of air flow at each air device with the unit fan operating at the specified air flow volume.

F. Delivery CFM scheduled for each air handling unit is scheduled for the block load of the area served. The CFM scheduled for each VAV and PIP terminal is scheduled for the zone peak air flow of that air terminal. The sum of all CFM scheduled for all terminals may exceed that of the air handling unit.

G. Water flow through individual water coils shall be balanced to the flow, pressure difference, and temperature difference values shown on the approved submittal for each coil.

H. Water pumping systems shall be proportionally balanced with all coil control valves blocked open and with the system differential bypass valve (if present) closed. Water flow through each coil shall equal the design flow for that coil divided by the sum of the design flows for coils in the system times the actual flow being delivered by the pump(s) at the completion of the balancing operation.

I. Central plant pumps, refrigerating equipment water flows and temperatures are scheduled at operating points representing the block load of the Project in temperature equilibrium. Water flows and temperatures for individual air handling unit and fan coil unit coils are scheduled for the zone peak of each individual air handling unit and fan coil unit coils are scheduled for the zone peak of each individual zone. The sum of all scheduled GPM or BTU of air units is not expected to match the values scheduled for the central plant equipment.

J. Control System Tubing: Test pneumatic control system under 50 psi air pressure for 24 hour period, during which time pressure loss shall not exceed 5 psi. Test connections with soap bubbles.

K. Controls: The Contractor shall calibrate and adjust all thermostats and other controlling devices.

3.4 SYSTEM OPERATING TESTS

A. After the successful completion of all equipment start-up and test requirements, the following formal testing and balancing shall be performed on the complete mechanical system:

B. Testing and Balancing: The contractor shall prove the operation of the mechanical system and shall adjust and set balancing cocks, valves, dampers, and similar items to ensure that the mechanical system performs as intended. At least 10 days' notice shall be given the Contracting Officer in advance of such tests. Should any item of the system fail to perform in an approved manner, this test shall be repeated until approved by the Contracting Officer. During or before this test, the contractor shall balance circulation of air and fluids conveyed to provide proper quantities to all equipment.

C. Checking by Authority and Contracting Officer: Following the successful completion of first operating tests by the Contractor, the Authority and the Contracting Officer shall have the privilege of making such tests as they may desire during a period of three weeks to ascertain in detail if any corrections are to be made to the system. At the end of testing by the Authority and Contracting Officer, the Contracting Officer shall direct the Contractor in writing to make such corrections to the system as are within the scope of the contract.

D. Contractor's Corrections to System: The Contractor shall make all required corrections to the system and shall notify the Contracting Officer in writing that he has completed the corrections outlined and shall give at least seven days notice of a final operating test.

E. Final Operating Test: An operating test shall be performed by the Contractor to the satisfaction of the Contracting Officer and the Authority for a period of not less than 8 hours. Should any element of the system not perform properly, the Contractor shall make all required corrections, and the test shall be repeated until successfully performed.

1. Measurements: All spaces provided on the report forms submitted for review shall be completed by typing the required information. Forms not fully completed or not legible will be returned to the Contractor for retesting of the equipment involved.

2. Report: The final operating test shall be submitted to the Contracting Officer for approval and subsequent transmittal to the Authority.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 15001, "Mechanical Systems - General".

END OF SECTION 15990
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies basic requirements specifically applicable to Division 16, "ELECTRICAL", in addition to Division 1, "GENERAL REQUIREMENTS".

B. Division 16, "ELECTRICAL", specifies work required to provide complete electrical systems, as indicated and specified. In addition, this division specifies the complete installation of systems as specified herein and as shown, and the provision of special devices, fittings, fabrications, cutting and patching and items required to fit the respective systems into the construction. Work done under this division shall be coordinated with the provisions of Division 1, "GENERAL REQUIREMENTS".

1.2 REFERENCED STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM A153/A153M - Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware

2. ASTM A563 - Standard Specification for Carbon and Alloy Steel Nuts

3. ASTM F436 - Standard Specification for Hardened Steel Washers

4. ASTM F1554 - Standard Specification for Anchor Bolts, Steel, 36, 55, and 105-ksi Yield Strength

B. Institute for Electrical & Electronic Engineers (IEEE):

C. National Fire Protection Association (NFPA):

1. NFPA 70 - National Electrical Code (NEC)

1.3 DEFINITIONS

A. Drawings: The Drawings for electrical work are diagrammatic and not intended for use in determining the exact locations of the components of the electrical systems, except where specifically dimensioned or indicated with specific spacing, nor do the Drawings indicate boxes, devices, accessories, etc., required for the complete installation. Refer to the drawings of "other contracts" as referenced in General Provisions, to determine the location of equipment to be furnished by this Contract, and by other contracts as referenced.

B. Where the word "concealed" is used in connection with insulating, painting, piping, ducts and the like, the word is understood to mean hidden from sight as in chases, furred spaces or suspended ceilings. “Exposed” is understood to mean open to view.

1.4 EXISTING UTILITIES AND TEMPORARY SERVICES FOR CONSTRUCTION

A. Verify the location and capacity of existing utility services pertaining to work of Division 16, "ELECTRICAL ". Relocate existing utilities unearthed by excavation as directed by the utility service companies affected.

B. Temporary Services for Construction: Provide temporary services in strict accordance with the provisions of these Specifications.

1.5 EXCAVATION AND BACKFILLING

A. Perform excavation and backfilling necessary, including compaction as specified, for the installation of Division 16, "ELECTRICAL" work.

B. Perform excavation and backfilling associated with the work of Division 16, "ELECTRICAL", in strict accordance with the provisions of these specifications including trench safety requirements.

1.6 JOB CONDITIONS

A. Examine the areas and conditions under which work of this Division will be performed. Include required work to correct conditions detrimental to the timely and proper completion of Division 16, "ELECTRICAL" work.

B. Where ducts, pipes other mechanical items are shown in conflict with locations of structural members and other equipment, include labor and materials required for extensions, offsets, and supports to clear the encroachment.

C. Although such work is not specifically indicated, furnish and install supplementary or miscellaneous items, appurtenances, and devices incidental to or necessary for a sound, secure and complete installation.

D. Verify dimensions and distances. No additional compensation will be allowed because of minor differences between work shown on the Drawings and actual dimensions and distances at the jobsite.
1.7 PREPARATION AND COORDINATION WITH OTHER TRADES

A. Perform coordination work associated with work of Division 16, "ELECTRICAL", in accordance with provisions of these Specifications and the following:

1. Coordinate as necessary with other trades to assure proper and adequate interface with work.

2. Coordinate accepted equipment changes from those scheduled or specified with other trades affected. Additional compensation to other trades for equipment changes are the responsibility of the contractor making the change.

B. The Electrical Drawings are diagrammatic, but are required to be followed as closely as actual construction and work of other trades will permit. Conduit arrangements have been designed for maximum economy consistent with standard industry practice. Install the systems arranged as shown on the Drawings, except as otherwise approved in advance by the Contracting Officer.

C. Where items such as boxes, switches, and control panels are not specifically located on the Drawings, locate as determined in the field by the Contracting Officer. Where such items are installed without such specific direction, relocate as directed by the Contracting Officer and at no additional cost to the Authority.

1.8 QUALITY ASSURANCE

A. Comply with the requirements of Section 01450, "Quality Control".

B. Provide quality control assurance in accordance with the provisions of these Specifications.

C. Perform work in accordance with the most recent edition of the following codes:

1. State and city building, and electrical codes.

2. NFPA 70

3. IEEE C2

5. Authorities having jurisdiction.

D. Where conflicts occur between drawings, specifications or code requirements, the most stringent requirement shall take precedence.

1.9 CUTTING AND PATCHING

A. Cutting and patching associated with the work of Division 16, "ELECTRICAL", shall be in strict accordance with Section 01731, “Cutting and Patching”, and other pertinent provisions of these Specifications:

1.10 TEMPERATURE RANGE

A. Unless noted otherwise, electrical equipment shall be capable of operating in the range of ambient temperatures listed below, at possible values of ambient humidity.

1. Indoor equipment: 0 degrees F to 100 degrees F.

2. Outdoor equipment: negative 10 degrees F to 120 degrees F.

1.11 PROJECT RECORD DOCUMENTS

A. Provide project record documents associated with the work of Division 16, "ELECTRICAL", in strict accordance with Section 01330, "Submittals", and other relevant provisions of these Specifications.

B. Throughout progress of the Division 16, "ELECTRICAL", work, maintain an accurate record of changes and revisions in the Contract Documents that apply to work of Division 16, "ELECTRICAL" and record the actual locations of installed piping and equipment on the project record documents.

C. Accuracy of Records:

1. Thoroughly coordinate changes within the Project Record Documents, making adequate and proper entries on each page of Specifications and each sheet of Drawings and other documents where such entry is required to show the change properly.

2. Accuracy of records shall be such that a future verification of items shown in the Contract Documents may rely reasonably on information obtained from the approved Project Record Documents.

D. Maintain the job site set of Project Record Documents completely protected from deterioration and from loss and damage until completion of the Work and transfer of recorded data to the final edition of Project Record Documents.

E. Project Record Documents (Final Edition):

1. The purpose of the final edition of the Project Record Documents is to provide factual information regarding aspects of the work, both concealed and visible, to enable future modification of the work to proceed without lengthy and expensive Site measurement, investigation, and examination.
2. Deliver one set of as-built drawings to the Contracting Officer in accordance with Section 01785, "Project Record Documents", prior to the date of substantial completion.

1.12 OPERATION AND MAINTENANCE (O&M) MANUALS

A. Operation and Maintenance Manuals: Provide manuals as specified in Section 01786, "Operation and Maintenance Instructions".

1.13 EQUIPMENT FOUNDATIONS

A. Provide equipment foundations and housekeeping pads for electrical equipment such as generators, switchgear, motor control centers, and supporting devices associated with the work of Division 16, "ELECTRICAL", in accordance with the provisions of Division 3, "CONCRETE".

1. Reinforcing: As specified in Section 03200, "Concrete Reinforcement".

2. Concrete: Mix S-7, as specified in Section 03305, "Portland Cement Concrete".

3. Anchor bolts (Bolts, nuts, and washers):
   a. Anchor Bolts: ASTM F1554, Grade 55, unless noted otherwise on drawings. ASTM A563, Grade A for nuts. ASTM F436, Type 1 for washers.
   b. Galvanized per ASTM A153/A153M.
   c. Bolts hooked, unless otherwise shown or recommended by manufacturer of structure being anchored.
   d. Two nuts and one washer for each anchor bolt for plumbing pole or leveling structure.

4. Pads shall be 6 inches high above finished floors or grades (unless otherwise noted) and shall protrude 2 inches beyond sides of equipment.

5. Provide chamfer of 1/2 inch on edges. Obtain dimensions for pads by certified and approved shop drawings, or by measuring the equipment to be installed.

6. Provide shop drawings showing method of anchoring housekeeping pads to concrete floor construction. Anchor pads to prevent lateral movement under conditions of vibration.

7. Set anchor bolts to template as required in strict accordance with details provided by the equipment manufacturer.

8. Remove and reset any anchor bolt that is set out of plumb, or has been displaced after installation.

1.14 PAINTING

A. Equipment shall be delivered to the Worksite with specified factory finish. Should the finish be damaged in transit or during the installation, it shall be finished to present a neat workmanlike appearance to the satisfaction of the Contracting Officer.

1.15 TESTING AND INSPECTION

A. Provide personnel and equipment, make required tests, and secure required approvals from the Contracting Officer and governmental agencies having jurisdiction.

B. Make written notice to the Contracting Officer adequately in advance of each of the following stages of construction:
   1. When rough-in is complete, but not covered.
   2. As specified in Division 16, "ELECTRICAL", sections.
   3. At the completion of the work in Division 16, "ELECTRICAL".

1.16 PROJECT COMPLETION

A. Upon completion of the work and prior to testing and final inspection, thoroughly clean exposed portions of the electrical systems; removing traces of soil, labels, grease, oil, and other foreign material; and using only the type of cleaner recommended by the manufacturer of the item being cleaned.

1.17 REGULATORY REQUIREMENTS & PERMITS

A. Comply with the General Provisions "PERMITS AND RESPONSIBILITIES" for permits and licenses required to complete the work.

1.18 RECOMMENDED SPARE PARTS LIST (RSPL)

A. Prepare a form listing of recommended spare parts on a Recommended Spare Parts List (RSPL) for each individual piece of equipment that is of a maintenance significant nature as specified in Section 01790, "Spare Parts and Maintenance Materials".
1.19 TRAINING
A. Operation and Maintenance Training: Provide training as specified in Section 01786, "Operation and Maintenance Instructions".

1.20 SYSTEMS STARTUP
A. The Contractor shall be responsible for a 30 day start-up period, during which time electrical and mechanical equipment, fixtures, and associated devices shall be energized and operated under local and automatic controls. The Contractor shall be present during the startup period with adequate labor and support personnel to adjust equipment and troubleshoot system failures that might arise.

1. Should a piece of equipment fail within the 30 day start-up period, then the start-up period shall start over at day zero.

B. When a piece of electrical equipment fails to perform in accordance with specifications, an adjustment shall be made to the item by an experienced representative of the manufacturer.

C. If adjustments fail to correct the operation of a piece of equipment or fixture, remove the equipment or fixture from the Worksite and replace it with a workable replacement that will meet the specification requirements.

1.21 SUPERVISORY CONTROL AND DATA ACQUISITION (SCADA)
A. For equipment which have monitored SCADA points, these points/dry contacts shall terminate at one location/interface cabinet. Contact shall be normally open in non-alarm condition.

B. Submit comprehensive list or diagram SCADA System points with their designations. Make submittal in a format acceptable to the Contracting Officer.

PART 2 - PRODUCTS
2.1 PRODUCTS
A. Supply products, including spare parts, as specified in the sections of Division 16, "ELECTRICAL", and as described elsewhere in the Contract documents.

B. Supply spare parts per Division 1, "GENERAL REQUIREMENTS", and in accordance with Paragraph A above.

PART 3 - EXECUTION
3.1 GENERAL
A. Comply with requirements for installation, field testing and adjusting as specified in this section, Section 16030, "Testing of Electrical Systems", and other sections of this division. Provide O&M manuals and training as described above in Article 1.18 of this section.

B. Work in Place: Inspect the work in place and verify ability to make connections to the work in place or being installed under other current contracts. Work in place generally consists of: support inserts embedded in the construction; piping embedded in the construction and below the base slab; penetrations through floors, walls, roof, or other structural elements; and cast-in-place concrete duct systems and shafts.

C. Connections to Existing Facilities: Make connections to existing facilities in accordance with details as shown or as approved by the Contracting Officer. Where material specified under this Contract differs from material in place, provide adapters, dielectric fittings, or special connectors as required. Use the requirements of applicable codes and recommendations of material manufacturers as a basis for determining exact type of adapters and fittings to be provided under this Contract.

D. Connections to Work by Others: Connect new work provided under this Contract to work installed under other contracts, or required for equipment furnished by other contractors. Make required connections of this Contract to work by others in a proper and workmanlike manner. Refer to the Drawings and Specifications for other contracts as referenced.

E. Alterations to Existing Facilities: If it is determined that, in order to make proper connections to existing conduits, support systems, and structures, existing facilities must be altered, make such alterations in accordance with Section 01731, "Cutting and Patching", or a manner as directed by the Contracting Officer, using materials compatible with existing materials and as approved.

PART 4 - MEASUREMENT AND PAYMENT
4.1 GENERAL
A. The work specified under the individual sections under Division 16, "ELECTRICAL", will be paid for under the Contract lump sum price for Electrical Work wherein no measurement will be made.

B. The Contract lump sum for Electrical Work will include warranties, training of Authority personnel, and light pole bases for light poles.

END OF SECTION 16001
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies the testing of electrical equipment to include the furnishing of required labor, instruments, wiring, cable, and incidentals to perform the required tests and adjustments for electrical systems and equipment.

B. Perform the tests specified in accordance with the General Provisions and in accordance with additional testing as described and specified elsewhere.

1.2 REFERENCE STANDARDS

A. National Fire Protection Association (NFPA):

1. NFPA 70 - National Electrical Code (NEC)

1.3 SUBMITTALS

A. Submit a detailed plan of the proposed methods of and scheduling of the overall systems and equipment testing program at least 45 calendar days prior to initiating the testing program.

B. Submit three complete bound sets of certified test reports upon completion of the project. Reflect in the reports test title, list personnel, and time spent in participating in test, describe significant change with previous product testing and describe adjustments required during test.

C. Provide NFPA 70 (NEC) Inspection and certification of the jurisdictional authorities.

1.4 QUALITY ASSURANCE

A. Comply with requirements of Section 01450, “Quality Control”.

B. Insure that upon completion of tests, systems, and equipment are in satisfactory working order. Provide adjustments and replacements required to ensure this in accordance with the Contract, and as specified for each system or piece of equipment.

PART 2 - PRODUCTS

Not used.

PART 3 - EXECUTION

3.1 GENERAL

A. Mechanical and electrical equipment including the interfaces with the supervisory and control system and communication system and alarm and operating modes for each such piece of equipment shall be tested by the Contractor to the satisfaction of the Contracting Officer before any facility is put into operation. Tests shall be as specified in these Specifications and shall be made to determine whether the equipment has been properly assembled, aligned, and connected. Any changes, adjustments, or replacements required to make the equipment operate as specified shall be carried out by the Contractor as part of the work.

1. At least 30 days before the time allowed in his construction schedule for commencing testing and startup procedures, the Contractor shall identify if any additional support will be required from other Contractors of the Authority and/or the Authority; and shall submit his request to the Contracting Officer together with, in duplicate, details of the procedure he proposes to adopt for testing and startup of mechanical and electrical equipment, except when such procedures have been covered in the Specifications. These procedures shall be submitted for review and acceptance.

2. The Contractor's testing and startup procedures shall include detailed descriptions of preoperational electrical, mechanical, and instrumentation testing work. Each control device, item of mechanical, electrical, and instrumentation equipment, and control circuits shall be considered in the testing procedures, which shall be designed, in a stepwise, logical sequence to ensure that equipment has been properly serviced, aligned, connected, calibrated, and adjusted prior to operation. The Contractor is advised that failure to observe these precautions may place the acceptability of the subject equipment in question, and he may either be required to demonstrate that the equipment has not been damaged, or replace it as determined by the Contracting Officer. Testing procedures shall be designed to duplicate as nearly as possible conditions of operations, and shall be carefully selected to ensure that the equipment is not damaged. Once the testing procedures have been accepted by
the Contracting Officer the Contractor shall produce checkout, alignment, and adjustment, and calibration signoff forms for each item of equipment, which shall be used in the field by the Contractor and the Contracting Officer jointly, to ensure that each item of electrical, mechanical, and instrumentation equipment has been properly installed and tested. Cooperate with project-wide systems contractors' startup and testing to be conducted concurrently where applicable.

B. Before startup, the Contractor shall properly service equipment and other items which normally require service in accordance with the maintenance instructions. The Contractor shall be responsible for lubrication of equipment throughout the entire equipment "break-in" period.

1. The Contractor shall be responsible for the startup, adjustment, preliminary maintenance, and checkout of equipment and instrumentation. Systems shall be carefully checked for conformance with the design criteria.

2. If any equipment or system does not operate properly, the Contractor shall immediately replace or repair components until it operates properly.

3. When the equipment startup is complete, the Contractor shall submit a test report to the Contracting Officer.

C. Perform execution in accordance with the applicable requirements of:

1. The Occupational Safety and Health Standards (OSHA).

2. NFPA 70 - National Electrical Code (NEC).

D. Provide qualified technical personnel thoroughly familiar with the electrical systems being tested.

E. Perform tests in the presence of witnesses selected by the Contracting Officer, if he so chooses.

F. Notify the Contracting Officer if the equipment or its components fail to meet the specified inspection and test criteria. Do not repair or modify the equipment without written approval from the Contracting Officer. After replacement, repair, or modification, repeat the specified inspections and tests to the satisfaction of the Contracting Officer.

G. Where applicable, test individual components of a system before testing the complete system to meet the requirements of the applicable specifications.

3.2 TESTING LOW VOLTAGE, SWITCHBOARDS, AND MOTOR CONTROL CENTER (Sections 16425, 16470 and 16915)

A. Check control and metering circuits for proper operation.

B. Check contact alignment on contactors, switches and circuit breakers.

C. Check and set trips for proper coordination.

D. Check circuit breakers and switches to ensure the protective device nearest the fault will open before other devices upstream open.

E. Perform insulation resistance test between phase-to-phase and phase-to-ground.

F. Test grounding conductors and enclosures for continuity to ground bus.

G. Test system ground.

H. Perform dielectric withstand test of 60 seconds duration on entire assembled and erected switchgear using 60 Hertz voltage level at 1000 volts AC or 80 percent of factory test voltage, whichever is more stringent.

I. Inspect and clean busses and contacts.

J. Check voltage at no load and full load (total connected load) on the busses of the switchgear, switchboards, and the secondaries of transformers. After the transformer voltage tests are performed adjust transformer primary taps.

K. Check space heaters on equipment for proper operation. Energize space heaters as soon as the equipment with space heaters is received on the site.

L. Low Voltage Switchboards:

1. Check wiring for accuracy, open circuits and short-circuits, ground connections and insulation integrity by means of high-potential, continuity and operational tests.

2. Subject wiring to high-potential test of 1,500 volts AC to ground for one minute.

3. Verify that wiring is in accordance with manufacturer's wiring diagrams.

4. Check wiring complete, including interconnections at shipping breaks.
3.3 Testing Wire and Cable

A. Check wires for continuity and identification by means of a D.C. test device with bell or buzzer or by means of battery operated phones before terminal connections are made.

B. Perform insulation resistance tests on wiring after final terminations and splices have been made but prior to energizing. Perform the tests with disconnecting devices in the open position to include only the circuits to be tested.

C. Cable Rated Above 600 Volts:
   1. After completion of terminations and prior to connection to the apparatus, perform insulation resistance tests on cable. Perform the tests on each phase to ground with the remaining 2 phases grounded.
   2. Perform tests by means of a D.C. step-voltage type tester with the steady-state leakage current being recorded at each of 10 equal steps from zero to maximum test voltage (80 percent of final factory test voltage).
   3. Record the leakage current each minute for a period of five minutes when the maximum test voltage is achieved.

D. Cable Rated 600 Volts and Below:
   1. Perform insulation resistance tests on feeders and subfeeders. This includes cables to the final points of distribution (panelboards, motor control centers, and other incidental items). Measure and record the insulation resistance for each phase conductor to ground.
   2. Perform the tests by utilizing a megger insulation tester with a full range scale from 0 to 200 megohms and using 1000 volts D.C. The minimum acceptable reading on any feeder is 2 megohms.

3.4 Ground Resistance Tests

A. Perform testing using ground resistance direct-reading single test meter utilizing alternating current fall-of-potential method and two reference electrodes.

B. Perform the tests by driving two reference electrodes. Locate one reference electrode 50 feet from the ground under test and locate the other reference electrode an additional 50 feet in the same direction away from the ground under test.

C. Performed ground resistance tests on driven ground rods and ground counterpoise systems.

D. Provide the maximum scale range for ground resistance tests of 0 to 200 megohms and using 1000 volts D.C. For the resistance to ground for equipment and system grounds do not exceed the maximum resistance values specified in Section 16450, “Grounding and Bonding”.

E. If ground resistance exceeds the specified maximum values, install additional ground electrodes to meet resistance requirements.

3.5 Testing of Transformers (Section 16460)

A. Submit certified manufacturer's test data for each type and rating of transformer confirming performance and test data previously submitted in accordance with Paragraph 1.3 of Section 16460, "Transformers".

B. Perform field testing in accordance with the requirements of Section 16030.

C. Test voltage ratio of each tap. Results deviating by more than 0.5 percent from calculated ratio will not be accepted. Set taps as directed.

D. Check polarity by means of vector check.

3.6 Testing of Motors

A. Before making final connections, use a motor rotation meter to determine the proper connections and to insure proper rotation when the motor is energized.

B. Megger test motors before connection and check for rotation before motors are coupled to fans or pumps. Verify that motor rotation is the same as fan rotation. Verify that motor is magnetically centered before coupling.

C. Perform the following motor tests prior to start-up:
   1. Check wiring connections in accordance with wiring diagram.
   2. Check motor nameplate data. From the nameplate full load amperes, determine, for motors, the rating of the overload heaters necessary to provide proper overload protection.
   3. Check the starters to ascertain that the proper overload have been installed. Furnish and replace any improperly sized overload heaters in starters.
4. Check space heaters of motor for proper operation. Energize space heaters as soon as the motors with space heaters are received on the site.

D. Perform the following motor tests after start-up:

1. Check line current on each phase for motors.
2. Investigate and correct the cause where a motor draws more current than rated full load current. Do not change the overload heaters without the approval of the Contracting Officer.

3.7 TESTING LIGHTING (Section 16500)

A. Check lighting and receptacle circuits for proper operation. Check lighting controls for proper operation.

B. Whenever practicable, test lighting systems at the same time that the distribution panelboard or switchboard is tested.

C. Adjust floodlights in accordance with the aiming chart provided by the manufacturer. Make adjustments during darkness to obtain the optimum lighting levels throughout.

D. Check fixtures with standby batteries to confirm that transfer switch, battery, and charger operate properly.

E. Check fixtures on an emergency power circuit (generator or other central power source) by simulating a failure of normal power.

F. After adjustments have been completed, check light levels with a precision light meter to verify that the specified footcandle level has been achieved.

3.8 TESTING LIGHTING CONTROL AND FIRE AND INTRUSION ALARM SYSTEMS (Section 16721)

A. Check control and alarm systems for proper operation. Check individual alarms for proper function.

3.9 TESTING LIGHTNING PROTECTION SYSTEM (Section 16670)

A. Inspect components, materials and workmanship, and determine that they meet or exceed UL and NFPA requirements.

3.10 FIELD INSTALLATION AND TESTING

A. Contact the manufacturers of the equipment consisting of substation, switchboards and motor control centers, and make arrangements to have their representatives present at the Site to:

1. Supervise and instruct personnel in assembling the various components of the equipment.
2. Coordinate and adjust the settings of relays and devices.
3. Inspect and supervise the testing of the equipment after it is installed.

3.11 TESTING EMERGENCY POWER SYSTEMS

A. Test operation of emergency power supplies (generator, CELPS, UPS, or other central power source) by simulating a failure of normal power. Note that power source and transfer switches operate properly (including voltages, frequency, and time delays) and that emergency loads are supplied with correct power.

B. Test of the functions of the emergency power system, including (but not limited to): Re-transfer to normal power, battery charging, engine operation, and programmed exercising.

1. Testing of Emergency Lighting Units:

a. Testing: Furnish necessary personnel equipment and perform tests and adjustments in the presence of the Contracting Officer.

b. Test units for continuity and operation.

c. Check tightness of cable connections.

d. Aim and adjust heads or fixtures to provide distribution pattern approximately as shown and as approved.

e. Test lighting levels to assure they meet requirements of codes (especially NFPA 101) and applicable drawings and specifications.

1) Unit must operate properly within 10 seconds maximum.

2) Unit must operate for minimum of 90 minutes.

3) Units must provide a minimum of 1 fc at ground level along path of egress. Adjust heads to meet this requirement.
2. Testing of Central Emergency Lighting Power Supply:
   a. Operate the complete system and demonstrate that component work properly and as specified.
   b. Demonstrate with meters and oscilloscope that power characteristics, including voltages, frequency, and wave form, are in accordance with the Specifications.
   c. Simulate power failure to demonstrate proper transfer and re-transfer.
   d. Visual Inspection
      1) Inspect equipment for signs of shipping or installation damage
      2) Verify installation per manufacturer’s approved shop drawings
      3) Inspect cabinets for foreign objects and debris
      4) Verify the neutral and ground conductors are properly sized and configured
   e. Mechanical Inspection
      1) Check power modules are correctly fitted
      2) Check battery modules are correctly fitted
      3) Check terminal screws, nuts and lugs for tightness
   f. Electrical Inspection
      1) Confirm input voltages and phase rotation is correct
      2) Verify bypass voltage jumpers are correct for voltages being used.

3. Standby Power Systems:
   a. Test the engine generator set and the automatic transfer switch in the field to demonstrate that the system has been properly installed and that it meets the requirements of this Specification. Supply test equipment including load bank and materials to conduct full load test.
   b. Test SCADA dry contacts operation to demarcation panel.

C. Tests shall be conducted using a load bank. Field equipment shall be disconnected until such time that emergency power system passes full load test.

3.12 STATION DEMARCATION TERMINAL CABINET TESTING (Sections 16130 and 16135)
   A. Test operation of SCADA alarm contacts at the terminal blocks of the Station Demarcation Terminal Cabinet for each of the described SCADA alarm functions indicated. Verify and record continuity of the cables for voice, VMB signal and PA systems.
   B. Record and submit, in accordance with paragraph 1.3 of this Section, the results of these tests.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL
   A. In accordance with Section 16001, "Electrical Systems - General"
SECTION 16040
IDENTIFICATION OF ELECTRICAL EQUIPMENT

PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies the furnishing and installing of nameplates on electrical equipment.

1.2 SUBMITTALS
A. Samples:
1. Two sample nameplates.
2. Samples of types of fasteners to be used.
3. Samples of adhesive materials (if used) with complete description and list of ingredients.

B. Identification List: Submit complete listing of nameplate identification system for approval, following guidelines to be developed by the Contracting Officer.

C. Material list showing composition of nameplate elements.

PART 2 - PRODUCTS

2.1 NAMEPLATES
A. Provide nameplates consisting of three-ply, laminated phenolic plates, approximately 1/8 inch thick with beveled edges, engraved through black face to white core and attached by four stainless steel rivets, drive screws, or sheet metal screws. Where it is not practical to drill holes in the item to be identified, an approved adhesive may be used in lieu of screws or rivets.

B. For letter size of nameplates conform to ANSI requirements.

C. Provide vertical gothic lettering using round or square cutter. V-shape groove is not acceptable.

D. Provide nameplates 1 inch high by 3 inches wide or as shown.

E. Where equipment nomenclature requires additional space, provide nameplates of such size as required.

F. Standard abbreviations may be used as required.

G. Obtain approval by the Contracting Officer of identification system before fabrication of nameplates.

PART 3 - EXECUTION

3.1 INSTALLATION
A. Place nameplates on each remote motor starter, motor operated damper, push button station, pilot light, alarm bell, and control device.

B. Place nameplates on each starter and circuit breaker in motor control centers.

C. Place nameplates on each transformer, CELPS, UPS, disconnect switch, generator, fire alarm panel, intrusion alarm panel, switchboard, panelboard, contactor, and time clock; and on each cabinet or panel containing control devices.

D. Install in accordance with nameplate manufacturer’s instructions.

E. Label pullboxes and junction boxes with circuit numbers identified with permanent marker or adhesive label.

F. Label switch and receptacle devices with circuit numbers identified with permanent marker on backside of cover plates.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL
A. In accordance with Section 16001, “Electrical Systems - General”

END OF SECTION 16040
PART 1 - GENERAL

1.1 DESCRIPTION

A. An Engineering Analysis and Coordination Study (Power Study) shall be performed for each Traction Power Substation (TPSS) and the associated electrical distribution system. This Specification Section contains the requirements for this Power Study. The study shall be performed utilizing the current ANSI/IEEE standards referenced herein. The intent of this study is to verify that the specified and supplied equipment is properly rated, correctly applied, and within industry and manufacturer’s tolerances.

B. Contractor shall prepare and submit a “Power Study” for approval by the Authority, the study shall consist of the following:

1. Short Circuit Analysis with Protective Device Evaluation: Evaluate the power system design to withstand fault currents and avoid resultant fires and equipment damage.

2. Protective Device Coordination Study: Prepare coordination time-current characteristic curves to determine the required setting and ratings for all the protective devices from the Utility fuse to the DC Breaker.

3. Arc Flash Evaluation: An arc-flash hazard analysis should be performed in association with or as a continuation of the short-circuit study and protective-device coordination study.

4. Harmonics Study:
   a. Perform harmonic analysis to determine the paths and harmonics that may flow into the Utility system. Include the
   b. Harmonic current magnitudes and voltage magnitudes.

C. Qualifications:

1. Contractor shall have the “Power Study” prepared by a qualified engineer of an independent consultant registered in the State of Texas who has at least 10 years of experience and specializes in performing power system studies.

2. Perform the study using a computer software package. Submit a complete description of the analysis program being used; include the version of software and any accessory software including database type libraries. Include sample copies of input and output screens and exact method of calculations.

3. If the Engineer makes self-generated type calculations, a copy of all the calculations shall be included.

1.2 REFERENCED STANDARDS

A. American National Standards Insitute (ANSI)

2. ANSI/IEEE 242 - Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems.

4. ANSI C37.5 - Calculation of Fault Currents for Application of AC High-Voltage circuit breakers rated on a total current Bases.

B. Institute of Electrical and Electronics Engineers (IEEE)

2. IEEE 519 - Recommended Practice and Requirements for Harmonic Control in Electrical Power Systems.

C. National Fire Protection Association (NFPA)

1. NFPA 70 - National Electrical Code (hereinafter referred to as NEC) requirements for warning labels

D. Occupational Safety and Hazard Administration (OSHA)

1. 29 CFR Part 1910 – Occupational Safety and Health Standards

2. 29 CFR Part 1926 – Safety and Regulations for Construction
E. International Cable Engineers Association (ICEA)

1. ICEA P-45-482 - Short Circuit Performance of Metallic Shields and Sheaths on Insulated Cable.

1.3 SUBMITTALS

A. NLT 30 days prior to shipment, submit for each Substation a complete coordination study for approval by the Authority.

B. Study shall include a one-line impedance diagram which shall include all pertinent equipment data, identify all busses, and shall include:
   1. A list of all fault contributors.
   2. A list of fault levels at each bus for 3-phase bolted faults and ground faults.
   3. Transformer KVA and voltage ratings, percent impedance, X/R ratios.
   4. Voltage at each bus.
   5. Identifications of each bus.
   6. Equipment data including feeder circuit sizes, conduit material and lengths.
   7. Equipment interrupting ratings.
   8. Time current plots which graphically illustrate performance.
   9. Equipment operating characteristics.
   10. A completely separate list of protective device settings.

C. Final report shall be bound in a 3-ring binder.

D. Submit for approval a short circuit study and coordination study for each Substation Site.

E. Submit for approval 1 equipment arc study for each type of TPSS.

1.4 QUALITY ASSURANCE

Not Used.

PART 2 - PRODUCTS

Not Used.

PART 3 - EXECUTION

3.1 GENERAL

A. Contractor shall coordinate with the TPSS Installation Contractor in obtaining the wire sizes, insulation types, conduit types and circuit lengths for use in the “Power Study”.

B. Primary service power for each Substation site shall be provided from an underground 3-phase utility feeder provided by the local utility. The Point of Service (POS) shall be at the utility service pole at the bottom of the utility fused cutout. Contractor shall coordinate with the Line Section Contractor to obtain the available short circuit power from the local utility for each site.

3.2 IMPEDANCE ONE-LINE DIAGRAM

A. Create an impedance one-line diagram. All electrical equipment wiring to be protected by the devices installed under this contract and each location where the fault current will be calculated shall be shown. Clearly show, on the one-line, the schematic wiring of the electrical distribution system, include:
   1. List of all fault contributors.
   2. List of fault levels at each bus for 3-phase bolted faults and ground faults. Include bolted faults and ground faults on the DC Bus.
   3. Transformer KVA and voltage ratings, percent impedance, X/R ratios.
   4. Voltage at each bus.
   5. Identifications of each bus.
   6. Equipment data including feeder circuit sizes, conduit material and lengths.
   7. Equipment interrupting ratings.
   8. Time current plots which graphically illustrate performance.
   9. Equipment operating characteristics.
   10. Separate list of protective device settings.

3.3 SHORT-CIRCUIT ANALYSIS WITH PROTECTIVE DEVICE EVALUATION

A. Systematically calculate fault currents based on the available fault current at the facility POS. The power study preparer shall coordinate with each Line Section Contractor to obtain the available fault current from the local utility. This Study shall recommend and coordinate the proper primary fuse size for the Utility.

B. The short circuit analysis shall terminate at each branch bus at the lowest utilization voltage secondary bus where the symmetrical short circuit RMS ampere is less than 10,000 amperes. It is the intent of these specifications to determine all
locations in the entire electrical system where the symmetrical short circuit amperes meets or exceeds 10,000 amperes.

C. Short circuit analysis shall compare interrupting ratings of all electrical protective devices connected to each bus with that of the available fault current at the load terminals of each protective device.

D. Short-circuit calculations shall be prepared by hand calculations or by means of a digital computer utilizing a commercially available software package.

E. Motor contribution shall be incorporated in determining fault levels. Results of short-circuit calculations shall be presented in tabular form and shall include momentary and interrupting fault values for 3-phase and phase-to-ground faults.

F. Analyze the short-circuit currents by preparing a tabulation comparing the fault levels to the device interrupting ratings. Indicate areas in which integrated/series ratings are utilized. The following information shall be included in the tabulation:

1. Bus identification number.
2. Location identification.
3. Voltage.
4. Manufacturer and type of equipment.
5. Device rating.

3.4 PROTECTIVE DEVICE COORDINATION STUDY

A. A Protective Device Evaluation Study shall be performed to determine the adequacy of circuit breakers, molded case switches and fuses. Any problems areas or inadequacies in the equipment due to prospective short-circuit currents shall be brought to the attention of the Authority.

B. A Protective Device Coordination Study shall be performed including calculations required to review the selection of power fuse ratings, protective relay characteristics and settings, ratios and characteristics of associated current transformers, and low-voltage breaker trip characteristic and settings.

C. Prepare coordination time-current characteristic curves to determine the required settings/sizes of the protective devices to maximize selectivity and backup tripping. The utility upstream protective device feeding the facility shall be maintained as the upper limit for coordination. These settings shall be obtained by the preparer, along with any other protective device setting requirements. The coordination curves shall be prepared on log-log paper and illustrate adequate clearing times between series devices. The curves shall be created using the study software package, but must reflect actual protective devices to be installed. Adequate time-current curves shall be generated to depict coordination. In addition, protective device characteristics shall be suitably determined to reflect calculated short-circuit levels at the location.

D. A narrative analysis shall accompany each coordination curve sheet and describe the coordination and protection in explicit detail. All curve sheets shall be multi-color for improved clarity. Areas lacking complete coordination shall be highlighted and reasons provided for allowing condition to remain or provide solution to resolve situation.

E. The following information shall be provided on all curve sheets.

2. Voltage at which curves are plotted.
4. ANSI frequent fault damage curve.
5. Cable insulation damage curves.
6. Transformer inrush point and Transformer Damage Curve.
7. Single-line for the portion of the system.
8. Fuse melting and clearing curves
9. Full load curves and overload curves

F. A summary tabulation shall be included in the study listing all adjustable protective devices with all recommended settings and each adjustable band included in each device.

G. Coordination study shall include ground-fault coordination inclusive of the medium voltage service cable shielding. The study shall verify that the service cable shielding and ground connections are adequate for the available fault current.

3.5 ARC FLASH CALCULATIONS

A. Contractor shall perform a system analysis of the equipment furnished by this Contract for determining the flash protection boundary and the requirements for Personnel Protective Equipment (PPE), Provide:
1. Calculations for the degree of arc flash hazard.

2. Warning labels on equipment containing the equipment’s flash protection boundary, its incident energy level, and the required personal protective equipment.

3. A list of appropriate tools and PPE required for safe working requirements. Note: the Contractor shall furnish any PPE determined to be required by these calculations.

4. A summary of any safety requirements for safe operation of this equipment for inclusion in the Authority’s Safety Program.

3.6 HARMONICS STUDY

A. A harmonic study shall be performed for each type of transformer in accordance with the recommendations in the Reference Standards and as specified herein.

B. Harmonic study shall verify that the voltage harmonics produced on the utility service connection feeder does not exceed the voltage harmonic limitations specified by the local utility.

3.7 ANALYSIS

A. In the final report, prepare an analysis of the short circuit calculations, coordination study, arc-fault calculations and harmonic study. Highlight any equipment that is determined to be underrated, propose approaches to effectively protect the underrated equipment.

B. After developing the coordination curves, highlight areas lacking coordination. Present a technical evaluation with a discussion of the logical compromises for best coordination.

3.8 ADJUSTMENTS, SETTINGS AND MODIFICATIONS

A. Necessary final field adjustments, settings and minor modifications shall be made to conform to the protective device study.

B. All final circuit breaker and relay settings and fuse sizes shall be made in accordance with the recommendations of the protective device study.

3.9 FINAL REPORT

A. Results of the “Power Study” shall be summarized in a final report. The report shall include the following sections:

1. Introduction, executive summary and recommendations, assumptions, impedance one line drawing, and copies of the project one-line drawing.

2. Tabulations of equipment ratings versus calculated short circuit values and X/R ratios, and commentary regarding same.

3. Protective device time versus current coordination curves, tabulations of relay and circuit breaker trip settings, fuse selection and commentary regarding same.

4. Copies of the manufacturer’s time current curves for the devices studied and plotted on the time current curves.

PART 4 MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

A. Work specified in this section will not be measured separately for payment, all costs in connection with this Section will be considered incidental to the furnishing and delivery of the TPSS units.

4.2 PAYMENT

A. Payment for the work specified in this section is considered as part of the project management of this Contract and shall be included in the Payment Schedule as a representative portion of each bid item value, which price will be full compensation for the performance of all requirements as described in this section including all materials, labor, transportation, handling, storage, tools, computer equipment, test equipment, rental equipment, printing services and incidentals necessary to complete the work as specified in this section, and all other related sections of the Specifications and the Drawings.
3. ANSI C37.58 - Rating Structure for AC Low-Voltage Circuit Breakers
4. ANSI C37.60 - Test Procedure for AC Low-Voltage Circuit Breakers
5. ANSI C37.62 - Preferred Ratings, Related Requirements and Application Recommendations for Low-Voltage Power Circuit Breakers and AC Power Circuit Protectors
6. ANSI C37.64 - Insulated Wire, Cable, and Accessories
7. ANSI C37.66 - Wiring Devices
8. ANSI C37.68 - Warning Signs
9. ANSI C37.70 - AC Distribution Panelboards
10. ANSI C37.72 - Lighting Fixtures
11. ANSI C37.74 - Low-Voltage AC Manual Transfer Switch
12. ANSI C37.76 - Low-Voltage AC Power Receptacles

1.3 SUBMITTALS
A. NLT (60 days after NTP): Manufacturer’s Equipment Drawings and Installation Instructions

1.4 QUALITY ASSURANCE
A. Contractor shall perform the work included in this section in strict accordance with the requirements of the Contractor’s Quality Control Program as approved by the Authority and in compliance with the requirements of these Specifications. Contractor shall perform the following:

1. Material qualification testing and certification for acceptance of materials, components, assemblies and sub-assemblies.

2. Project control testing of in-progress work being performed in shops, factories, and on-site and off-site locations.

3. On-site inspection of specified work elements.

PART 2 - PRODUCTS

2.1 GENERAL
A. Contractor shall submit for approval, manufacturer’s descriptions, catalog data, shop drawings, run sheets, and product information, including cut sheets, etc. showing model numbers or item identification, for all the electrical equipment and products incorporated into the Substations.

B. All equipment and materials shall comply with these Specifications and the Referenced Standards.

2.2 TEST REPORTS
A. Provide certified test reports or manufacturer’s certification demonstrating that materials comply with the specified requirements and the referenced standards.

2.3 MATERIALS
A. Materials furnished shall be standard products of manufacturers regularly engaged in the production of materials specified.

B. Contractor shall provide materials and equipment that is readily available for replacement.
2.4 CONDUIT EXPANSION AND DEFLECTION FITTINGS

A. Provide fittings that are UL listed and shall consist of 2 threaded end couplings, bronze for dry locations. Either hot-dip galvanized malleable iron, or hot-dip galvanized ductile iron.

B. A neoprene sleeve attached to the end couplings by stainless steel bands. Sleeve shall accommodate the following movements without collapsing or fracturing the conduits and damaging the wiring:

1. Axial expansion or contraction from normal of 3/4-inch minimum in either direction.
2. Parallel misalignment of the axis of coupled conduit runs, in any direction, of 3/4-inch minimum.
3. Angular misalignment of the axis of coupled conduit runs, in any direction, of 30 degrees minimum.

C. Where applicable, a tinned flexible copper braid bonding jumper, integral with the expansion fitting, attached to the end couplings to provide electrical continuity.

2.5 STEEL CABLE TRAYS

A. Steel trays shall be ladder type or solid-bottom type as required or indicated and shall be hot-dip galvanized after fabrication in accordance with the Referenced Standards.

B. Ladder Type Cable Trays:

1. Dimensions: Inside clear width shall be as required. Inside usable depth shall be 4 inches minimum. Outside depth shall be 6 inches maximum.
2. Fitting Radius: As required to suit tray width and capacity.
3. Rung Spacing: Maximum 9 inches between centers.
4. Working Load: Provide 50 pounds per linear foot on a maximum span of 8 feet with a safety factor of 1.5.
5. Fabrication: Straight sections and fittings shall consist of rungs located between channel-shaped side rails.
6. Flame Spread Index: Per the Referenced Standards.
7. Smoke Density: Per the Referenced Standards.

2.6 FIBERGLASS CABLE TRAYS

A. Fiberglass trays shall be ladder type, manufactured from fiberglass-reinforced polyester resin, designed as follows:

1. Dimensions: Inside clear width shall be as required. Inside usable depth shall be 4 inches minimum. Outside depth shall be 6 inches maximum.
2. Fitting Radius: 24 inches.
3. Rung Spacing: Maximum 9 inches between centers.
4. Working Load: Provide 50 pounds per linear foot on a maximum span of 8 feet with a safety factor of 1.5.
5. Fabrication: Straight sections and fittings shall consist of rungs located between channel-shaped side rails.
6. Flame Spread Index: Per the Referenced Standards.
7. Smoke Density: Per the Referenced Standards.

2.7 METAL FRAMING AND WIREWAYS

A. Metal Framing (Continuous Slot Metal Channel System): Comply with the following requirements:

1. Channel: Steel, where used as a raceway and lighting fixture support, channel shall be listed by UL as complying with UL 5 for use as surface raceway and support for lighting fixtures with electric discharge lamps.
2. Configuration: Single channel or 2 single channels welded together. Channels shall accept spring-held steel nuts.

5. General Fittings Dimensions, for Flat, Angular and U Shapes: 1/4 inch thick by 1-5/8 inch wide, unless otherwise indicated.

7. Nuts, Bolts, and Screws Finish: Electro-deposited zinc coating, Class Fe/Zn 5, Type III.

8. Wire ways: Galvanized sheet steel with screw covers, complying with UL 870.

2.8 HANGERS AND SUPPORTS

A. Hanger Rods: Threaded, hot-rolled steel, 3/8 inch diameter minimum with electro-deposited zinc coating, Fe/Zn 5, Type III.

B. Trapeze, Multiple Conduit Hangers: Fabricated of 2 or more galvanized steel hanger rods, a steel channel horizontal member and U-bolts, clamps and other attachments necessary for securing hanger rods and conduits.

C. Horizontal Member: Continuous slot galvanized metal channel single or double, as required.

2.9 CONCRETE INSERTS

A. Continuous Insert: Steel single channel with concrete anchors and continuous slot to accept spring held steel nuts. Channel hot-dip galvanized and filled with expanded polystyrene. Nuts and springs electro-deposited zinc coating.

B. Expansion Anchors: Steel with electro-deposited zinc coating.

C. Equipment Anchorages: Steel leveling plates, angles, and studs.

2.10 OUTLET, JUNCTION, PULL, AND CORROSION CONTROL BOXES

A. Surface Mounted Outlet and Switch Boxes: Cast iron alloy, hub-type with cover gasket in wet locations, complete with painted steel cover plates.

B. Pull Junction Boxes:

1. Dry Locations: Galvanized, 16-gage minimum, sheet steel with welded seams and screw covers. Corrosion control boxes shall have a hinged cover.

2. Wet Location: NEMA Type 4X or 3R, hot-dip galvanized sheet metal, stainless steel or Aluminum.

2.11 GROUNDING AND BONDING MATERIALS

A. Ground Rods: Medium carbon steel core, copper-clad by the molten weld casting process and have a conductivity of not less than 27 percent of pure copper. Rods shall be not less than 3/4-inch diameter with lengths as indicated.

B. Ground Conductors: Class B stranded annealed copper and sizes as indicated.

C. Ground Test Station Bus: Provide 98 percent conductivity tinned copper. Bus size shall be not less than 2 inch by 1/4 inch. Bus shall be supported by standoff insulators having an insulation level of 2 KV.

D. Connectors:

1. Exposed ground connections shall be bolted type of high copper alloy. Terminal lugs on cable ends shall be compression or exothermic-weld type.

2. Buried ground connections shall be exothermic-weld type.

2.12 INSULATED WIRE, CABLE, AND ACCESSORIES

A. High-Voltage AC Power Cable:

1. Type: Cables shall be single-conductor, shielded, and appropriate for use on 13.2 KV or 12.47 KV, 3-phase, 60 Hz systems. Cables shall comply with the referenced standards, type MV-90, and shall be suitable for installation in conduit and ducts. Conductor size shall be as required, but not less than No. 2 AWG and the maximum continuous operating temperature rating shall be 194 degrees F.

2. Conductors: Shall be uncoated copper wire in compliance with ASTM B3 and Class B stranded conductor conforming to ASTM B8.

3. Strand Screen: Extruded semi conducting ethylene - propylene - rubber (EPR) thermosetting compound, which shall be clean stripping from the conductor and firmly bonded to the overlying insulation.

4. Insulation: Insulation shall be a flame-resistant, ethylene-propylene-rubber thermosetting compound with minimum average insulation thickness for 133
percent insulation level in accordance with the applicable standards.

5. Insulation Screen: An extruded semi-conducting, EPR cover shall be applied directly over the insulation. It shall be clearly identified as being conductive.

6. Insulation Shield:
   a. Bare 5 mils thick minimum, copper tape shall be helically applied over the insulation screen with a minimum overlap of 25 percent.
   b. Nonmetallic jacket shall consist of a durable black moisture-resisting heavy-duty vulcanized chlorosulphonated polyethylene compound, with a thickness of not less than 80 mils.

7. Cable Identification: The following information shall be printed on the jacket, in contrasting color, at approximately 2-foot intervals:
   a. Manufacturer's name.
   b. Year of manufacture.
   c. Conductor size.
   d. Voltage rating.
   e. Insulation type.
   f. Jacket type.

8. Warranty: Cable shall have a written warranty of not less than 40 years.

B. Low-Voltage Wire and Cable:

1. Shall be UL listed for the intended purpose.

2. Conductors: Soft or annealed copper complying with ASTM B3.

3. Power Circuits: Size No. 12 AWG, minimum, shall be ASTM B8, Class B stranded conductor.

5. Fixture wiring: Size No. 16 AWG, minimum, ASTM B8, Class C stranded.

6. Wire that crosses hinge points shall be flexible Class C stranded.

C. Insulation:

1. Power Circuits: Conductors shall be insulated with a flame retardant dielectric based on an ethylene - propylene type elastomer meeting UL1581. Jacket overall shall be mechanically rugged cross-linked polyolefin or thermoplastic compound to comply with UL1277.

2. Control Circuits (except panel wiring): Conductors shall be insulated with a flame retardant dielectric based on an ethylene - propylene type elastomer meeting UL1581. Jacket overall shall be mechanically rugged cross-linked polyolefin or thermoplastic compound to comply with UL1277.

3. Panel Wiring: NEC Type SIS or TBS. Comply with UL 83 flame-retardant properties test. Wiring in dc switchgear compartments subjected to 845 V DC nominal potential shall have a 2,000 V AC minimum insulation level. Each conductor shall be one continuous length from terminal to terminal with no splices or taps. Control wiring shall be so designed and installed that faults on power circuits cannot be communicated to the control wiring of that circuit or of another power circuit.

4. Fixture Wiring: NEC Type SFF-2 or PFF.

5. Non-metallic jacket for single-conductor cable and as overall covering on multiple-conductor cable. Jacket shall have the following physical requirements, properties and tested in accordance with the Referenced Standards.
   a. Tensile strength, minimum pounds per square inch: 1,800.
   b. Elongation at rupture, minimum percent: 150.
   c. Aging requirement: After 168 hours in air oven test at 212 degrees F within plus or minus 33.8 degrees F.
   d. Tensile strength, minimum percentage of un-aged value: 100.
   e. Elongation at rupture, minimum percentage of un-aged value: 80.
   f. Oil immersion: 18 hours at 249.8 degrees F, within plus or minus 33.8 degrees F, ASTM D470, Table 1, No. 2 Oil.
BASIC ELECTRICAL MATERIALS – TRACTION POWER SUBSTATIONS

g. Tensile strength, minimum percentage of un-aged value: 80.
h. Elongation at rupture, minimum percentage of un-aged value: 80.

D. Multiple-conductor cable: Type TC, 194 degrees F Wet and Dry, 266 degree F emergency overload rating, 482 degrees F short circuit rating, insulated to 600 Volt and 2000 Volt in accordance with application usage.

E. Applied voltage testing:
1. Single-conductor cable and individual conductors of multiple-conductor cable to be given applied AC voltage dielectric strength test, i.e., 6-hour water-immersion tests.
2. For single conductors of multiple-conductor cable, conduct tests prior to assembly as multiple-conductor cable.

F. Test procedures:
1. In accordance with the Referenced Standards.

G. Color Coding of Conductors: Color code of single-conductor control wires shall be as follows:
1. 2000 V circuits: black
2. 480/277 V circuits: blue with yellow tracer
3. 208/120 V circuits: yellow with blue tracer
4. Color-coded with base colors and tracers per ICEA Method 1.
5. Color code of multiple conductor control cables shall conform to industrial standards and the referenced specifications.

H. Power Conductors: Color-code feeder and branch circuit conductors throughout the secondary alternating current wiring system as follows:

<table>
<thead>
<tr>
<th>Conductor</th>
<th>208/120V</th>
<th>480/277 V</th>

I. Branch Circuit Phase Conductors No. 10 AWG and Smaller and Neutral and Equipment Ground Conductors: Solid color insulation or solid color coating.

J. Phase Conductors Having Colored Tracers: A strong adherent paint or dye not damaging to the insulation and which will not be obliterated by pulling into a conduit or raceway.

K. On-site coloring of ends of conductor may be permitted upon receipt of satisfactory evidence that the Contractor is unable to order color-coded wire and cable as specified.
1. Provide certification from the cable manufacturer that the paint or dye proposed for field application is non-damaging to the insulation.

L. Terminations for Low-Voltage Wire and Cable:
1. Terminal connections shall be UL listed and have capacity and insulation voltage ratings of not less than the ratings of the wire or cable terminated.
2. Terminals for No. 10 and smaller wire: Except as noted, vinyl-insulated, electro-tin-plated, electrolytic copper locking spade or ring type.
3. Terminals for No. 8 to No. 3/0 wire: Compression-type, tin-plated copper lug.
4. Terminals for No. 4/0 and larger wire: Long-barrel, tin-plated copper, compression-type, with 2 bolting holes in the pad.

M. At the Overhead Contact System (OCS) Poles: Termination furnished and installed by the Site Contractor.

N. Terminations for 2,000 V Cables:
1. Contractor shall provide TPSS terminations at the TPSS for installation by the Site Contractor.
2. Provide 3 (at each DC Power feeder) long-barrel, double-indentation, compression-type, tin-plated copper sleeve, with 2-hole lug.
3. Provide an equal number of terminations for the DC negative returns.
4. Terminal lugs shall be as specified for 2,000 Volt cables and shall be rated not less than 194 degree F.
BASIC ELECTRICAL MATERIALS – TRACTION POWER SUBSTATIONS

O. Wire Identification Markers:
   1. Feeder Identification Marker: Fungus and water-resistant, self-laminating vinyl, with opaque blank write-on section and transparent adhesive section to wrap around the cable and protect printing. Identify cable at both ends.
   2. Control Wire Identification Marker: Fungus and water-resistant, factory-printed, self-adhesive vinyl with printing protected by clear, permanent overcoat. Identify cable at both ends.
   3. Wire Tie Wraps: Stainless steel or nylon, with locking barb and taper, capable of supporting bundled conductors and insulated cables.

P. Factory Testing:
   1. All UL and ICEA production tests including standard dielectric withstand tests shall be performed on each reel supplied by this Contract.
   2. Contractor shall furnish a certified copy of the test results for each reel as tested.

2.13 WIRING DEVICES AND PARTS

A. Terminal Blocks:
   1. Except where noted, blocks shall be of the screw type with washer style head to accommodate terminals specified.
   2. Base and inter-terminal barriers shall accommodate terminals for No. 8 AWG and smaller stranded copper wire connectors.
   3. Metallic parts shall be nonferrous and corrosion-resistant.
   4. The 845 V DC control, sensing or logic circuit shall be brought out to separate terminal blocks and identified with permanent labels.
   5. Terminal blocks shall be identified and provided with 2 spare terminals, over those required for circuit wiring.

B. Receptacles: Provide heavy-duty, general-purpose, with fire-resistant, non-absorptive, hot-molded phenolic composition bodies and bases, with metal ears suitable for mounting in specified metal outlet box.

C. Switches:
   1. Provide heavy-duty, AC general use, snap type, toggle-operated and rated 20 amp, 120-277 V.
   2. Switches shall be single-pole, double-pole, 1-way or 3-way, as indicated.
   3. Provide hot-molded phenolic composition bodies and bases with metal ears for mounting in specified metal outlet box.

D. Identification of Parts:
   1. Electrical components shall be permanently marked to the lowest level of repair and replacement with part number identification, which coincides in all cases with the latest manufacturer's data.
   2. Nameplates shall be provided on major equipment items with adequate space for the addition of the Authority identification numbers by the Contractor as directed by the Authority.

E. Equipment Identification Nameplates: Nameplates shall be attached at the center or center middle of the equipment, in a neat manner, depending on the space available, or as specified, using screws.

2.14 HIGH VOLTAGE WARNING SIGNS

A. Shall be made from stainless steel plate with red background and engraved white lettering of 2 inches minimum height. The plate shall be 10 inches high by 14 inches wide and 1/8-inch thick minimum, machine drilled to accept 6 stainless steel machine screws, included, for attachment to vertical surface. Inscription shall read:

   WARNING
   HIGH-VOLTAGE
   KEEP OUT

2.15 STANDARD NAMEPLATES

A. Equipment standard nameplates shall comply with the references of the cited references given in the Specifications.

B. Each Substation equipment and associated control and metering devices shall be assigned an identification nameplate.

C. Nameplates shall be opaque, white over black laminated melamine, not less than 3/32 inches thick. They shall have black engraved letters and comply with FS L-P-387, Type NDP. Equipment nameplates shall have 1-5/8 inch high plates with 7/8-inch high characters.
D. Device nameplates shall have 5/8-inch high plates and 1/4 inch high characters.

E. Nameplates shall be fastened to the equipment or device compartment door with machine screws.

2.16 SEALING COMPOUND

A. Sealing compound shall be 2-part silicone foam used to prevent passage of fire, smoke toxic gases and water.

B. Sealing compound shall be rated for 2 hours and UL 1479 listed.

C. Approved products include or an Authority approved equal:
   1. Dow Corning 3-6548 Silicone RTV Foam, as manufactured by Dow Corning Corporation, Midland, Michigan 48640; or
   2. Chase-Foam, CTC PR-855, as manufactured by Chase Technology Corporation, 168 Railroad Street, Huntington Station, New York 11746.

D. Sealing compound shall be installed in accordance with the manufacturer's written instructions.

2.17 LIGHTING FIXTURES

A. The following requirements shall apply to all Traction Power Substations.

B. Substation Interior Fluorescent Lighting:
   1. Luminaries for interior 120 VAC lighting system shall comply with the Referenced Standards and be UL listed or as required by the final design.
   2. Luminaries shall be standard suspended type industrial 4-foot fluorescent lamp fixtures.
   3. Product shall have porcelain coated steel self-ventilated reflector with apertures for 10 percent up light.
   4. Lamp ballasts shall comply with ANSI C82.1 and UL 935 and shall be UL listed, Class P, with integral protection set to limit case temperature. Product shall be suitable for use at 120 VAC and coordinated with the luminaries furnished.
   5. Fluorescent lamps shall be rapid start, cool white, and shall comply with ANSI C78.1.

C. Substation Interior Emergency Lighting:
   1. Emergency lighting assemblies shall be self-contained units, complete with 2 adjustable, prismatic lens fixtures and high intensity tungsten (HIT) lamps, battery, and battery charger, suitable for 120 V ac power supply.
   2. Battery shall be sealed, maintenance-free, lead-acid type, suitable for float service with 15-year life expectancy and extended warranty. Battery shall have 1-1/2 hour minimum cut-off capacity from fully charged state.
   3. Assembly shall be provided with the following accessories:
      a. Operation test switch, with spring return.
      b. AC supply healthy pilot lamp.
      c. High-charge supervision lamp.
      d. Battery low-voltage load cut-off protection.
      e. Automatic connection of lamp load upon failure of ac supply, and automatic disconnection following restoration of supply.

D. Substation Exterior Lighting Fixtures:
   1. Luminaries shall be mounted at a height of not less than 10 feet, on the exterior surface of each side of the Substation enclosure. Luminaire spacing shall produce a uniformity ratio of 6:1 average/minimum and 15:1 maximum/minimum, and provide a minimum illumination level of 1 foot-candle at ground level within a radius of 20 feet from each luminaire.
   2. Luminaries shall be UL listed as suitable for wet locations.
   3. Housing shall be one-piece hot-galvanized steel, or die-cast aluminum with anodized finish. Housing shall be provided with knockouts or lugs for 2-bolt attachment to wall, and 2 threaded and plugged conduit hubs.
   4. Housing shall be furnished with inset extruded silicone gasket for door seal, and integral hinge pins to mount the door. Front access door and prismatic lens shall be of integrated, vandal-resistant design. Door shall be hinged at
bottom, allow full front access, and be retained in closed position by 2 captive stainless steel tamperproof screws.

5. Luminaries shall be furnished with 150 watt high pressure sodium lamps, and class H insulated regulated high power factor type ballast complying with ANSI C82.1, UL 935 listed, and suitable for 120 VAC supply. Lamp holder shall be heavy-duty glazed porcelain, under hung mounted and tilted from vertical to provide optimum light transmission. Luminaire shall be provided with built-in photocell control, with door-mounted prismatic window designed to prevent operation by light from below.

6. Lamp reflector shall be high quality finish coated aluminum or glass.

2.18 METAL-ENCLOSED BUS AND BUSWAYS

A. Work in this Article consists of providing AC and DC metal-enclosed bus assemblies and accessories for power interconnections between Substation components, assemblies and sub-assemblies.

B. Bus assemblies shall comply with the applicable requirements given in ANSI C37.20 and NEMA BU 1 for self-cooled, metal-enclosed bus.

C. Bus conductors shall be high conductivity electrical grade copper. Bus conductors, splices, and fittings shall be insulated within each bus enclosure. Insulation shall be flame-retardant and nonhygroscopic. Bus joints and terminations shall be silver-plated.

D. Bus conductors shall be electrically connected to equipment terminals by means of flexible braid or laminations. Bus enclosures shall be furnished with removable gasketed covers at bus connections for ease of installation and maintenance.

E. Low-voltage AC bus enclosures for AC-to-DC conversion assemblies shall be electrically insulated from the rectifier enclosures, and connected to the transformer enclosure ground circuit only.

F. AC bus shall be non-segregated type as follows:

1. Ratings: Rectifier transformer low-voltage AC bus continuous current rating shall match the specified 2-hour load rating of the associated rectifier transformer output windings. Momentary current rating, KA asymmetrical, shall be not less than the theoretical maximum value of bolted short-circuit current at the output winding terminals of the transformer.

2. Insulation Level: Bus insulation level shall be coordinated with that for the transformer output windings.

G. DC busses shall be segregated type as follows:

1. Current Ratings: Rectifier DC bus circuits to cathode circuit breaker shall have a continuous current rating not less than the circuit breaker rating. Momentary current rating shall be not less than 100 KA asymmetrical.

2. Voltage Ratings: Busses shall have a rated voltage of 2000 VDC. Insulation level shall be not less than 4.6 KV rms.

2.19 CABLE SEALS

A. Provide watertight seal as required by the final design.

2.20 AC CIRCUIT BREAKER & PANELBOARDS:

A. General Requirements:

1. Interchangeability: Components of the same type, size, rating, functional characteristics and make are to be interchangeable.

2. Finish for enclosures for panelboards.
   a. Clean and degrease metallic surfaces.
   b. Prime with zinc primer. Finish with 1 coat of light gray enamel per the Referenced standards.

B. Circuit Breaker:

1. NEMA AB1, UL489, molded-case, bolt-on, quick-make/quick-break, mechanically trip-free, switching mechanism, with thermal trip for inverse time delay overcurrent protection and magnetic trip for instantaneous short-circuit protection.

2. Main frame size 225 amperes and above equipped with interchangeable thermal trip and adjustable magnetic trip unit.

3. Designed to carry continuous rating in ambient temperature of 104 degrees F.

C. Panelboards:

1. NEMA PB1, UL 67 with main breaker.

2. Enclosure:
   a. UL 50.
b. Galvanized steel, surface mounted unless otherwise shown.

c. NEMA 250, Type 1.

d. Interior components mounted on back plate of reinforced steel for rigid support and accurate alignment.

e. One-piece sheet steel front panels with hinged door and lock so constructed that when panel board door is locked the front cannot be removed.

f. Provide latch and handle in accordance with UL 50; screw fastenings will not be accepted in lieu of latch.

g. Provide provision for enclosure grounding.

3. Bus bars:

a. ASTM B187.

b. 98 percent conductivity copper.

c. Contact surface silver-plated or tin-plated.

d. Rating of neutral and ground bus: Equal to that of phase bus.

e. Neutral bus mounted on insulating block.

f. Neutral and ground bus equipped with integral mechanical connectors.

4. Circuit Directory:

a. Neatly typed to identify the load fed by each circuit by number.

b. Mounted on a metal frame with clear plastic cover inside cabinet door.

2.21 SURGE PROTECTIVE DEVICES (SPD)

A. General:

1. Surge Protective Device (SPD) shall provide for the protection of all AC and DC electrical circuits and equipment from the effects of lightning induced voltages, external switching transients, and internally generated switching transients resulting from inductive and or capacitive load switching.

2. Surge protection devices shall be provided for all distribution panels, feeding external circuits such as catenary motorized disconnect switch power units, Signal Service Panel, Communication Station Service Panel’s and DC data circuits which enter or exit the TPSS.

B. Acceptable Manufacturers:

1. AC Panels: APEX Series manufactured by Transtector Systems, Inc, Hayden Lake, ID or an Authority approved equal.

2. AC Circuits (external): HPS Series manufactured by Transtector Systems, Inc, Hayden Lake, ID or an Authority approved equal.

3. DC Circuits: TSP, FSP, or DR DIN Rail Protectors, manufactured by Transtector Systems, Inc, Hayden Lake, ID or an Authority approved equal.

C. General Material Requirements: Furnish all equipment specified herein and as required by the Referenced Standards.

1. As required by the final design the SPD System shall consist of a Service Protection Panel for each service rated 600 volts or less.

2. All SPD’s shall operate as a total coordinated and engineered system.

3. Surge protections shall be engineered as a system by the manufacturer.

4. Maximum continuous operating voltages of any system component shall not be less than 115 percent of the nominal system operating voltage.

5. All SPD components shall be rated with an operating temperature range of negative 20 to 120 degrees F, and from 1 to 85 percent humidity with no condensing.

6. SPD components shall operate in altitudes up to 2,000 feet above sea level.

7. No system component shall generate appreciable magnetic fields, i.e. sufficient fields to damage stored magnetic data.

8. Average power consumption of any single SPD system shall be 1 watt per phase or less with zero percent total harmonic distortion.

9. Nominal system frequency is 60 Hertz, operating frequency range of the SPD system shall be 0 to 400 Hertz.
10. All SPD’s shall be connected in parallel with the power system they are protecting.
   a. Series connected components shall not be used.

D. SPD Panel:

1. SPD Service Protection Panel enclosure shall be as a minimum:
   a. NEMA 12 construction.
   b. Factory primed and painted.
   c. Wall or floor mounted.
   d. Provide visual indication on the cover of the enclosure to identify system and indicate systems operation.
   e. The Service Panel SPD must be furnished with terminal connections capable for accepting up to No. 1/0 conductors.

2. Service Panel SPD, as a minimum must be UL listed for Permanently Connected Products.

3. Service Panel Protectors shall be installed parallel to the disconnect switch or circuit breaker and rated for the interrupting current of the panel protected panel.

4. During normal suppression cooperation, the units shall not short circuit or crowbar the power flow that would result in an interruption to the load.

5. Unit shall not require interruption of service power for maintenance.

6. Hybrid designs are not allowed.

7. Primary and back-up suppression components must not employ a degrading technology.

8. SPD must not experience degradation from published specifications for a minimum of 10 years, as long as system performance parameters are not exceeded.

9. Surge Voltage Rating (SVR), and protection level (clamping voltage) shall be per the Referenced Standard’s for each service voltage.

   a. This remote will consist of a normally open and normally closed (single pole, double throw) dry contact.
   b. It shall provide status information on whether the suppression system is on line.

E. DC Data Line Circuits:

1. Furnish all equipment specified herein and as required by the Referenced Standards.

2. Data Line Protector (DLP) shall consist of a single line or Rail type line surge protectors, which stop damage and downtime caused by Voltage transients.

3. All surge protective devices shall operate as a total coordinated and engineered system, as well as be engineered as a system by the manufacturer.

4. Maximum continuous operating voltages of any system component shall not be less than 115 percent of the nominal system operating voltage.

5. All DLP components shall be rated with an operating temperature range of negative 20 to 120 degrees F, and from 1 to 85 percent humidity with no condensing.
   a. DLP components shall operate in altitudes up to 2,000 feet above sea level.
b. No system component shall generate appreciable magnetic fields, i.e. sufficient fields to damage stored magnetic data.

c. Average power consumption of any single SPD system shall be 1 watt per phase or less with zero percent total harmonic distortion.

6. All DLP’s shall be connected in parallel with the power system they are protecting.

a. Series connected components shall not be used.

b. Suppression paths shall not be grounded.

c. During normal suppression cooperation, the units shall not short circuit or crowbar the power flow that would result in an interruption to the load.

d. Hybrid designs are not allowed.

e. Primary and back-up suppression components must not employ a degrading technology.

f. DLP must not experience degradation from published specifications for a minimum of 10 years, as long as system performance parameters are not exceeded.

7. Performance Specifications:

a. L-L Leakage at max line-to-line voltage: 5 micro amps.

b. L-L Leakage at max line to ground voltage: 5 micro amps

c. Power Dissipation:

1) 24 VDC: 15,000 Watts

2) 125 VDC: 30,000 Watts Voltage protection Level

3) 125 VDC: 150V, L-L and L-G

4) 24 VDC: 33V, L-L and L-G

2.22 WORKMANSHIP

A. All equipment surfaces shall be smooth and free of defects, which detract from safe performance and neat appearance. Such defects include, but are not limited to gaps, burrs, sharp edges, wrinkles, waves, and blemishes. Enclosing structures shall possess sufficient reinforcement to maintain structural integrity as well as the safety of their contents through transport, handling, installation and operation.

B. Equipment Metal Enclosures: Enclosures shall be fabricated according to the requirements of the cited references listed in the Specifications.

C. Threaded Fasteners:

1. Fasteners shall be Unified-type screw threads with dimensions in inches.

2. When specifically approved by the Authority, the Contractor may use metric fasteners for internal assemblies, or components.

3. Each assembly or component containing ISO-metric threaded fasteners shall be indelibly identified in a manner approved by the Authority.

4. Additionally, all maintenance manuals shall be conspicuously marked on each page where metric threaded fasteners are used to assemble the component.

5. Spare parts shall contain all necessary replacement ISO-metric fasteners of the correct size and grade.

D. Surface Treatment:

1. Exposed non-wearing metal surfaces shall be painted.

2. Surface shall first be thoroughly cleaned and treated with an anti-rust coating.

3. Metal finish shall be a semi-gloss paint system that is the manufacturer's standard for the service specified.

4. Unfinished metal surfaces shall be coated with a layer of grease. The grease shall be removable by a petroleum-derived solvent.

E. Finish Color:

1. Enclosures shall have an exterior finish of light gray color No. 61 in accordance with Referenced Standards.
2. Interior colors of enclosures shall be the manufacturer’s standard for the intended service.

3. Touchup:
   a. Provide touchup paint for each color furnished.
   b. Each set of substation equipment shall be furnished with sufficient finish coat touchup paint to cover 5 percent of the metal surfaces.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION REQUIREMENTS

A. Installation work shall be in accordance with applicable requirements of the NEC and the Referenced Standards and shall comply with the regulations of the Authority Having Jurisdiction (AHJ) in all cases.

B. Materials and equipment shall be applied, installed, and connected as recommended by the manufacturer.

C. External wiring between major electrical equipment shall be accomplished with cable trays, conduit or wireways. The interface wiring shall be readily accessible for future additions/modifications.

3.2 CABLE TRAYS, METAL FRAMING, AND WIREWAYS

A. Trays and wireways shall be supported by cantilever type metal frame support or hangers of sufficient strength to carry combined weights of tray and cable and the dynamic loads imposed during cable pulling.

1. Provide load calculations for all cable tray installations.

B. Electrical continuity shall be maintained between sections of steel tray by bolted copper braid and the steel tray connected to local grounding system by green colored insulated wire.

C. Trays shall have tray number stenciled in red on the side rails at each end of the tray run.

D. Anchors used to fasten DC switchgear to the floor shall be duly insulated to ensure integrity of high resistance grounding floor insulation.

3.3 OUTLET, JUNCTION, PULL, AND CORROSION CONTROL BOXES

A. Mount boxes on enclosure columns with machine screws.

B. Install switch and outlet boxes on lock side of entry doors and 48 inches above floor level.

C. Install junction, pull, and control boxes so that covers are accessible after completion of the installation.

D. Install blank cover plates on unused openings in boxes after completion of installation.

3.4 GROUNDING

A. General:

1. Except for insulated DC equipment, all Substation equipment metal enclosures, equipment ground bus, and exposed non-current carrying metallic parts shall be solidly connected to the substation ground bus bar or ground mat.

2. Design and installation of each Substation ground grid shall be by the Site Contractor, this Contract shall provide ground connections for connection to the substation enclosure, and the substation equipment grounding bus, AC lightning arresters, transformer ground pads and to high resistance equipment grounding points.

3.5 INSULATED WIRE, CABLE, AND ACCESSORIES

A. General:

1. Wire and cable shall be installed by means of equipment, devices, and methods recommended by manufacturer.

2. High-voltage cable terminations shall be performed by qualified personnel only.

3. External wiring and cabling to the substations, remote mounted traction power equipment, and other facilities shall be provided as indicated.

4. Wiring and cabling shall be terminated and connected, except as indicated, by means of connectors, lugs, and other methods specified.

5. Wire and cable shall be installed, supported and segregated in cable tray, raceway or conduit within the substation enclosure.

6. Wiring and cabling shall be run end to end without splices, except where indicated otherwise on the Contract Drawings. Each cable shall be identified at each end, and at any intermediate pull.
box, by markers as specified in these specifications.

7. Interconnecting circuit wiring between equipment panels and cubicles shall be terminated at terminal blocks.

8. Suitable installation equipment shall be provided, to prevent cutting and abrasion of conduit and wire during the pulling of feeders, power cables and control cables.

9. Masking or other means shall be used to prevent obliteration of cable identifications when solid-color coating or colored tracers are used.

10. Cables to be installed in a single conduit shall be pulled together.

11. Manufacturer's recommended pulling tension or sidewall pressure shall not be exceeded.

B. Power Cabling:

1. AC and DC circuits consisting of multiple single conductors shall be grouped and pulled together in the designated raceway. Conductors shall be continuous from end to end without splices, except as approved by the Authority. Adequate slack shall be provided at terminations and in pull boxes.

2. Bundle circuit conductors neatly and securely to cable trays with specified strap. Cables entering equipment panels and cubicles shall be spaced and tied to supports provided.

3. Cables shall also be identified at 10 feet intervals in cable trays and at each termination point.

C. Control Wiring:

1. Unless otherwise specified, multi-conductor control wiring with 600 V or 2000 V insulation between equipment panels and cubicles shall be installed in designated conduits and raceways separate from those used for power cables. Multi-conductor cables installed in the same conduit shall be pulled together.

2. Control wiring shall be run from end to end without splices. Each multi-conductor cable shall be identified at each end and at any intermediate pull box by specified markers. Control wiring shall be identified at 10 feet intervals in cable trays.

3. Control cable shall be neatly laid and grouped in cable tray and secured by specified straps. Cable entering equipment panels or cubicles shall be supported and secured to prevent tension on terminations. Adequate slack cable shall be provided and each wire terminated shall be double looped.

4. Interconnecting circuit wiring between equipment panels and cubicles shall be terminated at terminal blocks. Substation interior wiring across shipping sections shall be neatly coiled and secured before shipment and each wire identified by specified marker.

5. Equipment panel and cubicle wiring shall be run in wireways and each conductor shall be continuous without splices or taps from terminal to terminal.

6. Wiring within DC switchgear and disconnecting switch compartments and cubicles shall be shielded from primary current conductors by flame-resistant insulating barriers.

7. Wiring within high-voltage AC equipment compartments shall be shielded by a grounded metal screen.

8. Interior wiring within equipment panels and cubicles shall be identified at each termination with the equipment manufacturer's wire number by a marker as specified with imprinted identification.

3.6 WIRING DEVICES

A. Device Mounting: Convenience power receptacles and lighting switches shall be rigidly attached to outlet boxes by 2 machine screws.

B. Wire Termination: Power wiring shall be terminated with specified connector. Provide adequate slack wire, 1 loop minimum, to prevent strain on termination.

3.7 WARNING SIGNS

A. Attach specified warning signs to exterior surface of Substation Enclosure, and enclosure access doors with tamper proof mechanical fasteners.

3.8 FIELD TOUCH-UP

A. Galvanized Metal Surfaces: Coat damaged surfaces, to the strength and finish of the original coating, with polystyrene organic rich compound
containing not less than 91 percent by weight metallic zinc powder in dried film.

B. Painted Metal Surfaces: Clean, treat, and coat damaged surfaces with required rust inhibiting undercoating and finish coat paint system in accordance with manufacturer's instructions.

C. Fiberglass: Reinforced Polyester Enclosures: Repair damage surface with materials and methods recommended by manufacturer.

3.9 SURGE PROTECTIVE DEVICES

A. Installation - Service Panel Protection and Data Line Protectors:

1. Installation shall comply with the manufacturer's printed instructions, the NEC, and local wiring codes.

2. Equipment Identification:

   a. SPD and DLP system components shall be identified.

   b. Refer to the electrical identification section of these specifications for identification requirements.

B. Field Quality Control:

1. SPD System and DLP shall be installed in accordance with the manufacturer’s printed instructions to maintain warranty.

2. All local and national codes shall be observed.

3. Upon completion of installation, the SPD and DLP shall not require testing of any kind.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

A. Work specified in this section will not be measured separately for payment, all costs in connection with this Section will be considered incidental to the furnishing and delivery of the TPSS units.

4.2 PAYMENT

A. Payment for the work specified in this section is considered as part of the project management of this Contract and shall be included in the Payment Schedule as a representative portion of each bid item value, which price will be full compensation for the performance of all requirements as described in this section including all materials, labor, transportation, handling, storage, tools, computer equipment, test equipment, rental equipment, printing services and incidentals necessary to complete the work as specified in this section, and all other related sections of the Specifications and the Drawings.

END OF SECTION 16050
THIS PAGE INTENTIONALLY LEFT BLANK
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Work includes complete conduit and raceways for above ground Systems Work. Reference Section 02780, “Underground Electrical and Communications Distribution Systems”, for underground electrical and distribution systems. Reference Section 16111, “Conduits”, for above ground non-systems related conduits.

B. This Section specifies the requirements for coating of metallic conduits.

C. Conduits assembled into systems concrete encased duct banks, stub-ups and stub-outs shall meet the requirements of Specification Section 02780, “Underground Electrical and Communications Distribution Systems”.

1.2 DEFINITIONS

A. Conduit: Individual electrical raceway.

B. Duct: Assembly of conduit in configurations shown, either concrete encased or not, with or without reinforcement.

C. Raceway: An enclosed channel of metal or nonmetallic materials designed expressly for holding wires, cables, or busbars.

1.3 REFERENCED STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM)
   1. ASTM A36/A36 M - Standard Specification for Carbon Structural Steel
   4. ASTM A153/A153 M - Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware
   5. ASTM A615/ A615 M Rev B - Standard Specification for Deformed and Plain Carbon Steel Bars for Concrete Reinforcement
   6. ASTM C33 - Standard Specification for Concrete Aggregates

B. National Electrical Manufactures Association (NEMA)
   1. NEMA C80.1 - Rigid Steel Conduit, Zinc Coated Specification for
   2. NEMA ANSI C80.3 – American National Standard for Electrical Metallic Tubing (EMT)
   3. NEMA TC 2 - Electrical Polyvinyl Chloride (PVC) Conduit
   4. NEMA TC 3 - Polyvinyl Chloride (PVC) Fittings for Use with Rigid PVC Conduit and Tubing
   5. NEMA TC 6 & 8 - Polyvinyl Chloride (PVC) Plastic Utilities Duct for Underground Installations

C. Nation Fire Protection Association (NFPA)
   1. NFPA 70 - National Electrical Code (hereinafter referred to as NEC)

1.4 SUBMITTALS

A. Submit the following for Authority approval in accordance with these Specifications and with the additional requirements as specified for each.

B. Submit product data 30 days to any conduit or raceway installation, on the following items unless noted otherwise:
   1. Raceways
   2. Fittings
   3. Metallic joint compounds, caulking and sealing compounds
   4. Pull cords
   5. Raceway tags and labels
   6. Conduit mandrels and brushes
   7. Warning tape
   8. PVC Conduit joint cleaning solvent and cement
   9. Conduit Numbering Schedule/Tabulation

C. Mandrel log sheets shall be submitted 7 days after completion.
D. All submittals shall be submitted at least 21 days prior to installation.

E. Submittals for concrete encased conduits (CENC) conduits, duct banks and manholes shall be in accordance with Specification Section 02780, “Underground Electrical and Communications Distributions Systems”.

1.5 QUALITY ASSURANCE

A. Contractor shall perform the Work included in this Section in strict accordance with the requirements of the Contractor’s Quality Control Program as approved by the Authority and in compliance with the requirements of these Specifications.

B. Contractor shall perform the following in accordance with Contractor’s Quality Control Program specified in these Specifications.

1. Material qualification testing and certification for acceptance of materials, components, and assemblies.

2. Job control testing of in-progress Work being performed in shops, factories, and on-site.

3. On-site inspection of specified Work elements.

1.6 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Receive, transport and store until use.

1. Area for storage of those materials provided by other contractors or utilities.

PART 2 - PRODUCTS

2.1 GALVANIZED RIGID STEEL CONDUIT (GRSC)

A. Conduit shall comply with NEMA C80.1 and shall be hot-dip galvanized inside and out. Threaded ends shall be galvanized using a zinc metallizing process, which sprays or blasts molten or semi-molten zinc on the threaded area. Minimum size shall be 3/4 inch.

B. Approved manufacturers: LTC, Triangle, Allied or Authority approved equal.

2.2 PVC SCHEDULE 40 CONDUIT (PVC)

A. Conduit shall comply with NEMA TC 2, rigid polyvinyl chloride, Schedule 40. Conduit shall be sunlight resistant and suitable for 194 degrees F conductors and exposed locations.

B. Approved manufacturers: Carlon, PW Pipe, Western Plastics or Authority approved equal.

2.3 PVC SCHEDULE 80 CONDUIT (PVC 80)

A. Conduit shall comply with NEMA TC 2, rigid polyvinyl chloride, Schedule 80. Conduit shall be sunlight resistant and suitable for 194 degrees F conductors and exposed locations.

B. Approved manufacturers: Carlon, PW Pipe, Western Plastics or Authority approved equal.

2.4 ELECTRICAL METALLIC TUBING (EMT)

A. Conduit shall comply with NEMA ANSI C80.3.

B. Interior exposed, dry locations only, not subject to damage

2.5 FLEXIBLE METAL CONDUIT

A. Galvanized flexible steel, listed for dry locations. Minimum size shall be 1/2 inch.

B. Liquid tight: Polyvinyl chloride (PVC) weatherproof cover over galvanized flexible steel conduit, listed for damp and wet locations. Minimum size shall be 1/2 inch.

2.6 GRSC CONDUIT FITTINGS

A. Conduit fittings shall be steel or cast malleable iron and shall be hot-dip or mechanically galvanized. Die-cast zinc fittings shall not be used.

B. Bushings and grounding bushings shall have molded phenolic or “Nylon” insulating collars. Grounding bushings shall have a “lay-in” tinned copper lug.

C. Expansion fittings for exposed conduit runs shall be weatherproof with external bonding jumper, providing up to 4 inches longitudinal movement with bushed conduit ends. Manufacturers shall reference the product to ANSI, IEEE, UL, NEMA or any other recognized standards or code.

D. Watertight split couplings or 3-piece (“Ericson”) couplings shall be O-Z/Gedney, or Authority approved equal.

E. Running thread or set screw type fittings shall not be used.

F. Lock nuts 2 inches and smaller shall be heavy galvanized steel. Lock nuts larger than 2 inches shall be galvanized malleable iron.

G. Hubs shall be galvanized steel or galvanized malleable iron, with insulating inserts and sealing rings. Hubs shall provide watertight conduit connections to boxes and enclosures.
H. Conduit outlet bodies shall be cast ferrous alloy, with gasketed ferrous alloy cover, hot-dip or mechanically galvanized. Aluminum alloy conduit bodies shall not be acceptable. “Short” conduit bodies such as SLBs shall not be acceptable. Acceptable manufacturers: O-Z/Gedney, Crouse-Hinds, Appleton, or Authority approved equal.

2.7 PVC CONDUIT FITTINGS
A. Fittings for PVC conduit shall comply with NEMA TC 3. PVC conduit fittings shall be of the same manufacturer and type as the conduit.

B. Expansion fittings shall allow expansion, with the same characteristics as the PVC conduit and be of the same manufacturer. Manufacturers shall reference the product to ANSI, IEEE, UL, NEMA or any other recognized standards or code.

2.8 EMT FITTINGS
A. Fittings for EMT shall be by the same manufacturer and specifications as for EMT conduit.

B. Fittings shall comply with NEMA ANSI C80.3.

2.9 FLEXIBLE METAL CONDUIT FITTINGS
A. Flexible Metal Conduit Fittings: Galvanized malleable iron or steel squeeze-type, setscrew fittings with insulated throat. Acceptable manufacturer: O-Z/Gedney C-8T Series, Thomas and Betts 3112 Series, or Authority approved equal.

B. Liquid Tight Flexible Metal Conduit Fittings: All fittings shall be galvanized steel compression fittings, with O-rings, conduit ferrule and insulated throat, and shall be oil-tight and water tight. Manufacturers shall reference the product to ANSI, IEEE, UL, NEMA or any other recognized standards or code.

2.10 RACEWAY TAGS AND LABELS
A. Tags and labels shall be made from nonferrous metals with raceway designations shown on the Drawings stamped by steel dies.

2.11 CONDUIT MANDRELS AND BRUSHES
A. Conduit brushes shall utilize round wire bristles for maximum cleaning of sand, grit, and obstructions from the conduit. They shall have a pulling eye on one end, and a smaller twisted eye on the other end, which shall allow for bi-directional pulling. Conduit brushes shall be sized as shown in Table 2.16A, Conduit Brush Sizes.

B. Conduit mandrels shall be flexible, and manufactured for cleaning out mud, dirt, and light obstacles from ducts before the installation of cable. Mandrels shall be suitable for pulling around tight bends, and use a tapered profile that allows pulling in either direction. Pulling eyes shall be provided on each end. The mandrel shall be fabricated from polyurethane, or an Authority approved equal material, and shall not damage conduit inner walls. Conduit mandrels shall be sized per Table 2.16B, Conduit Mandrel Sizes.

C. Conduit mandrels and brushes shall not damage any conduit interior coating.

D. Conduit brushes and mandrels shall be manufactured for the purpose by a company regularly engaged in the production of electrical equipment, such as Greenlee Textron, Inc., or Authority approved equal. Mandrels shall not be fabricated by the Contractor in the shop or field.

2.12 WARNING TAPE
A. Tape shall be installed in accordance with Specification Section 02780, “Underground Electrical and Communications Distribution Systems”, and Systems Elements Standard Drawings.

2.13 PULL CORD
A. Pull cord shall be twisted or braided nylon cordage with a minimum tensile strength of 1,000 pounds.

PART 3 - EXECUTION
3.1 GENERAL INSTALLATION REQUIREMENTS
A. Many raceways shall remain empty, with conductors installed in the future. All raceways installed for future use shall have a nylon pull-cord installed and secured at each end, with tags referenced the same at both ends on the pull-cord.

B. Install raceways with not more than 270 degrees of bend, total, in each raceway run between boxes, manholes, handholes, and raceway terminations.

C. Unless otherwise noted, minimum raceway size shall be 3/4 inch for inside buildings or in a building slab, and one inch for underground raceways governed by this specification section.

D. Install raceways concealed in construction unless shown otherwise on the Contract Drawings.

E. Cut raceway ends square, ream, and extend maximum distance into all couplings and connectors. Tighten all fittings securely.

F. Field-cut threads and reamed ends in metallic conduit shall be protected from corrosion immediately after cutting, reaming and cleaning by application of a zinc-rich coating.
G. Use conductive joint compounds to insure electrical continuity of metallic raceway joints. Manufacturers shall reference the product to ANSI, IEEE, UL, NEMA or any other recognized standards or code.

H. Install manufactured end caps or plugs on all raceway ends immediately after installation to prevent the entrance of liquids or foreign materials.

I. Bends in GRSC shall be factory ells or field bends. Field bending shall be done using one-shot or segment benders which do not decrease the raceway cross-section. Bending shall be done in accordance with manufacturer's instructions.

1. Unless otherwise indicated, minimum bend radius for raceways within structures shall be in accordance with the NEC. Exceptions to the NEC shall not be used to determine conduit bend radius, even if permitted by the NEC, for any part of this Contract unless Authority approved. Minimum bend radius for raceways installed underground shall be as shown in Table 3.1, Underground Conduit Minimum Bending Radius, except where otherwise indicated.

J. Route raceways to avoid structural obstructions and to minimize crossovers. Should any core drilling or installation of sleeves not shown on drawings be desired by the Contractor, such proposed concrete penetrations shall be submitted to the Authority for structural review prior to any core drilling or sleeving.

K. Install expansion fittings complete with grounding jumpers where raceways cross expansion joints, construction joints, sawn joints, and where shown.

L. All connections shall be watertight, except for non-liquid tight flexible metal conduit.

M. Install PVC conduit in accordance with manufacturer's instructions. Cut the conduit ends square, deburr, and apply an Authority approved solvent to clean the joint. Apply Authority approved cement and allow to set 24 hours before mandrelling, brushing, and installing conductors. Joint cleaning solvent and cement shall be approved by the conduit manufacturer and the Authority.

N. This Clause covers bends in PVC conduit runs underground but not in duct banks as governed by this specification section. Minimum bend radius for conduits/raceways installed underground shall be as shown in Table 3.1, Underground Conduit Minimum Bending Radius, except where otherwise indicated. Refer to Specification Section 02780, “Underground Electrical and Communications Distribution Systems”, for bends in PVC conduit runs in CENC duct banks, stub-ups and stub-outs. PVC/GRSC shall be used for conduit bends 30 degrees or greater in PVC conduit runs underground but not in duct banks. Bends in PVC conduit runs underground but not in duct banks that are less than 30 degrees shall be factory PVC ells or field bend PVC conduit. Use of 2 PVC ells of less than 30 degrees with short, straight lengths of PVC between ells to make up a bend 30 degrees or greater is not acceptable. Field bends in PVC conduit with a radius of 100 feet or less shall be formed hot using only a heater recommended by the conduit manufacturer. Use conduit plugs during bending for conduit 2 inches and larger. Remove plugs only after conduit has cooled. Field bends (sweeps) with radius greater than 100 feet may be formed cold.

O. Route all exposed raceways installed in a building parallel or perpendicular to building lines except where otherwise shown. Form bends in adjacent raceways to match radius and center of bend.

P. Install all ground bushings, and incidentals.

Q. All PVC conduits entering concrete manholes, handholes, or pullboxes shall be terminated with bell-end fittings.

R. End Bells: Flared, smooth surfaced fittings of same material as conduit.

3.2 REQUIREMENTS FOR RACEWAY TYPES

A. General

1. Raceway types for specific locations shall be as shown on the drawings. Where conduit types are not called out on the drawings, or specified elsewhere in this Section, the conduit type shall be as specified herein. See Tables 3.3-1, Summary of Conduit Types by Specific Location and 3.3-2, Summary of Conduit Types by Application.

2. For the purpose of this Specification raceways are considered 'subject to damage' in any of the following locations:

a. Exposed installations within 48 inches of finished floor or final grade.

b. Exposed installations where the area is subject to vehicular traffic, within 4 feet of established drive lanes or parking areas unless the area is protected by bollards or other structure. Height of affected area shall be 8 feet or maximum height of vehicles whichever is greater.

c. Exposed installations where the area is subject to maintenance activity, including electrical and
CONDUIT AND RACEWAYS

mechanical equipment rooms. Height of affected area shall be 8 feet above finished floor.

B. For interior and exterior installations above ground, exposed or concealed in construction, not embedded in concrete or masonry, or not subject to damage, provide uncoated galvanized rigid steel conduit. For equipment requiring flexible connections, provide flexible metal conduit.

C. For concrete encased conduits in underground duct banks, provide raceway types specified in Specification Section 02780, “Underground Electrical and Communications Distribution Systems”.

D. For direct buried underground conduit, provide PVC Schedule 80 or raceway type DB-120 specified in Specification Section 02780, “Underground Electrical and Communications Distribution Systems”. Conduit shall be encased and embedded in 4 inches of Authority approved cement based soil stabilizer/flowable fill or clean sharp sand on all sides of the raceway, as indicated on the drawings.

E. For concrete embedded conduit, such as conduit embedded in concrete building or structure walls, or where the conduit is fully encased in concrete not in a duct bank, where used in formed concrete, provide uncoated galvanized rigid steel conduit. PVC conduit shall not be used, unless otherwise indicated.

F. For conduits installed in pole foundations, in roadways, and all track crossings, not in duct banks, provide GRSC. PVC conduit shall not be used unless otherwise indicated.

G. For direct buried raceway not in a roadway, for crossing lighting, roadway lighting, pathway lighting, or site lighting, or under station platforms provide schedule 40 PVC conduit, except where schedule 80 PVC conduit is indicated. Conduit shall be encased and embedded in 4 inches of Authority approved cement based soil stabilizer/flowable fill on all sides of the raceway. PVC raceway is not permitted at burial depths less than 36 inches.

H. For conduit risers on catenary poles, provide GRSC type conduit, ells and fittings unless otherwise indicated.

I. For bridge abutment conduit risers, use GRSC type conduit unless otherwise indicated.

3.3 RACEWAYS INSTALLED UNDERGROUND

A. Install underground raceways in accordance with Specification Section 02780, “Underground Electrical and Communications Distribution Systems”.

3.4 SLEEVES

A. All sleeves shall be GRSC unless otherwise indicated.

B. Install, in advance of pouring concrete, all sleeves where shown. Sleeves shall terminate flush with the surface of the concrete with a coupling.

3.5 RACEWAYS Stubbed UP Through FLOORS, WALLS, FOOTINGS OR FOUNDATIONS

A. Install at such depth that the exposed raceway is vertical and no curved section of the elbow is visible. End of conduit stub-ups or stub ups shall terminate 3 inches above finished floor or vertical services, unless indicated otherwise.

B. GRSC shall be provided for all raceways installed through floors, walls, footings, or foundations. PVC conduit shall not be stubbed-up through floors, walls, footings, or foundations. PVC conduit may be terminated in vault walls as shown on the drawings.

3.6 CONDUIT MANDRELLING AND CLEANING

A. A log shall be kept for all conduits mandrelled. The mandrel log shall contain the following information in tabular format for each conduit mandrelled:

1. Conduit designation
2. Conduit endpoints
3. Conduit size
4. Date mandrelled
5. Pass/fail for specified mandrel
6. Install pull cord

B. After final assembly is in place, all conduit 2 inches and larger shall be thoroughly cleaned and mandrelled prior to installing wires or pull cords. Each conduit shall be mandrelled by pulling a mandrel sized in accordance with these Specifications through the conduits, followed by a steel bristle brush to clean the conduit. At the completion of cleaning and mandrelling, and before final acceptance, a “Nylon” pull cord shall be installed in each empty conduit. The pull cord shall remain accessible from each end at all times.

C. After final assembly is in place, all conduits smaller than 2 inches shall be thoroughly cleaned and mandrelled by one of the following methods:

1. Pulling through the conduits a wire brush and mandrel sized 1/4 inch maximum less than the inside diameter of the conduit for
CONDUIT AND RACEWAYS

1. 1-1/2 and 1-1/4 inch conduits, and 1/8 inch maximum less than the inside diameter of the conduit for 1 inch and smaller conduits.

2. Pulling through the conduits a cloth rag or conductor bundle sized 1/4 inch maximum less than the inside diameter of the conduit for 1-1/2 and 1-1/4 inch conduits, and 1/8 inch maximum less than the inside diameter of the conduit for 1 inch and smaller conduits.

3. At the completion of cleaning and mandrelling, and before final acceptance, a "Nylon" pull cord shall be installed in each empty conduit. The pull cord shall remain accessible from each end at all times.

D. If requested by the Authority, cleaning and mandrelling shall be done in the presence of the Authority. Notify the Authority 7 days in advance of mandrelling.

E. Where raceways are stubbed and capped, the pull cord shall extend through a drilled hole in the cap.

F. Raceways that cannot meet the requirements for mandrelling, shall be deemed defective, and shall be replaced as Authority approved.

3.7 RACEWAY LABELING

A. Identify each exposed raceway conduit at each end with tags as described below. Tags shall always designate location conduit ends. Tags and labels shall be made from nonferrous metals with raceway designations stamped by steel dies.

B. Conduit numbering shall be decided by the Contractor at time of construction. Use a left to right convention for numbering all conduits.

C. Fasten tags above raceway in manholes using a stainless steel anchor screw. At stub-up locations, band tag to rim of conduit using a stainless steel tie wrap band.

1. MH (manhole no.) - (conduit no.) - (chain marker)
a. MH 110B - 08 - 552+28

2. POS - (conduit number) - (chain marker)
a. POS - 08 - 552+81

3. NEG - (conduit number) - (chain marker)
a. NEG - 06 -552+90

4. TPSS - (conduit number)- (conduit type)
a. TPSS - 08 – POS
b. TPSS - 06 – NEG
c. TPSS - 02 – COMM
d. TPSS - 02 - SIG

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this Section will not be measured separately for payment.

4.2 PAYMENT

A. All costs will be considered incidental to the Work specified under Section 16312 “Traction Power System Substation Installation.”

END OF SECTION 16110

For CENC duct banks, stub-ups and stub-outs refer to the requirements of Specification Section 02780, "Underground Electrical And Communications Distribution Systems", for conduit type applications.

* If cable fill is greater than 40 percent, add another conduit.

Note: These tables do not address all situations or locations. Conduit types shall meet all the requirements of these Specifications and Contract Drawings.
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Work includes conduits for above ground non-systems related conduits. Reference Section 02780, "Underground Electrical and Communications Distribution Systems", for underground electrical and distribution systems. Reference Section 16110, "Conduits and Raceways", for above ground conduit and raceways for Systems Work.

1.2 REFERENCED STANDARDS

A. American National Standards Institute (ANSI):
   1. ANSI C80.1 - Rigid Steel Conduit - Zinc Coated (GRC)
   2. ANSI/NEMA C80.3 - Electrical Metallic Tubing - Zinc Coated

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   2. ASTM A780 - Standard Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings

C. National Electrical Manufacturers Association (NEMA):
   1. NEMA FB 1 - Fittings, Cast Metal Boxes, and Conduit Bodies for Conduit, Electrical Metallic Tubing and Cable
   2. NEMA TC 6 & 8 - PVC Plastic Utilities Duct for Underground Installations

D. National Fire Protection Association (NFPA):
   1. NFPA 70 - National Electric Code (hereinafter referred to as NEC)
   2. NFPA 130 - Standard for Fixed Guideway Transit and Passenger Rail Systems

E. Underwriters Laboratories, Inc. (UL):
   1. UL 1 - UL Standard for Safety Flexible Metal Conduit
   2. UL 6 - UL Standard for Safety Rigid Metal Conduit - Steel
   3. UL 514B - UL Standard for Safety Fittings for Cable and Conduit
   4. UL 651 - UL Standard for Safety Schedule 40 and 80 Rigid PVC Conduit

1.3 SUBMITTALS

A. Product data or certification indicating compliance with the requirements listed.
B. Provide certification that galvanized rigid steel conduit and fittings comply with NFPA 130.

1.4 QUALITY ASSURANCE

A. Manufacturer: Select a firm regularly engaged in the manufacture of conduit, conduit fittings, connectors, and accessories of the type specified herein indicating conformance and compliance with specifications indicated herein.

PART 2 - PRODUCTS

2.1 GENERAL

A. Do not use conduit smaller than 3/4 inch in diameter for interior work and not smaller than 1 inch in diameter for exterior work, unless shown otherwise on the drawings.
B. Do not use polyvinyl chloride materials in tunnels or in stations below grade.

2.2 GALVANIZED RIGID STEEL CONDUIT AND FITTINGS

A. Manufacture galvanized rigid steel conduit in accordance with UL 6.
B. Apply protective coating and threading complying with ANSI C80.1. Hot-dip galvanize externally and internally after fabrication in accordance with ASTM A123.
C. Hot dip galvanize the male threads of conduit and fittings in a manner to keep the threads clear of excess zinc. Female threads may be electrogalvanized instead of hot dipped. Provide zinc coating for conduit accessories such as lock nuts, bushings and connectors.
D. Touch up galvanized coating with cold galvanizing compounds for all ferrous and non-ferrous surfaces; ASTM A780 where the original galvanized coating on conduit or galvanized steel has been damaged.

2.3 RIGID STEEL PLASTIC COATED CONDUIT AND FITTINGS

A. Use galvanized rigid steel conduit (GRSC) as specified in Article 2.2. Apply external coating of polyvinyl chloride (PVC), 40 mils (0.040 inch) thick, minimum. Apply internal coating of either urethan, 2 mils (0.002 inch) thick, minimum; or epoxy, 5 mils (0.005 inch) thick, minimum. Apply coatings under factory conditions, using heat and other environmental conditions as required for optimum quality of finished product. Apply these coatings to conduit and also to couplings, fittings, and conduit bodies that are parts of the conduit system. At female threaded areas of fittings - including both ends of couplings - provide a skirt of PVC (40 mils minimum thickness) extending far enough to cover the exposed male threads of the mating conduit section and overlap the PVC coating sufficiently to provide a seal.

B. Liquid PVC compound shall not be used as a substitute for factory applied PVC coating. The liquid compound shall be used only for touch-up and bonding in the field, as described in "Installation of Conduit" below.

2.4 NON-METALLIC RIGID CONDUIT AND FITTINGS

A. Furnish non-metallic rigid conduit and fittings fabricated from polyvinyl chloride (PVC). Provide sunlight-resistant, PVC, with impact strength conforming to the requirements of ASTM D256 and also NEMA TC 6 & 8 and ASTM F512.

B. Fabricate rigid, non-metallic, fiberglass reinforced epoxy (FRE) type conduit as indicated. Provide each conduit length with an expanded coupling with integral gaskets for a watertight seal when the coupling is mated to the joining conduit end. Make watertight joint without the use of lubricants or adhesives.

C. Provide non-metallic rigid conduit and fittings conforming to UL 514B and UL 651.

D. Provide end bells, flexible couplings, and expansion joints as necessary.

E. Use fitted plastic couplings to ensure a watertight joint.

2.5 ELECTRICAL METALLIC TUBING AND FITTINGS

A. Manufacture electrical metallic tubing from galvanized steel in accordance with ANSI C80.3.

B. Fittings and conduit bodies shall be steel compression type in accordance with NEMA FB 1. Do not use set screw type fittings.

2.6 LIQUID-TIGHT FLEXIBLE STEEL CONDUIT AND FITTINGS

A. Provide liquid-tight flexible conduit UL listed with galvanized steel core and thermoplastic cover conforming to UL 1 and being UL listed, where indicated. Do not use flexible steel conduit other than watertight type.

B. Provide fittings and conduit bodies suitable for watertight flexible steel conduit and in accordance with NEMA FB 1.

2.7 CONDUIT FITTINGS AND ACCESSORIES

A. Provide conduit connector fittings which conform to ULB 514, material similar to that of conduit with which they are to be used with the following additional requirements:

1. For enclosures, cabinets, boxes, and gutters which are subject to moisture or dirt: Tapped conduit hub.

2. For enclosures having punched or formed knockout for conduit entry: Watertight hub fitting with gasket, nylon insulated throat, and locknut.

B. Thread conduit couplings on both ends. Do not use slip-on couplings.

C. Provide malleable iron union couplings for joining rigid conduit at intermediate runs, threaded watertight to permit completing conduit run when neither conduit can be turned and to permit breaking the conduit run at the union.

D. Fabricate bushings of the same material with which the bushings are to be used. Provide insulated bushings 1-1/4 inches and larger with 300 degrees F temperature rating. Install insulated grounding bushings in conduits to protect wires inside boxes except where the protective shoulder is provided as part of the conduit thread connection.

E. Equip metal fittings with bonding jumper cable where required to provide electrical continuity.

F. Provide expansion fittings with both expansion and deflection types on conduits crossing expansion joints. Fabricate conduit expansion fittings from material similar to that of conduit with which coupling is to be used, having factory installed packing ring and pressure ring to prevent entrance of moisture. Equip metallic couplings with grounding ring.

G. Provide sealing fittings watertight, malleable iron cadmium plated with pouring spout perpendicular to the conduit. Provide vertical seals complete with drain seals.
PART 3 - EXECUTION

3.1 INSTALLATION OF CONDUIT

A. Provide conduit of size and type approved for use in accordance with NEC and as indicated on drawings.

B. Provide conduit concealed, where possible, within finished walls, ceilings, and floors. Install exposed conduit parallel with or at right angles to the building walls in accordance with the NEC.

C. Use galvanized rigid steel conduit for all exposed installations.

D. Use flexible metal conduit for final connection to rotating and/or vibrating equipment and as permitted by NEC. Install a green insulated wire in flexible conduits for grounding purposes. Use liquid-tight flexible conduit in wet and damp locations. Provide flexible conduit no longer than 36 inches, except from outlet box to recessed lighting fixtures, provide flexible conduit no longer than 6 feet from outlet box to recessed lighting fixture. Do not use flexible conduit to aid in the final positioning of panels, back boxes and terminal cabinets.

E. Make all conduit bends in accordance with NEC with not more than three 90 degree bends between conduit ends or pull boxes. 90 degree bends for conduit sizes 4 inches or greater shall not be made in the field. Provide conduit manufacturer’s factory elbows for conduit sizes 4 inches or greater.

F. For all installations of metal conduit that will be in direct contact with earth, use only galvanized rigid steel conduit and fittings with factory-applied exterior PVC coating as described above. After installation, touch-up any areas where the external coating has been damaged, using liquid PVC compound. Apply as many coats as required to assure that damaged area has been covered with at least 40 mils of PVC. If any damaged area is so large that liquid PVC will not make a permanent bond, remove the damaged pieces and provide new ones. Before connecting a coupling to a section of conduit, apply liquid PVC compound liberally to the conduit near the threads so it will form a seal between the PVC coating of the conduit and the PVC skirt on the coupling. Provide a finished system of conduits that is completely covered inside with urethane or epoxy - all at the specified thicknesses.

G. Cut off square all field-cut conduit without restriction to the conduit openings. After conduit is cut and threaded, ream conduit to remove all burrs and sharp edges and then clean thoroughly. Make all joints waterproof by the application of a suitable corrosion-resistant sealer to the threads immediately before assembly.

H. Cut off square non-metallic conduit without restriction to the conduit openings. Trim all cut ends inside and out to remove rough edges and then clean thoroughly. Install all joints completely sealed and watertight.

I. For each completed run of conduit, pull a flexible mandrel through the conduit at a speed not greater than 1-1/2 feet per minute prior to installation of cable. Use mandrel size not less than shown below. If the mandrel does not pass through the conduit, remove the obstruction or replace the clogged conduit with new conduit.

J. Where non-metallic conduit is installed in concrete, use adapters used for transition from non-metallic conduit to galvanized rigid steel conduit before leaving concrete enclosure. Do not install non-metallic conduit exposed.

K. After the conduit has been rodded and swabbed, repack boxes and protect conduit ends to prevent any foreign material from entering the conduit.

L. Install conduits in tiers under the slab with a minimum of 6 inches between rows where indicated. Set conduits so as not to interfere with reinforcing bars.

M. Provide metallic numbering tags (brass or aluminum) indicating the conduit number on the ends of conduit. Identify signal and communication conduit as indicated.

N. Securely fasten each conduit entering a non-threaded metal box with two locknuts and a bushing. Retain bushing caps, where required, in place until just before conductors are installed. Secure continuous ground by bonding as required. Thread free ends of spare conduits and install couplings and plugs.

O. Install bell ends on conduits terminating in manholes, hand holes, building walls, or floors.

P. Install a pull rope or cable in each conduit having a minimum tensile strength of 600 pounds. Double back 2 feet of pull rope at each termination. Do not use nylon rope for pulling wires.

Q. Mechanically connect together metal conduits, fittings, boxes, cabinets, and raceways to form an effective continuous electrical path for grounding purposes.

R. Examine carefully conduits and fittings before installing. Set aside pieces having splits, breaks, blisters, or defects and remove from the Worksite.
S. Install expansion and deflection fittings as required on all conduits crossing expansion and contraction joints.

T. Install sealing fittings on conduits and cables penetrating fire rated walls, floors, partitions, and ceilings to insure that the fire rating is maintained.

U. After sanding, apply joint solvent cement to the male end of all PVC conduit prior to inserting in coupling. Furnish solvent cement of type as recommended by the conduit manufacturer.

V. Apply electrically conductive pipe joint compound to male threads prior to assembly of metallic conduits.

W. Install conduit spacers for buried conduit and duct banks before placing concrete.

X. Prime coat and paint galvanized rigid steel where shown on drawings and as specified in Section 09920, “Interior Painting” for interior locations and Section 09970, “Coatings for Steel” for exterior locations.

Y. Where metal conduit runs exceed 500 feet, provide insulated couplings at intervals of 500 feet or less, to minimize stray current effects.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 16001, “Electrical Systems - General”

END OF SECTION 16111
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies furnishing and installing of cable trays complete with accessories as shown.

1.2 REFERENCED STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
2. ASTM A1008/A1008M - Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability
3. ASTM A1011/A1011M - Standard Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability

B. National Fire Protection Association (NFPA):
1. NFPA 70 - National Electrical Code (hereinafter referred to as NEC)
2. NFPA 70B - Recommended Practice for Electrical Equipment Maintenance

C. National Electrical Manufacturers Association (NEMA):
1. NEMA VE 1 - Metal Cable Tray Systems
2. NEMA VE 2 - Cable Tray Installation Guidelines

1.3 SUBMITTALS

A. Submittal Drawings: Submit drawings of cable tray and accessories including clamps, brackets, hanger rods, splice plate connectors, expansion joint assemblies, and fittings, showing accurately scaled components.

B. Product Data: Submit manufacturer's data on cable tray including, but not limited to, types, materials, finishes, rung spacings, inside depths and fitting radii. For side rails and rungs, submit cross sectional properties including Section Modulus (Sx) and Moment of Inertia (Ix).

1.4 QUALITY ASSURANCE

A. Experience:
1. Manufacturer: Select a firm regularly engaged in the manufacture of cable trays of the type specified.
2. Incorporate equipment into this work which essentially duplicate equipment that has been in satisfactory use for a period of 5 years prior to the bid opening of this Project.

PART 2 - PRODUCTS

2.1 CABLE TRAY - GENERAL USE

A. Provide steel ladder type cable tray in accordance with NEMA VE 1 in 12 foot or 24 foot lengths with rung spacing as shown on the drawings. If no spacing is shown, provide tray with 9 inch rung spacing. Width as indicated on the drawings.

B. Fabricate tray from steel conforming to ASTM A1008/A1008M, Grade C, hot dipped galvanized after fabrication, conforming to ASTM A1011/A1011M or ASTM A123. Side rails: reinforced I-beams with nominal inside loading depth of 3, 4, 5, or 6 inches, as required. Rungs: reinforced channels, with minimum depth of 1 inch and minimum width of 1 inch, or 1 inch diameter tubes, which may be flattened on top.

C. Tray capacity: Provide for a working load of 40 pounds per linear foot with a deflection not enough to cause permanent deformation of any part of the tray system. Design tray with a safety factor of 2. In addition, provide tray to support, without failure, or permanent deformation, a 200 pound concentrated load applied on the rungs or side rails anywhere in the span. Design for a NEMA Class 16A system.

D. Connect splice plates in the field with 3/8 inch by 1-1/2 inch stainless steel carriage bolts, lock washers, and nuts.

E. Connect ground jumpers in the field with 3/8 inch by 1-1/2 inch hexagon head stainless steel bolts, lock washers, and double hexagon head nuts.

F. Locate cable tray supports as required for a rigid installation. Provide cable tray supporting components comprised of clamps, clips, concrete inserts, hanger rods, insulators, racks, frames, trapeze, hangers, beams, structural steel clamps, U-bolts, slotted angles and fittings, machine screws, wall anchors, and similar items. Use 1/2 inch diameter minimum bolts, rods, etc., in the support system unless otherwise approved. Avoid using dissimilar metals that are not compatible with adjacent materials.
G. Provide hot-dipped galvanized steel expansion guide clamps, conduit to tray adapters and miscellaneous fittings.

H. Provide hot-dipped galvanized steel barrier strips for straight lengths 12 feet long. Provide barrier strips for elbows full length of elbow complete with drilled holes and bolts or clamps for attaching to the cable tray.

I. Bend radii: Use standard radius bends (12, 24, 36, and 48 inches) for horizontal and vertical bends. Select each bend radius to be not less than minimum bend radius of cable to be installed.

1. For incoming service cable: As required by local power company.

2. For all other cable: As recommended by cable manufacturer.

2.2 CABLE TRAY - COMM ROOM IN SERVICE BUILDING

A. General: Except as otherwise indicated, provide metal cable trays, of types, classes and sizes indicated; with splice plates, bolts, nuts and washers for connecting units. Construct units with rounded edges and smooth surfaces; in compliance with applicable standards; and with the following additional construction features.

B. Materials and Finish: Material and finish specifications for each tray type are as follows:

1. Aluminum: Straight section and fitting side rails and rungs shall be extruded from Aluminum Association Alloy 6063. Fabricated parts shall be made from Aluminum Association Alloy 5052.

C. Ladder type trays shall consist of 2 longitudinal members (side rails) with transverse members (rungs) welded to the side rails. Rungs shall be spaced 6 inches on center. Spacing in radiused fittings shall be 9 inches and measured at the center of the tray's width. Rungs shall have a minimum cable-bearing surface of 7/8 inch with radiused edges. No portion of the rungs shall protrude below the bottom plane of the side rails.

D. Tray Sizes shall have 3 inch minimum usable load depth, or as noted on the drawing.

E. Straight tray sections shall have side rails fabricated as I-Beams. Straight sections shall be supplied in standard 12-foot lengths, except where shorter lengths are permitted to facilitate tray assembly lengths as shown on drawings.

F. Tray widths shall be 12, 18, 24 inches or as shown on drawings.

G. Fittings must have a minimum radius of 12 inches.

H. Splice plates shall be the bolted type made as indicated below for each tray type. The resistance of fixed splice connections between adjacent sections of tray shall not exceed 0.00033 ohms. Splice plate construction shall be such that a splice may be located anywhere within the support span without diminishing rated loading capacity of the cable tray.

1. Aluminum Tray - Splice plates shall be made of 6063-T6 aluminum, using 4 square neck carriage bolts and serrated flange locknuts. Hardware shall be zinc plated in accordance with ASTM B633, SC1. If aluminum cable tray is to be used outdoors then hardware shall be Type 316 stainless.

I. Cable Tray Supports: Shall be placed so that the support spans do not exceed maximum span indicated on drawings. Supports shall be constructed from 12 gauge steel formed shape channel members 1-5/8 inch by 1-5/8 inch with necessary hardware such as Trapeze Support Kits. Cable trays installed adjacent to walls shall be supported on wall mounted brackets.

J. Center hung supports shall be manufactured of 12 gauge, 1-5/8 inch by 1-5/8 inch B-Line B22 steel strut with a pipe welded at the middle of the support to provide eccentric loading stability. Support shall withstand 700 pounds in a 60 percent versus. 40 percent eccentric loading condition with a safety factor of 3.

K. Trapeze hangers and center-hung supports shall be supported by 1/2-inch (minimum) diameter rods.

L. Barrier Strips: Shall be placed as specified on drawings and be fastened into the tray with self-drilling screws.

M. Accessories - special accessories shall be furnished as required to protect, support, and install a cable tray system. Accessories shall consist of but are not limited to: section splice plates, expansion plates, blind-end plates, specially designed ladder dropouts, barriers, etc.

N. Cable tray shall be capable of carrying a uniformly distributed load of 222 lbs./ft. on a 12 foot support span with a safety factor of 1.5 when supported as a simple span and tested per NEMA VE 1 Section 5.2.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install cable trays as indicated: Installation shall be in accordance with equipment manufacturer's instructions, and with recognized industry practices to ensure that cable tray equipment comply with requirements of NEC and applicable portions of NFPA 70B. Reference NEMA-VE2 for general cable tray installation guidelines.

B. Coordinate cable tray with other electrical work as necessary to properly integrate installation of cable tray work with other work.

C. Provide sufficient space encompassing cable trays to permit access for installing and maintaining cables.

D. Cable tray fitting supports shall be located such that they meet the strength requirements of straight sections. Install fitting supports per NEMA VE-2 guidelines, or in accordance with manufacturer's instructions.
E. Ground the steel cable tray in accordance with Section 16450, "Grounding and Bonding".

F. Ground the aluminum cable tray in accordance with Section 16876, "Grounding and Bonding - Communications System".

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 16001, “Electrical Systems - General”

END OF SECTION 16114
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies furnishing and installing wires and cables, cable connectors, and cable connections as shown.

1.2 REFERENCED STANDARDS

A. Association of Edison Illuminating Companies (AEIC):

1. AEIC CS 6 - Ethylene Propylene Rubber Insulated Shielded Cables Rated 5 through 69 KV

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM B3 - Standard Specification for Soft or Annealed Copper Wire
2. ASTM B8 - Standard Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft
3. ASTM B33 - Standard Specification for Tinned Soft or Annealed Copper Wire for Electrical Purposes
4. ASTM D1000 – Standard Test Methods for Pressure-Sensitive Adhesive-Coated Tapes Used for Electrical and Electronic Applications
5. ASTM E662 - Standard Test Method for Specific Optical Density of Smoke Generated by Solid Materials

C. Insulated Cable Engineers Association Inc. (ICEA):

1. ICEA T-29-520 - Conducting Vertical Cable Tray Flame Tests with Theoretical Heat Input Rate of 210,000 B.T.U./Hour
2. ICEA T-30-520 - Conducting Vertical Cable Tray Flame Tests with Theoretical Heat Input Rate of 70,000 B.T.U./Hour

D. Institute of Electrical & Electronics Engineers (IEEE):

1. IEEE 48 - Standard Test Procedures and Requirements for Alternating-Current Cable Terminations 2.5 kV Through 765 kV
2. IEEE 383 - Standard for Type Test of Class IE Electric Cables, Field Splices, and Connections for Nuclear Power Generating Stations
3. IEEE 404 - Standard for Extruded and Laminated Dielectric Shielded Cable Joints Rated 2500 V to 500 000 V

E. National Electrical Manufacturers Association (NEMA):

1. NEMA WC 70 - Nonshielded Power Cables Rated 2000 Volts or Less for the Distribution of Electrical Energy
2. NEMA WC 71 - Standard for Nonshielded Cables Rated 2001-5000 Volts for Use in the Distribution of Electric Energy
3. NEMA WC 74 - 5-46 kV Shielded Power Cable for Use in the Transmission & Distribution of Electric Energy

F. National Fire Protection Association (NFPA):

1. NFPA 70 - National Electrical Code (hereinafter referred to as NEC)
2. NFPA 130 - Standard for Fixed Guideway Transit and Passenger Rail Systems
3. NFPA 258 - Recommended Practice for Determining Smoke Generation of Solid Materials

G. Underwriters Laboratories, Inc. (UL):

1. UL 22 - UL Standard for Safety Amusement and Gaming Machines
2. UL 44 - UL Standard for Safety Thermoset-Insulated Wires and Cables
3. UL 224 – UL Standard for Safety Extruded Insulating Tubing
4. UL 854 - UL Standard for Safety Service-Entrance Cables
5. UL 1072 - UL Standard for Safety Medium-Voltage Power Cables
6. UL 1277 - UL Standard for Safety Electrical Power and Control Tray Cables with Optional Optical-Fiber Members

1.3 SUBMITTALS

A. Provide Certification or product data (manufacturer's data sheets) indicating that materials comply with standards listed in this specification.
B. Submit Installation procedures for:
1. Wires and Cables.
2. Tape.
3. Heat shrink material.

C. Provide wire pulling calculations for wires and cables.

1.4 QUALITY ASSURANCE

A. Experience: Manufacturer: Select firms regularly engaged in the manufacture of wires and cables and connectors of the types specified herein, and having a performance record demonstrating a minimum of 10 years of successful operating experience.

PART 2 - PRODUCTS

2.1 SINGLE CONDUCTOR 600 VOLT CABLE FOR GENERAL USE IN ANY APPLICATION NOT REQUIRING LOW-SMOKE PROPERTIES AND PERMITTED BY NFPA 130

A. Conductors: Coated copper per ASTM B33, or uncoated. Conductors shall be stranded.

B. Insulation: Moisture resistant and heat resistant thermoplastic (type THHN/THWN) or cross-linked synthetic polymer (type XHHW). Must be rated for 194 degrees F (minimum) in dry locations and 167 degrees F (minimum) in wet locations.

C. Color code lighting and power wiring as indicated in Table 16120 - 1.

2.2 SINGLE CONDUCTOR 600 VOLT CABLE FOR LOW-SMOKE APPLICATIONS

A. Conductor: Coated copper per ASTM B33 stranded per ASTM B8, or uncoated copper.

B. Conductors shall be stranded.

C. Conductors shall be insulated with a low-smoke thermosetting dielectric based on ethylene propylene rubber elastomer meeting the requirements of NEMA WC 70.

D. Jacket insulated conductors with a mechanically rugged low-smoke compound. The jacket shall be firmly bonded to the underlying EPR insulation.

E. Color code lighting and power wiring as Table 16120 - 1.

F. General Requirements:
1. Samples of identical cables (No. 6 AWG and larger) shall pass the ICEA T-30-520 vertical tray flame test.

2. Cables shall be rated for service in dry locations at 194 degrees F continuous, 266 degrees F emergency overload, and 482 degrees F short circuit. Cables shall be rated for service in dry locations at 167 degrees F continuous.

2.3 MULTI-CONDUCTOR 600V CABLE FOR GENERAL USE

A. Conductors: Coated copper per ASTM B33 stranded per ASTM B8, or uncoated copper.

B. Insulation: Flame-retardant dielectric based on anethylene propylene elastomer meeting the requirements of NEMA WC 70. The insulated conductors shall be color coded per NEMA WC 70, Appendix K, Method 1, Table K-2, except that neutral conductor shall be colored white.

C. Assembly: The insulated power conductors, neutral conductor, and bare or green insulated ground conductor shall be cabled together with flame-retardant and moisture resistant fillers to form a substantially round core, covered by a binder tape.

D. Jacket: The cable core shall be covered by a mechanically rugged thermosetting chlorosulfonated polyethylene or chlorinated polyethylene compound which is flame-retardant, weather resistant, and resistant to most oils, acids, and alkalies.

E. General Requirements:
1. Samples of identical cable shall pass the ICEA T-29-520 210,000 Btu/hr. vertical tray flame test.

2. Cables shall be rated for service at 194 degrees F continuous for dry, 167 degrees F continuous for wet, 266 degrees F emergency overload, and 482 degrees F short circuit.

3. Individual conductors shall be UL rated VW-1.

4. Cables shall be UL approved for use in cable tray, for direct burial, and Sunlight Resistant.

2.4 MULTI-CONDUCTOR 600 VOLT CABLE FOR LOW-SMOKE APPLICATIONS

A. Conductors: Coated copper per ASTM B33 stranded per ASTM B8, or uncoated copper.
B. Insulation: Flame-retardant low-smoke dielectric based on an ethylene propylene elastomer meeting the requirements of NEMA WC 70. The insulated conductors shall be color coded per NEMA WC 70, Appendix K, Method 1, Table K-2, except that neutral conductor shall be colored white.

C. Assembly: The insulated power conductors, neutral conductor, and bare or green insulated ground conductor shall be cabled together with flame-retardant and moisture resistant fillers to form a substantially round core, covered by a binder tape.

D. Jacket: The cable core shall be covered by a mechanically rugged low-smoke compound which is flame-retardant, weather resistant, and resistant to most oils, acids, and alkalies.

E. General Requirements:
   1. Samples of identical cable shall pass the ICEA T-30-520 vertical tray flame test.
   2. Cables shall be rated for service at 194 degrees F continuous for dry, 167 degrees F continuous for wet, 266 degrees F emergency overload, and 482 degrees F short circuit.

2.5 INSTRUMENTATION CABLE

A. NEC Type shielded pair-overall shield (SP-OS) shielded triads with each triad twisted with a drain wire and shielded with an aluminum polyester tape in accordance with UL 1277.

B. Other configurations of single conductors, pairs, triads, etc., shielded or unshielded, as described on drawings. Assemble multiple groups with flame and moisture resistant fillers where required.

C. Insulate conductors with low smoke generation insulation. Provide wall thicknesses of insulation consistent with the system nominal voltage.

D. Fabricate jacket with low smoke non-halogenated compound meeting the requirements of NEMA WC 70.

E. Minimum conductor size: No. 16 AWG uncoated copper in accordance with ASTM B3, Class B, stranded per ASTM B8.

F. Flame test the cables to meet requirements of IEEE 383.

G. Provide the cross-sectional area and conductor resistance in accordance with NEMA WC 70.

2.6 COAXIAL CABLE

A. Assemble single and multiple elements of the coaxial cables with flame and moisture resisting fillers in the interstices and a binder tape over the conductors.

B. Jacket single element cables with low-smoke non-halogenated compound meeting the requirements of NEMA WC 70.

C. Cover the individual elements of a multiple element assembly with low smoke non-halogenated compound meeting the requirements of NEMA WC 70.

D. Make circuit identification using printed color coding in accordance with NEMA WC 70.

E. Flame test the completed multi-conductor cables to meet requirements of NEMA WC 70.

2.7 WIRE CONNECTION ACCESSORIES

A. Connectors:
   1. Provide connectors for No. 8 AWG and smaller of the pressure indent type with nonflammable, self-extinguishing insulation of temperature rating equal to that of cable being connected.
   2. For wires No. 8 through No. 22, use low smoke, low toxic insulated compression terminals, or as approved.
   3. Where insulated connectors are not required, use uninsulated terminals or as approved.
   4. Terminate wire and Cable No. 6 AWG and larger with bolted pressure type connector. Design connectors compatible with the conductors for which they are used.
   5. For cables above 600 volt rating, provide termination kits of the correct voltage rating, including a heat shrink stress control tube, a heat shrink non-tracking outer insulation, and the mastic and sealant materials required. For cables 600 volts and below, heat shrink terminations may be used at Contractor's option.
   6. Provide solderless lugs for connections to motor leads.
   7. Provide connectors for connecting lighting fixtures to branch circuit wiring of the pre-insulated permanent pressure electrical spring connector type encased in an insulating cover.
   8. Provide compression terminals for control and instrumentation cables.
   9. No crimp-on connectors shall be used on solid conductors.
B. Conductor Bundling Straps:

1. Formed from self-extinguishing nylon having a temperature range of 0 degrees F to 250 degrees F.

2. Equip each strap with a locking hub or head with a stainless steel locking barb on one end with a taper on the other end.

3. Provide ultraviolet-resistant bundling straps for outdoor locations.

C. Splices:

1. For wires No. 8 AWG and smaller, provide pressure indent type splices with nonflammable, self-extinguishing insulation of temperature rating equal to that of the wires.

2. For wires No. 6 AWG and larger, provide bolted pressure type connectors with nonflammable, self-extinguishing insulation of temperature rating equal to that of the wires.

3. For cables 600 volts and below, heat shrink splices may be used at Contractor's option.

D. Insulation Tapes (use limited to wires and cables below 600 volts in locations other than tunnels and underground):

1. Of the type approved by UL for the particular use, location and voltage, 3/4 inch nominal width.

2. Plastic electrical insulating tape for general use: Vinyl plastic tape with rubber-base pressure-sensitive adhesive, pliable at 0 degrees F with the following minimum properties when tested in accordance with ASTM D1000:
   a. Thickness: 0.085 inches.
   b. Breaking strength: 15 pounds per inch width.
   c. Elongation: 200 percent.
   d. Dielectric breakdown: 10,000 volts.
   e. Insulation resistance, indirect method of electrolytic corrosion: 1,000,000 megohms.

E. Heat Shrink Cable Terminations:

1. Description: IEEE 48; Class I, heat shrinkable cable terminations in kit form, capable of properly terminating cables specified in this section.

2. Terminations for single-conductor cables shall consist of heat-shrinkable radiation cross-linked high dielectric constant linear stress relief material and heat-shrinkable radiation cross-linked non-tracking outer insulation. Terminations shall contain a high relative permittivity electric stress relief mastic for insulation shield cutback treatment and a heat activated sealant for environmental sealing.

3. In addition to the components described above, three-conductor kits shall contain heat shrinkable components to seal the cable jacket, phase connectors, ground wire and rejacket phase and ground conductors.

4. Kits shall be factory engineered and shall accommodate any common form of cable shielding or construction without the need for special adaptors. Kits shall accommodate a wide range of cable sizes and be completely independent of cable manufacturer's tolerances. Kits shall accommodate commercially available standard connectors.

F. Heat or Cold Shrink Cable Splices:

1. Description: IEEE 404, heat or cold shrinkable cable splices in kit form, capable of properly splicing cables specified in this section.

2. Splice kits shall contain necessary components to reinstate primary cable insulation, metallic shielding and grounding systems and overall jacket to the equivalent of the cable itself. Splices shall be of a uniform cross-section and shall consist of heat-shrinkable radiation cross-linked insulation. The outer insulating layer shall be bonded to a conducting layer for shielding. The splice shall be rejacketed with a heavy-wall, heat-shrinkable sealant lined sleeve to provide a waterproof hot melt adhesive seal. Splices shall contain a high relative permittivity electric stress relief mastic for insulation shield cutback treatment and a heat activated sealant for environmental sealing.

3. Kits shall be factory engineered and shall accommodate any common form of cable shielding or construction without the need for special adaptors. Kits shall accommodate a wide range of cable sizes and be completely independent of cable manufacturer's tolerances. Kits shall allow splicing cables with different conductor sizes and shielding construction. Kits shall accommodate commercially available standard connectors.
G. Heat Shrink Identification Markers:

1. Description: Heat-shrinkable radiation cross-linked, thermally stabilized, flame-retarded modified polyolefin sleeves. Markers shall be recognized to UL 224.

2. Sleeves shall be smear resistant prior to shrinking and achieve mark permanency when shrunk without the need for permatizing equipment. Sleeves should achieve mark permanency when standard ballpoint pens or high-carbon content fabric ribbons are used. The markers shall be flattened and mounted on a carrier suitable for use with typewriters or printers. Markers shall be resistant to common industrial fluids including Freon TF, Isopropyl alcohol, and Ethylene Glycol.

3. Markers shall be compatible with an integrated hardware and software system allowing high speed, automated, set or batch, wire list printing. System shall allow external data to be imported from mainframe computers. System shall be compatible with panel and wraparound markers specified in this section.

4. Locations: Each conductor at panelboard gutters, pull boxes, outlet and junction boxes, and each load connection.

5. Legend:
   a. Power and Lighting Circuits: Branch circuit or feeder number indicated on drawings.
   b. Control Circuits: Control wire number indicated on schematic and interconnection diagrams on drawings.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install wires in conduits after conduits are in place and related work is completed and the area cleared for a safe working condition.

B. Use UL-listed lubricant and provide suitable installation equipment to prevent cutting and abrasion of wire during the pulling of feeders. Avoid using any lubricant that may be injurious to the materials of the wires and cables to be installed. Provide installation procedure as recommended by the cable manufacturer, and approved by the Contracting Officer.

C. Pull in cables or wires to be installed in a single conduit at the same time. Use steel cable or other pulling material with a low coefficient of elongation. Avoid use of nylon or other rope that elongates during pulling, causing uneven stress on cables.

D. Install branch circuit, neutral and ground wires in accordance with the requirements of the latest provisions of the NEC and local agencies having jurisdiction.

E. Join conductors securely both mechanically and electrically to engage strands equally by use of proper connectors and terminal lugs.

F. Make wire and cable splices in outlet, junction or pull boxes, or in manholes or handholes. Make splices in accessible locations. Keep splices to a minimum. Do not pull splices into the conduit.

G. Replace cables for any rupture of insulation.

H. Use nylon straps to bundle and secure wires and cables in panel boards, cabinets, switchboards, motor control centers, and switchgear.

I. Connect branch circuits in each panelboard serving single-phase loads in a manner that will balance the load on all phases as closely as possible.

J. No. 1/0 AWG and larger cables require a 2-bolt connector.

K. For wires above 600 volts, cover joints, taps and splices with approved type heat shrink tubing. For wires 600 volts and less, use tape or heat shrink materials (Contractor’s option).

L. Install compression connectors and terminal lugs using tools and pressures recommended by manufacturer and approved by the Contracting Officer.

M. Make tap connections for lighting and receptacle wiring No. 12 AWG and No. 10 AWG with screw type connectors.

N. Identify phases of wires by using colored wire as listed elsewhere in this section. For wires not available in needed colors, use colored plastic tape. Wrap the tape in 3 layers at pull boxes, junction boxes, manholes, wire ways, splicing and access points. Provide the length of wrap sufficient to permit easy identification but not less than 12 inches per conductor.

O. Provide No. 12 AWG as the minimum conductor size for power and lighting and No. 14 AWG as the minimum conductor size for control, signal, and alarm circuits, unless otherwise indicated.

P. Label main and feeder cables in pull boxes, junction boxes, wire ways, wiring gutters, and panels. Label branch circuits and control wiring in panels. Label control wiring in outlet boxes and at the control devices. On each wire or cable indicate wire or cable number and/or piece of equipment served. Use heat shrink tubing, with lettering applied by typewriter or computer printer.

Q. Connect and label wires to equipment on 3-phase circuits so that the phases are arranged A, B, and C
from left to right, when viewed from the front of the equipment.

R. Secure cables passing through manholes to the embedded channel inserts. Place utility power supply cables and traction power cables on insulating saddles secured to cable racks.

S. Use grip type cable supports where cables are installed in raceways with a vertical rise of more than 20 feet.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 16001, “Electrical Systems - General”

Color ground wire green.

Provide colored tape to identify wires that are not available with colored insulation.

END OF SECTION 16120
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies furnishing and installing electrical boxes as shown including interior demarcation panels for Comm Room in Service Building at Aerial Stations.

B. Exterior demarcation cabinets at At-Grade Stations are specified in Section 16135 “Exterior Demarcation Cabinets”.

1.2 REFERENCE STANDARDS

A. American Society of Mechanical Engineers (ASME):
   1. ASME B1.1 - Unified Inch Screw Threads (UN and UNR Thread Form)

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

C. National Fire Protection Association (NFPA):
   1. NFPA 70 - National Electrical Code (hereinafter referred to as NEC)

D. Underwriters Laboratories, Inc. (UL):
   1. UL 50 - UL Standard for Safety Enclosures for Electrical Equipment
   2. UL 508A - UL Standard for Safety Industrial Control Panels
   3. UL 514A - UL Standard for Safety Metallic Outlet Boxes
   4. UL 514B - UL Standard for Safety Fittings for Cable and Conduit

1.3 SUBMITTALS

A. Product Data: Provide manufacturer's standard catalog data for items described in this Specification indicating conformance and compliance with standards and criteria listed.

1.4 QUALITY ASSURANCE

A. Manufacturer: Select a firm regularly engaged in the manufacture of electrical boxes of the types specified herein.

PART 2 - PRODUCTS

2.1 ELECTRICAL BOXES

A. Include outlet, junction, terminal, device, splice, and pull boxes.

B. Conform to UL 50, UL 514A and 514B.

C. Provide the volume required by NEC for the number of conductors enclosed.

D. Provide boxes of the material, finish, type, and size specified and required for the location, kind of service, number of wires, and function.

E. Provide weatherproof boxes for outdoors and for locations subject to moisture, with neoprene cover gaskets.

F. Provide watertight surface mounted boxes with external mounting lugs where required.

G. Provide boxes for exposed switches, receptacles, and telephones fabricated of cast aluminum alloy, Type FS, and FD, or of hot dipped galvanized steel, or of malleable iron.

H. Fabricate boxes 12 inches square and larger of stainless steel, copper-free cast aluminum, cast iron, or cadmium plated malleable iron, with NEMA rating based on location and application. Provide factory installed hubs. Fabricate boxes smaller than 12 inches square with hot-dipped galvanized steel in accordance with ASTM A123.

I. Follow instructions on drawings if different materials are called for. Do not install aluminum boxes in contact with or embedded in earth or in concrete.

J. Provide boxes complete with covers suitable to the purpose for which they will be used, except equip boxes in which or on which no devices or fixtures are to be installed, with flat or raised blank covers as required. Equip ceiling fixture outlet boxes with 3/8 inch boltless fixture studs.

K. Furnish covers of the same material thicknesses and finish as boxes, secured in position by means of screws compatible with the material of the box and with the environment. Arrange covers to be readily and conveniently removed.

L. Galvanize steel junction boxes after fabrication inside and outside to prevent oxidation. Where outlet boxes are used as junction boxes, do not provide boxes smaller than 4 inches square by 1-1/2 inches deep. Provide boxes with flat blank covers fabricated of galvanized steel. Galvanize (hot-dip) junction boxes and covers in accordance with ASTM A123.
ELECTRICAL BOXES

M. Provide boxes for flush mounting in concrete fabricated of Ferroalloy hot-dip galvanized cast body and screwed on cover with neoprene gasket.

N. Provide outlet boxes of hot-dipped galvanized steel, in accordance with ASTM A123, and not smaller than 4 inches square by 2-1/8 inches deep.

O. Galvanize concealed switch boxes in accordance with ASTM A123. Provide covers with rectangular openings of proper size and shape. Furnish special boxes and install as required to suit the kind of service for the building construction requirements.

P. Furnish brackets, supports, hangers, fittings, bonding jumpers, and all other accessories required.

Q. Use flat terminal strips made of polyamide 6.6 insulation or bakelite suitable for No. 22 to No. 12 wires, with 6-32 by 5/16 inch long screws in accordance with ASME B1.1 for ring or spade lugs, rated at 20 amperes, 300 or 600 volts as required.

R. Terminal strips for wires larger than No. 12: Provide compression type line terminals rated 600 volts and equipped with two washer head screws per wire.

S. Cast boxes shall be of aluminum or ferroalloy, deep type, with gasketed cover and threaded hubs. Do not install aluminum boxes in or touching concrete.

T. Cast Iron Boxes: For Cast iron box installations indicated on the plan drawings or shown within electrical details, the substitution of concrete polymer boxes is acceptable.

U. Concrete Polymer Boxes: The concrete polymer boxes shall be the same size and have equivalent conduit entry locations. Provide proper grounding for conduit. The concrete polymer boxes shall have gasketed bolt down covers. Where the boxes are shown to be installed so the covers are exposed to the surface and visible to the public, provide with bolt down cast iron covers. Exposed covers shall be flush with the surface grade.

2.2 INTERIOR DEMARCATION PANELS IN COMM ROOM IN SERVICE BUILDING AT AERIAL STATIONS

A. Single-door enclosures conforming to UL 508A, Type 12.

B. General construction:
   1. Bodies: 14 gauge steel.
   2. Doors: 14 gauge steel.
   3. Optional panels: 12 gauge steel.
   4. Seams continuously welded and ground smooth, no holes or knockouts.

C. Provide:
   1. Door clamps and removable heavy gauge continuous hinge pin.
   2. Hasp and staple for padlocking.
   3. Data pocket of high-impact thermoplastic inside door.
   4. Oil-resistant gasket attached to the door with oil-resistant adhesive.
   5. Collar studs for mounting optional panels.
   6. Bonding provision on door.

D. Finish: White inside with ANSI 61 gray outside finish over phosphatized surfaces. Optional terminal block panels white.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install electrical boxes for switches and receptacles flush in finished areas and exposed on walls and columns in unfinished areas or as shown.

B. Install boxes plumb and straight, rigidly secured in place.

C. Install conduit fittings in boxes for conduit connectors.

D. Install brackets, supports, hangers and accessories required for installation of boxes. Provide additional support, independent of conduit system, for boxes weighing substantially more than an equal length of conduit.

E. Provide suitable bushings, shields, or fittings having smooth rounded edges where conductors pass through partitions and at other locations where necessary.

F. Install bonding jumpers across all boxes from conduit to conduit, where conduits contain 1 or more feeders.

G. Install receptacle outlet boxes 18 inches from the finished floor to the center of the outlet box unless shown otherwise. Install switch boxes measuring 4.5 feet from the finished floor to the center of the switch box unless shown otherwise. Locate outlets as shown on the Drawings.

H. Do not obstruct access to boxes. Provide removable box covers without interference to or from other conduit boxes or equipment.
I. Coat with coal tar mastic as per Section 13100, "Corrosion Control", all embedded boxes with exposed covers for underground installations.

J. Clean boxes thoroughly after installation and correct any damage to boxes and to finish.

K. Provide adequate support for all boxes. Boxes in conduit runs shall be supported independently of the conduit, unless conduit supports (adequate to support the additional weight) are placed within 24 inches of the box on both sides.

L. In damp or wet locations, do not mount boxes against walls. Provide 1/2 inch or more of air space between box and wall. If strips or channels are used for standoffs, mount them vertically so they will not collect moisture.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 16001, “Electrical Systems - General”

END OF SECTION 16130
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies furnishing and installing exterior demarcation cabinets at At-Grade Stations as shown.

B. Interior demarcation panels for Comm Room in Service Building at Aerial Stations are specified in Section 16130, “Electrical Boxes”.

1.2 REFERENCED STANDARDS

A. National Fire Protection Association (NFPA):
   1. NFPA 70 - National Electrical Code (hereinafter referred to as NEC)

B. Underwriters Laboratories, Inc. (UL):
   1. UL 50 - UL Standard for Safety Enclosures for Electrical Equipment
   2. UL 514A - UL Standard for Safety Metallic Outlet Boxes
   3. UL 514B - UL Standard for Safety Fittings for Cable and Conduit

1.3 SUBMITTALS

A. Product Data: For terminal blocks, manufacturer’s standard data sheet including mounting track and end barrier indicating conformance and compliance with standards and criteria listed.

B. Shop Drawings:
   1. Scale 1 inch to the foot for elevations and details to scale to reflect graphically the construction elements.
   2. Demarcation cabinet layout, including plan and elevation drawings.
   3. Conduit entrance layouts and details.
   4. Schematic wiring diagram of the demarcation cabinet cable terminations labeled “Facilities Side Schematic Wiring Diagram”. The schematic wiring diagram shall be enclosed inside of a protective transparent plastic envelope and affixed to one of the interior side walls of the demarcation cabinet.

1.4 QUALITY ASSURANCE

A. Manufacturer: Select a firm regularly engaged in the manufacture of stainless steel cabinets of the types specified herein.

B. Conform to NEC, UL 50, UL 514A and 514B.

PART 2 - PRODUCTS

2.1 EXTERIOR DEMARCATION CABINETS

A. Constructed of 12 gauge stainless steel and shall be equal to NEMA 4X specifications.

B. Demarcation cabinet shall be equipped with a copper grounding busbar for demarcation cabinet and terminal blocks grounding.

C. Demarcation cabinets shall have 2 doors on the front side and no rear doors.

D. Doors shall be gasketed and hinged, and shall lock closed with an Abloy hasp lock. Install steel plates as backing on the lockset or hasp.

E. Dimensions of demarcation cabinet shall be as shown on Contract Drawings.

F. Data pocket of high-impact thermoplastic inside door.

2.2 TERMINAL BLOCKS

A. Terminal block lengths shall be 3 feet minimum mounted on snap-off mounting tracks with screw-on end clamps.

B. Terminal blocks mounted on snap-off mounting tracks shall be easily broken every 5/16 inch. Blocks that are broken off shall have slip-in end clamps and end barriers.

C. Each terminal block shall have a blank vinyl marking strip.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install equipment according to Contract Drawings and manufacturer’s requirements.

B. Install cabinets plumb and straight, rigidly secured in place.

C. Coordinate with the local telephone company to provide conduit from the telephone enclosure to the demarcation cabinet.
D. Install 3/4 inch plywood backboard over the entire interior area of the demarcation cabinet rear wall.

E. Mount terminal blocks on backboard within demarcation cabinet as shown on Contract Drawings.

F. Bond the protected terminal block ground terminals together using No. 8 AWG stranded ground conductor as shown on the Drawings.

G. Connect the protected terminal clock ground terminals to the copper grounding busbar as shown on the Drawings with No. 8 AWG stranded ground conductor.

H. Connect the copper grounding busbar to a ground rod(s) below grade with No. 6 AWG stranded ground conductor as shown on Contract Drawings and as specified in Section 16450, “Grounding and Bonding”.

I. Terminate communication, signal and control cables at terminal blocks as shown on Contract Drawings.

J. Label each terminal on the terminal blocks with the number shown on Contract Drawings.

K. Route, harness and support cables within demarcation cabinet with bending radii not less than recommended by cable manufacturer.

3.2 TESTING

A. Inspect the demarcation cabinet after all installation is complete and verify that each cable terminated therein is securely attached to the terminal blocks.

B. Verify that ground connections are securely attached to the protected ground terminals and grounding busbar.

C. Verify continuity of each cable from its origin to its termination point.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 16001, “Electrical Systems - General”

END OF SECTION 16135
PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies furnishing and installing supporting devices for electrical equipment and materials.

1.2 REFERENCE STANDARDS
A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1.3 SUBMITTALS
A. Product Data: Catalog cuts, covering types of fasteners to be used for supporting devices.
B. Shop Drawings.

PART 2 - PRODUCTS

2.1 MATERIALS
A. Furnish inserts and fastenings necessary for the rigid and secure installation of equipment.
B. Provide supporting hardware including steel bolts, nuts, washers, lockwashers, and screws with either hot-dipped galvanized steel in accordance with ASTM A123 or cadmium plated steel.
C. Use wood screws or lag screws of appropriate length to securely fasten equipment to wood.
D. Use inserts, expansion bolts, or self-drilling type anchors and drive pins for fastening to masonry. Provide inserts of the type to receive machine bolts after installation.
E. Provide channel inserts not lighter than 12-gauge steel channel not smaller than 1-1/2 inches by 1-1/2 inches, and a continuous 7/8 inch wide slot. Hot dip galvanize all channel inserts in accordance with ASTM A123 after fabrication. Cover inserts with a zinc chromate solution. Channels may be PVC coated.
   1. Provide surface mounted channel inserts with a 3/8 inch by 3 inch base slot on 4 inch centers. Galvanize inserts for surface mounting on concrete surfaces or for installation in damp or wet areas.
   2. Provide concrete embedded channel inserts with a solid base, and provide concrete anchors welded to the base during fabrication and before galvanizing.
   3. Provide channel insert assemblies with a pull-out load rating of not less than 4,500 pounds per linear foot uniformly distributed. Fill the channel with styrofoam in a manner which will prevent concrete from entering into channel during installation.
   4. Rate spot inserts at 800 pounds, and with a safety factor of five. Fabricate inserts from steel, hot dip galvanized in accordance with ASTM A123 after fabrication. Cover inserts in a manner which will prevent the entering of concrete during installation.
F. Hot dip galvanize hangers in accordance with ASTM A123 after fabrication. Provide hangers consisting of two or more steel rods, a steel horizontal member and U-bolts, clamps, and other attachments necessary for securing hanger rods and conduits. Furnish hanger rod not smaller than 3/8 inch diameter, threaded either full length or for a sufficient distance at each end to permit at least 1-1/2 inches of adjustment. Provide hangers capable of supporting a load equal to 200 pounds plus the sum of the weights of the conduit, cable tray, conductors, and hangers.
G. Furnish miscellaneous steel consisting of steel supports, angles, flats, and channels for the proper spacing and support of lighting fixtures, starting and control equipment, disconnect switches, panelboards, switchboards, wall mounted transformers, and other electrical equipment.

PART 3 - EXECUTION

3.1 INSTALLATION
A. Install fastenings, supports, and devices as necessary for the installation requirements of the electrical equipment and material.
B. Fasten exposed conduit to structures acceptable to the Contracting Officer by clamps, straps, or hangers spaced at intervals not more than 10 feet when fastened to a steel structure or more than 7-1/2 feet when fastened to concrete. Do not support or fasten conduit by welding directly to equipment or to the building structure. Do not use C clamps as a permanent method of supporting vertical conduit risers. Install clamps within 3 feet but not closer than 6 inches to couplings, boxes, and fittings in conduit runs in which expansion joints are installed. Install exposed raceways parallel to
or perpendicular to walls and structural members, and parallel to intersections of vertical plans and ceilings. Provide all conduit straps and clamps with base fittings or back plates which provide an air space of 1/4 inch minimum between the conduit run and supporting surfaces. Do not use perforated iron or wood plugs and nailing as methods of attachment. Make fastenings to steel members with granular flux filled welded studs.

C. Locate cable tray supports to ensure a rigid installation on centers not greater than 8 feet. Provide interconnections of sections for a rigid mechanical assembly. Provide cable tray supporting components comprised of clamps, clips, concrete inserts, hanger rods, insulators, racks, frames, trapezes, beams, structural steel clamps, U-bolts, slotted angles and fittings, machine screws, wall anchors, and similar items. Provide that components of dissimilar metals are compatible with the raceway, cable tray, and cable equipment which such components support. The cable tray layouts are described in Section 16114.

D. In damp or wet locations, do not mount electrical equipment (including boxes, starters, panels, and conduit) so that it touches the walls. Provide 1/2 inch or more of air space between wall and equipment. If strips or channels are used for standoffs, mount them vertically, so they will not collect moisture.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 16001, “Electrical Systems - General”.

END OF SECTION 16190
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section of the Specification describes in detail the requirements for the final design, fabrication, delivery and other Work required for the Traction Power Substations (TPSS).

B. The TPSS shall operate as a single unit to transform, convert, protect and distribute electrical power to the Overhead Contact System (OCS).

C. TPSS shall consist of a weatherproof enclosure as specified in the Contract Documents, with integrated Alternating Current (AC) Switchgear, Direct Current (DC) Switchgear, transformer rectifier/thyrister, and all the necessary auxiliary equipment to construct a complete and operational Light Rail Substation.

D. Each TPSS shall be uniform in physical and electrical design in every respect. Equipment providing like functions shall be of the same design and manufacture. Equipment of the same rating shall be identical and interchangeable.

1.2 REFERENCED STANDARDS

A. Publications: The technical documents and publications pertaining to the requirements for the fabrication of the TPSS are listed in this section and elsewhere in the Contract Documents, and are applicable to the extent cited in these Specifications. Note that some references and publications may be “inactive”; however this Standard may be used in production as guidelines and reference values, and therefore are considered for reference.

B. American National Standards Institute (ANSI):

1. ANSI B1.1 - Unified Inch Screw Threads.
2. ANSI B1.13M - Metric Screw Threads.
4. ANSI C12.11 - Transformers, Instruments for Metering.
7. ANSI C34.2 - Semiconductor Power Rectifiers.
10. ANSI C37.06 - Preferred Ratings and Related Required Capabilities for AC High Voltage Circuit Breakers Rated on a Symmetrical Current Basis.
12. ANSI C37.09 - Test Procedure for AC High-Voltage Circuit Breakers Rated on a Symmetrical Current Basis.
13. ANSI C37.1 - Definition, Specification, and Analysis of Systems used for SCADA.
14. ANSI C37.100 - Standard Definitions for Power Switchgear.
15. ANSI C37.11 - Electrical Control for AC High Voltage Circuit Breakers Rated on a Symmetrical Current Basis or a Total Current Basis.
17. ANSI C37.121 - Switchgear-Unit Substation Requirements.
20. ANSI C37.16 - Preferred Ratings, Related Requirements and Application Recommendations for Low-Voltage Power Circuit Breakers and AC Power Circuit Breakers.
21. ANSI C37.16a - Preferred Ratings, Related Requirements and Application Recommendations for Low-Voltage Power Circuit Breakers and AC Power Circuit Breakers.
22. ANSI C37.17 - Trip Devices for AC and General Purpose DC Low-Voltage Power Circuit Breakers.
25. ANSI C37.20.2 - Standard for Metal-Clad Switchgear.
26. ANSI C37.20.3 - Standard for Metal-Enclosed Interrupter Switchgear.
27. ANSI C37.21 - Control Switchboards.
29. ANSI C37.30 - Definitions and Requirements for High-Voltage Air Switches, Insulators, and Bus bars Supports.
30. ANSI C37.31 - Indoor Apparatus Insulators.
31. ANSI C37.32 - HV Air Switches, Bus bar Supports Application Guide.
32. ANSI C37.34 - Test Code for High-Voltage Air Switches.
33. ANSI C37.35 - Application, Installation Operation and Maintenance of HV Switches.
34. ANSI C37.40 - Service Conditions and Definitions for HV Fuses.
35. ANSI C37.41 - Design Tests for Power Fuses.
36. ANSI C37.46 - Specifications for Power Fuse and Fuse Disconnecting Switches.
38. ANSI C37.50 - Low-Voltage AC Power Circuit Breakers Used in Enclosures Test Procedures.
40. ANSI C37.52 - Test Procedures for Low-Voltage AC Power Circuit Protectors used in Enclosures.
41. ANSI C37.54 - Indoor Alternating Current High Voltage Circuit Breakers in Metal Enclosed Switchgear Conformance Test Procedures.
42. ANSI C37.55 - Medium Voltage Meta-Clad Assemblies-Conformance Test Procedures.
43. ANSI C37.57 - Metal-Enclosed Interrupter Switchgear Assemblies Conformance Testing.
44. ANSI C37.58 - Conformance Test Procedures for Indoor AC Medium Voltage Switches for Use in Metal Enclosed Switchgear.
46. ANSI C37.91 - Guide for Protective Relay Applications to Power transformers.
47. ANSI C37.97 - Protective Relay Applications to Power System Busbars.
49. ANSI C37.100 - Standard Definitions for Power Switchgear.
50. ANSI C39.1 - Requirements for Electrical Analog Indicating Instruments.
51. ANSI C39.5 - Controlling Instrumentation.
52. ANSI C57.12.00 - General Requirements for Distribution, Power, and Regulating Transformers.
53. ANSI C57.12.01 - General Requirements for Dry Type Distribution and Power Transformers.
54. ANSI C57.12.10 - American National Standard for Transformers, 13.8KV and below.
55. ANSI C57.12.50 - Requirements for Ventilated Dry Type Distribution Transformers, 1 to 500 KVA.
56. ANSI C57.12.51 - Requirements for Ventilated Dry Type Power Transformers, 501 KVA and Larger.
57. ANSI C57.12.55 - Dry Type Transformers used in Unit Substations.
58. ANSI C57.12.70 - Terminal Markings and Connections for Distribution and Power Transformers.
61. ANSI C57.12.91 - Test Code for Dry-Type Distribution and Power Transformers.
63. ANSI C57.13 - Requirements for Instrument Transformers.
64. ANSI C57.18.10 - Requirements for Semiconductor Power Rectifier Transformers.
65. ANSI C57.94 - Recommended Practice for Insulation Application, O&M of Dry Type Transformers.
66. ANSI C57.96 - Guide to Loading Dry-Type Distribution and Power Transformers.
69. ANSI C62.2 - Systems.
70. ANSI Z358.1 - Emergency Shower and Eyewash Equipment.
71. ANSI Z55.1 - Gray Finishes for Industrial Apparatus.

C. American Society of Testing and Materials (ASTM):
1. ASTM A36 - Structural Steel.
2. ASTM A446 - Steel Sheet, Zinc-Coated, Structural Quality.
3. ASTM B187 - Copper Bus Bar, Road and Shapes.
4. ASTM D229 - Rigid Sheet and Plate Materials Used for Electrical Insulation.
5. ASTM D1532 - Polyester Glass-Mat Sheet Laminate.

D. Electronic Industries Association (EIA):
1. EIA RS-422 - Electrical Characteristics of Balanced Voltage Digital Circuit.
2. EIA RS 443 - Solid State Relays.
3. FS L-P-387 - Plastic Sheet, Laminated, Thermosetting.

E. Institute of Electrical and Electronics Engineers (IEEE):
1. IEEE 1 - General Principles for Temperature Limits in the Rating of Electric Equipment and for the Evaluation of Electrical Insulation.
2. IEEE 4 - Techniques for High-Voltage Testing.
12. IEEE 484 - Recommended Practice for Installation Design and Installation of Large Lead Storage Batteries for Generating Stations and Substations.

18. IEEE 730 - Software Quality Assurance Plans

F. Instrumentation, Systems and Automation Society (ISA):

1. ISA S18.1 - Annunciator Sequences and Specifications.

G. International Organization for Standardization (ISO):

1. ISO 3001 - Recommended Practices and Procedures, Quality Assurance and Quality Control.

H. National Electrical Manufacturers Association (NEMA):

1. NEMA AB 1 - Molded Case Circuit Breakers and Molded Case Switches.

2. NEMA AB 2 - Procedures for Field Inspection and Performance Verification of Molded Case Circuit Breakers Used in Commercial and Industrial applications.

3. NEMA AB3 - Molded-Case Circuit Breakers and their Application.

4. NEMA AB4 - Guideline for Inspection & Maintenance of Molded-Case Circuit Breakers.

5. NEMA BU 1 - Busways.

6. NEMA CC1 - Power Connections.

7. NEMA EI 2 - Instrument Transformers.

8. NEMA FU 1 - Low-Voltage Cartridges Fuses.

9. NEMA IB 1 - Definitions and Precautionary Labels for Lead-Acid Industrial Storage Batteries.

10. NEMA ICS 1 - General Standards for Industrial Controls and Systems.

11. NEMA ICS 2 - Industrial Control Devices, Controllers and Assemblies.

12. NEMA ICS 4 - Terminal Blocks for Industrial Control Equipment.

13. NEMA ICS 6 - Enclosures for Industrial Controls and Systems.

14. NEMA LA 1 - Surge Arresters.

15. NEMA PB 1 - Panelboards.

16. NEMA PE 5 - Constant-Potential-Type Electric Utility (Semiconductor Static Converter) Battery Chargers.

17. NEMA R 12 - General Purpose and Communication Battery Chargers.

18. NEMA SG 3 - Low Voltage Power Circuit Breakers.

19. NEMA SG 4 - AC High-Voltage Circuit Breakers.

20. NEMA SG 5- Power Switchgear Assemblies.

21. NEMA SG 6 - Power Switching Equipment.

22. NEMA ST 20 - Dry-Type Transformers for General Applications.

23. NEMA TR 1 - transformers, Regulators, and Reactors (Sound Levels).

24. NEMA VE 1- Metal Cable Tray Systems.

25. NEMA VE 2 - Cable Tray Installation Guidelines.

27. NEMA WC 7 - Standard to Cross-Linked Thermosetting Polyethylene Wire and Cable.

28. NEMA WC 8 - Ethylene-Propylene-Rubber-Insulated Wire and Cable (ICEA S-68-516).

29. NEMA 250 - Enclosures for Electrical Equipment (1,000 Volts Maximum).

I. International Electrical Testing Association (NETA):
   1. ATS03.

J. National Fire Protection Association (NFPA):
   1. NFPA 10 - Portable Fire Extinguishers.
   2. NFPA 70 - National Electrical Code (hereinafter referred to as NEC)

K. National Uniform Seismic Installation Guidelines (NUSIG):
   1. IUBC (As adapted by the AHJ).

L. Sheet Metal and Air Conditioning Contractors National Association (SMACNA):
   1. SMACNA 15d - HVAC Dust Construction Standards.

M. Underwriters Laboratories (UL):
   1. UL 50 - Standard for Safety Enclosures.
   2. UL 67 - Panelboards.
   3. UL 94 - Flammability test for plastic.
   4. UL 100 - DC Low Voltage Power Circuit Breakers.
   5. UL 154 - Carbon Dioxide (CO2).
   6. UL 486A - Lugs for Use with Copper Conductors.
   7. UL 489 - Molded-Case Circuit Breakers and Circuit Breaker Enclosures.
   8. UL 752 - Bullet Resisting Equipment.
   9. UL 1236 - Battery Chargers.
   10. UL 1564 - Industrial Battery Chargers.

1.3 ABBREVIATIONS

A. AC – Alternating Current

Z. PTs - Potential Transformers
1.4 SUBMITTALS

A. Submit the following in accordance with these Specifications and Contract Documents.

B. NLT (120 days after NTP): Manufacturer’s Equipment Drawings including

1. Product and equipment literature, inclusive of:
   a. Catalog data.
   b. Ordering information.
   c. Supplementary information for all equipment used in the fabrication and manufacture of the Units.

2. Equipment arrangement drawings including:
   a. Dimensions and section views.
   b. Elevation drawings for the substation enclosure.
   c. Detail drawings for each item of the transformer-rectifier unit.
   d. AC switchgear.

C. NLT (150 days after NTP):

1. TPSS One Line Diagram including:
   a. Sequence of operation for substation and individual equipment.
   b. Transformer and power rectifier circuit diagrams.
   c. Control power one line and data for TPSS.
   d. Include 125 VDC one line.
   e. 120 VAC, 240 VAC and 480 VAC one line.

2. Equipment control schematics, logic diagrams and elementary diagrams for:
   a. AC Switchgear.
   b. Transformer-Rectifier Unit (TRU).
   c. Negative drainage unit.
   d. DC switchgear.
   e. Annunciator.
   f. CIC.

3. Substation lighting and low voltage AC wiring, equipment load data.

4. Fire alarm, telephone and power distribution layout drawings.

5. Supervisory Control and Data Acquisition (SCADA) Remote Terminal Unit (RTU) points listing and data table memory address assignment.
g. SCADA RTU.
h. Battery Charger.
i. Distribution panels, test stations, etc.

3. Battery and battery charger sizing calculations.

4. Heating and Air Conditioning (HVAC) Load Calculations: Include heat loss and heat gain calculations for each type of TPSS supplied on this Contract.

5. TPSS equipment arrangement drawings including:
   a. Cross section views.
   b. Structural details and views.
   c. Elevation drawings.
   d. Equipment weights:
      1) Overall TPSS and each shipping section.
      2) Transformer.
      3) Rectifier.
      4) Lifting instructions.

D. NLT (180 days after NTP):
   1. Rectifier/Transformer Design Calculations of the following:
      a. Rectifier transformer resistance.
      b. Rectifier transformer impedance.
      c. Rectifier transformer X/R ratio.
      d. Rectifier transformer voltage and current harmonic study; primary and secondary side.
      e. TRU voltage regulation curve.
      f. TRU efficiency-load curve.
      g. TRU temperature rise curve.
      h. TRU power loss curve.
      i. Rectifier power factor-load curve.
      j. Rectifier harmonics.
   k. Rectifier momentary peak and sustained short circuit currents.
   l. DC Filter configuration and DC voltage ripple content.

2. Internal wiring diagrams.
3. Interconnection wiring diagrams.
4. Operation and maintenance spare parts.

E. NLT (240 days after NTP):
   1. Include any application software or any software developed or modified under or as a direct result of this Contract.
   2. Submit for all and any software furnished under this Contract including software for the Thyristor Control System and SCADA/RTU equipment.
   3. Calculations:
      a. Battery and Charger sizing calculations.
      b. Heat load calculations.
      c. Equipment sizing Calculations.
      d. Seismic bracing for floor, ceiling, etc Calculations.
      e. Load calculations for the concrete pad/piers.
      f. Cable tray fill calculations.

4. Software Requirements Specification (SRS). SRS document shall include:
   a. All functions (including system management functions and off-line functions), to the point where there is no remaining ambiguity or interpretations, and covering all cases and bounds.
   b. All external interfaces in terms of the functions, behavior, and performance, of the interface.
   c. All inputs to the subsystem, and all outputs produced by the subsystem.
   d. All user interfaces (e.g. display formats, user commands, controls and indicators, etc.), their behavior, and their attributes.
e. All data flows between interfaces and functions, and between functions.

f. All performance requirements (e.g. availability, response times, capacity and throughput, integrity of operation, etc.).

g. Conceptual database design represented by an Entity-Relationship Diagram or an Authority approved equal.

h. A detailed 2-way cross-reference mapping between (each atomic requirement of) the technical specification and (each atomic requirement of) the SRS.

5. Software Design Description (SDD). SDD shall include:

a. Any application software or firmware or any software or firmware developed or modified as a result of this Contract:

b. The architecture of the system shall identify and describe the relationship between all top-level modules and all second-level modules in terms of both data flow and control flow.

c. All global data structures and databases, all data structures, which are used to help implement externally visible functions, and all data structures that are used to determine system-level and module-level control flow.

d. All external interfaces.

e. Identification and description of all top-level software modules, a mapping of all top-level software modules to hardware, and a mapping of all top-level software modules to the system software they use.

f. A description of software design principals or rules for areas such as:

1) Error detection, handling and recovery.

2) Transaction management, database consistency and data consistency between various holders of the same data.

3) Failure detection, handling and recovery.

F. NLT 200 days prior to Shipment of each Substation Unit:

1. Utility Service Studies:

a. Utility Coordination Study.

b. Utility Three Phase Harmonics Study.

c. Utility AC Power Factor Study.

d. Utility Voltage Distortion.

1) Calculations and Study for individual substations (50 percent, 100 percent, 200 percent and 300 percent Load).

2. Protective Relay Study and Settings.

G. NLT 90 days prior to testing:

1. Factory test procedures.

2. Acceptance and Verification Test Plan.

3. Acceptance and Verification Test Report Forms.

H. NLT 10 days after Factory Testing: Certified Test Reports.

I. NLT 120 days prior to Shipment of each Substation Unit:

1. RTU I/O memory address assignments listing).

2. Integration Systems Tests Forms.

3. Spare Parts and Special Tools Listing (with each TPSS).

J. As required:

1. Special Test Plan.

2. Special Test Reports.

3. Test equipment data and calibration certificates.
K. Organize submittal in 3-ring binders with tabs inserts sectionalizing each submittal, organized in alphabetical order.

1.5 QUALITY ASSURANCE

A. Contractor shall perform the Work included in this section in compliance with the requirements of these Specifications and in strict accordance with the requirements of the Contractor's Quality Control Program (CQCP). Contractor shall as a minimum:

1. Perform material qualification testing and certification for acceptance of all equipment, cables, raceway, cable tray, material components, assemblies and appurtenances associated with the Substations.

2. Perform inspections and tests during the fabrication of the Substations to guarantee proper and safe operation of all systems and sub-systems and to prove the adequacy and acceptability of the total installation.

3. On tests to be performed shall cause each system and sub-system to be sequenced through its required operations, including imposition of simulated conditions to prove that the equipment and assembly's installed complies with all specified fail-safe requirements.

4. The main supplier and manufacturer of the TPSS shall have an ANSI/ISO/ASQC Q9001 compliant Quality Assurance Program (QAP) in practice at its facility.

B. The Authority reserves the right to witness all tests and inspections in the Contractor's plants or other manufacturing facilities. In concurrence with the standard QC functions the Contractor shall:

1. Notify the Authority of all testing, testing procedures and inspection procedures. Test results shall be reviewed by the Authority.

2. Supply and maintain test equipment of proper type, capacity, range and accuracy necessary to perform the required tests and inspections.

3. Maintain all testing equipment in good working order and properly calibrated.

4. Contractor shall advise the Authority a minimum of 30 days in advance of each factory test.

5. When tests are to be conducted continuously as in a production-line routine, the Authority shall be advised at least thirty days in advance of the start of such tests and duration period in which such tests will be conducted.

C. Contractor shall perform QC and Quality Assurance (QA) practices, procedures, methods, and policies in accordance with these specifications during all phases of fabrication including:

a. Design
b. Development
c. Material Procurement
d. Fabrication
e. Processing
f. Assembly
g. Packaging
h. Shipping
i. Storage
j. Site Specific Data
k. Site System Interface
l. Substation Final Certification
m. Calibration Plan and Procedure
n. Configuration Management Control Plan and Procedure
o. Witness, Installation, Certification and reporting

D. To demonstrate that the installed equipment meets these Specifications and design requirements the Contractor shall perform all system and sub-system tests prior to performing operational testing.

1.6 SUBSTATION EQUIPMENT

A. Each TPSS and associated equipment shall be of proven design manufactured for the intended purpose.

B. All equipment shall be provided and installed in an enclosure with the approximate dimensions of 45 feet long, 16 feet wide and 12 feet high (excluding any roof mounted equipment).
C. Contractor shall integrate all specified Substation equipment into a “Package Substation”, including AC switchgear, transformer, thyristor rectifier, DC switchgear, feeder breakers, and other equipment as specified in these Contract Documents.

D. Each unit shall be assembled and tested by one manufacturer in one manufacturing plant.

E. All Substation equipment and products shall be made by manufacturers and suppliers with proven experience.

F. Prior to shipment:
   1. Each Substation will be fully assembled, tested and certified to be in full compliance with the Referenced Standards and these specifications.
   2. All Substations shall be inspected by an Underwriter Laboratory (UL) Inspector and a UL Field Evaluated Product Label applied to all equipment that does not bear the UL Listing Mark.

G. Equipment Interchangeability: Contractor shall furnish the same design and equipment for similar assemblies and sub-assemblies at all Substations; similar equipment shall have interchangeable parts.

H. Equipment Arrangement:
   1. Contractor shall as near as possible use the Substation design layout as shown on the Contract drawings to locate equipment within the substation enclosure.
   2. Deviations from the indicated arrangements to accommodate Contractor’s final design are subject to approval by the Authority.
   3. The final arrangement shall result in minimum space requirement and optimum accessibility for maintenance and shall comply with the Referenced Standards. Arrangements must conform to the NEC equipment clearance requirements and other applicable codes.
   4. Equipment, devices, and components shall be arranged to be conveniently accessible and easily visible. Grouping shall be neat, modular, and logical with like related functions in proximity.
   5. Devices shall be plumb and square with the lines of the panel and mounted as recommended by the manufacturer. Devices of the same general type shall be manufactured by the same company and shall be similarly arranged and mounted.

6. Substations may be shipped fully assembled or in shipping sections, if shipping sections are required, no more than 2 shipping splits will be permitted. Substations shall be fitted with impact recorders prior to shipment. Cost for re-assembly of Substations at the job site will be by this Contract.

I. Accessibility:
   1. All equipment and components shall be readily accessible for inspection, maintenance, adjustment, and reading of data.
   2. All devices, including protective relays, from which data are to be read, shall be mounted on the front panels. Devices mounted on the front panels and elsewhere shall be limited to a height of 78 inches from the Substation floor. The minimum height for panel-mounted devices shall be 18 inches from the Substation floor.
   3. All other devices shall be readily accessible on the surface of the equipment or by opening a hinged door or panel.

J. Warranty:
   1. All equipment, assemblies, and sub-assemblies shall be warranted for defects and workmanship for a period of not less than 1 year.
   2. Some equipment shall have an “extended” warranty, and shall be as specified in the Contract Documents.

K. Maintenance and Repair:
   1. Equipment and assemblies furnished under this contract shall be field repairable to the maximum extent possible.
   2. Contractor shall furnish materials and equipment that can be maintained or repaired on-site by the Authority, using its own facilities and personnel.
   3. Return of equipment to the manufacturer’s facilities, for repair or replacement shall be required only where necessary to comply with Warranty provisions.
1.7 APPLICATION

A. TPSS shall consist of the specified electrical traction power supply equipment and associated electrical systems.

B. TPSS will be used to convert incoming Utility High-Voltage AC, 3-phase, power to Low Voltage DC for transit rail vehicles.

C. The Substation shall also provide low-voltage, station service AC power, for auxiliary equipment in the substations and nearby communication and signal installations.

1.8 QUANTITIES AND TPSS LOCATIONS

A. Contractor shall fabricate and furnish, Free On-Board (FOB) to each TPSS site location as required by Section 01010, “Summary of Work” and Contract Drawings.

B. Contractor shall verify the utility voltage, Kw and KVA rating prior to ordering material and beginning fabrication.

C. A total of 2 Substations will be furnished by this Contract.

D. Each TPSS shall be fabricated as specified herein, with the DC switchgear assembly consisting of a DC main breaker and 4 feeder breakers unless indicated otherwise.

1.9 DESIGN REQUIREMENTS

A. Provide a design that will integrate the following substation equipment:

1. Substation Enclosure: TPSS equipment shall be installed in this enclosure. The enclosure provides the equipment with protection from the weather and allows protected access to the equipment.

2. AC Switchgear: The service point for the incoming 3 phase utility service. This section shall contain an AC circuit breaker and an auxiliary compartment(s) for station service and signal service power.

3. Rectifier Transformer: Rectifier transformer transforms the voltage from service voltage to 670/346 volts or as required by the rectifier. The main protection for the transformer is the AC circuit breaker

4. Thyristor-controlled rectifier (TCR): TCR shall consist of 2 thyristor-controlled power modules, a control module, a negative bus section and a positive output bus

5. DC Switchgear: DC switchgear distributes the DC power to the OCS and provides protection and control functions for each feeder circuit

6. 125 VDC Battery System: 125 VDC battery system consists of batteries, rack, enclosure, battery charger, battery disconnect switch and DC distribution panel.

7. Communications Interface Cabinet (CIC): CIC provides termination points for interconnecting the TPSS’s with adjacent TPSS’s and to the master Supervisory Control System (SCS).

8. AC Station Service Panel: Provides 120/240VAC power as required to various sub-systems

9. AC Signals Services Panel: Provides 480VAC single-phase power to the signal system

10. Local Annunciator Panel: Located in the CIC panel and shall provide information on the status of system components and is used in detecting and troubleshooting substation malfunctions

11. AC and DC Breaker Test Cabinets:

a. Provide for routine maintenance as a convenient way to test the circuit breakers while they are disconnected and racked out of their cells.

b. The test cabinet cable plug shall have an electrical interlock with the circuit breaker receptacle to prevent the cable plug being energized without it being properly connected to the circuit breaker.

12. HVAC Control Panel: HVAC Control Panel shall provide controls to the air conditioners in the TPSS

13. Fire Alarm Panel: Locate this panel near the AC switchgear section and next to the entry door to be activated by the smoke and heat detectors located in the Enclosure

14. Intrusion Alarm Panel: Intrusion alarm panel shall provide a signal to the CIC panel for local and SCADA indication

15. Design the TPSS for the following “Modes of Operation”.
a. Disconnected Mode: As received from the factory, no external cables are connected and the unit is safe to work on

b. De-energized Mode: The AC and DC circuit breakers are open. Work on the unit is limited to trained maintenance personnel only

c. Energized, off line Mode: The AC and DC main circuit breaker is closed with the DC Feeder breakers open. This is an intermediate mode, encountered during startup or a maintenance condition with both of the Contact sections de-energized

d. On Line Mode: The AC and all DC breakers are closed. This is the normal operating mode

e. Feed-Through Mode: The Main AC and main DC breaker are open; the DC feeder breakers are closed. This is desired to tie the inbound and outbound Contact systems together with the rectifier and transformer out of service

f. Maintenance Mode: Maintenance modes may be any combination of the above; work on the unit can only be accomplished by qualified maintenance personnel

16. Each TPSS shall include all equipment and materials from utility termination point in the utility service cubicle to the points of connection to positive feeder cables, negative-return cables, and negative drainage cables.

17. Provide a design to supply low voltage AC and DC power for station service, auxiliary equipment, communication equipment, signal equipment and SCADA.

18. Furnish all equipment and materials required for the Substations to be complete and operable. Prior to shipment, all equipment shall be completely assembled, wired, and tested. The Substations shall be ready for energization upon off-loading at the project site and connection to the incoming utility feeder.

19. Each TPSS will be designed for below grade utility service, service shall be provided by underground conduits.

20. Each Substation shall be designed to provide DC service feeders via underground conduits to an OCS with the negative return by the “running” rails.

21. All substations DC systems shall have a high resistance floating ground system unless noted otherwise.

22. Ambient Conditions. Substations shall be capable of operating satisfactorily in the Dallas/Metroplex area (which includes occasional icing) and as follows:

a. Elevation: to 400 feet.

b. Ambient Temperature:
   1) Minimum: 4 degrees F.
   2) Maximum: 115 degrees F.

c. Humidity: 5 to 100 percent

d. Precipitation:
   1) Maximum rainfall rate: 7 inches per hour
   2) Average maximum: 1 inch per hour

e. Wind Speed:
   1) Maximum: 70 mph
   2) Average: 10 mph.

23. Safety Design Requirements. Contractor shall provide a system design and operational procedures that shall incorporate the following as a minimum:

a. Incorporating fail-safe principles where failures would disable the system or cause human injury, damage to equipment or inadvertent operation of critical equipment.

b. Locating equipment components so that access to them by the required personnel during operation, maintenance, repair, or adjustment shall not require exposure to hazards such as entrapment, chemical burns, electrical shock, cutting edges, sharp points, or toxic atmospheres.

c. Provide suitable warning and caution notes in operations, assembly, maintenance, and repair
instructions, and distinctive markings on hazardous components, equipment or facilities for personnel protection.

d. All components containing or generating obnoxious, flammable, or harmful gases shall be vented to the outside.

e. Cables or wires of different systems and/or high and low voltage conductors shall be physically segregate/ separated from each other in accordance with these specifications and the Referenced Standards.

24. Utility Company Service:

a. Utility service will be provided by the local utility company(s).

b. Three phase, 3-wire, 15KV (Class), 60 Hz. AC Service will be provided.

c. This Contract shall coordinate with each TPSS Installation Contractor and verify the nominal service voltage for each site location.

d. Contractor shall coordinate this Contract’s requirements with each TPSS Installation Contractor and local utility(s) for each Substation site; the Contractor shall obtain the utility short circuit MVA and other utility data as required to complete the final design and fabrication.

e. Each unit shall be designed for not less than 95KV basic impulse insulation level (BIL).

25. Wiring Arrangement:

a. All power, control wiring and labeling shall be the same for all Substations.

b. Similar termination labels and wire markings shall be used at all Substations.

c. Incoming cables, incoming terminations, conduit, and equipment foundations/pads shall be coordinated and provided.

26. Warning Signs:

a. Warning signs, operational warning and designation labels and signs shall be furnished for all devices and equipment.

b. All electrical equipment operating over 600 Volts shall be provided with “High Voltage” warning signs.

27. Uniformity. Contractor shall provide TPSS that are identical as much as feasible. Provide:

a. Device function numbers as cited in the Specifications and Contract Drawings or as provided in the Referenced Standards.

b. Equipment enclosures, assemblies, sub-assemblies and components that do not differ in operational, functional and performance characteristics shall be designed so that all components are positioned in the same location and internal wiring is routed in between components in a like manner.

28. Where identical installations exist the following requirements shall be adhered to:

a. Unless site conditions prevent it, equipment enclosures shall be mounted and installed in a like manner.

b. Penetrations for conduit, grounding and access panels shall be located in the same locations.

c. Location of equipment relative to adjacent equipment shall not differ.

d. The routing of conduit, cable trays and cables between equipment enclosures shall not differ.

e. Termination and mounting of hardware shall be located in a like manner.

f. Cables and wire terminations shall be located in a like manner.

29. Seismic Design Considerations: Provide a final design for equipment, conduit, cable trays and associated mounting hardware/anchors that conforms to the Referenced Standards and shall be intended to operate in a seismic zone 1 environment.
30. Testing:

a. Manufacture, factory and on-site (Acceptance) tests shall be performed on each component, assembly and sub-assembly. Testing shall demonstrate that the equipment will perform correctly for its intended application.

b. Failure to meet this requirement to the satisfaction of the Authority will require retesting by the Contractor. Cost associated with re-testing necessitated by failure to comply with this requirement shall be borne solely by the Contractor.

1.10 PRODUCT DELIVERY, STORAGE AND HANDLING

A. General:

1. This sub-clause is a guide for the handling, storage, and installation of the TPSS and emphasizes safety aspects and other considerations in working with this type of equipment. It supplements, but does not replace, the manufacturer’s detailed instructions. The objective is to furnish additional guidelines to promote and enhance a reliable installation.

2. Contractor shall include instruction books and drawings, Operations and Maintenance Manual (O&M manual), with each TPSS unit. The O&M manual shall contain detailed recommendations for storage, handling, installation, operation, and maintenance.

3. Personnel responsible for these functions should review these recommendations before handling the equipment. Particular attention should be given to recommendations for the preparation of the foundation and forms on which the TPSS is to be installed.

4. One set of manufacturer’s instruction books should remain with the TPSS at all times.

B. Receiving:

1. This contract shall deliver each completed TPSS to individual site locations or to a storage area designated by the Authority. Off-loading shall be provided in accordance with Specification 16312, Traction Power System Substation Installation. Each TPSS unit shall be carefully inspected and packaged before leaving the factory.

2. Immediately upon receipt, the equipment should be examined for damage that may have been sustained during transit. If damage is evident or indications of rough handling are visible, the carrier (transportation company) and the manufacturer should be notified promptly. A list of all found damage, shortages and discrepancies will be made by the inspecting personnel and sent to the Contractor.

3. Only authorized personnel should be permitted to handle the equipment. Care should be exercised in handling each piece of equipment, even if crated, because parts may be damaged.

C. Rigging:

1. Instructions for lifting and handling of each shipping section and piece of equipment shall be contained in the O&M manual and drawings.

2. Rigging should be adequate for the size and weight of the equipment.

3. Contractor shall furnish the “rigging” information to the Site Contractor or TPSS Installation Contractor at a minimum of 2 weeks prior to shipment.

D. Storage:

1. Indoor units that cannot be installed immediately shall be stored in a dry, clean location and shall remain in crates and packing during the storage period. The longer the period of storage, the greater the care required for protection of the equipment.

2. Outdoor units shall be placed directly on the Substation foundation if possible. If unit is to be stored, the Substation shall be placed on proper cribbing or ties.

3. During storage, the TPSS shall be placed on a level surface to prevent unnecessary strain and possible distortion.

4. During the fabrication period, protection should be provided against dust, dirt, falling objects, dripping water, excessive water, excessive moisture, and other possible causes of damage to the equipment.

5. Temporary covering should not restrict ventilation and should not be removed until the equipment is ready for installation.
a. Store equipment in a heated building. If this is not possible, special precautions should be taken to keep the equipment sufficiently warm with adequate ventilation to prevent condensation during the storage period.

b. If necessary, temporary heating should be installed in the equipment.

c. If outdoor switchgear cannot be installed and energized, temporary power must be provided for the operation of the space heaters to minimize condensation of moisture within the housing.

PART 2 - PRODUCTS

2.1 STATIONARY STRUCTURE(S)

A. General:

1. Each switchgear section and equipment lineup shall be comprised of the required number of metal-clad and metal-enclosed equipment sections, assembled together to form a rigid self-supporting structure with barriers of galvanized steel between each section.

2. Equipment sections shall be segregated by grounded metal barriers into separate compartments for circuit breakers, instrument transformers, main bus, instruments, relays, and incoming service connections.

3. Completed assembly shall provide front accessibility to the power fuses, instruments, relays, control wiring and wiring terminations. Unless full compliance with NEC is demonstrated and approved by the Authority, rear access will not be allowed.

B. Compartments:

1. Each compartment shall be provided with a separate hinged door or a removable bolt-on cover for servicing without exposing circuits in adjacent compartments.

2. Adequate provisions shall be provided for escape of gases from the compartments to the outside by means of louvered vent openings covered with grilles, and arranged in such a way that hot gases, hydrogen or other materials cannot be discharged in a manner hazardous to personnel.

C. Doors and Panels:

1. Each circuit breaker, voltage transformer(s), and fused switch compartment shall be provided with a formed, hinged door with handle and 3-point lockable latch.

2. Each door shall be furnished with a stop to hold the door in the open position. Circuit breaker and voltage transformer compartment doors shall not hinder withdrawal of the element from the compartment when the door is open and doorstop set. Relays, instruments, meters, and secondary control devices shall be mounted on formed front-hinged panels and provided with handle, lockable latch, and a doorstop to hold the door panel in the open position. Equipment mounted on the panel shall be isolated by grounded metal barriers from all primary circuit elements.

3. Access to main bus, incoming service connections, bus duct or feeder cable terminations, current transformers, bushings, and other stationary devices shall be rear access and provided with removable bolted panels. Instrument wiring shall terminate on the front of each cubicle and shall not require access to the rear of the compartment.

D. Station Service and Signal Power Transformer Compartments:

1. Separate transformer compartments shall be designed to house the Station Service transformer and the Signal Power transformer.

2. Adequate ventilation shall be provided in each transformer compartment to prevent heat buildup.

3. Separate draw-out fuse trunnion carriages shall be installed on the front of each transformer compartment cubicle to allow removal of primary voltage. The draw-out fuse trunnion carriage shall be equipped with the following:

   a. Fuse clips mounted on the trunnion centers for accommodating primary and secondary fuses.

   b. Silver-plated contacts designed to provide adequate contact pressure.
c. Provide a design so that all primary contacts will be disconnected from the energized circuit and visibly grounded before the fuses become accessible for replacement. A minimum of 95 kV BIL is required in the open position.

d. The fuse draw out carriage shall be grounded in all de-energized positions. This may be accomplished by use of a grounding strap. Sliding or rolling ground connections are not acceptable.

e. The fuse draw out carriage shall be sealable in the closed or operating position.

4. Provide a key interlock system for each service and the associated LV panel board main circuit breaker to prevent withdrawal of the fuse carriage without first opening the LV main circuit breaker. The key shall remain captive in the LV panel until the main LV circuit breaker is opened.

E. Space Heaters: Each switchgear compartment, front and rear, shall be furnished with strip space heaters, thermostats and humidistat.

2.2 AC SWITCHGEAR

A. General Requirements:

1. Contractor shall furnish for each TPSS, high-voltage, metal-enclosed, indoor, AC power switchgear. Switchgear assembly shall be comprised of an integrated lineup of metal-clad equipment and an incoming power cable termination enclosure.

2. AC Switchgear assembly shall form a deadfront, freestanding, enclosure. Switchgear assembly shall be metal-clad type. Each assembly shall incorporate a draw-out type AC circuit breakers, power fuses, surge arrestors, bus and bus connections, instrument transformers, meters, relays, control wiring, and accessory devices as specified herein and as shown on the Contract Drawings.

3. AC Switchgear assembly will provide the power supply to the transformer-rectifier assembly from the incoming utility service. Contractor shall verify the primary nominal voltage for each site prior to material procurement and fabrication.

4. Switchgear assemblies and major components shall be tested in accordance with the requirements in these specifications and the Referenced Standards.

5. Contractor shall provide, install and test the high-voltage AC switchgear as an integral part of the TPSS. All components and equipment shall be as specified and shall be so assembled to produce a complete and operational system. Provide:

   a. 15 KV Circuit Breaker Assembly.
   b. 15 KV incoming Utility Line Section.
   c. 15 KV Bus Assembly.
   d. Lightning Arrestors (3).
   e. Station Service Transformer.
   f. Signal Service Transformer (unless specified otherwise).
   g. Associated meters, instruments and relaying.

6. Submit the following as part of the submittals specified in this section and elsewhere in the Contract Documents:

   a. Manufacturer’s general arrangement and detail drawings for each type of switchgear assembly inclusive of all prime components.
   b. Manufacturer’s and fabricator’s schematic wiring and interconnection diagrams.
   c. Protection device instruction bulletins, coordination curves, and relay setting data.
   d. O&M manuals, including spare parts list.
   e. Design and Production test reports.
   f. AC utility cubicle entrance details, including plan, profile and sections views.
   g. Provide certification that the switchgear complies with the floor loading design criteria and conforms to all specified standards.

7. AC power switchgear assemblies shall be fabricated in accordance with the requirements of the Referenced Standards, the local utility company
electrical service requirements and the AHJ requirements for each site location.

B. Switchgear Ratings. Switchgear assemblies shall have the following ratings unless industry or design practice requires higher values:

1. Service Voltage Class: 15KV.
2. Nominal Operating Voltage, kV, rms: 13.2KV (verify for each site).
3. Rated Maximum Voltage, kV, rms: 15KV.
4. Rated Frequency: 60Hz.
5. Rated Insulation Levels:
   a. Low Frequency Withstand: 36 KV.
   b. Full Wave withstand (BIL): 95.
   c. Rated Bus Continuous Current: 1200 Amps.
   d. Rated Momentary Current Withstand, kA, rms, corresponding to circuit breaker.

C. Main AC Bus:

1. Main 3-phase bus shall be comprised of 98 percent conductivity electrical grade copper.
2. Bus shall be fully insulated over its entire length with flame-retardant, nonhygroscopic, track-resistant insulation.
3. All bus tap connections, including bus taps and circuit breaker connections, shall be silver-plated.
4. Main bus and connections shall be braced to withstand the mechanical stresses associated with the rated short-circuit momentary currents without deformation or damage to the supports or the bus.
5. Bus compartments within the AC switchgear section shall be insulated to metal-clad switchgear standards.
6. AC incoming bus connections shall be pre-drilled for standard NEMA termination.

D. Utility Company Service Entry:

1. AC switchgear shall be designed for utility service to be provided by below grade conduit. Provide removable panels for future conduit and cable installation.

2. Service feeder cables, conduit and terminations shall be provided in accordance with Specification 16312, Traction Power System Substation Installation.

3. Incoming service feeder compartments shall have adequate space to accommodate feeder cable terminations, grounding, lighting protection and future maintenance.

4. Means for supporting, connecting, and shield grounding of the service cables shall be included in each incoming service section.

5. Lightning arrestors shall be furnished as specified herein and installed in the service entrance compartment. Coordinate and verify with the local utility and the TPSS Installation Contractor for the proper sizing of the Lightning Arrestors.

6. Back panel of this compartment shall be removable for inspection and terminations of the incoming primary cables. Provide a hinged panel with a viewing window for infrared measurements with means for padlocking for limited access. Provide padlock for each access door, key to specifications as required by the Authority to match existing Substations.

7. Utility Company Metering:

   a. All revenue metering will be by the local utility and shall not be installed in the TPSS.
   b. Contractor shall be responsible for interfacing the TPSS with the site revenue metering.
   c. Contractor shall coordinate with each Line Section Contractor, local utility, the Authority to receive the proper pulse from the service utility meter.

E. High-Voltage AC Circuit Breakers:

1. Incoming AC main circuit breakers shall be indoor, 3-pole, draw-out type, with sealed vacuum interrupters, and motor-charged spring-operated mechanisms.
2. Circuit breakers of each type and rating shall be physically and electrically interchangeable.
3. Ratings:
   a. The circuit breakers shall be rated on a symmetrical current basis and have the following ratings and required related capabilities as defined in the Referenced Standards.

   1) Nominal voltage: 12.47/13.2 KV (verify per site).

   2) Short Circuit Level at Nominal Voltage: 500MVA.

   3) Rated maximum voltage: 15 KV.

   b. Rated withstand test voltage:

      1) Insulation Level: 36 KV.

      2) Impulse Withstand: 95 KV.

      3) Rated continuous current: at 60 Hertz, 1200 Amps.

      4) Rated interrupting time, cycles: 5.

      5) Rated permissible tripping delay, sec: 2.

      6) Rated voltage range factor (k): 1.30.

      7) Rated short-circuit current at rated maximum kV. Amperes, ms: 18,000.

     10) Closing and latching capability, Amperes, crest 62,000.

4. Insulation:
   a. Materials used for circuit breaker insulation shall be of a type that is noncombustible, nonhygroscopic and tracking-resistant.

   b. Mechanical strength and physical characteristics of the insulation structure shall match the stresses imposed by the circuit breaker closing and latching current capability.

5. Removable Assembly:
   a. Circuit breaker removable elements shall be track-mounted suitable for manual removal and insertion from the stationary compartment. The circuit breaker element must roll in and out of the cubicle without the use of ramps or lifts.

   b. Removable element shall be provided with a fully interlocked, manually operated racking mechanism to move the circuit breaker between the “Test/Disconnect”, and “Connected” positions. A clearly visible position indicator shall be provided.

   c. Removable element frame shall be provided with a full front metal shield to prevent access to any live primary bus or load terminals when the circuit breaker is in the “Connected” position.

   d. Circuit breaker removable element’s primary disconnecting contacts shall be provided with heavy-duty, self-aligning, spring-loaded, silver-plated, copper disconnect fingers that engage with the line- and load-side stationary disconnecting contacts.

   e. Circuit breaker interrupters shall be provided with a means for determining contact wear without dismantling the unit.

   f. Control wiring connections, from the circuit breaker compartment to the removable element, shall have provisions for maintaining or automatically re-instating circuit continuity when the removable element is moved between the “Connect” and “Test” positions.

   g. Recessed stationary receptacle and a set of self-aligning multiple contact plugs shall be provided for simultaneous disconnection of the control wiring connections when the removable element is fully withdrawn from the compartment.

   h. Tripped SCADA indications shall be maintained when circuit breaker is
in the “Test” or “Disconnected” position.

i. Circuit breakers shall be provided with auxiliary switches for the functions specified herein and as indicated on the Contract Drawings, in addition 2 spare normal open and 2 spare normal closed contacts shall be wired to the control compartment.

e. Each mechanism shall be provided with a 4-digit non-resettable mechanical register operation counter to record each circuit breaker close/open cycle.

f. For test purposes and for use in emergency, the mechanism shall be provided with “Open” and “Close” mechanical control push buttons, mounted on the front of the removable element.

g. Mechanism shall also be furnished with an easily readable mechanical position indicator, mounted on the removable element, to indicate the “Open” and “Closed” positions of the main moving contacts.

7. Circuit Breaker Control:

a. Circuit breaker shall be designed for electrical operation at the local control voltage of 125 VDC and remote supervisory control voltage of 24 VDC. Supervisory Control interposing relays (24VDC) shall be installed and wired out to a terminal block for interconnection with the SCADA/RTU.

b. Closing mechanism shall be provided with a spring release coil, anti-pump relay, and spring charging motor suitable for operation over a voltage range of 90 to 140 VDC.

c. Tripping mechanism shall be provided with a shunt trip coil suitable for operation over a voltage range of 70 to 140 VDC.

d. Local-Remote: Each circuit breaker unit shall be provided with a “Local-Remote” selector switch arranged for operation as follows:

1) Local Position: Permit local open and close operation of the circuit breaker by its associated control switch, when the removable element is in the “Connected” or “Test” positions.
2) Remote Position: Permit open and close operation of the circuit breaker from the SCADA equipment when the removable element is in the “Connected” position.

3) A white LED indicating light with nameplate indicator shall be provided which illuminates when the Local-Remote control switch is in the Local position.

4) A blue LED indicating light and nameplate indicator shall be provided which illuminates when the Local-Remote control switch is in the Remote position.

e. Permissive electrical interlock circuits shall be provided with the AC main circuit breaker to allow closing the main DC circuit breaker once the main AC circuit breaker is closed, and to automatically open the main DC circuit breaker in the event the main AC circuit breaker is “tripped”.

f. Provide auxiliary contacts to indicate the status of the AC circuit breaker to SCADA and the local Annunciator Panel.

g. Provide auxiliary contacts to operate the AC circuit breaker by the SCADA/RTU system.

3. Ratings:
   a. Arrester ratings shall be suitable for use at the utility company nominal service voltages.
   b. Contractor shall coordinate with TPSS Installation Contractor and the local utility company for arrester installation and rating.

4. Arrangement:
   a. Arrester pressure relief diaphragm shall be arranged in the enclosure so that the vent ports are directed away from all energized adjacent apparatus.
   b. Preferably, the generated ionized gases during normal operation shall be vented to the outside of the switchgear enclosure.

5. Provide means for the surge arrester ground terminals to be connected to the Substation ground system.

6. TPSS Installation Contractor shall design and install the TPSS AC and DC ground mats. Contractor shall coordinate with the site contractor to meet the resistance requirements and connection arrangements as recommended by arrester manufacturer and the ground mat design.

G. Digital Power Meter (DPM):

1. Provide a DPM to monitor the incoming AC line circuit as indicated on the one-line diagram and as specified herein.

2. Provide a Siemens 9510 or Authority approved equal, the DPM shall:
   a. DPM shall measure the real-time RMS values of phase currents, ampere, demand, phase and line voltages plus power measurements including KW, KW demand, KW-hours, KVA, KVAR-hours, in addition the DPM shall:
   b. Monitor loss of incoming line voltage for each phase and send this signal to the local and remote annunciators.
   c. Monitor Power Factor and frequency.
d. The KW demand period shall be user programmable from 1 to 60 minutes.

e. Accuracy of current and voltage measurements shall be 0.2 percent for KW. KWH and other power measurements shall be 0.4 percent or better.

f. Re-settable minimum and maximum values for each measured value shall be recorded in nonvolatile memory.

g. A user-defined password shall be required to change configuration, reset minimum/maximum log and kW/KVAR-hours or change any relay set points.

3. DPM shall be provided with an auxiliary voltage input.

4. DPM shall be capable of high-speed sampling of the power waveform for power quality analysis and measurement of harmonics in both the current and voltage waveforms.

5. DPM shall be UL listed and meet all the requirements of the Referenced Standards.

6. All configuration information such as CT ratios, voltage scales, and communications address shall be stored in nonvolatile memory so that the DPM can be set either from the integral display or remotely using the communications module.

   a. No batteries shall be required to maintain configuration information indefinitely.

7. DPM shall derive power from a dedicated 125 VDC source provided by the DC distribution panel board.

8. DPM with integral display shall be flush mounted on the AC equipment door. Operation of the power meter to read real-time or minimum/maximum measured values or to program configuration and any relay set points shall not require opening doors or removing panels.

9. Display:

   a. DPM shall include an integral illuminated display for reading all real-time and minimum/maximum measured values as well as any relay set points.

   b. The display shall consist of at least 20 alphanumeric characters, 0.4-inch high and be operated using clearly labeled sealed membrane keys with stainless steel switch elements for long mechanical life and resistance to atmospheric contamination.

10. Relay output:

   a. Three programmable relay outputs shall be provided to activate based on threshold and time-delay values associated with any of the measured parameters or for kilowatt demand pulse initiation.

   b. One relay output shall be programmed and annunciate loss of incoming line voltage. Provide indication for loss of any one phase.

   c. Remote relay operation shall be possible through the communications module.

   d. Relay contacts shall be form C rated 10A 120 VAC/24 VDC.

   e. Activation and release of the relays shall be recorded in a nonvolatile log with cause of operation. The log shall record at least the last 50 events.

   f. Provide a programmable auxiliary 0 to 1 mA or 4 to 20 mA analog output.

11. Relay input:

   a. Provide a minimum 8 discrete inputs to monitor status of “Normal Open” and “Normal Close” AC and DC Circuit Breaker status.

   b. One of the discrete inputs shall also be capable of counting state changes.

12. Communications:

   a. A communications module shall be provided using an Authority approved standard bus to remotely read all system parameters (Voltage, Current, Power, KVAR, Power Factor, KVA, circuit breaker status) in real-time and min/max...
measured values. Send all data to the SCADA RTU.

b. A means shall be provided to periodically synchronize the meter's internal clock with a master bus clock so that the meter's event and minimum/maximum logs are accurately time-stamped within 1 second.

c. Provide, install and test Ethernet Converter(s), Data Reporting and Data Power Management Software to provide remote monitoring and analysis of the electrical distribution system. Provide reporting software for cost analysis; load shifting, maintenance reporting, power quality and revenue billing.

13. Extended memory: DPM shall include extended nonvolatile memory to record at least 100 snapshots of each measured parameter. Interval between snapshots shall be readable using the communication module.

14. Portable Interface Device:

a. As specified herein, provide 4 data acquisition type portable notebook computers with latest Intel (or equal) processor shall be provided prior to acceptance of the first Substation with appropriate interface software to access the DPM communications module.

b. A minimum of 8 hours of on-site, field instruction for the DPM shall be provided for each Line Section. This shall be in addition to the requirements for training listed elsewhere in the Contract Documents.

H. AC Switchgear Maintenance Accessories:

1. Each TPSS shall be provided with the following for AC power accessories:

a. AC Circuit Breaker test cabinet, wall-mounted, complete with test jumper cable and connectors – Qty: 1

b. Cranks for manually racking circuit breaker from cubicle – Qty: 2

c. Spare sets of each type of high-voltage and low voltage fuses – Qty: 2

2.3 TRANSFORMER/RECTIFIER UNIT (TRU)

A. General:

1. Each Substation shall contain a TRU. The TRU shall consist of a rectifier transformer and a thyristor controlled power rectifier with all standard and specified accessories, auxiliaries, controls, hardware, interconnecting busses, wiring, and related devices as specified herein and as required for a safe and reliable operation.

2. Description and Scope:

a. Each TRU shall receive power from the Substation high-voltage AC switchgear and supply power to the associated DC switchgear. Connections between the rectifier and the AC switchgear shall be by AC busway; Connections between the rectifier and the DC switchgear shall be by DC cables or bus, with bus being the preferred option where/if feasible.

b. Tests shall be performed on each fully assembled TRU in accordance with industrial standards, as specified herein and the Referenced Standards.

c. Contractor shall provide, install and test a TRU as an integral part of the TPSS. All components and equipment shall be integrated into the TPSS as specified herein and shall be so assembled to produce a complete and operational system. Provide:

1) Rectifier Transformer.

2) Rectifier.

3) Power Module.

4) Control Module.

5) Protective Relaying.

6) Associated meters and instruments.

3. Submittal Requirements. Submit the following as part of the submittals specified in this section and elsewhere in the Contract Documents: Manufacturer's general arrangement and detail drawings for each Transformer/Rectifier assembly:
a. Manufacturer's drawings.
b. Protection devices, coordination curves, and relay setting data.
c. O&M and instruction manuals.
d. Spare parts list.
e. Design and Production test reports.
f. Installation and bracing drawings, including plan, profile and sections views.
g. Provide certification that the TRU complies with the design criteria and conforms to all specified standards.

4. Types and Ratings: The Traction Power Supply TRU shall be 12-pulse, double-way type, designed for rectifier circuit No. 31 as identified in the Referenced Standards, with the inter-phase transformer removed and replaced with a large output filter capacitor (if required). The size of the filter capacitor shall be such that the ripple of the DC bus voltage and its harmonic content shall not exceed those of a diode-based TRU with the standard ANSI circuit No. 31

5. Thermal Rating. TRU shall be rated as indicated herein and shall be designed to meet the following heavy-duty traction overloads cycle:

a. After steady-state temperatures at full load has been reached by all TRU components, the TRU shall be capable of operating at 150 percent base load for 2 hours, with superimposed 5 periods of 1 minute duration each at 300 percent of rated load which are equally spread over the 2 hour period.

b. The temperature of any component of the TRU shall not exceed its normal design limit by the end of the specified 2 hour overload period and the TRU shall be designed to support 2 such overloads per day, separated by a 6 hour interval at full load.

c. TRU shall be designed to meet the above daily duty cycle without damage to any parts or the insulation of the equipment for a period of 30 years.

6. Fault Current Withstand: TRU, including interconnecting bus and switchgear, shall be certified as capable of withstanding 100 percent of the theoretical maximum short-circuit current, with the short circuit applied at the load terminal of a DC feeder circuit-breaker, without damage to any component for the time period for the DC feeder breaker to open and clear the fault using its inherent over-current trip device.

7. Efficiency: Each TRU’s overall efficiency shall be 98 percent or better at its continuous kilowatt rating.

8. Power Factor: At the rated AC primary voltage, and from 25 percent to 100 percent rated kilowatts, the power factor of each TRU shall be 0.95 lagging or greater.

9. Voltage Regulation:

a. From no-load to 115 percent load, the TRU shall maintain a constant voltage of 845VDC at the DC bus, assuming a nominal primary AC voltage is maintained.

b. For loads from 115 percent to 300 percent of rated load, the DC voltage shall decrease linearly from 845 Volts in accordance with the inherent voltage regulation of the TRU, which shall be 4.5 percent. Current limiting after 300 percent rated load shall be employed thereafter.

B. Rectifier Transformer:

1. General:

a. Rectifier transformers shall be designed and manufactured in accordance with the requirements specified herein and the Referenced Standards.

b. Provide a dry-type construction, self-cooled, heavy-duty traction power transformer suitable for installation in a ventilated indoor enclosure.

2. Design:

a. Manufacturer of the rectifier transformer shall have been regularly engaged in the design and production of rectifier transformers for TPSS, and shall demonstrate a successful record of providing rectifier transformers of similar kind,
rating and insulation on at least 1 mass transit project over a period of no less than 5 years.

b. Primary windings shall be delta-connected and rated for the utility nominal voltage (13.2 or 12.47KV) on a 3-phase, 60-Hz system. The primary insulation voltage class shall be 15KV and the power frequencies withstand shall be 31KV. The BIL of the primary windings shall not be less than 95KV.

c. Secondary windings shall be delta/wye connected for the two 6-pulse, double-way rectifiers in accordance with the Referenced Standards. The BIL of the secondary windings shall not be less than 45 KV.

d. Output (LV) windings rated voltage, ampacity, related characteristics, and winding connection shall be designed for use with the required power rectifier circuit configuration, voltage regulation, etc.

e. Rectifier transformers shall be harsh environment indoor design, 3-phase, 60 Hz, ventilated, dry-type, self-cooled, class AA, similar to Uniclad™ design from Virginia Transformer or a Authority approved equal.

3. Transformer Impedance:

a. Transformer impedance shall be selected to provide the required minimum voltages at the rectifier load terminals under the specified loading conditions and utility service system characteristics.

b. The design shall coordinate the Transformer Impedance with the DC power switchgear circuit breaker short-circuit ratings assuming a bolted fault at the nearest feeder breaker load side terminals.

4. Transformer Winding Temperature:

a. Transformer winding temperature limit requirements, shall be based on the transformers being housed in a Substation enclosure in an indoor environment, suitably designed for an interior operating temperature as defined in Section 13121, “Substation Enclosures – Traction Power Substations”, of these specifications.

b. Average winding temperature rise measured by resistance, when operating at 100 percent rated continuous load, shall not exceed the Referenced Standards.

c. Average winding temperature rise measured by resistance method after a 2-hour overload cycle shall not exceed the referenced standards.

5. Audible Noise Level:

a. Rectifier transformer in particular, and the TPSS in general, shall be designed to meet the specified maximum noise levels as specified herein and in the Referenced Standards.

b. Equipment design, enclosures with acoustic mitigation capacity, and other measures, as appropriate, shall be employed to achieve compliance with the audible noise level criteria.

c. Noise levels outside the TPSS measured at a distance of 50 feet from the substation during operation at 100 percent load and with the normal air conditioning on line shall not exceed 45 dB.

d. Noise level inside the Substation enclosure, at a distance of 5 feet from the rectifier transformer during operation at 100 percent load and with the normal air conditioning on line, shall not exceed 80 dB.

6. Harmonics:

a. Thyristor rectifier current harmonics in the transformer windings shall be factored into the design of the transformer to meet the transformer temperature limitations, voltage regulation, efficiency, power factor and other performance parameters.

b. Harmonic loading shall be evaluated under the full range of load conditions with the thyristor conduction angle in a minimum and maximum position, (i.e. worse case conditions).
c. A harmonic study shall be performed for each type of transformer in accordance with the recommendations in the Referenced Standards to verify that the voltage harmonics (6 pulse and 12 pulse mode) produced on the Utility Service Connection Feeder does not exceed the voltage harmonic limitations specified by the Authority and the local Utility Company.

7. Mechanical Characteristics:
   a. General: Transformers shall be so designed and installed that all parts are easily accessible for maintenance and replacement.
   b. Enclosure:
      1) Transformer enclosure shall be moisture-resistant and shall be substantial enough to protect the transformer coils against accidental mechanical damage.
      2) Enclosure shall be of self-supporting steel construction with bolted removable panels for access to the winding taps, and bolted removable panel for access to the core and coils.
      3) Panels shall be provided with close mesh ventilating grilles.
      4) The complete case structure shall be removable.
   c. Base Structure:
      1) Base structure shall be comprised of base members suitable for mounting the core and coil assembly and for skidding or rolling the complete assembly in any direction.
      2) Base assembly shall have provisions for jacking the base-mounted core and coil assembly, to permit insertion of rollers between floor and base.
      3) Tuned vibration shall be provided to ensure the best mitigation of noise transfer by mutual resonance.
   d. Core Design and Assembly:
      1) Provide a steel type core using high-grade, cold-rolled, heat-treated, grain-oriented, high efficiency, high electrical resistance, high magnetic permeability, low sulphur and carbon content, non-aging, electrical grade silicon steel alloy to produce transformers with low no-load and load losses.
      2) Joints in winding or at terminals shall be brazed or clamped.
      3) Core-bolt insulation shall be high temperature resistant, stepped mitered lap core construction and the entire assembly braced or bolted adequately to prevent displacement and distortion under all normal conditions of handling and operation under normal, overload and short-circuit conditions.
      4) Design adequate core supports so that the transformer can withstand the highly fluctuating load currents and the high occurrence of short circuits on the rail system without overheating, decrease in life expectancy, and injury.
      5) Design clamps, and braces to strengthen the core to withstand mechanical and thermal stresses without damage.
      6) Provide locking provisions for units at all inside bolted members or connections.
      7) The serial number for each unit shall be stamped on the core in an easily accessible and conspicuous place.
   e. Core and Windings:
      1) Core and coils shall be rigidly braced to withstand the mechanical forces under...
short-circuit conditions and resist normal vibration and shock forces during shipment.

2) Core laminations shall be of non-aging cold rolled, high magnetic permeability, and of a suitable Grade of silicon steel to provide a transformer as specified herein and in the Referenced Standards, including but not limited to all structural and efficiency requirements. Select appropriate thickness of laminating to restrain eddy current losses in the transformer core, but to maintain adequate mechanical strength of the core. Select only flat laminations with no waviness to minimize stresses when the sheets are pressed flat in a core.

3) Core legs shall be firmly clamped by glass fiber bands, structural steel members and insulated bolts. The outside surfaces of the core shall be protected by an evenly applied coating of resin base paint.

4) Core clamps and structural members shall be grounded by a bolted copper strap.

5) The high-voltage AC and low-voltage output winding coil assembly shall permit adequate circulation of air in the core-to-coil and coil-to-coil insulation system.

6) Eyebolts shall be furnished for lifting the entire assembly by hoist or crane.

8. Winding Insulation Systems:
   a. Coil insulation systems shall be appropriate for the traction rating class and limiting temperatures specified herein and in the Referenced Standards.
   b. Insulation systems shall be nonhygroscopic, have high thermal stability and mechanical strength suitable for the daily loading cycles imposed by traction service duty, and mechanical forces due to vibration and short-circuit current.
   c. Dry-type insulation system shall be minimum Class F, 155C construction.

9. Windings:
   a. Windings shall be Vacuum Pressure Impregnated (VPI) or Cast-coil Construction.
   b. Each coil shall be oven dried at atmospheric pressure through which hot air is continuously circulated to remove any moisture.
   c. After the coil is preheated and dried, the bottom coil ends shall be sealed with a cast-in-place epoxy end ring formulated to match the material characteristic of the coil.
   d. Each coil shall be VPI with a flexible silicon varnish under vacuum of 3 to 5 mm mercury minimum for at least 3 hours, then pressurized at 4 or more atmospheres of pressure for 3 hours to allow trapped air bubbles to be purged.
   e. Immediately following each VPI cycle, the coil shall be oven baked and cured following an established temperature vs. time baking cycle in a hot air circulating oven.
      1) VPI process and baking cycle shall be completed 4 times for each coil.
      2) Adequate drying time shall be allotted to allow curing of the insulating liquid.
      3) Upon completion of the 4-step VPI process, the second cast-in-place coil end ring shall be made to seal the top coil end.
      4) Each coil shall receive a final seal using a modified 220 C epoxy cladding.
   f. The entire transformer assembly shall be dipped in a cladding mixture of high temperature varnish, resin and silica baked to
impert the final seal against the environment.

1) All resins shall be oven cured under controlled temperature and air circulation.

2) The silicone resin insulation system shall seal the winding coils against moisture, be chemical resistant, and eliminate voids, which could create hot spots or cause corona formation.

10. Electrostatic Shield:
   a. Provide a shield between the primary and secondary windings to attenuate transient common mode primary over voltages.
   b. Connection between the shield and its terminal shall be short and direct and of heavy gauge to minimize its impedance at high frequencies.

11. Winding Taps:
   a. Provide a no-load tap changer on the high-voltage winding with two 2½ percent taps above rated voltage and two 2½ percent taps below rated voltage.
   b. Taps shall be changed by removable links on a tap board with taps and connections identified.
   c. To prevent access to the tap board when the transformer is energized provide tap board accessible through a door key interlocked with transformer feeder breaker.
   d. Provide a tap board that is segregated from the winding so that winding cannot be touched when changing taps.
   e. Taps shall be rigidly supported by brazing to the coils. Tap connections shall be clearly identified and tap positions changed by the movement of bolted links between connection points.
   f. With the approval of the Authority, and where the design of thyristor rectifier controls can compensate for sustained utility voltage regulation (within plus or minus 10 percent), transformer-winding taps will not be a requirement.

12. Busses and Bus Connections:
   a. Busses shall be 98 percent conductivity electrical grade copper.
   b. Provide busses braced to withstand the maximum theoretical short circuit forces.
   c. Bus connections shall be silver-plated.

13. Winding Terminations:
   a. AC windings line termination arrangement shall be in accordance with the Contractor's standard design practice subject to approval by the Authority.
   b. Terminals shall be adequately braced to withstand the mechanical forces and thermal stresses produced by a bolted short circuit.
   c. Output winding leads shall be brought out to a flanged throat, for connection to bus duct by means of flexible bolted links.
   d. Means and materials used for interconnecting the output winding leads to the rectifier terminals shall be subject to approval by the Authority prior to implementation by Contractor.

14. Accessories. Transformers shall be furnished with accessories as follows:
   a. Device 49:
      1) Provide hot-spot temperature indication, with maximum reading indication and with the thermocouple incorporated in each winding coil at the point of highest expected temperature rise.
      2) Device shall be factory-set with first-stage operation to initiate remote supervisory and local annunciation.
      3) Second stage shall operate the substation lockout relay, device No. 86 and initiate
C. Power Rectifier:

1. Contractor shall design, furnish and install voltage-controlled thyristor type traction substation rectifiers with automatic voltage regulation.

2. General:

   a. Thyristor rectifier manufacturer shall provide a proven and tested design for use as a traction substation rectifier, and shall have a minimum of 5 consecutive years of operational use in a transit system.

   b. Thyristor rectifier shall be equipped at a minimum, with all auxiliary equipment as specified herein and in the Referenced Standards.

   c. Thyristor rectifier shall be designed to take advantage of the full voltage and current control capabilities of the units.

   d. Thyristor units shall be metal-enclosed and freestanding with hinged lockable access doors. Provide with windows of translucent material to allow visual inspection of the diode and thyristor fuse indicators and other equipment.

   e. Surge protective devices shall be employed to limit reverse voltages across the thyristor to a value within the peak-reverse-voltage rating of the thyristor during voltage transients originating in either the AC or DC power circuits.

   f. Thyristor rectifier shall be of proven and tested design as a traction substation rectifier, such as manufactured by Powell Power Electronics Co. model VGF-2500, or Asia Brown Boveri model 3AUB470052-UFBA, or an Authority approved equal.

   g. Thyristor rectifier controller shall have the capability of manually viewing and changing all parameters from an integral touch-pad and 12-line LED display, along with the capability of manually viewing and changing all parameters using the Contractor supplied laptop computers.

3. Enclosure:

   a. Description:

      1) Thyristor rectifier enclosure shall be a NEMA-1, indoor type, ventilated, metal structure with hinged doors, high-resistance grounded, forced-air or natural convection ventilated structure.

      2) Power rectifier shall be mounted on a rigid self-supporting structural steel or formed metal framework with all principal members bonded together and containing louvered expanded metal or mesh opening for ventilation.

      3) As required by the final design, provide ventilation or other openings in the top of the enclosure to allow the heated air to be mechanically discharged outside the Substation enclosure.

   b. Materials:

      1) Choose materials to preclude the possibility of corrosion or galvanic action interfering with the proper operation or appearance during the life of the equipment.

      2) Provide similar and completely compatible materials to be used for thyristor cases, studs and heat sinks.
c. Openings: Provide openings and mounting holes for front-mounted indicating and control devices that are neatly cut out, drilled or punched without marring or distorting the finished surfaces.

d. Accessibility:
   1) Provide convenient access for all normal maintenance and inspection activities.
   2) Equip each door with a mechanical latch and doorstop to hold the door in the open position.

e. Thyristor Visibility:
   1) Locate thyristors and fuses adjacent to windows in the enclosure or internal lighting to allow visual inspection of all fuses and diodes without opening the enclosure doors.
   2) Source of power for light fixture shall be 125 VAC from the Station Service.

4. Voltage Regulation:

   a. Output voltage characteristics of the thyristor rectifier shall maintain a constant voltage of 845 VDC from no-load to 115 percent full load with a linear decrease of the voltage from 115 percent to 300 percent. Current limiting after 300 percent shall be employed.

   b. Thyristor rectifier shall be equipped with a digital control system and the DC output voltage regulation shall be by means of a phase angle control system with the following features:

      1) In the remote operating mode, the DC voltage regulation curve shall be adjustable by an increase/decrease command from the remote control center.

      2) Control system shall include 2 controllers implemented in the digital control system.

   a) One for the DC output voltage using a feedback signal obtained through an isolating voltage sensing device.

   b) One for the DC output current using a current feedback signal obtained through an isolating current sensor.

   3) A selector switch shall be provided on the thyristor rectifier to enable control mode selection (local/remote).

   4) Digital control system shall insure a continuous, smooth and efficient regulation of the DC output voltage.

   c. Voltage regulation curve resulting from the automatic phase controller shall be within the following bandwidth (deviation in regulation is given in percent of rated values):

      1) Steady state deviation in regulation during normal operating conditions from zero percent to 115 percent load shall not deviate more than plus or minus 0.4 percent at no load.

      2) Dynamic deviation in regulation during normal operating conditions of more than plus or minus 0.4 percent shall be corrected within 1 second (regulating time).

      3) Increasing DC voltage is obtained by decreasing the phase angle delay. No further increase in the phase angle will be permitted when the minimum limit is attained. Minimum phase angle delay (firing angle) shall be 0 to 15 degrees and shall be user selectable from the thyristor control system. This parameter shall be password protected. Minimum firing angle shall be set at the factory to limit the output voltage to a
maximum of 895vdc under all operating conditions.

d. Increasing DC voltage is obtained by decreasing the phase angle delay. No further increase in the phase angle will be permitted when the minimum limit is attained.

e. Output DC voltage regulation curve shall be adjustable by means of programmable software parameters in the digital control system.

5. Control Section:

a. Thyristor shall contain all the necessary equipment for:
   1) Trigger pulse amplification and distribution.
   2) Current measuring.
   3) Voltage measuring.
   4) Ventilation monitoring.
   5) Energy Management Control and Indication (as required).
   6) SCADA indication.

b. Control cubicle shall contain all necessary equipment for:
   1) Sequential control (ON, OFF, TRIP sequences).
   2) Voltage and current regulation.
   3) Protection.
   4) Operation and indication.
   5) Voltage and current monitoring.
   6) Internal power supply.

c. Thyristor control panel shall include alarms, visual indicators, metering, and digital counters for the following functions or operations.
   1) Digital meters (4-digit) shall be provided for:
      a) DC output voltage set point.
   2) Analog meters with digital display shall be provided for:
      a) DC output voltage.
      b) DC output current.
      c) DC negative current.
      d) DC drainage current.
      e) DC negative rail voltage.
   3) Indicator lights shall be provided for:
      a) AC breaker status: green-open, red-closed.
      b) Rectifier ready: yellow.
      c) Computer fault: red.
      d) 6-pulse mode: red.
      e) 12-pulse mode: yellow.
      f) Local Mode: blue.
      g) Remote Mode: white.
      h) TCR modes
         (1) Constant current mode: white
         (2) Constant voltage mode: white
         (3) Diode mode: white

6. Other TRU Features. TRU shall also include the following:

a. TRU shall be provided with surge protection against incoming AC transients.

b. Busses and Bus Connections:
   1) Rectifier busses shall be made of rigid, 98 percent
conductivity electrical grade copper with silver-plated contact surfaces.

2) Busses shall be suitably braced between each other and to the enclosure with high-strength, non-tracking insulators.

3) Busses shall be designed to safely withstand the theoretical maximum short-circuit current without damage to the bus or the enclosure.

4) Rectifier output bus bars shall be suitably designed to carry currents under worst case loading.

7. Power Module Design. Thyristor rectifier power section shall perform and be equipped with the following features and capabilities:

   a. Designed to maintain current balance between parallel-connected thyristors in each phase within plus and minus 10 percent of their proportionate share under all specified load conditions.

   b. Output voltage ripple shall not exceed 5.0 percent RMS at rated load. For this purpose, filtering equipment may be required.

   c. Rectifiers shall use multiple thyristors in parallel in each leg such that failure of any one thyristor shall not take the rectifier out of service. If a second thyristor fuse blows and the TRU cannot meet the load requirements, the transformer rectifier AC breaker and DC main breaker shall trip, providing local and remote indication.

   d. Anyfaulted thyristor shall be electrically removed from the circuit by means of a fast acting current limiting fuse.

   e. Blown fuses shall have clear and easily visible indicators to outside the enclosure.

   f. Replacement of faulted thyristors and blown fuses shall be made possible without the removal of adjoining healthy thyristors.

   g. Each thyristor or group of thyristors shall be provided with a surge protective device to limit the peak inverse voltage to within its value as appropriate to the present application.

   h. Thyristor gating shall be by means of isolating pulse transformers with 120 electrical degrees "picket fence" signals.

   i. Thyristor and associated circuitry including fuses, snubber circuits, gating circuits, fans, etc. shall be arranged with interchangeable modules for each full-wave bridge.

   j. Each thyristor module shall have its own forced air-cooling fan.

   k. Variable speed fan motor controlled from a variable frequency drive shall be used.

   l. Secondary current transformers on each AC lead to the thyristor modules shall be used for current feedback and metering.

   m. In the event of a component failure in one of the thyristor bridges or fan blower, the digital control system shall be programmed to allow the thyristor to operate as a 6-pulse rectifier (half power), for a preset time delayed period (1 day to 7 days), programmable from the control system.

   n. In the event of a system trip due to a transient condition such as an AC under-voltage or DC overcurrent momentary fault, the thyristor control system shall attempt to restart the rectifier unit 3 times before defaulting to an alarmed tripped condition.

8. Protective Relays and Instrumentation:

   a. The following protective relays and devices shall be provided with each rectifier assembly. Rectifier protective relay and device contacts shall be wired to terminal blocks located in the control compartment.

   b. Device No. 26 (R1 and R2) 2-stage factory-set rectifier over-temperature detector:
1) First stage shall detect an abnormal rise in actual or calculated heat sink temperature and initiate local and remote supervisory annunciations.

2) Second stage shall operate the unit lockout trip relay, device No. 86 and 186. This function may be performed by the rectifier control processor.

c. Device No. 98 (Thyristor Failure):

1) First thyristor failure shall initiate local and remote supervisory annunciations.

2) Loss of a second thyristor shall operate the unit lockout trip relay, device No. 86 and 186.

d. Device No. 33 (Door interlock):

1) Located at the top and bottom of the rectifier enclosure doors.

2) Contacts shall operate the lockout relay, device No. 86 and 186 on opening of the door and shall prevent closing of the rectifier transformer AC circuit breaker and rectifier main DC circuit breaker when any of the rectifier enclosure doors are open.

3) Operation of device No. 33 shall also initiate remote supervisory annunciation.

e. Device No. 64R/64MR (Enclosure Ground Relaying):

1) DC Switchgear, rectifier cubicle, and negative enclosure shall be isolated from the AC Switchgear transformer, substation enclosure walls and floor, all other grounded items.

2) DC enclosure shall be connected to station DC ground grid through a high resistance ground relay. Ground relay system shall be furnished with contacts to initiate alarm and tripping of the station lockout relay(s) when the enclosure is energized or grounded.

3) Ground relay system shall be provided with a contact to initiate annunciation upon the occurrence of any of the following:

   a) Enclosure in contact with the positive of the DC system.

   b) Enclosure in contact with ground.

   c) Enclosure in contact with the negative of the DC system.

   d) Enclosure in contact with the 125VDC, 120 VAC or 24 VDC power supplies.

   e) Malfunction of the ground relay.

   f) Loss of potential between the DC equipment enclosures and station ground.

9. Rectifier Accessories. Spare Parts (Optional):

a. At least 1 full set of power module circuit boards, electronic assemblies, 6 main thyristor, 6 main fuses, and any other manufacturer recommended spare parts shall be furnished with the first shipment.

b. Special maintenance test accessories including 2 new portable, hand held, dual trace, digital oscilloscopes, Fluke or Authority approved equal, shall be furnished with the delivery of the first substation to perform diagnostics and troubleshooting.

2.4 DC SWITCHGEAR

A. Work specified in this section describes the furnishing and integration of a metal-enclosed DC power switchgear assembly and associated accessories for each TPSS.
B. General:

1. Select a switchgear manufacturer and supplier of DC circuit breakers of proven quality and design, and who have demonstrated a successful record of providing similar type and rating of equipment for at least 5 similar transit projects.

2. Tests shall be performed on each complete DC switchgear assembly and components in accordance with the requirements given herein and in Referenced Standards.

3. Contractor shall provide, install and test the DC switchgear as an integral part of the TPSS. All components and equipment shall be integrated into the TPSS as specified and shall be so assembled as to form a complete and operational system. Provide:

   a. DC Main Circuit Breaker.
   b. DC Feeder Circuit Breakers.
   c. DC Main Bus (Positive Bus).
   d. DC Negative Bus.
   e. Surge (Lightning) Arrestors.
   f. Associated meters, instruments and relaying.

4. Switchgear assembly shall form a lineup of dead-front, metal-enclosed, freestanding enclosures suitable for indoor service.

5. Each switchgear assembly shall include draw out, single pole, DC circuit breakers, DC positive busses and bus connections, positive feeder cables terminal connectors, indicating lights, terminal blocks, protective and auxiliary relays, control circuitry, wiring, local/remote control switch, and all other devices necessary to make a complete and operable assembly.

6. Switchgear insulation level shall be coordinated with the maximum crest voltage to ground that can be produced by the rectifier circuit and shall withstand peak voltage surges of 1,200 V during train regenerative braking.

7. Unless otherwise indicated in these specifications, each DC switchgear assembly for each Substation shall be comprised of the 1 main DC circuit breaker (cathode breaker) and 4 feeder breakers.

8. Submittal Requirements. Submit the following as part of the submittals specified in this section and elsewhere in the Contract Documents:

   a. General arrangement and detail drawings for each DC Switchgear assembly.
   b. Manufacturer's shop drawings, product literature and bill of materials for all installed components.
   c. One-line diagrams, elementary schematics, equipment wiring, interconnection and connection diagrams.
   d. Floor and panel layout drawings including equipment layouts, arrangements, elevations and section detail drawings.
   e. Placement drawings for all relays, instruments and protective devices.
   f. Protection devices, coordination curves, and relay setting data.
   g. Operation, maintenance and instruction manuals.
   h. Spare parts list.
   i. Design test reports or certified copies of test reports to the latest standards, for identical units performed for each type and rating of switchgear and circuit breakers as assembled in its complete switchgear unit, furnished under this contract.
   j. Production test reports, Conformance testing reports and Acceptance testing reports.
   k. Installation and bracing drawings, including plan, profile and sections views.
   l. Certify that the DC Switchgear complies with the design criteria and conforms to all specified standards.
   m. Short-circuit calculations and system coordination study for system protection and selective overcurrent tripping in accordance with the Referenced Standards for
fault calculations and coordinated system protection.

n. Complete bill of materials and cut sheets for all selected components and devices.

C. Switchgear Enclosure:

1. DC switchgear assembly shall be metal-enclosed, dead front, freestanding, indoor, with draw-out power circuit breakers.

2. All serviceable components such as relays, instruments and other devices shall be accessible from the front of the switchgear lineup.

   a. If these limitations cannot be satisfied with all the equipment required for each circuit breaker housed in 1 cubicle, a separate control panel shall be provided to house the remaining components, relays, and devices.

   b. Not more than 1 circuit breaker shall be assigned to a control panel.

D. Switchgear Ratings. Switchgear assemblies shall have the following ratings and requirements:

1. Rated Nominal Voltage, volts, DC: 845

2. Maximum Rated Voltage; DC: 1,200

3. Rated current, amperes, DC Main: 6,000 amps

4. Rated current, amperes, DC Feeder: 3,000 amps

5. Power Frequency: Withstand Insulation Level 4.6 KV

6. Rated Short-time Current: amperes 72,000

7. Rated Short-circuit Rating: amperes 158,000

E. Doors and Panels:

1. Each circuit breaker compartment shall be furnished with a formed hinged door on the front of the structure to cover the compartment opening.

   a. Door shall be provided with a handle and lockable latch. Hinges shall be heavy-duty type. Doors shall be provided with stops and latches to hold them securely in the open position.

   b. Not more than 1 circuit breaker shall be assigned to a control panel.

F. DC Power Circuit Breakers:

1. Switchgear shall be equipped with individually enclosed, high-speed power circuit breakers rated for use with the TRU. Main switching and interrupting device shall be of the removable type, arranged for moving physically between the connected, test, and disconnected positions. Power circuit breakers for the DC power switchgear shall be manufactured in accordance with the requirements in the Referenced Standards.

2. Type:

   a. Low-voltage power circuit breakers shall be DC, air-break, single-pole, and single-throw, high-speed.

   b. Provide draw-out type circuit breakers with electrically controlled closing and electrically controlled tripping, mechanically and electrically trip-free, suitable for local and remote supervisory control, provided with trip devices as specified herein and on the Contract Drawings.

   c. For the purposes of this Specification, a single-pole breaker constitutes a switching device with a single current path and a single arcing path during current interruption.

   d. DC circuit breakers shall be equipped with a mechanical device on the front of the breaker, (available with door closed), to
manually, without electrical power, trip the circuit breaker.

e. Provide indication on the front of each circuit breaker, visible with door closed, to mechanical show the position of the circuit breaker (open or closed).

f. Circuit breakers shall be operable in the disconnected, test and connected positions. There shall be indications to the control and indication circuits to indicate the position of each breaker. Indications for the connected position, test position, and disconnected position (breaker in the cell). When the breaker is in the test or disconnected position, Operations Control Center (OCC) shall display a “breaker open” signal regardless what state the breaker is in. If no breaker is in the cell, the OCC shall display a “no breaker” indication.

g. Circuit breaker element must roll in and out of the cubicle without the use of ramps or lifts.

h. Circuit interruption arc chutes shall be suitable for bi-directional current flow and designed for positive interruption of all currents within the circuit breaker ratings. The arc chute may be furnished with air puffer device, if required to positively extinguish low current arcs within the arc chute.

i. Provide with each Substation a portable lifting device to remove and replace the circuit breaker arc chutes. Lifting equipment may be rail mounted on the front of the DC Switchgear.

3. Circuit Breaker Ratings:

a. DC power circuit breakers shall be tested and certified to the requirements of the Referenced Standards and shall be designed for use on transit rail systems.

b. DC circuit breakers shall have certification to the preferred ratings as specified in the Referenced Standards according to maximum rated voltage, and to the following:

1) Rated Continuous Current, rms, amperes:

2) Main CB 6,000, Feeder CB 3,000

3) Maximum Rated Voltage, volts, DC: 1000 or 1200

4) Power Freq. Withstand Insul. Level, kV, rms 4.6

c. Each circuit breaker compartment shall be closed at the top to prevent objects from the top being dropped on live parts.

d. Materials shall be of a type that is noncombustible, nonhygroscopic and tracking resistant.

e. Mechanical strength and physical characteristics of the insulation structure shall match the stresses imposed by circuit breaker rated momentary current.

4. Circuit Breaker Compartments:

a. A separate metal-enclosed compartment shall be provided to house each draw out circuit breaker. Guide rails for positioning the removable element shall be provided as an integral part of the compartment.

b. Removable assembly (rack) shall be provided with 3 positions:

1) Connected.

2) Test.

3) Disconnected.

c. Provide a fully interlocked, manually operated racking mechanism for placing the circuit breaker in the “Test” and “Connected” positions. A clearly visible position indicator and indicating light shall be provided to display the connected position. Racking handle (if required) shall be clearly and permanently labeled “DC Breaker Racking Handle”.

d. Means shall be provided for positively holding the circuit breaker in place in the housing when the removable element is in the “Connected” or “Test” position.

e. Interlocks shall be provided so that when a breaker is in the
“Connected” position the circuit breaker cannot be closed when the door is open and the compartment door cannot be opened when the circuit breaker is closed.

f. Circuit breaker primary disconnecting contacts shall be comprised of heavy-duty, self-aligning, spring-loaded, silver-plated, copper disconnect fingers that engage with the line and load-side stationary disconnecting contacts.

g. Each compartment shall be suitably shrouded or provided with automatic safety shutters to prevent accidental contact with live parts.

h. Circuit breaker control wiring connections between the removable element and stationary compartment shall have provisions for maintaining, or automatically reinstating, circuit continuity when the removable element is moved between the “Connected” and “Test” positions within the compartment.

i. Recessed stationary receptacle and set of self-aligning multiple contact plugs on the removable element shall be provided for simultaneous disconnection of control wiring connections when the removable element is moved between connect, test and disconnected position.

j. After racking out the DC breakers to the test position or the disconnect position, then pulling out the control cable from the DC breaker control receptacle, a transfer trip shall not occur and OCC should get an empty rectangle symbol for indication.

k. Circuit breaker compartments shall only permit the interchange of circuit breaker removable elements of the same type and rating.

5. Circuit Breaker Positions:

a. Provisions shall be made for moving each circuit breaker to the “Connected”, “Test” and “Disconnected” position. In the “Connected” position, both the primary disconnecting devices and the secondary disconnecting devices shall be in full contact and the breaker shall be in position for normal operation.

b. In the “Test” position, the primary disconnecting device shall be open and separated by a safe distance, and the secondary disconnecting devices shall be in full contact.

c. In the “Disconnected” position, both the primary and secondary devices shall be open and separated by a safe distance.

d. Mechanical interlocks shall be provided to prevent moving the circuit breaker in or out of the “Connected” position when the circuit breaker is in the closed position. An indicator shall be provided to show the circuit breaker in the “Connected”, “Test” or “Disconnected” position. The circuit breaker shall be prevented from closing electrically, unless the circuit is in the “Connected” position with the primary disconnecting devices in full contact, and the compartment door fully closed and latched, or in the “Test” position.

e. Each AC and DC Circuit Breaker shall be provided with one “a” and “b” contact and shall interface with the DPM for status indication.

6. Operating Mechanism:

a. Circuit breaker operating mechanism shall be magnetic, solenoid or motor-charged, stored-energy, spring-operated type. The mechanism shall be mechanically trip-free.

b. Operating mechanism shall be furnished with mechanical indicators to show the open and closed positions of the main moving contacts.

c. The main DC circuit breaker closing mechanism shall be furnished with a unique key interlock coordinated with the associated rectifier negative disconnect switch.

1) Interlock system shall prevent closing of the circuit breaker unless the disconnect switch is closed and shall prevent the opening of the disconnect
switch unless the circuit breaker is open.

d. A minimum of 8 spare, electrically separate sets of reversible auxiliary switch contacts shall be provided in addition to those required for the circuit breaker control and annunciation circuits, for use as “a” and “b” contacts. All auxiliary switch contacts shall be operated by the breaker mechanism in both the “Connected” and “Test” positions. All auxiliary contacts, both used and spare, shall be wired to terminal blocks on the structure through secondary disconnecting device contacts.

e. A 4-digit, nonresettable register-type operations counter shall be provided on each circuit breaker to record tripping operations.

7. Breaker Position Indications:

a. Open or closed positions for the breakers shall be indicated by green and red indicating LEDs mounted on the front panel and by mechanical flag indicators. The LEDs shall provide a visible indication of the circuit breakers status when the circuit breaker compartment door is closed.

b. The red indicating light shall be connected to supervise the continuity of the trip circuit. Connections to the terminal blocks shall be provided for parallel remote indication.

c. The mechanical flag indicators shall be visible from outside the compartment with the compartment door closed.

A white LED indicating light shall be provided to indicate that the stored-energy closing mechanism is charged.

8. Circuit Breaker Control:

a. Circuit breakers shall be designed for both Local and remote supervisory electrical operation.

1) When the circuit breaker is in the local position, the breaker shall operate via dry contacts placed in the DC control “trip” scheme such that failure of any control or system components shall not defeat the tripping function.

2) When the circuit breaker is in the Remote mode, the unit shall operate via the SCADA system.

3) Closing mechanism shall be suitable for operation over a voltage range of 90 to 140 VDC.

4) Triping mechanism shall be suitable for operation over a voltage range of 70 to 140 VDC.

5) Supervisory control interposing relays shall be installed and wired to a terminal block for interconnection to the SCADA RTU.

b. Each circuit breaker unit shall be provided with a “Local-Remote” control selector switch arranged for operation as follows:

1) Local Position: Permit local close and open operation of the circuit breaker by its associated electrical control switch, when the removable element is in the “Connected” or “Test” positions.

2) Remote Position: Permit open and close operation of the circuit breaker from the SCADA equipment when the removable element is in the “Connected” position.

c. A white LED indicating light with nameplate indicator shall be provided which illuminates when the Local-Remote control switch selector switch is in the Local position.

d. A blue LED indicating light with nameplate indicator shall be provided which illuminates when the Local-Remote control switch selector switch is in the Remote position.
e. When the DC Breaker is completely removed from the cell, the OCC should get an empty rectangle symbol to indicate “no breaker”.

f. When 125VDC control power is disconnected from the DC breaker and the breaker is in the “Test” or “Disconnected” positions, a transfer trip shall not be initiated and OCC should receive an empty rectangle symbol.

g. DC breaker control cell door latching mechanism and limit switches shall be mechanically strong and not be susceptible to bending or warping.

9. Supervisory Control Requirements:

a. Each switchgear assembly shall be provided with the following circuits to interface with the SCADA system.

b. Each circuit breaker compartment shall be equipped with 24 VDC interposing relays for SCADA control: (94C, 94T)

   1) One relay for closing the circuit breaker (94C).

   2) One relay for tripping the circuit breaker (94T).

c. Provide interposing relays with 20 percent spare contacts for:

   1) Control Circuits:

      a) DC Circuit Breaker: CLOSE.

      b) DC Circuit Breaker: TRIP.

   2) Status Indication Circuits:

      a) DC Circuit breaker: CLOSE (Circuit breaker closed and in the connected position).

      b) DC Circuit breaker: TRIPPED (Circuit breaker open or in the test or disconnected position).

   3) DC Circuit Breaker Local/Remote:

      a) Local: (Circuit breaker local/remote switch in the local position).

      b) Remote: (Circuit breaker local/remote switch in the remote position).

      c) DC Circuit Breaker in disconnected position.

10. Instruments:

a. DC power switchgear assemblies shall be furnished with DC voltmeters, ammeters, and accessories, as indicated on the Contract Drawings and as specified herein: All meters shall have an integral digital display along with the analog display.

b. Provide ammeters scaled to have an overload capacity for repeated over currents of up to 300 percent of scale range.

c. Ammeter shunts shall comply with the Referenced Standards and have a rated output of 50 mV.

d. Voltmeters shall be scaled as required with 0 to 1000 VDC with signal input from a 1000 VAC insulated voltage transducer.

e. Shunt/Isolation/Amplifier (Voltage Transducer):

   1) Shunt/Isolating transducers shall be provided for all 750/845-VDC relays and instruments. However, if the sensitivity of the protection relays will be jeopardized, use of DC shunts will be accepted as an alternate.

   2) Control wiring associated with the shunts shall be housed in a separate nonmetallic trough. Wire terminating to the devices shall be covered with insulating boots.
3) Shunt/isolating transducer shall be a linear amplifier designed to amplify DC shunt millivolt signals.

4) Provide complete isolation of the input signal. A magnetic amplifier shall be used in the input circuit to isolate the inputs from all other circuits and grounds.

5) Input shall be tested at 4000 Volts DC for 1 minute to insure that no breakdown will occur when connected to shunts operating at high voltage.

6) Output shall be a hybrid amplifier operating in the transconductance mode to provide a constant current output. Load resistance variations from 0 to 10K ohms shall have less than 0.1 percent effect on the output current to make the amplifier an ideal device for telemetering, scaling and recording applications.

7) Output should be filtered.
   f. A variable resistor with adjustments from zero to maximum gain shall be provided and be accessible through the top cover. Large gain changes should be accomplished by changing the auxiliary gain resistor.

1) Power Requirements: 125 VDC within plus or minus 10 percent 10 VA (Max)

2) Input Impedance: 5000 ohms/Volt

3) Load Impedance: Any load between 0 to 10K ohms

4) Accuracy: Within plus or minus 0.5 percent RO at 77 degrees F

5) Temperature Range: 14 degrees F to 158 degrees F

6) Temperature Coefficient: Within plus or minus 0.04 percent °C

g. Transducers shall be compatible with the rating of the DC switchgear.

h. Control devices, instruments, and circuits, whether mounted on the compartment door or other portion of the stationary unit structure, must be physically accessible and so connected as to permit safe testing and maintenance of relays and control circuitry.

i. Shunt/Isolation/Amplifier shall be SMC type or an Authority approved equal.

G. DC Bus:

1. Negative Disconnect Switch:
   a. A negative disconnect switch shall be included within a separate metal-enclosed compartment for each rectifier unit.

   b. Disconnect switch shall be single-pole, single-throw, bolted pressure contact, stationary type, rated at 2,000 VDC, with continuous and momentary current ratings to match the associated rectifier Main DC circuit breaker ratings.

   c. Disconnect switch shall be furnished with an insulated operating handle and shall be key-interlocked with the rectifier-main DC circuit breaker.

   d. Interlocking shall prevent opening or closing of the switch unless the main DC circuit breaker is open, and similarly, prevent the main DC circuit breaker from closing unless the disconnect switch is closed.

2. Negative Rail Grounding Unit (NRGU): (Device No 57NR):
   a. NRGU shall consist of a bi-directional solid state switch with potential and current sensors, associated relaying and control circuitry in parallel with a manual reset, lockout, electromagnetic, spring-loaded mechanical shorting contactor.

   b. The purpose of this solid state switch unit is to ground the negative system should the voltage between the system negative and ground
exceed a safe value, settable between 50 V and 100 Volts in steps of 10 volts.

c. The shorting contactor shall be rated to sustain 750 Amps continuously, with a peak capability of 15,000A for 0.3 seconds, the shorting contactor closes and locks-out if the resulting current flow exceeds a set level (approximately 700 amperes).

d. Annunciation shall be provided both locally within the rectifier unit, at the Annunciator Panel and remotely through SCADA.

e. The unit shall be mounted inside the rectifier unit.

f. NRGU shall be isolated from the incoming negative return cables and negative bus. When manually resetting the NRGU, personnel cannot contact the negative bus and switch.

g. NRGU shall send the following 4 signals to the thyristor-rectifier controller for permanent recording and storage with date and time stamp:

1) Negative rail to ground overvoltage.

2) Ground to negative rail overvoltage.

3) Over-Current lockout forward.

4) Over-Current lockout reverse.

h. Enclosures:

1) Negative drainage equipment shall be contained in the rectifier enclosure.

2) Hinged doors shall be provided for access to the negative equipment.

i. Disconnect Switches:

1) Negative drainage disconnect switches shall be manually operated, single-pole, single-throw, bolted pressure type, solid copper blades with silver-plated contacts, rated at 2000 VDC, 100 Amps.

2) Switches shall be equipped with insulated operating handles.

3) A minimum of 3 switches shall be provided.
j. Shunts: DC instrument shunts shall comply with the requirements of the Referenced Standards.

k. Cable Terminations:

1) Negative drainage panel enclosure shall provide adequate space for spreading and termination of the drainage cables as required by the final design.

2) Cable entry cover plates shall be bolted to permit field drilling of holes for conduit.

3) Cover plates shall be 18 inches minimum distance from the cable termination bus.

4. Surge Arrestors. Surge arrestors shall be provided for protecting the negative bus as follows:

a. Provide 1 surge arrester for each feeder section, and 2 surge arresters for the negative bus. Surge arresters shall be of the metal oxide varistor type.

b. Each surge arrester shall have an energy discharge capability of 2.6 kJ/kV for currents of 500A or less.

c. Provide Type MCOV, 1280 V, Model No. 6007-006 as manufactured by SMC, or an Authority approved equal.

d. Each surge arrester shall be individually connected to the station ground mat.

e. Each grounding connection shall have a grounding resistance of 5 ohms or less or as specified by the surge arrester manufacturer for the type of unit supplied.

f. Provide rear compartment-mounted, indoors style, away from rectifier components.

g. Arrestors shall be suitable for connection to a 845 VDC power supply for protection of the rectifier against lightning surges.

h. Arrestors shall have a maximum continuous operating voltage of 1280 V. Maximum peak spark over

and residual voltage values shall be coordinated with the dielectric withstand voltage characteristics of the rectifier insulation structure, as well as the maximum arcing voltage produced by the DC Circuit Breakers during interruption.

i. Cable connection between the surge arrester and the rectifier b-negative bus shall be kept as short as possible and sufficient clearance from any metallic parts shall be maintained. Cable connection to the surge arrester shall be taped to 4 times rated voltage.

H. Emergency Trip System (ETS):

1. Provide an ETS to disconnect all power to and from the TPSS under emergency conditions. Provide a Control System as shown on the drawings and as described herein.

   a. Contractor shall provide 2 interior emergency trip devices and 1 exterior emergency trip device for each TPSS.

   b. Provide 1 interior device at each access door as shown on the Contract Drawings. The indoor device shall be a “mushroom” shaped large pushbutton switch, with a protective cover. Clearly, label the device “EMERGENCY TRIP” and protect from accidental trip. The ETS device or relay shall be a lockout type, requiring manual reset.

   c. Outdoor disconnect device shall be mounted in a lockable type Knox Box such as series Model No. 4400 or an Authority approved equal, Recess mount, with dual entry locks in a dark bronze color or an approved equal.

   d. ETS pushbutton inside the substation enclosure and the ETS outside at the substation entrance door, shall initiate trips to the AC high-voltage incoming primary breaker, the DC main breaker, all DC feeder breakers, and initiates transfer trip to the adjacent substations feeder breakers with “disallow reclosure”.

   e. Exterior lock system shall be keyed to the appropriate keying system for the local jurisdictional Fire
Department and the Authority maintenance. Contractor shall contact the Authority’s “Technical Services” Department for the proper form’s and procedures prior to purchasing the Knox Boxes or keying. Keys shall be furnished for each Knox switch.

2. Local Annunciator Panel Circuits: Circuits shall be provided between each DC Switchgear assembly and the local Annunciator panel for the alarm points as indicated on the Contract Drawings and as specified herein.

I. Switchgear Maintenance Accessories:

1. Each TPSS DC switchgear assembly shall be provided with the following:

2. One DC circuit breaker test cabinet, wall-mounted, complete with test jumper cable and connectors.

3. One set of circuit breaker removal accessories, including lifting and handling devices (i.e. 3 wheel) and racking crank.

4. Two sets of all sizes and ratings for any associated fuses, circuit breakers or indicating lamps.

2.5 STATION SERVICE AND SIGNAL POWER TRANSFORMERS

A. Provide Station Service and Signal Power Transformers, sized as required by the TPSS equipment requirements, as specified herein, or as required by the final design.

B. General:

1. Contractor shall provide, install and test Station Power and auxiliary power as an integral part of the TPSS. All components and equipment shall be integrated into the TPSS as specified, and shall be so assembled as to form a complete and operational system. Provide:

   a. Station Service Transformer.

   b. Signal Service Transformer.

   c. Distribution Panel Boards.

   d. Associated meters, instruments and relaying.

2. Provide ventilated dry type, self-cooled distribution transformers manufactured and tested in accordance with the Referenced Standards.

3. Insulation class: Provide 15 kV BIL of 95 kV full-wave.

4. Maximum allowable temperature rise under continuous full load shall not exceed the values in the Referenced Standards.

5. Efficiency shall be 98 percent or better.

6. Fuse:

   a. Each transformer shall be protected on the “primary” by draw-out fuses mounted on a withdrawable trunnion carriage in the HV Switchgear.

   b. Trunnion shall be mechanically interlocked (i.e. Kirk-Key) with the LV panel secondary main breaker ensuring that the load is removed prior to fuse trunnion withdrawal.

   c. Transformer compartment(s) shall be equipped with a gasketed wire glass window to allow visual inspection of the fuses. Provide blown fuse indication visible from the substation enclosure interior aisle.

   d. Alternate arrangements are subject to prior approval by the Authority.

C. Station Service Transformer:

1. Provide Substation AC Power by providing a Station Service Transformer as part of the Substation package. The transformer shall be sized as required by the connected loads but no smaller than:

   1) 50KVA.

   2) Single phase.

   3) 12.47/13.2 KV - 240/120 VAC.

   4) Within plus or minus percent primary taps above and below rated voltage in 2.5 percent steps.

2. Protection shall be in accordance with the latest edition of the NEC with metering and monitoring as indicated herein and as shown on the Contract Drawings.

3. Contractor shall verify the primary nominal voltage for each Substation site.
D. Signal Power Transformer:

1. Provide power for track signal’s functions by providing as part of the Substation package a “Signal Power Transformer”. The transformer shall be:
   1) 75 KVA.
   2) Single phase.
   3) 12.47/13.2 KV - 480VAC (primary voltage is site specific).
   4) Within plus or minus 5 percent primary taps above and below rated voltage in 2.5 percent steps.

2. Protection shall be in accordance with the latest edition of the NEC with metering and monitoring as indicated and as shown on the contract drawings.

3. Contractor shall verify the primary nominal voltage for each Substation site.

2.6 PANELBOARDS

A. Furnish and install a Station Service AC Distribution Panel, Signal AC Distribution Panel and a DC Distribution Panel in accordance with the Contract Drawings and these specifications.

B. General:

1. Panelboards shall be surface mount suitable for indoor use.
2. Panelboards bus shall be copper.
3. Provide panelboards with 100 percent rated insulated neutral bus.
4. Provide multiple lugs if final design requires parallel conductors.
5. Provisions for additional breakers shall be such that no additional connectors will be required to add breakers.
6. Circuit breakers shall be bolted securely to the panelboards bus. Push on or plug in breakers are not acceptable.
7. Where circuit breakers are intended for supplying HID or fluorescent loads, they shall be rated and labeled for use on HID loads.
8. Provide GFI breakers where required by the NEC and per the final design.
9. Panelboard lugs shall be UL listed to accept solid or stranded copper. Lugs shall be suitable for 194 degrees F rated wire, sized according to the 75-degree temperature rating per NEC.
10. Provide panelboards rated for connection to the rated voltages as specified herein and as indicated on the Contract Documents, with 22,000 amperes RMS short-circuit current available, as a minimum.
11. Panelboards shall be sized to provide adequate wire gutters and bending space so as to not exceed the fill and bending requirements in accordance with the Referenced Standards. Mount the Station Service Panelboard and the Signal Panelboard side by side in the enclosure. Provide a wire raceway beneath the Station Service Panelboard extending past the Signals Panelboard. The raceway shall be of adequate size to accommodate four 4-inch conduits and two 2-inch conduits for future extension to other TPSS site equipment.
12. Panelboard fronts shall be of the door-in-door type such that breaker handles can be accessed by opening the inner door and panel wiring can be accessed by opening the outer door.
13. Circuit directory frame and card with a transparent protective plastic covering shall be provided on the inside of the door. The directory card shall provide a writing space at least 1/4 inches high by 3 inches long for each circuit. Contractor shall provide a typed circuit directory identifying all connected loads.
14. Enclosure shall be steel, with rigidity and gauge as specified by the Referenced Standards with full finish rust-inhibiting primer and baked enamel finish, furnish ANSI 61 gray color or as specified herein and as directed by the Authority.
15. Provide engraved nameplates for each Panelboard.
16. Panelboards shall be rated NEMA Type 1.
17. Provide step-down transformers, fuses, cabling and distribution panelboards as required to make a complete power distribution system for AC and DC service to the TPSS and the Substation assemblies and sub-assemblies.
18. Each service distribution panelboard shall include a main molded case circuit breaker sized per the equipment load requirements; lugs only panelboards will not be accepted.

19. Provide all necessary molded case branch circuit breakers as required by the final design. Furnish no less than 20 percent spare circuit breakers with a minimum of 4 for each panel.

20. Separate branch circuits shall be provided for control and power circuit, size per the latest edition of the NEC.

21. Provide surge protection devices for each distribution panel.

22. Contractor shall coordinate panel design and sizing of all circuit breakers with substation equipment loading requirements.

23. As part of the submittals listed above, provide panelboard calculations, design and circuit breaker ratings to the Authority for approval.

C. Station Service Distribution Panel:

1. Distribution Panel shall be surface mounted, dead-front type, housed in a NEMA Type 1 steel enclosure with hinged front cover, lockable handle, and 2-point latch.

2. Provide a keyed interlock with the Station Service AC main breaker and the Station Service transformer.

3. Mount on 1 exterior wall a 20 Amp, fused safety disconnect switch for use by the TPSS Installation Contractor for irrigation service.

4. Provide at a minimum a 225 amp, 240/120 VAC station service distribution panel.

5. As part of the sizing requirements for this panelboard, provide, in addition to the sizing requirements for the TPSS, a 240/120-volt, 125 amp, 2-pole circuit breaker for use by the Communications Contractor.

6. Contractor shall also provide for the Communications Contractor a 2-inch conduit or raceway from the Station Service Distribution Panel to an interface point location in the TPSS. The Communications Contractor will extend the conduit to the nearest Communications manhole. Power cable and installation will be by the Communications Contractor.

D. Signal Power Distribution Panel:

1. Provide for use by the Light Rail Signals Contractor an AC distribution panel suitable for 480 VAC, single-phase, 2 wire service. Provide power from the signal step down distribution transformer.

2. The Distribution Panel shall be surface mounted, dead-front type, housed in a NEMA Type 1 steel enclosure with hinged front cover, lockable handle, and 2-point latch.

3. Furnish a complete system inclusive of key interlocks and accessories to provide a complete functioning system.

4. Provide a panelboard with a keyed interlock with the main breaker and the Signal Service transformer. This panelboard shall contain a 150 amp, 2 pole, main breaker with branch breakers and spare breakers.

5. This Contract shall also provide for the TPSS Installation Contractor a 2-inch conduit or raceway from the Signal Service Distribution Panel to an interface point location in the TPSS. TPSS Installation Contractor will extend the conduit to the nearest Signals manhole or as shown on the site drawings. Power wiring will be by the TPSS Installation Contractor.

E. DC Distribution Panel:

1. Provide 2-wire DC system panelboard of appropriate size in each Substation and protect the panelboard with a main molded-case circuit breaker.

2. Distribution Panel shall be surface mounted, dead-front type, housed in a NEMA Type 1 steel enclosure with hinged front cover, lockable handle, and 2-point latch.

3. Contractor shall calculate the required rating of the DC control power distribution panel and submit the calculations to the Authority for approval.

4. DC panel shall be supplied with 2 main incoming lug terminals for separate connection of battery and battery charger.

5. Furnish the appropriate quantity of circuit breakers with a minimum of 20 percent spare circuit breakers.
6. DC panel shall be OSHA red and connected on the line side of the DC battery disconnect switch to permit continuous operation of the DC load when the batteries are disconnected for service.

2.7 PROTECTIVE DEVICES

A. General:

1. Contractor shall design a complete protective scheme to protect the substation equipment and the overhead distribution system as well as provide back up to the LRV protective devices. Base the protective scheme on the connected load, overload, and available short circuit currents. Select the characteristics and ranges of all protective relays and fuses to ensure optimum coordination of all devices and fast fault clearance to prevent equipment damage.

2. Relay scheme shall be designed, constructed, and tested in accordance with the applicable provisions specified herein and the Referenced Standards. Design the protective scheme to be immune to noise, harmonic distortion, traveling waves, and instrument transformer saturation.

3. Protection relay functional designations and circuits shall be as indicated on the Contract Drawings, in the Referenced Standards and as specified herein. Relay contacts shall be rated for the intended duty and meet the performance characteristics indicated. Contacts and adjusting devices shall be readily visible, accessible, and adjustable from the front of the relay.

4. Arrange all protective relays to be conveniently accessible, easily visible, and logically grouped. Locate devices of related functions in proximity to each other. Install the protective relays semi flush on the circuit breaker cubicle door.

5. Interposing relays for input/output interface with other devices and the SCADA equipment shall be plug-in style with stainless steel hold-down spring clips. Mounting boards shall be provided with pressure plate terminals.

6. Relay types shall be UL approved. Contractor shall use only high quality, utility-type draw-out protective devices enclosed in rustproof, dustproof, high-impact cases with integral test switches and silver-to-silver non-bonding contacts.

7. Contractor shall provide a protective device relay coordination study, coordination curves, proposed relay settings, fuse rating and supporting calculations for all Substation sites. Initial setting shall be made at the factory; final field setting and field-testing of the protective relays will be by this Contract.

8. The minimum protective requirements are specified below, described in the individual section of these Specifications and shown on the Contract Drawings. The Contract Drawings show the minimum protective schemes and are intended to serve as an aid to the protective scheme(s) functional requirements; final design shall be by this Contract and shall be approved by the Authority.

9. Contract Drawings do not show all components such as auxiliary relays, isolating diodes, fuse(s) and similar devices required for a complete protective system. This Contract shall perform all final design including selection of device characteristics, model numbers, style, connections and settings for all auxiliary devices.

10. Contractor may, if approved by the Authority, as an option to individual relays as described in this section furnish a Multi-Purpose Relay or relays that integrate the functions of several relays. Contractor shall provide, at a minimum, the following relay and protective functions:

B. AC Switchgear:

1. Device 50/51-(50N/51N): (Overcurrent Relay):

   a. Each AC Switchgear section shall be provided with a 3-phase multifunction nondirectional overcurrent relay. Provide overcurrent and instantaneous phase and neutral protection.

   b. In addition, the relay shall have selectable time current curves to coordinate with the Substation short circuit and coordination study.

   c. Relay shall have time overcurrent and instantaneous elements for phase and ground tripping.

   d. Provide Cooper Power Systems model DM30AE or an Authority approved equal.
2. Device 86H: (Lock-Out Relay-LOR):
   a. Provide a “lock-out” relay to function as indicated herein and on the Contract Drawings.
   b. “Lock-out” relay shall be manual reset, with a mechanical target as part of the nameplate; black for reset, orange for trip, to indicate the condition of the LOR.
   c. Provide Electroswitch Series 24 LOR or an Authority approved equal.

3. Device 94C/94T: (Interposing Relay)
   a. Each AC Switchgear section shall contain SCADA interposing relays for remote “trip” (94T) and remote “close” (94C) functions by the Authority’s OCC.

   a. Provide 3-phase voltage monitoring of the incoming service feeder.
   b. Protective relay(s) shall provide protection for phase loss, phase reversal, over-voltage, and under-voltage conditions.
   c. Upon detection of an unstable service voltage condition the protective device shall “trip” the AC main circuit breaker. Provide means for, “local” and “remote” reset. The relay shall provide protection even if regenerative voltages are present.
   d. Provide ABB WVM series, 3-phase voltage monitor or an Authority approved equal.

C. Rectifier Transformer:
   1. Device 49T/49TH: (Transformer Thermal Relay):
      a. Provide transformer-winding temperature monitoring and relaying.
      b. Protective relay (monitoring device) shall be equipped with a temperature display, trip contacts, alarm contacts and shall directly control transformer fans if required by the final design.
   c. Each stage setting shall be adjustable over a range of temperatures. The device shall indicate when an over-temperature condition has occurred and how long it lasted.
   d. Provide the ability to download and print rectifier faults from rectifier computer to a laptop computer. Data collected should be date and time stamped.

D. Rectifier:
   1. Device 98: (Current Limiting Fuse): A high-speed current limiting fuse shall be provided in series with each Thyristor full wave bridge, complete with an indicator to a blown fuse. Fuses shall be clearly visible from a viewing window and sized to protect the rectifier against internal faults resulting from a thyristor losing its blocking ability. Fuse shall prevent spreading of the fault to adjacent Thyristor(s), by fast fault current interrupting. Thyristor fuses shall not open or fail during external faults or rated overload conditions.
   2. Device 26R/26RH: (Thermal Relay): Overtemperature Protective Relays, provide 2 stage relaying to monitor the heat sink temperature. Each stage setting shall be adjustable over a range of temperatures. Relay thermal sensors shall be mounted in the hottest location of the rectifier.
   2. Surge Protection: Rectifier shall be equipped with a surge protection device(s) to limit the reverse voltage across the diodes and thyristors to a value lower than the peak reverse voltage rating of the diodes and thyristors. The device shall protect the rectifier irrespective of whether the surges originate in the AC or DC power circuits.
   3. Device 33R: Provide enclosure position contacts at the top and bottom of all rectifier enclosure doors. Upon opening the enclosure doors, the contacts shall trip the AC circuit breaker and the DC main circuit breaker and shall initiate annunciation. AC and DC main breakers shall not be allowed to close unless all rectifier enclosure doors are closed.

E. Main DC Circuit Breaker:
   1. Device 32 (DC Reverse Current Instantaneous Relay):
a. A reverse current relay shall be furnished on the incoming main DC bus and shall detect reverse current on the outgoing DC positive bus from the rectifier. Relay shall trip the Main AC breaker relay on reverse current and shall be adjustable between 5 percent and 100 percent of the combined feeder circuit breakers continuous current ratings. The relay shall be equipped with an unidirectional direct-acting overcurrent trip, set as low as practically possible and reacting on reverse currents only. In addition, each main DC breaker shall be equipped with a direct acting reverse current tripping device.

b. Provide contacts indicating an operation of the Device 32 relays to the local Annunciator panel and the SCADA system.

c. Provide Swartz Type 32 Reverse Current Relay or an Authority approved equal.

d. If the main DC breaker Device 32 is tripped, the DC feeder breakers shall remain closed and the main AC Circuit Breaker shall trip. When Device 32 is reset, and the main AC breaker is then closed locally or by the OCC, a transfer trip shall not occur.

e. Main DC breaker shall be allowed to be closed when it is in the “test position” and the AC breaker is open. Whenever the main DC breaker is in the “test position” it should be allowed to open and close without regard to the status of other TPSS electrical equipment.

2. Relay 186H (DC Lockout Relay):

a. Provide a “lock-out” relay to function as indicated herein and as indicated on the Contract Documents.

b. “Lock-out” relay shall be manual reset, with a mechanical target as part of the nameplate; provide black indication for reset, orange for trip, to indicate the condition of the relay.

c. Provide Electroswitch Series 24 LOR or an Authority approved equal.

3. Device 86H (AC Lock-out Relay):

a. Provide a manual reset, mechanical target lock-out relay.

b. Relay shall trip on an overcurrent, reverse current, ETS emergency trip, TCR fault 3 and “hot structure”.

F. Feeder DC Circuit Breakers:

1. Device 150/151: (Overcurrent Relay):

a. Each DC feeder breaker shall be equipped with an overcurrent relay protecting the distribution system from overloads, arcing and high resistance faults. Relay characteristic shall closely follow the maximum permissible DC current overload characteristic of the distribution system to prevent conductor annealing during sustained overloads or faults.

b. Provide a solid state overcurrent multi-purpose relay with the following functions:

1) Instantaneous overcurrent.

2) Reverse overcurrent.

3) Extra-long timed overcurrent.

4) Timed overcurrent.

5) Rate-of-rise overcurrent.

6) Undervoltage protection.

7) Arcing protection.

c. Relay shall be front-panel mounted, plug-in type, and self-contained.

d. Relay shall have automatic reset feature and shall directionally trip for high impedance faults on the overhead positive distribution system.

e. Relay shall not trip for train starting currents.

f. Rate-of-rise overcurrent trip device shall discriminate between remote short-circuit currents and inrush currents of starting trains.
g. Relay shall have the ability to manually scan faults on the display without the use of a laptop computer interface and be able to download and print faults to a laptop computer. Data collected should be date and time stamped.

2. Device 196/197: (Extra Long Time Overcurrent Relay):

a. Provide for each DC feeder circuit breaker an “extra long overcurrent relay” that shall initiate a trip if the current exceeds the trip limit and stays above the set limit during the delay time. If the current drops below the trip level during the delay time, the delay timer shall reset.

b. This protection is intended to detect low current faults, which are well below train normal currents.

c. This function may be incorporated into the MPR.

3. Device 182/183: (Automatic Reclosing Relay):

a. Provide automatic reclosing for each feeder breaker, incorporating automatic reclosing and load measuring devices No. 182 and No. 183 to provide load-side fault verification before the breaker is closed.

b. Each mainline Substation feeder circuit breaker shall be furnished with a front panel mounted, plug-in type, and self contained, solid-state DC breaker recloser relay, including a load measuring network consisting of a load measuring reclosing relay, voltage sensing relay, loading measuring contactors, load measuring resistors, adjustable time-delay reclosing relays, counters and other associated devices as required. Contractor may furnish an alternative automatic reclosing scheme if approved by the Authority.

c. Load measuring circuit shall be activated only when the feeder breakers are in the connected positions and before the circuit breaker closes or attempts to close. When activated, circuit shall measure the resistance on the circuit on the load side of the circuit breaker. Circuit breaker shall close only when the track load resistance is within an acceptable range and the bus voltage is above the preset point. The acceptable range, which includes the LRV loads, shall be adjustable. Load measuring circuit shall prevent the circuit breaker from closing if the circuit measurement indicates a fault on the load side of the circuit breaker. Reclosing shall only be permitted when a circuit breaker is tripped by the direct-acting overcurrent trip devices and overcurrent relay. Reclosing shall not be permitted when a circuit breaker is tripped by local control switch or station lockout relay, or by the transfer trip-disallow reclose command from SCADA. Load measuring scheme shall be designed to prevent initiating the load-measuring circuit when the circuit breaker is in either the closed or disconnected position.

d. Automatic reclosing shall be activated after a short adjustable delay (1 to 5 sec) after the circuit breaker has been tripped by its own overcurrent series trip device, overcurrent relay(s), or by the transfer trip-allow reclose command from SCADA. Reclosing circuit shall be set for only 1 reclosing attempt at the factory with reset capability of up to a minimum of 5 attempts. Circuit shall be deactivated if the closure of the circuit breaker does not occur within a preset time, which shall be adjustable from 5 to 10 seconds. Circuit shall remain deactivated until reset by a new close command of the circuit breaker. The new close command can be initiated by either local or remote control. An enable-disable toggle switch shall be provided in the breaker control compartment to permit disabling of the automatic reclosing function.

e. Load measuring resistors shall be rated for repeated operations. Circuit breaker may be subjected to repeat operating cycles due to a malfunction of another control device. Load-measuring device shall operate only if the circuit breaker is in the connected position. Means shall be provided to disconnect the load measuring device from the 845VDC whenever the circuit breakers are in the test or disconnect position. Relay
components shall be assembled in a separate isolated plug-in housing assembly within the breaker cubicle to facilitate testing and replacement. Reclosure relay can be reset by initiating an open command both locally or remotely.

f. Test cycle shall be initiated by a local “Test” pushbutton, but shall not close the circuit breaker when the removable element is in the “Connected” position.

g. Each feeder circuit breaker control compartment shall be furnished with a 2-position, AUTO-BYPASS selector switch with spring return to the AUTO position. Selector switch shall permit the automatic reclosing and load measuring system to be bypassed only when the circuit breaker is selected for LOCAL control.

h. Load measuring circuit shall compensate for preexisting (rail drop) voltage up to 20 volts and shall preclude closing on a fault at any preexisting voltage. Load measuring resistor shall be mounted on top of the cubicle for ventilation and space efficiency.

i. Each automatic reclosing and load measuring system shall be furnished with a test function, which shall check the functioning of all devices. Reclosure relay shall not be activated when the DC feeder breaker is in:

1) “Test” or “Disconnect” position.

2) The feeder breaker is tripped manually, by the ETSA or from SCADA.

j. Provide Swartz Type 82 reclosing relay or an Authority approved equal.

4. Device 32: (Reverse Overcurrent Relay):

a. Each DC feeder shall be equipped with a reverse overcurrent relay that shall trip the feeder breaker if the reverse current exceeds the trip limit.

b. If the reverse current drops below trip level during the delay time, the delay timer shall reset and start counting anew.

c. Reverse Overcurrent Relay shall have the ability to be “on” or “off”

5. Device 85 (Transfer Trip Relays): Each DC feeder circuit breaker shall be equipped with a transfer trip protective scheme as specified herein:

a. Provide a transfer-trip relay and relay scheme to open adjacent Substation circuit breakers in the event of a fault condition being detected between the circuit breakers on each end of an overhead contact wire section, defined as the “tripping zone”.

b. In the event of a fault in the tripping zone, resulting in the operation of the overcurrent, relay device, overcurrent, device 150, or activation of the ETS, the transfer trip relay shall initiate tripping of the remote (adjacent) circuit breaker(s).

c. Two types of transfer trips shall be provided.

1) First type shall be automatically resettable or "Allow Reclosure":

a) Transfer trip with "Allow Reclosure", will be initiated by the feeder breaker overcurrent devices (150/151 and 176).

2) Second type shall require manual resetting or "Disallow Reclosure".

a) Second type, requiring manual resetting, shall “Disallow Reclosure” of feeder breakers until the emergency trip relay (device ETS, EDS) in the originating Substation, is manually reset.

d. Trip signal to the adjacent circuit breaker shall operate through the SCADA/RTU and the fiber optics communication system.
e. Contractor shall furnish and install multiple conductor cable of appropriate size and quantity from each feeder breaker transfer trip relay, to the CIC and SCADA/RTU for interface with the communications equipment. It is the responsibility of this Contract to provide the proper interface and “handshake” with the Communication Central Contract.

d. LSVDR shall consist of a 0 to 1000 VDC voltage, shunt/isolation transducer in combination with an analog threshold detector to monitor the level of analog signal in relation to a fixed preset threshold. Provisions shall be made to provide for adjustment of the preset thresholds setting.

f. Sufficient quantity and voltage rating of interposing relay contacts and relays shall be provided with the transfer trip devices to interface with the SCADA/RTU.

g. Breakers within a tripping zone shall be equipped with interfacing transmitting and receiving relays.

h. Transfer tripping circuitry shall be energized for tripping only when the transfer trip function is being performed, and shall be self de-energizing when the transfer trip function has been completed. Only the faulted contact wire within the “tripping zone” section shall be de-energized.

i. Contractor shall be responsible for programming the tripping matrix for SCADA/RTU control between adjacent stations.

6. Device No. 159 (Load-side Voltage Detection Relay):

a. Each DC feeder circuit breaker shall be equipped with a Load-Side Voltage Detection Relay (LSVDR), which shall provide both local and remote indication when the load-side of the DC feeder circuit breaker is energized.

b. A red LED indicating lamp, GE ET-16 or Authority approved equal, shall be used to indicate the associated cable or bus is energized.

1) Lamp shall be mounted on the front of the individual circuit breaker compartment unit with a nameplate inscribed “FEEDER CIRCUIT ENERGIZED”.

c. Remote indication to SCADA shall be provided to the SCADA/RTU using appropriate auxiliary contacts.

1) LSVDR shall be equipped with sufficient auxiliary contacts to provide local and remote indication (minimum 2 N.O. and 2 N.C.).

7. Device 176 (Direct-acting Instantaneous Overcurrent Relay):

a. Each DC Feeder circuit breaker shall be equipped with a bidirectional direct-acting overcurrent trip relay, set to open the circuit breakers on short circuits currents.

b. Provide a bi-directional, direct acting relay, with adjustable setting range of 100 to 400 percent of rated continuous current.

c. Use of control power for direct acting tripping shall not be permitted.

G. DC Enclosure Protection:

1. Device 64R/64MR (Structure Ground Energized Relay):

a. DC equipment shall operate as a high-resistance grounding system. Provide a highly sensitive relay that will operate in the event that any part of the DC enclosure becomes energized or grounded.

b. DC switchgear enclosure shall be insulated from the Substation enclosure floor and any adjacent grounded metal work and protected using a high-resistance grounding relay.

c. DC switchgear, rectifier cubicle, and negative enclosure shall be insulated from each other and from ground, and connected through isolating links.

d. The structure ground relay shall be connected to the middle enclosure and single point grounded by means of an insulated No. 12 AWG
copper conductor(s) connected directly to the Substation DC ground bus.

e. A panel-mounted voltmeter (digital readout and analog needle display) shall be connected in parallel with the high-resistance ground relay to indicate the potential between the enclosures and the station ground. The relay shall detect any part of the enclosures which may become energized in the event of a fault between the enclosure and any of the current carrying components and initiate tripping of the AC Main Circuit Breaker and all DC Circuit Breakers through the 86 and 186 lockout relays.

f. Ground relay shall be provided with a contact to initiate tripping of all DC circuit breakers upon the occurrence of any of the following:

1) Enclosure in contact with ground or the positive DC system.
2) Enclosure in contact with the negative of the DC system.
3) Malfunction of the high-resistance ground relay.
4) Loss of potential between the DC equipment enclosures and station ground.
5) Enclosure in contact with any voltage 24 volts and above including 125VDC and 120VAC.

g. Ground relay shall also be furnished with contacts to initiate an annunciation alarm for:

1) Grounded structure.
2) Energized structure.
3) A red rotating type light, Federal Signal model 225, or an Authority approved equal, shall be furnished and installed on the rectifier enclosure to operate when the structure is energized or grounded.

h. If the 64MR device senses an energized enclosure, the thyristor rectifier control system shall wait 2 seconds before sending a transfer trip to the adjacent substations. If after the AC breaker and DC breakers trip open, the DC enclosure is no longer energized, then there is no reason to send a transfer trip. Since the enclosure is high resistance grounded, there will be no high fault current to damage equipment.

H. Other Protection:

2. Devices 86H and 186H: (lock-out relay): Provide as indicated and specified herein.

3. Station Service Power and Signal Power:

   a. Provide and coordinate primary and secondary, fuses, and circuit breakers.
   
   b. Coordinate all molded-case circuit breakers protecting the AC auxiliary system.
   
   c. Coordinate all molded-case circuit breakers protecting the DC auxiliary system.

5. Surge Protection: Furnish suitable surge arresters and transient voltage suppression devices to protect all electronic equipment in the Substation. Apply protection to the power supply and data lines as appropriate. Select the appropriate voltage rating, energy dissipation rating, and other characteristics to be compatible with the equipment to be protected. As a minimum, protect the following equipment:

   a. Programmable logic controller(s) (PLC).
   
   b. SCADA system equipment.
   
   c. Electronic relays.
6. Fire Detector: Use the fire detector device to de-energize and lock out all substation circuit breakers in the event of fire.

I. Lockout relays:
1. Lockout Relays shall be hand-reset by a red pistol-grip handle, complete with amber indicating light rated at 125 VDC.
2. The light shall be connected to supervise the relay-operating coil.
3. Relays shall be furnished with independent contacts for tripping, indications, closing and lockout of circuit breakers.

J. Auxiliary relays:
1. Auxiliary relays shall be installed where required by the final design or as specified herein.
2. They shall be accessible from the front and protected with a dustproof case.
3. Relays shall be semi-flush mounted unless not suitable, in which case they shall be surface mounted within the equipment control compartment.
4. Surface mounted relays shall be provided with transparent dust covers.

K. Loss of Voltage:
1. Loss-of-voltage relays shall be provided as indicated on the Contract Drawings and as specified herein:
   a. Substation AC incoming utility.
   b. DC power.
   c. Signal power.
   d. Station Service power.
2. Relays shall be equipped with a dry contact to be wired to the supervisory control interface terminal cabinet for remote supervisory annunciation.
3. Provide indication and tripping as required for loss of incoming voltage or any “single phasing” condition.

L. Surge Suppressors:
1. Where required by the final designs, provide voltage surge suppressors. Provide units that are high-speed, high current, solid-state devices designed to protect electronic equipment and systems from transient over voltages.
2. Provide devices in a NEMA-4 wall mounted enclosure, with amber lights on the front of the enclosure to illuminate, to indicate the suppressor(s) are operational and power is applied. Suppressors shall be mounted on the enclosure back panel.
3. Suppressors shall provide continuous bipolar bi-directional, non-interrupting protection and be capable of instant automatic reset with no degradation in protection capabilities.
4. Provide electrical connections and wiring to install the units in parallel with the power distribution system. All cable lengths should be as short as possible for optimum suppressor performance.
5. Provide means for remote annunciation for each suppressor.

2.8 INSTRUMENTATION

A. General:
1. This Contract shall provide, install and test as an integral part of each TPSS, instrumentation as specified herein and as indicated on the Contract Drawings. All components and equipment shall be integrated into the TPSS as specified and shall be so assembled as to form a complete and operational system. Provide transducers, current transformers, potential transformers, protective relaying and associated meters and instruments.
2. As a minimum, provide the following instrumentation in each Substation:
   a. AC Switchgear:
      1) Provide an AC feeder voltmeter with selector switch to allow for phase selection, 1 for each feeder if dual feed.
      2) Provide an AC feeder ammeter with a selector switch to allow for phase selection, 1 for each feeder if dual feed.
      3) Provide a DPM for each incoming feeder.
b. Rectifier Transformer: Resettable drag pointer type instrument, measuring traction transformer winding temperature.

c. Rectifier:
   1) Rectifier output voltmeter.
   2) Rectifier output ammeter.

d. DC Switchgear:
   1) DC feeder voltmeter, 1 for each feeder.
   2) DC feeder ammeter, 1 for each feeder, protects the ammeters against reverse current flow.
   3) Monitoring terminals for negative busbar to ground voltage and negative drainage cable currents.

e. Substation Enclosure:
   1) Substation high ambient temperature detector.
   2) Thermometer.

3. Provide each instrument with test blocks to permit connection of portable recording and testing equipment.

B. Current Transformers (CT):

1. Provide Current Transformers (CTs) to accurately transform the system currents for metering and relaying. Select the CTs to satisfy the Referenced Standards for the accuracy classifications under the burdens imposed by the metering and protective devices.

2. CTs shall be multi-ratio or fixed ratio, epoxy-encapsulated, wound-type or bushing type as required by the final design and approved by the Authority.

3. Transformers shall be capable of withstanding the thermal and mechanical stresses imposed by currents equal to the specified switchgear momentary short circuit ratings.

4. Transformers shall comply with the requirements for C class relaying and 0.3 class-metering accuracy under the burdens imposed by the connected devices.

5. Provide current ratio as required by the final design.
   a. Provide 15 KV with BIL of 95 KV full-wave; or
   b. 600 volts with BIL of 10 KV full wave as appropriate.

6. Maximum allowable temperature rise under continuous full load above average ambient temperature of 55 degrees C:
   a. By winding resistance: 131 degrees F.
   b. By hottest spot in winding: 104 degrees F.

7. CTs shall be installed in a compartment isolated from the circuit control panel and high-voltage equipment except for primary connection bushings.

8. CTs and secondary wiring shall be protected from induced voltages by metallic shielding and shall be no smaller than No. 10 AWG. Terminate with ring type termination connectors.

9. CT secondary wiring terminal blocks shall have covers.

10. Secondary wiring shall be run to readily identifiable terminal blocks in the control compartment.

11. All CT secondary terminal blocks shall be furnished with an integral shorting bar.

12. Provide each CT with a mounting frame which bolts securely to the switchgear cubicle.

C. Potential Transformers (PTs):

1. Provide Potential Transformers (PTs) to accurately transform the system voltages for metering and relaying. Select PTs to satisfy the Referenced Standards for metering and relaying accuracy classifications under the loads imposed by the metering and protective devices.

2. Protect the primary circuits of all PTs by means of non-renewable cartridge-type fuses. Locate the primary fuses in rollout carriages equipped with disconnecting devices. Protect secondary circuits of all PTs by molded-case circuit breakers mounted in the cubicle control compartment.
3. PTs shall be molded rubber or epoxy-encapsulated, or an Authority approved equal.

4. PTs shall be Group 2 class for line-to-line or line-to-neutral connections as appropriate for the application and final design.

5. Primary voltage ratings and transformation ratios shall be as required by the final design.

6. Voltage transformers shall have an accuracy rating of not less than 0.3 class at the standard burden imposed by the connected devices.

7. Insulation class: 15 KV with BIL of 95 KV full-wave.

8. Maximum allowable temperature rise under continuous full load above average ambient temperature of 122 degrees F:
   a. By winding resistance: 86 degrees F.
   b. By hottest spot in winding: 104 degrees F.

D. Transducers and Converters:

1. Provide compact transducers and converters to convert input variables into proportional DC output signals within accuracy of no more than 0.1 percent. Select transducer and converter inputs to be compatible with the magnitude of the input variable.

2. Install the transducers and converters in a suitable enclosure.

3. Furnish 3 complete sets of transducer and converter test and calibration equipment made by the transducer and converter manufacturer. Supply calibrators for field-testing of the transducers and converters.

E. Instruments and Meters:

1. Meters, instrument and relay circuits shall be furnished, wired and connected as specified herein, and on the Contract Drawings. Provide additional components such as auxiliary relays, isolating diodes and similar devices that may not be indicated, but are required by the final design for an operable Substation.

2. Instruments and meters shall be designed, constructed, and tested in accordance with the applicable provisions of the Referenced Standards.

3. Instrument scales shall be calibrated to match the primary circuit current and voltage ranges.

4. The devices shall have 1 percent accuracy, taut-band suspension, switchboard type and a 250-degree scale.

5. Displays shall be approximately 4-1/2 inches square, with black lettering on a white background.

6. Instruments shall be metal-case, semi-flush types for panel mounting.

7. Instruments and meters shall be wired through suitable test switches.

F. Accessories:

1. Control and selector switches shall be rotary type.
   a. Switches shall have silver-to-silver contacts rated at 20 A and cam action or similar positive means for actuating contacts.
   b. All contacts shall be enclosed within easily removable covers.
   c. All switches shall have escutcheon plates.

2. Local control switches shall have heavy-duty pistol-grip handles and operation targets.
   a. Switch positions shall be “Trip-Close” with spring return to normal.
   b. Lights shall be furnished indicating, “Open” and “Closed” positions.

1) “Open” position of a circuit breaker or switch shall be indicated by an illuminated Green LED light.

2) “Closed” position shall be indicated by a Red LED light.

3. Selector switches shall have Tee handles:
   a. Switchgear control selector switches shall have “Local-Remote” positions.
b. Provide selector switches with LED indicating lights.
c. "Local" position of the switch shall be indicated by an illuminated White LED light.
d. "Remote" position shall be indicated by a Blue LED light.

4. A minimum of 2 separate isolated contacts shall be furnished for each selector switch:
   a. One contact shall be used for local control annunciation.
   b. In addition, the other contact shall be used for remote supervisory control annunciation of the "Local" position, as indicated.

5. AC Ammeter and Voltmeter Selector Switches shall have round knurled handles and:
   a. Shall indicate 4 positions (OFF-1-2-3).
   b. Provide nameplates for each position.

2.9 BUS AND CONNECTIONS

A. General. Contractor shall provide, install and test as an integral part of each TPSS, DC positive and DC negative busses. All components and equipment shall be integrated into the TPSS as specified and shall be so assembled as to form a complete and operational system. Provide:
   1. Positive Bus.
   2. Negative Bus.
   4. Cable Terminations.
   5. Lightning Arrestors.

B. Design:
   1. Provide a DC switchgear positive bus for the full length of the DC switchgear assembly.
   2. The bus shall be made of 98 percent conductivity electrical grade copper, and shall be fully insulated over its entire length with flame-retardant, nonhygroscopic, track-resistant insulation.

3. Bus and bus connections shall be of adequate strength to withstand thermal and mechanical stresses associated with short circuit currents as required by the Referenced Standards and the final design.

4. The DC bus overload rating shall be coordinated with that of the rectifier unit without exceeding the permitted temperature rise per Referenced Standards.

5. Bus connections, including bus taps, shall be silver-plated.

6. Each main bus joint shall have conductivity at least equal to that of the bus bar and each joint shall be constructed so that no loss of conductivity will occur during the life of the switchgear.

7. Connections to the bus shall be bolted.
   a. Bolts shall be cadmium-plated, galvanized, or similarly coated, high-strength steel, and of sufficient number and size to provide solidly bolted connections.
   b. Provide Bellville washers, bolts and washers as necessary for joining of shipping sections.
   c. Provide (if required) as part of the spare parts for each Substation, a torque wrench and other equipment as necessary for joining sections.

C. Ground Bus:
   1. A copper ground bus, not less than 2 inches wide by 1/4 inch thick, shall extend the length of the switchgear.
   2. In each switchgear unit, where power busses enter or leave the switchgear at the top, a copper ground bus, not less than 1 inch by 1/8 inch, shall be extended from the main ground bus up to the top of the unit.
   3. All joints in the ground bus shall be made with a minimum of 2 bolts.
   4. Bolted joints shall be silver-plated.

D. Bus Transition Units:
1. Bus Transition Units (if required) shall be provided as required by the final Substation design.

2. All transition units shall be full height with front and rear bolted panels.

3. Front panel shall be in line with those of the adjacent switchgear sections.

E. DC Control Power Bus:

1. Control power for the switchgear will be obtained directly from the DC Battery/Battery charger. The closing coil circuit for each circuit breaker shall be fused and the trip coil shall not be fused. Provide 2 separate Control Busses, 1 for the AC Switchgear and 1 for the DC Switchgear.

2. At each circuit breaker cubicle, a white LED indicating light shall be provided indicating DC control voltage is present.

3. A 125 VDC control power bus with 1000 VAC insulation shall be furnished the full length of the DC Switchgear assembly and shall be used for circuit breaker control and operation. The bus shall be terminated on a terminal block at each compartment for connection to the circuit breaker control. A single conductor negative bus with 2,000 VDC insulation shall be furnished the full length of each switchgear assembly. Control power for the switchgear will be provided from the DC battery/charger.

4. A double-pole, pullout fuse block shall be provided at each circuit breaker compartment. The device shall effectively isolate the operating mechanism from the control bus. The closing coil circuit for each Circuit Breaker shall be fused and the trip coil shall not be fused. A white LED indicating light shall be provided at each circuit breaker cubicle indicating DC control voltage is present.

5. Each DC compartment shall be provided with a control power voltage-monitoring relay connected to the load-side terminals of each pullout fuse block. Relay shall be set to drop out at 90 VDC and shall initiate local and remote supervisory annunciation.

6. If required an AC control power supply with 1000 VAC insulation shall be provided for operation of protective devices and voltage transducers. Solid-state type inverters shall be used to achieve this requirement. The inverter protection device contacts shall be wired to the local Annunciator panel and to the supervisory annunciation. A voltage-monitoring relay shall be provided at each compartment requiring an AC power supply, which shall initiate local and remote supervisory annunciation. The relay shall be set to drop out at 85 percent of the nominal voltage level.

7. All control wiring shall run in a protective raceway. The raceway shall open to the side or top, not from the bottom.

F. Cable Terminations:

1. Contact feeder cables, negative cables and drainage cables shall enter through the bottom of the switchgear. Provisions shall be made to accommodate the number and size of specified feeder cables. Ample cubicle space and bus contact surfaces shall be provided for pulling and terminating the cables entering or leaving the DC and AC switchgear.

2. Each DC circuit breaker assembly (load side) shall have adequate space for termination of the “positive” power feeder cables; provide provisions for a maximum of three 750 KCMIL feeder cables per circuit breaker and connections for surge protection.

3. For the DC negative return cables provide bus connections for an equal number of negative return cables as positive feeder cables.

4. Provide for drainage cable connections as required by the final design.

5. Provide necessary means for supporting and connecting the cables at the incoming terminals.

6. Cable-entry cover plate(s) shall be bolted and removable to permit field drilling for conduit entry.

7. DC busbars shall be sized and drilled for the load and service cables, provide standard NEMA 2-hole or 4-hole lug spacing, provide bus connections rated not less than 194 degrees F. Provide termination connections, hardware, bolts, nuts, washers, etc., for mounting and terminating all DC cable. Coordinate cable size and number of cables with the TPSS Installation Contractor for each TPSS location.

8. AC incoming busbars shall be pre-drilled for standard NEMA 2-hole and 4-hole termination. Mounting hardware,
terminations and cable shall be performed during installation.

G. Space Heaters:
1. Each switchgear assembly shall be furnished with front and rear space heaters. Provide a thermostat and humidistat control for each unit.
2. Each cubicle shall be equipped with a 2 inch AC ammeter, appropriately scaled to monitor each space heater(s) current.
3. Provide space heaters that are humistatically controlled.
4. Provide the quantity and capacity required to maintain the humidity and temperature inside the equipment enclosures to 20 percent above any anticipated dew point temperatures for the ambient conditions indicated.
5. Space heaters shall be designed for continuous operation by 120 volt or 240 volt, 60 Hz, single-phase power.

H. DC Surge Arrestors:
1. Provide an intermediate type surge arrester for each outgoing DC feeder circuit.
2. Surge arrests shall be of the metal oxide type. Arrestor selection shall be based on line to ground maximum continuous operating voltage (MCOV).
3. Each surge arrester shall have an energy discharge capability of 2.6 kJ/kV for currents of less than 500 amps.
4. Provide type MCOV, 1280 V, Model No. 6007 as manufactured by SMC, or an Authority approved equal.
5. Each surge arrester shall be individually grounded to the station DC ground mat.
6. Each grounding connection shall have a grounding resistance of 5 ohms, less, or as specified by the surge arrester manufacturer for the type of unit supplied.
7. Surge arrestors shall be:
   a. Rear compartment-mounted, indoor style.
   b. Arrestors shall be suitable for connection to a 750V DC power supply for protection of the DC power switchgear against lightning surges.
   c. Arrestors shall have a minimum continuous operating voltage of 1280 volts. Maximum peak break over and residual voltage values shall be coordinated with the dielectric withstand voltage characteristics of the switchgear bus and circuit breaker insulation structure, as well as the maximum arcing voltage produced by the DC circuit breakers during interruption.
   d. Cable connection between the surge arrester and the load-side of the feeder circuit breaker shall be kept as short as possible and sufficient clearance from any metallic parts shall be maintained.
   e. Cable connection to the surge arrester shall be taped or insulated to 4 times rated voltage.

I. Ground Bus:
1. DC switchgear shall be furnished with an isolated insulated low resistance copper ground bus for directly connecting the surge arrester ground terminals.
2. Each end of the ground bus shall be provided with terminal lugs suitable to accommodate 2 No. 2/0 AWG grounding insulated copper cables for connecting to the substation DC grounding system.

2.10 TRANSFER TRIP DEVICES

A. General:
1. Contractor shall provide, install and test as an integral part of each TPSS, transfer trip devices. All components and equipment shall be integrated into the TPSS as specified in these Specifications and shall be so assembled as to form a complete and operational system. Provide:
   a. Transfer trip relays as described herein.
   b. Factory testing.
   c. Field test procedures.
   d. Field testing (including station-to-station interface).
2. In the Authority’s Traction Electrical System there shall be a DC breaker
assigned to each power section and power shall be applied to each track in each direction by a separate breaker.

3. If a single breaker detects a fault, the faulted breaker shall remotely trip any other breaker(s) feeding the faulted section. Tripping all breakers feeding a section shall remove the possibility of a sustained fault.

4. To ensure the tripping of all breakers connected to the faulted section during contingency power supply conditions; the transfer trip circuits shall be capable of being locally and remotely configured.

5. Transfer trip relays shall be furnished and installed for all DC mainline feeder breakers for each Substation supplied under this Contract.

6. Interface new TPSS’s to transfer trip feeder breakers at adjacent existing Substations. Provide fiber optic RTU at existing Substations as required for transfer trip implementation between existing and new TPSS’s.

B. Testing:

1. Contractor shall be responsible for furnishing, installing, factory testing and field testing the transfer trip system for all new and modified Substations, this shall include interface with existing Substations.
   a. Contractor shall supply the supervision and shall retain the responsibility for the Field Testing of the Transfer Trip Scheme until accepted by the Authority.
   b. All field interface coordination and correctional work (if required) shall be by the Contractor.
   c. Contractor shall test the operations of the transfer trip system from each SCADA/RTU to the adjacent Substation upon completion of the communication system and prior to Final Acceptance.

2. Transfer tripping system will use the SCADA/RTU and fiber optics communication network as the means for transmitting transfer trip signals to adjacent Substations.

3. A test plan for field-testing shall be submitted as part of the “Acceptance and Verification” testing plan.

2.11 EMERGENCY SHUT DOWN

A. General:

1. As a safety feature, each Substation shall be equipped with 3 emergency trip stations. One button is to be recessed in a stainless steel enclosure mounted on the exterior wall and accessible by key only. The second and third button are to be located inside the Substation by each access door. Actuation of any pushbutton will trip and lock out the 15KV AC breaker and all DC circuit breakers and transfer trip and lock out the associated DC breakers at the adjacent substations, thus completely isolating the fault or trouble.

2. Provide an emergency shutdown scheme consisting of:
   a. Interior emergency trip stations (2 required).
   b. Exterior emergency trip station (1 required).

B. Installation:

1. Connect the emergency trip stations to provide a loop circuit of contacts wired in series, which shall de-energize a summary relay. Interruption of the series circuit shall cause the Substation to shut down by:
   a. Tripping and locking out the main AC circuit breaker.
   b. Tripping and locking out all DC circuit breakers.
   c. Transfer tripping and locking out the corresponding circuit breakers at adjacent Substations to achieve de-energization of the distribution system conductors.

2. Use heavy-duty, industrial grade, pushbutton operators and contact block with a large, red, mushroom shaped actuating head.

3. Design the pushbuttons so that a Substation that has been taken "off-line" by the Emergency Trip Scheme cannot be re-energized locally or from SCADA system unless the system has been manually reset.
2.12 LOCAL ANNUNCIATOR AND SUPERVISORY CONTROL REQUIREMENTS

A. General

1. Contractor shall provide, install and test as an integral part of each TPSS unit, Local Alarm Annunciation and Remote Supervisory Control and Indication Functions. All components and equipment shall be integrated into the TPSS as specified herein and shall be assembled to produce a complete and operational system. Provide:

   a. Local annunciation panel.
   b. SCADA/RTU.
   c. Thyristor rectifier alarms.
   d. CIC

2. The supervisory design requirements for the TPSS shall be for use in unattended remote Substations.

3. Final design shall use processors in the master station (existing) and in the remote stations. Contractor shall interface the new TPSS Supervisory System with the existing Authority’s Master Station.

B. Submittals Requirements

1. Submit the following as part of the submittals specified in this section and elsewhere in the Contract Documents:

   a. Connection, interconnection, elementary and internal layout drawing complete with power input points and test points.
   b. Operations and equipment reference manuals.
   c. RTU I/O memory address assignments listing.
   d. Spare part listing and parts bulletins.
   e. Program listing (e.g., ladder logic listing), of all resident software in hard copy and electronic formats.
   f. Functional requirements document consistent with the format in the Referenced Standards.
   g. SDD shall be consistent with the format specified in the Referenced Standards.
   h. SVVD plan shall be consistent with the format specified in the Referenced Standards.
   i. A complete list in table form of all control and indication points for the local annunciation and the SCADA/RTU unit inclusive of all spare points.

C. Local Annunciation:

1. Provide and install a local annunciator panel for each new TPSS, provide alarms and status indication as specified herein and as required by the Referenced Standards. The minimum circuits shall be as indicated herein and on the Contract Drawings.

2. Each annunciator shall have a 17 inch High-Brightness TFT LCD touch-screen annunciator panel with speakers to visually annunciate TPSS equipment status and alarms and audibly annunciate alarms: Provide Technoland TL-PPC 170S478 or an Authority approved equal.

3. General Requirements:

   a. Provide an annunciator system designed to provide status information of discrete signal contacts and provide interface and monitoring of analog devices. Annunciator window arrangement and designations shall be per the approved Contractor’s annunciator drawings and submittals. Annunciator’s internal clock shall be synchronized with the SCADA/RTU’s internal clock.

   b. The basic annunciation system shall comprise of:

      1) Chassis or cabinet.
      2) Point cards.
      3) Light box displays.
      4) Flasher box displays.
      5) Digital time display.
      6) Push-buttons.
      7) Audible devices.
8) Power supply.

c. Factory tests shall be performed on each complete annunciator panel assembly in accordance with the application requirements given in the Referenced Standards and these Specifications.

d. Annunciator visual display assembly shall be flush mounted on a metal enclosure and shall be front accessible.

e. Annunciator point requirements and configuration shall be as indicated on the Contract Documents and as required by the final design.

f. Annunciators shall be of the integral logic type to include visual displays solid-state logic circuits in one assembly.

g. Annunciator shall have screen saver capability, which automatically shows the annunciator windows when the light switch is on.

h. Sequence logic circuits shall be of the plug-in type and may be combined with the visual display windows and lamps.

i. Annunciator shall be designed for an ISA sequence designation "A", without audible alarm device.

j. Annunciator and accessories shall be housed in a metal enclosure complying with NEMA ICS 6, Type 12 enclosure and shall be provided with a hinged front panel with lockable handle and 2-point latches minimum.

4. Annunciator Operation:

a. Each annunciator point as indicated herein and as indicated on the drawings, shall be designed for operation from either a normally open or normally closed field contact.

b. When a field contact operates from a relay function (trip condition), the associated annunciator point logic sequence shall assume lock-in alarm or indication state and initiate a flashing visual display if this status is other than normal. If the field contact is closed by normal operating procedure, the associated annunciator point shall be indicated by a steady display.

c. When the trouble signal is "Acknowledged" at the local annunciator panel, the visual display shall assume an "On" state. Then the field contact self-resets or is manually returned to its normal condition, the visual display shall automatically return to an "Off" status, and the logic sequence reset to a "Normal" state.

d. Annunciator logic sequence shall be capable of accepting and displaying multiple trouble signals simultaneously or in sequence.

e. Operation of the "Lamp Test" feature shall initiate an operational test of the logic sequence and visual display of all annunciator points. Operation of the "Lamp Test" shall not activate alarms to the SCADA system.

5. Relays:

a. Annunciator sequence logic relays shall be hermetically sealed plug-in type.

b. Coordinate the annunciator field contact voltage and logic relay minimum operating current with the type of field contact that is furnished.

c. Each annunciator point logic device shall be provided with an electrically isolated normally open and normally closed repeater contacts, rated at not less than 100 milliamperes resistive current at 125 VDC. Contacts shall be used for initiating equipment trouble signals to the SCADA/RTU equipment through the communication interface terminal cabinet if duplicate alarms are specified.

d. Power removal to the annunciator cabinet shall not result in repeater alarms being reported to the RTU.

6. Display Windows:

a. Separate inscribed display windows shall be furnished for each annunciator point. Windows shall be sized to accommodate 4 lines of
inscription with a 1/4-inch character height.

b. Windows shall be snap-on type, fabricated from translucent plastic and back illuminated by 2 lamps.

c. Annunciator points that indicate substation alarms resulting from a tripped condition shall have a red lens; all other lenses shall be white.

d. Verify individual circuit window designations with the Authority prior to fabrication. DC circuit feeder designations shall be provided by the Authority.

7. Power Supply:

a. Annunciator shall be designed to operate on a 125 VDC control power. Power shall be provided from the Substation DC power panel.

b. Power supply shall be supervised by a voltage detector, which shall initiate remote supervisory annunciation on loss of supply, by a circuit to the supervisory control interface terminal cabinet.

8. Accessories:

a. Push buttons:

1) Annunciator assembly shall be furnished with push buttons for "Acknowledge" and "Test" initiation of the logic sequences.

2) Push buttons shall be flush mounted, color black, heavy-duty and oil tight complete with identifying nameplates of black-face, white-core, engraved laminated plastic.

b. Power Disconnect Switch: Panel shall be furnished with a control power disconnect switch and a "Power On" indicating light. Indicator shall be flush mounted with white translucent lens.

c. Terminal Blocks: Panel shall be furnished with sufficient terminal blocks for wiring to every annunciator field contact and annunciator point logic relay repeater contact, plus 20 percent spare terminals.

d. Four spare windows and I/O cards shall be provided with each annunciator panel.

D. SCADA:

1. Each TPSS shall contain a SCADA that shall interface with the Authority’s existing SCADA/RTU system.

2. The AC switchgear assembly, TRU, and DC switchgear assembly shall be equipped with the necessary devices to provide control, status and alarm indications to the SCADA.

3. Contractor shall install and test all wiring from the rectifier control panel, switchgear assemblies and TPSS accessories to the CIC, SCADA RTU.

4. Additionally, provide a minimum of two (52a) and two (52b) auxiliary contacts, wired to the CIC, for each circuit breaker for future use.

5. Each Substation assembly control circuit status indication circuits and alarms shall be equipped with 24VDC interposing relays for SCADA control and indication.

6. The control, alarm points and status indication requirements shall be as indicated herein and on the Contract Drawings.

E. Remote Terminal Unit (RTU):

1. Contractor shall furnish for each TPSS a RTU to interface the Substation and the existing DART SCS. The existing SCS is based on PC equipment operating in a TCP/IP LAN environment under Windows 2003. The middle-ware is Tecnomatix's Factory Link (version 7.1).

2. General:

a. Provide a PLC system to control, protect, and monitor the operation of the Substation equipment and establish an interface with the SCS. Include in the PLC system all the necessary hardware, software, and diagnostic equipment to ensure an operational and coordinated system. The RTU shall be a self-contained PLC type.
b. Program the RTU specifically for the TPSS application. Use the RTU's to integrate the following functions into a single, high-speed Central Processing Unit (CPU):

1) Relaying logic including:
   a) Reclosing.
   b) Transfer trip (all adjacent Substations).
   c) Other associated logic.

2) Electrical interlocks.

3) Substation annunciation.

4) Substation control.

5) SCADA.

c. RTU shall be fully compatible with Allen-Bradley, SLC 5/05 series or better (model numbers 1747-L553, 1747-M13, 1746-B32, 1746-A10 and all required ancillaries and adaptor socket).

d. RTU's shall have the manufacturer's latest stable firmware revision compatible with the existing system. Future firmware upgrades shall be required if the manufacturer corrects known issues, or defects which are relevant to the Authority's operational system.

e. RTU shall be self-contained units capable of collecting data through dry relay contacts from Substation equipment and devices, and reporting that status to the master station by using the "polled report-by-exception" method.

f. RTU shall be capable of carry out the commands it receives from the Master Station and provide control outputs through interposing relays of momentary and timed duration.

g. If the 86-lockout relay is activated, the RTU shall not accept any closing commands from OCC. Only after the lockout relay is reset, may the RTU accept a closing command. The AC main breaker shall not immediately close after the 86-lockout relay is reset.

h. Contractor shall be responsible for ensuring that the RTU programmable instruction set, character transmission format, protocol and command set are compatible with the existing Authority's SCADA/RTU system.

i. RTU shall be of programmable design with stand-alone restarting capability.

j. Contractor shall install and activate codes and programs as necessary for the RTU to boot and establish communications with the Authority's SCS. Field interface with the existing Authority's OCC is the responsibility of the Contractor. All IP addresses for the SCADA interface will be provided by the Authority.

k. All program/data table memory information shall be resident in non-volatile type memory (i.e. EEPROM).

l. All information shall be coordinated with the Communications Central Contract to ensure compatibility with the SCS.

m. RTU configuration, database definition, algorithms, and program parameters shall be downloadable from the SCS. RTU's shall be capable of being initialized by a single command from the SCS.

n. A power failure restart indication shall be reported to the SCS after recovery from a power failure so that any necessary initializing and downloading may be initiated by the SCS.

3. Bitmap Delivery Dates:

a. Provide TPSS RTU software programming information "bitmap" to include the status of each control and indication point. Bit nomenclature shall be consistent with that of the local CIC. Spare or unassigned bits shall be labeled as spare. Additionally, provide ladder-logic programming and information of any functions provided by the RTU, e.g. transfer trip function, or safety related functions.
b. For all Substations in each Line Section listed below, the Contractor shall furnish to the Authority the Substation RTU “bitmap” data, in accordance with Specification Section 16868 SCADA RTU Subsystem – Communications System.

4. Processor:
   a. RTU processor shall support the following communications options:
      1) Ethernet (10Base-T).
         a) 10 Mbps communication rate.
      b) ISO/IEC 8802-STD 802.3(RJ-45) connector for 10Base-T media.
      c) TCP/IP Communication protocol and built in isolation.
      d) SNMP support Optional dynamic configuration using BOOTP utility.

b. Program Memory Modules:
   1) The CPU user configurable memory shall be used to store program. The size of the CPU memory shall be minimum of 64K with battery backup on the circuit board.
   2) Each RTU shall be equipped with Flash EPROM, with minimum memory of 64K, for memory backup.

5. Components:
   a. All electronic components shall be mounted on a chassis with plug-in printed circuit cards or modular subassemblies. All printed circuit boards of the same model number shall be identical.
   b. Printed circuit boards shall not include or require tack-soldered components (i.e. not mounted in locations with plated through holes or in sockets) on the boards for “tuning” or “timing” purposes.
   c. Printed circuit cards and modules, which contain modifications accomplished by the removal of printed circuit leads and corrected with wired replacements, are not acceptable.
   d. All interconnecting cables shall have keyed housings or contact pins to ensure correct mating of connectors and prevent damage from improper connection. All connectors shall be clearly marked for reconnection (P1-J1, P2-J2, etc.).
   e. Gold-plated contacts shall be provided for all printed circuit cards and multi-pin connectors.
   f. Each printed circuit card and subassembly shall be model and serial numbered to uniquely identify it.
   g. All point inputs and outputs, communication inputs, and power supply inputs shall pass the tests as required by the Referenced Standards.

6. Discrete I/O Modules:
   a. RTU shall be equipped with minimum of 3 input modules and a minimum of 2 output modules with a density of 32 points each. Contractor shall leave a minimum of 40 percent spare points on the modules.

7. Design Requirements:
   a. Logic functions shall be implemented to receive data from and transmit data to the interface device or modem, perform address decoding and error checks, and transfer data to and from the point input/output logic.
   b. To allow for future changes in communication channel configuration, all RTU’s shall have strapable or switch selectable hardware addresses.
   c. In conjunction with the other RTU logic elements, the following functions shall be performed:
      1) Respond to commands for retrieving data.
2) Provide select-acknowledge-execute logic sequence for relay control commands. After a point is selected, a check shall be made from the final stage of the output circuitry for the re-encoded check back message. Merely transmitting the received point selection code will not be acceptable.

3) An acknowledgment of receipt and activation of the relay execute command shall be sent to the SCS after a control operation is performed.

4) Prevent selection of more than 1 control point in a command sequence by:
   a) Inhibiting interposing relays from inadvertently being energized during the initial power up period of the logic, because of failed communication, or any other anomaly.
   b) Protecting against a missing or failed logic card or assembly from causing an invalid operation, damage to other logic, or false transmission to the SCS.
   c) Protecting against over/under voltage conditions from the Authority's power source and the Contractor's power subsystem from causing an invalid operation, damage to logic, or false transmissions to the SCS.

5) Scan intended logic for data in 50 milliseconds or less.

6) Respond to request from the OCC within 50 milliseconds (i.e. from the receipt of the first bit in the request word until the acknowledged message is complete).

7) Respond to a change in an external device such that the time from the recognition of the change to the transmission of the first bit in the RTU-OCC packet shall be 100 milliseconds or less.

8. Operation:
   a. RTU shall operate continuously with specified performance and without reduction in equipment life under the operating temperatures and humidity as specified in the Contract Documents.

9. Communications Interface:
   a. Traction Electrification System (TES) shall be interfaced to the existing SCS via the TPSS RTUs. RTUs shall be interconnected to the Ethernet port via fiber optic cable and associated media converters. RTU shall communicate with the SCS through one of the supported Factory Link protocols. Contractor shall verify with the Authority and the Communications Contractor the interface protocol and hardware requirements for communications interface.
   b. Furnish and install media converter(s) or Ethernet switch to link the RTU(s) with the nearest communication facility. Provide 24VDC or other backed-up power to power the media converters or switch.

10. RTU Communication Logic:
   a. RTU communication logic shall perform the following functions:
      1) Synchronization pattern recognition and generation.
      2) Serial-to-parallel and parallel-to-serial conversions.
      3) Error-check encode and decode.
      4) Decoding and processing of incoming messages.
5) Assembling reply messages.

b. RTU communications to Central shall be over TCP/IP.

c. RTU shall be configured for data error check (CRC or BCC) and retransmission.

11. Communication Line Interface:

a. After delivery of the TPSS to the job site, the TPSS Installation Contractor will furnish and install a fiber optics patch panel, a SCADA Media Converter will link the RTU(s) with the nearest Communication facility. Contractor shall interface with the SCADA system.

b. Contractor shall provide space in the TPSS for the Communication furnished equipment. Contractor shall also provide conduit and raceways as indicated on the Contract Drawings for connection of the equipment to the RTU’s.

12. Indication Inputs:

a. Both form “a” (N.O.) and form “b” (N.C.) relay contacts shall be provided to represent status and alarm indications to the RTU’s. The RTU’s shall detect the states of these contacts by applying a contact sensing voltage generated in the RTU and isolated from the logic voltage. A logic output representing either a 1 or 2 bit word shall be provided according to the requirements identified herein and on the contract drawings.

b. The minimum current through closed contacts shall be 2 milliamperes. The maximum allowable contact sensing current shall be 20 milliamperes. The maximum resistance of the external indication circuit, when closed, shall be 1000 ohms. The minimum resistance of the indication circuit, when open, shall be 50,000 ohms. Contact wetting voltage shall be provided by an isolated power supply in the RTU.

c. RTU shall provide optical isolation between the field contacts and the RTU electronics. Contractor shall provide 2 terminals per point for connection of the field wiring. Common termination points for field-wiring inputs are not acceptable.

d. Each indication input shall include hardware input filtering to eliminate contact bounce or voltage transient signals of less than 8 milliseconds from being detected and processed by the RTU as a valid alarm or change of state. Additional input signal processing and verification shall be provided by the RTU firmware, which combines the detection of more than a single input sample to confirm the state of the input contacts.

e. The number of sample counts used to determine a valid input shall be changeable in firmware as one number for all indication inputs and shall be set to guarantee that an on or off signal that is present for a minimum of 10 milliseconds is detected as a valid alarm or change of state.

f. Each RTU shall have the capability to interface to either of 2 types of indication inputs to be monitored and processed by the RTU, as follows:

1) Two-State: consists of inputs which change state at a rate slower than the SCS poll intervals. The state of the input at the time of the SCS poll shall be reported to the SCS.

2) Two-State with Momentary Change Detection: consists of inputs which may change state more than once between the SCS polling scans. Therefore, a buffer shall be provided which is set when any changes are detected between scans. The condition of this buffer, plus the on/off state of the input at the completion of input processing, shall be reported to the SCS. The change- detect buffer shall not be reset until the SCS has confirmed the receipt of the reported changes by sending an acknowledge message to the RTU.
13. Control Output Requirements:

a. All control outputs from the RTU shall follow the check back-before-operate procedure wherein a selection message is sent to an RTU, stored and decoded down to the drive circuits or interposing relay, re-encoded from those same drive circuits or point select relay, transmitted back to the SCS, and verified at the SCS before any command of execution ("open", "close", "execute", etc.) is sent.

b. Two full transactions shall be required for a control output to occur under this check back-before-operate requirement. Any control scheme, in which a single message with undetected errors can cause a false command, shall be unacceptable. All logic and point selection shall be reset with the reception of a "reset" function, receipt of any command other than an execute command following a valid point selection, time out of the control function timer, or power failure restart.

c. Control outputs shall have individually adjustable time duration for closure, with time ranging from 0.1 seconds to 15 seconds.

d. Control output drive circuitry shall be designed such that a single component failure in the RTU does not cause an invalid operation (uncommanded or wrong operation).

e. A front panel mounted “Master” local/remote selector switch with a white LED indication lamp shall be provided with each RTU.

   1) Switch shall inhibit the remote close and trip control of all AC and DC circuit breakers when the switch is in the local position.

   2) A normally open contact of the switch shall be wired to the RTU to initiate remote supervisory indication when the switch is transferred from remote position to local position.

f. Contractor shall supply interposing relays with single isolated, form "C" contacts rated to make and carry 2 amps at 24 VDC or 5 amps at 120 VAC (1/3 H.P.). Coil surge suppression diodes shall be provided as required. All control output relays shall be plug-in type, general purpose with clear polycarbonate dust covers or solid-state devices. Hold-down devices or springs shall be provided for all relays.

14. Coordination:

a. Contractor shall be responsible for the transmittal of RTU program/data table memory assignments, character transmission formats and the RTU data port configuration to the Authority in strict accordance with the submittal requirements to allow adequate time to coordinate with the Communications SCADA software design.

b. Contractor shall ensure that the RTU is fully addressable to/from the Authority's SCS.

   1) If a software/firmware mismatch is discovered by field testing during or after factory testing of the RTU's, the Contractor shall be responsible for modifying the program/data memory assignments, point address assignment and or data port configuration, necessary to establish 2-way addressable communication with the SCS.

   2) Contractor shall be responsible for coordinating the transmittal of program/data table memory assignments and character transmission formats.

15. Terminal Blocks and Wiring:

a. In order to accept substation field wiring, terminal blocks shall be provided within the RTU enclosure. These terminal blocks (and all interposing relays) shall be stationary within the enclosure and not mounted on swing-racks or doors. Terminal blocks shall be sized to accommodate No.22 - No.24 AWG field wiring.
b. Terminal blocks shall be Allen-Bradley, Finger-Safe type 1492-HM2V24 with voltage indicating LED's or an Authority approved equal, and shall be grouped by like point type within the RTU enclosure.

c. Each terminal block and each terminal shall be uniquely identified and readable by the Authority's maintenance personnel. All terminals to which the power supply voltage is connected shall be provided with protective covers.

d. All wire connections between any moving part such as a swinging door and a stationary part or object shall be stranded wire wrapped with a cable harness protector.

e. All wiring shall be of suitable gauge and insulation to meet the intended use. Installation of this wiring shall be such that no tension is exerted when moving parts are exercised.

f. Input and output signal wiring and power wiring shall be kept physically separate from RTU logic wiring. Low voltage field wiring shall also be separate from control wires and AC power wiring. Internal wiring shall be installed in wire harnesses or wire duct.

g. Wires and cables (signal and power), shall be color-coded and suitably labeled for identification. All wire and cable connectors and terminations shall be permanently labeled for identification and shall be mechanically keyed to prevent improper connection.

h. All connection points for external cables and wires shall be easily accessible for connection/disconnection and shall be permanently labeled.

i. All wires shall be appropriately terminated.

16. Internal Layout:

a. All components including the programmable controller, terminal blocks, power supply, etc., shall be fixed mounted on a nonconductive back plate.

b. Nameplate: Cabinet shall be labeled "SCADA / RTU" using a 4 inch high, blackface, white-core, engraved laminated plastic nameplate. Lettering shall be 2 inch high Gothic font.

17. RTU Mounting Requirements:

a. All RTU's shall be wall mounted and accessible by maintenance personnel.

b. RTU shall be mounted in a chassis (such as the Allen Bradley model number 1746-A10 or an Authority approved equal) with minimum of 10 slots or larger to provide a minimum of 2 slots for future additions.

18. Power Subsystem:

a. RTU shall operate from the 125 VDC Substation battery power panel. Internal DC-DC converters shall be supplied to provide reliable, filtered 24 VDC power.

1) Provide a dedicated 24VDC power supply and terminal block.

b. RTU power subsystem shall convert power as necessary to operate the RTU and distribute it to the sub-assemblies as required. The RTU's power subsystem shall conform to the following requirements:

1) Indicating lamps shall be provided which light only if the rated output of each voltage is present.

2) Provide over-voltage and under-voltage protection on the power supply outputs to prevent the RTU logic from being damaged due to component failure in the power supply, or from becoming unstable and causing invalid operations.

3) When the protection operates under normal conditions (no component failure) the output shall go into a current limiting mode and no source or output circuit breakers shall trip
4) Short circuit protection shall also be provided on the outputs. When the cause of the short circuit is removed, the output voltage shall return to normal.

5) Failure of the DC input source shall not cause any damage to the power subsystem.

6) Provide isolated power sources to interrogate status contacts.

c. Power distribution shall include disconnect switches or breakers such that all external power entering the RTU can be interrupted before it is distributed in the RTU. It shall be possible to repair/replace any of the RTU modules in a completely powered down state by interrupting power at these switches or breakers.

19. Battery Operation:

a. When the RTU is operating on substation battery power, all RTU functions shall continue to operate normally as the battery voltage deteriorates.

b. Before the battery voltage falls below the threshold of error free RTU operation, the RTU shall terminate all application functions, set a battery fail flag on the next reply to a scan from the SCS, followed by a complete power down of the RTU.

20. Grounding:

a. All equipment shall be adequately grounded to safeguard all personnel from shock hazards, and to provide noise elimination.

b. RTU assembly shall be grounded in accordance with the Contract Drawings and vendor recommendations to limit impact of possible EMI noise.

21. Equipment Replacement and Backup:

a. Provide a safe means for maintenance personnel to disable power to input/output circuits. The power –disabled state shall be indicated locally.

b. RTU shall provide for safe I/O card and communication module replacement. Upon replacement and power-up, self-tests shall automatically be initiated, and the RTU shall notify the SCS of the replacement. Self-testing shall include verification that the I/O configuration of the replacement card matches the previous I/O configuration.

c. Training:

1) Contractor shall provide training for the SCADA and RTU systems, this training shall be in addition to the training specified elsewhere in the Contract Documents. Provide:

a) Four 8-9 hour training sessions for RTU procedures.

b) Training booklets and materials for 8 personnel per session.

c) Training will be at the Authority’s facilities.

F. Thyristor Rectifier Alarms:

1. Visual and electronic relay alarms shall be provided to indicate failure of any element critical to the operation of the system.

2. Rectifier:

a. In addition to the control functions and alarm points as specified elsewhere in this Contract, the Contractor shall design the thyristor control system to provide fault signal control and indication logic which belong to one of the following fault and failure groups, provide both local and remote indication:

1) Thyristor Rectifier Fault 1: Rectifier not ready for operation, Cathode Breaker not closed, invalid test mode - electronics, TPSS air
2) Thyristor Rectifier Fault 2: Rectifier trip resulting in opening of AC and DC main breaker; all DC feeder breakers remain closed. AC main breaker may be reclosed or reset from SCADA if required. Rectifier control panel must be evaluated and the problem corrected to restart thyristor. Alarm conditions consist of TPSS air overtemp trip, emergency stop, low battery, blower failure, low air pressure, blower overtemp, bridge overcurrent, ripple fault, regulation fault, thyristor overtemp, AC line under voltage, DC current unbalance, DC short circuit – load, DC voltage unbalance, ON sequence time-out.

3) Thyristor Rectifier Fault 3: Opens AC and DC Main breakers. Feeder breakers remain closed. Rectifier over-temperature trip (Dev 26RH), Transformer over-temperature Trip (Dev 49th), Rectifier door open (Dev 33) and thyristor failure relay (Dev 98T).

4) Thyristor Failure Stage 1: (98A), No more than 1 thyristor per bridge fails.

5) Thyristor Failure Stage 2: (98T), More than 1 thyristor per bridge fails. The 86H lockout trips, 52 AC circuit breaker opens, and 72 DC main circuit breaker opens.

7) Thyristor Rectifier Overtemp Stage 1 (26R1): Annunciation point is activated when the thyristor temperature is higher than 85 degrees C.

8) Thyristor Rectifier Overtemp Stage 2 (26RH): Annunciation point is activated when the thyristor temperature is higher than 95 degrees C. The 86H lockout trips, 52 AC circuit breaker opens, and 72 DC circuit breaker opens.

9) Thyristor Rectifier Control Power Loss: Loss of DC control power or computer fault within thyristor rectifier - A trip signal is sent to the 86H lockout relay in an attempt to trip the incoming AC breaker and DC main breaker. If there is 125 VDC control power available, the lockout relay and circuit breakers will trip.

10) Thyristor Door Open (33): One of the thyristor compartment door limit switches has operated or failed. The 86H lockout relay trips, 52 AC breaker and 72 DC main breaker opens.

11) Negative Disconnect Switch Open: Negative disconnect switch open, local annunciation provided and initiates thyristor rectifier Fault 1.

12) DC Negative Over Voltage: DC negative over voltage annunciates when the running rail voltage increases above the set point of the negative rail-monitoring device.

13) NRGU Lockout (Closed): If the running rail potential rises above the set point (50 to 100 V) and the potential rise is not static, the pursuing current flow closes a contactor, grounding the running rail to earth ground and requires manual reset.

Test points for measuring DC current, voltage and other programmable analog signals shall be provided on the front control panel of the thyristor.
4. All functions in the control cubicle shall be integrated in a microprocessor based control system such as a PLC.

5. Thyristor control system shall incorporate control and indication points as necessary for a fully operation system.

6. Digital control system shall be equipped with enough memory and processor speed to store electronic data for annunciation and retrieval of up to a minimum of 100 past faults, each date and time stamped, which could be downloaded to a customer printer or computer. Time and date data shall be received by the OCC via SCADA once each day. In addition, the memory shall store the negative rail max voltage and max current and for the last 25 times the NRGU activated with time and date stamp. In addition, the memory shall store 24 hours of negative drainage current values at 10 second intervals with time and date stamp, then start re-writing the data.

7. For communicating with the thyristor digital control system, RTU’s, protection relays, and DPM, provide 4 new commercially available, personal notebook type computers (latest Intel processor, or equal,) with:
   a. Latest MS operating software (operating and equipment specific).
   b. 256 MB of RAM and 20 GB hard-drive.
   c. All required application programs to communicate with, download/upload, and check status of parameters of the above listed devices.
   d. Printed instruction manuals and electronic instruction manuals installed in all computers for all above listed devices.
   e. Leather carrying cases with space for computer accessories and cables.
   f. 3-1/4 inch floppy drive.
   g. CD drive.
   h. Optical mouse.
   i. Extra battery.
   j. All required interface cables.
   k. Ink jet type portable printers with extra ink cartridge.

8. Computers shall be used for programming and downloading programs, checking parameters and signal values, etc.

9. Units shall be supplied with the shipment of the first unit.

10. Training:
   a. Contractor shall provide in addition to the Training specified elsewhere in the Contract Documents the following training directly related to the thyristor control system:
      1) Four 8-hour training sessions for the thyristor control system procedures.
      2) Training booklets and materials for 8 personnel per session.
      3) Training will be at the Authority’s facilities.

G. Communication Interface Cabinet (CIC):

1. A CIC shall be provided in each TPSS. The CIC shall permit interface between the SCADA System via the RTU and the:
   1) AC breaker.
   2) DC breakers.
   3) Alarm and status indications.
   4) TRU.
   5) Substation auxiliary systems.

2. CIC shall be the primary enclosure for the Annunciator Cabinet, and shall be a NEMA 12 ventilated enclosure with hinged, gasketed cover/door; the enclosure shall be a padlockable cabinet with a 3-point latch.

3. General:
   a. CIC cabinet shall be sized to house the annunciator panel with enough depth and back panel space to accommodate the required number of SCADA and annunciator points with 20 percent spare capacity. Terminal block layouts shall be
vertical with wire troughs to prevent uncluttered wiring.

b. All substation SCADA control and status indication points shall be terminated in the CIC cabinet, and a 125 VDC to 24 VDC converter power supply shall be provided for power distribution to the SCADA, and communications equipment. Provide a dedicated circuit from the DC distribution panel.

c. Contractor shall provide internal and external wiring from the power supply, indication contacts, control functions, etc., to the status indication and control terminal blocks points.

d. SCADA points existing or entering the substation shall be terminated on protected or non-protected terminal blocks as approved by the final design.

e. In each TPSS CIC enclosure, the Contractor shall provide a permanent mounted wiring diagram for all SCADA point designations.

f. CIC enclosures shall have the following properties and characteristics:

1) Cutouts shall be provided as required for cable entrance.

2) Cable entrances shall be provided with bushings and shall be sealed.

3) Padlocks for all CIC’s shall be keyed identically.
   a) A master and slave key shall be provided with each substation. Verify keying with the Authority prior to installation.

4) A 3/8-inch high strength grounding stud and a No. 6 AWG stranded green insulated ground wire shall be used to ground the CIC.

4. Terminal and Terminations:

a. Unprotected terminal blocks shall be Weidmuller Test terminal or approved equal.

b. Provide assembly rail and modular terminals, Weidmuller Terminations, Incorporated, or equal.

c. Furnish modular test terminals, melamine plastic, and screw clamp connections, with socket screws, with the following requirements:

1) Amperes: 25

2) Volts: 300

3) Wire gauge range: 22 AWG to 12 AWG

4) Thickness: 0.256 inch

5) Terminal and terminations shall be UL Listed

d. Standard accessories: Compatible with the terminal, with the following additional requirements:

1) End Section: Type AP, No. 1179.2

2) End Bracket: Type EWK1, No. 2061.6

3) Test Plug: Type PS, No. 1804.0

4) Jumpering combination: Type QB, No.91455.0

5) Disconnect plug for SAKC4 terminal: Type TST, No. 413074

6) Locking Pin: Type SST#, No. 1527.0

7) Assembly rail: Type TS 32 steel

8) Marking tags: FW, No. 4681.6 white thermoplastic

e. Group marking carrier with paper marking strip and transparent cover:

1) Type SCHT5, Catalog No. 2924.6

2) Type ES05, Catalog No. 2937.0

3) SST, Catalog No. 2940.0
f. Two Weidmuller terminal block screwdrivers shall be provided with each TPSS CIC.

g. Provide protected terminal blocks for any power or data communication cabling and wiring, which either enters or exits the substation.

h. As required, terminal block surge protectors shall be provided in accordance with the referenced standards and these specifications.

2.13 BATTERY SYSTEM (125 VDC)

A. Contractor shall furnish and install with each TPSS, a battery, battery charger, battery rack, battery enclosure, battery disconnect switch and accessories to provide DC power for the Substation equipment.

B. General:

1. Contractor shall be responsible for determining the sizing requirements for the battery system. Contractor shall submit for approval, battery calculations indicating sizing and capacity.

2. Battery shall be nickel cadmium, ALCAD Vantage Valve Regulated, Type VN, Ultra Low Maintenance or an Authority approved equal.

3. Battery shall include all necessary vent caps, inter-cell, and inter-rack connectors for a complete and finished installation.

4. Battery system shall be sized to supply the high discharge rates necessary to close and trip each electrically operated AC and DC circuit breakers after the battery has supplied, without assistance from a charging source, the lower discharge rates required for the indicating lights and relay coil loads with the AC bus dead for 8 hours.

C. Warranty:

1. Battery capacity shall be sized in accordance with the Referenced Standards and the final design.

2. Battery shall have a 5 year full replacement warranty from date of acceptance and a 20 year prorated warranty to deliver not less than 80 percent of its rated capacity.

D. Operation:

1. The charger, in addition to float and equalize charging the battery, shall be designed to carry the full continuous and momentary connected DC loads without the station battery connected.

2. Sufficient filtering shall be provided to minimize the effects on the connected load with the battery disconnected.

3. When the AC supply to the charger is interrupted, the battery shall supply the required power for the load duty cycle for 8 hours.

4. A standard duty, DC rated, fused service disconnect switch shall be provided to isolate the battery for maintenance purposes without interrupting the control power load.

E. Assembly:

1. Battery shall have no requirement for water refurbishment over the 20-year warranty period.

2. Battery shall deliver a nominal 125 VDC at full charge to all substation equipment with an operating range from 95 VDC minimums to 130 VDC maximum.

3. Battery shall be designed for float service at 1.42 Volts per cell.

4. Battery shall consist of a sufficient number of cells with a maximum equalize voltage of 1.47 Volts per cell and provide 80 percent rated capacity after 10s hour of applied equalize charge.

5. Contractor shall establish the required capacity in rated ampere-hours for an 8-hour discharge rate to a terminal voltage of 1.04 V per cell at 77 degrees F.

6. Battery capacities and battery charger shall be adequate for the following load duty cycle over a period of 8 hours from a fully charged state with the battery charger out of service:

a. Normal continuous demand of all substation DC ancillary loads including relays, indicating lamps, meters, local annunciator panel, RTUs, fire and intrusion alarm, emergency lighting and all other supervisory control or power supply circuits.
b. After 8 hours, close and trip 1 high-voltage AC circuit breaker.

c. After 8 hours, close sequentially, all the 750 VDC switchgear circuit breakers.

7. Each positive and negative plate assembly shall be designed for the required battery duty cycle, within the specified substation operating temperatures ranges.

8. Each cell of the battery assembly shall be hermetically sealed and leak proof. Polarity of cell terminal posts shall be clearly and permanently identified.

9. Battery shall not be capable of explosion under any condition, including a short circuit discharge.

10. Battery cells shall be provided with inter-cell connectors. Connectors, plates, and lugs shall be lead-plated solid copper.

11. Battery Cabinet and Battery Rack:

a. Battery shall be installed in a full size, ventilated, fiberglass, multiple door cabinet, and in accordance with the battery manufacturer recommendations.

b. Cabinet shall be a NEMA type 1, painted ANSI 61 light grey and shall provide adequate ventilation at the top and bottom to dispense gas given off during charge and shall also minimize condensation.

c. Provide sufficiently ventilated (either passive or active) to provide sufficient air changes for projected hydrogen emission under worst-case conditions in accordance with battery manufacturers recommendations.

d. Cabinet shall be provided with multiple-tier and or multiple-step structural steel or fiberglass support racks with sufficient space above each rack to perform battery servicing as recommended by the battery manufacturer.

e. Battery rack shall be provided with insulating plastic strips to cover all supports, hold-downs, and restraining rails that are in contact with the battery cells.

f. Cabinet and racks shall be treated with corrosion-resistant finish paint coat.

g. Cabinet doors shall be constructed with sufficient structural support, with full size viewing windows made from perforated Lexan or approved equal.

F. Electrical Connections:

1. Overall layout should be as simple as possible with minimum cable lengths to reduce voltage drop.

2. The main positive and main negative take-off points should always be arranged well apart. The cables must be well secured and of ample length to avoid chafing and strain on the terminal sockets.

3. To maintain electrical integrity apply a light protective coating of NO-OX-ID non-corrosive grease or similar mineral jelly to each connection.

G. Insulating Mat:

1. An electrolyte resistant plastic mat shall be provided under each battery rack.

2. Battery mounting racks and enclosures should be solidly mounted for shipment.

H. Nameplates:

1. Each battery cell container shall be marked with the following information:

   a. Manufacturer's name.

   b. Month and year of manufacture.

   c. Cell type.

   d. Amp-hour capacity.

I. Accessories. One set of the following accessories shall be provided for each battery:

2. Battery maintenance logbook with standard test forms.

3. Quart of No-Co terminal grease.

4. Set of special tools, including torque wrench.

5. Set of cell identification numbers.
6. Main battery fuses and holders:
   a. Fuses shall comply with NEMA FU 1 and shall provide short circuit protection for the battery and main cables to the DC distribution panel.
   b. A general duty, fused disconnect switch or circuit breaker, 250 VDC, shall be mounted adjacent to the battery rack to provide service isolation of the battery.

7. Pegboard:
   a. Provide hardboard, AHA IS 1, tempered, SIS, 1/2-inch nominal thickness, perforated, sized to accommodate all products specified, framed with 1-inch by 1-inch hardwood.
   b. Paint frame and hardboard a color selected by the Authority.
   c. Include hardware for wall mounting and pegboard accessories suited to the products to be mounted.
   d. Provide nameplates as specified, 1-inch high by length as required, with accessory names inscribed in 1/2-inch high vertical letters.

J. Battery Charger:
   1. Battery charger shall be silicon-controlled rectifier, convection cooled, and constant voltage, current limited, complying with the referenced standards.
   2. Battery charger shall be designed to float charge nickel cadmium batteries.
   3. Charger shall be designed to provide a system life expectancy of 20 years.
   4. Battery charger enclosure shall be NEMA 1, ventilated.
   5. Enclosure shall be floor or wall mounted provided with a hinged front panel complete with lockable handle and 2-point latch, and equipped with knockouts for conduit entrance.
   6. Paint color shall be ASA 61 Grey.
   7. Battery charger shall be rated as follows:
      a. Capacity: Capable of float and equalize charging for the specified battery and simultaneously supplying continuous and short time DC loads.
      b. Recharging: Shall be designed to recharge the battery from a terminal discharge voltage of 1.04 V per cell to 80 percent of the battery recharge capacity in 10 hours, using 1.47 V per cell, minimum.
      c. Contractor shall provide certification tests to show battery charger is capable of supplying 80 percent of the ampere-hours required to recharge a fully discharged battery within 10 hours, in addition to maintaining substation continuous and short time loads.
      d. Input Voltage: 240 VAC, 60 Hz, single phase.
      e. Output Voltage: In accordance with specified battery float and equalize voltage requirements.
      f. Output Current: Appropriately rated for charging battery from discharged state, (i.e., 1.04 V per cell), while simultaneously supplying substation continuous and short-time DC loads.
      g. Charger shall be designed to operate as a DC power supply without batteries connected.
      h. Regulation: within plus or minus 1 percent of output DC voltage over its complete load range with within plus or minus 10 percent variation of input AC voltage.
      i. Current Limiting: Adjustable from 80-120 percent; factory set at 110 percent of output nominal current rating.
      j. Ripple: Output ripple voltage shall be 30mVrms or 0.06 percent of nominal output voltage, whichever is higher.
      k. Conversion Efficiency: 0 to 100 percent load; 80 percent (minimum).

K. Charger Accessories.
   1. Each battery charger shall be furnished with the following accessories:
a. One DC voltmeter, 0 to 200 V, 2 percent accuracy.
b. One DC ammeter, battery charge/discharge current, range as applicable, 2 percent accuracy.
c. One AC input pilot light (green LED) marked AC POWER ON.
d. One selector switch, 2 position or push-buttons marked FLOAT and EQUALIZE. LED indicator light provided when Equalize mode activated.
e. One AC input molded-case circuit breaker, NEMA AB 1.
f. One DC output molded-case circuit breaker, NEMA AB 1.
g. One 10 hour plus Current Limit Auto-Equalize Timer with “Equalize” indicating light Charger shall be switched to equalize mode for a set time interval after charger is in current limiting for 36 seconds or more. Equipped with "Float Reset" and "Equalize" override switch.
h. One combined status charger monitor alarm board provided with appropriately rated and quantity of relay contacts for local annunciation and remote status indication.
i. Red LED indicating lamps shall be provided for all alarms on the charger front panel. A “Lamp Test Reset” switch shall be provided for verifying lamp operation and resetting alarm lights.

2. The alarm monitor board shall include the following:
   a. AC failure alarm relay.
   b. High DC voltage alarm relay.
   c. Low DC voltage alarm relay.
   d. Charger failure alarm relay.
   e. Ground detection alarm relay.
   f. Common alarm relay.

3. Nameplates shall be provided for all battery charger devices, meters, etc.

L. Eye Wash Station:

1. Provide self-contained gravity fed eyewash for each TPSS. Unit shall be wall mounted, easily accessible and require no maintenance. Unit shall meet all ANSI and OSHA standard,

2. Be able to deliver fluid to both eyes simultaneously at a volume of not less than 0.4 gallons/minute for 15 minutes.

3. Velocity of fluid should not be high enough to cause eye injury.

4. Mounted 33 to 45 inches from the floor.

5. Mounted a minimum of 6 inches away from the wall or obstructions.

6. Activation time of 1 second or less and the unit should remain in operation without the need for continued activation.

7. Actuating valve or lever should be in an easily located area and be highly visible.

8. Must have nozzle caps to prevent foreign matter from accumulating in the nozzle area.

9. Nozzle caps should automatically separate from the nozzles when activated.

10. Highly visible signs must be posted in the area of the emergency eyewash. The location should be well lighted.

11. Provide with 2 spare re-fill kits for each Substation.

2.14 GROUNDING

A. General

1. Provide all grounding as required by the Referenced Standards and as specified herein.

2. All electrical equipment shall be bonded in accordance with the latest edition of the NEC. All interior-grounding conductors shall be green in color; tape wrap for indication will not be accepted.

3. Ground connections to cabinets, busses or equipment frames shall be made utilizing a compression NEMA type configuration lug, which shall be silver or tin plated copper. The lug shall be attached to the item being grounded with stainless steel or silicon bronze bolting hardware.
4. All connections shall be made in accordance with the manufacturer’s recommendations and with the use of a torque wrench.

B. Raceway and Cable Tray Grounding:

1. All metallic raceway and cable tray systems shall be bonded together to provide a continuous electrical ground path and connected to the overall grounding system.

2. Metallic cable trays shall be bonded to other cable tray components and conduits using a No. 4 AWG insulated green ground cable and NEMA 2-hole, compression type, tin or silver-plated copper lugs. Grounding shall comply with NEC and NEMA, and as otherwise shown.

3. Ground conductors shall be provided in non-metallic raceways systems.

C. DC Grounding:

1. Rectifier and DC switchgear equipment enclosures should be insulated from ground (6 feet minimum) and connected to a DC ground grid through a high-resistance device.

2. TPSS Installation Contractor will provide at each TPSS site an AC ground grid, DC ground grid, and utility ground as required.

3. DC surge arrester ground should be isolated from the AC ground mat and connected to DC ground grid.

4. AC ground mat and DC ground mat should be kept physically separated to limit the voltage on the DC ground mat due to transfer of potential from the AC ground mat.

D. Stray Current Monitoring:

1. Each substation shall be equipped with provisions to monitor stray currents. Each substation shall contain a negative switch cubicle with a shunt and disconnect switch.

2. Provide means to connect the shunt to a chart recorder or voltmeter to monitor and record stray currents.

2.15 CABLES AND WIRE

A. Control Wiring: Secondary and control wiring (low voltage) shall be minimum No. 14 AWG, stranded copper conductors, Type SIS insulation.

B. 600 Volt:

1. All conductors shall be 98 percent conductivity copper with insulation rated 194 degree F.

2. For size No. 1/0 AWG and smaller, NEC Type XHHW-2, Cross-linked-thermosetting-polyethylene-insulated or NEC Type THW-2 ethylene-propylene-rubber-insulated conductors are approved for use.

3. For size No/ 2/0 AWG or larger, NEC Type THW-2, Ethylene-Propylene-Rubber-Insulated conductors are approved for use.

2.16 EQUIPMENT IDENTIFICATION NAMEPLATES

A. General:

1. Size and legends of all nameplates shall be submitted to the Authority for approval. Each switchgear assembly, rectifier unit, transformer unit, circuit breaker auxiliary unit, control panel, panel-mounted and auxiliary device shall be provided with a nameplate for proper identification.

2. Similarly, nameplates shall be provided for all internally mounted devices such as fuse, capacitors, and resistors. Nameplates identifying major equipment shall have lettering 1-inch high (minimum). Where rear access is provided, 2 nameplates shall be furnished, 1 on the front and 1 on the rear of the equipment.

3. Nameplates identifying AC and DC circuit breakers shall have lettering 1-inch high (minimum). The inscription shall include circuit breaker number and service.

4. Nameplates for relays, meters, control and instrument switches, fuses and auxiliary devices shall have 0.125 inch (minimum) lettering. For protective and auxiliary relays, the nameplate inscription shall include the device number and function. Nameplates for fuse shall indicate fuse rating, polarity, and circuit identification.

5. Nameplates identifying each Substation shall be mounted next to each entry door. Nameplate shall have 3-inch high lettering with the inscription “TPSS #1, TPSS #2, etc. Below the Substation number, provide a separate nameplate with the name of the Substation, such as “Victory”, “Walnut”, etc.

6. All nameplates shall be laminated, 3-ply plastic with a dull white surface and black core. All exposed edges shall be beveled.
Nameplates shall be fastened with stainless steel screw.

2.17 INDICATION LIGHTS
A. General: Indicating lights on equipment enclosures shall be LEDs. The LEDs shall be suitable for operating over the range of control voltages as specified by the final design. The LEDs shall be mounted in compact, rugged sockets, and shall be of the bayonet base design. Lenses and bezels shall be rectangular in design. The design shall permit ready replacement of the LEDs from the front. Lenses shall emit convenient reading of the LEDs from oblique angles. Overall dimensions of the lens and bezel shall not exceed 1–3/8 inch in width and height.

2.18 OTHER EQUIPMENT AND MATERIALS
A. Electrical Insulation:
1. Floor insulation thickness shall be determined by the final design calculations, but not less than 1/3 inch.
2. The extent of floor insulation shall be as required to maintain the integrity of the high resistance grounding system.
3. Substation walls behind and to the sides of the DC equipment enclosure shall be insulated with fire resistant insulating material that meets Class 1 flame spread requirements of UBC.
4. Insulation system design shall protect against any accidental contact between the DC equipment enclosure and grounded metal surfaces.
B. Telephone Cabinet and Equipment:
1. Provide a 1-hour fire rated, 4’x8’ plywood backboard for mounting telephone equipment. The rating of the plywood shall be stamped on both sides of the backboard.
2. Telephone cable will be provided from the CIC. Provide a conduit raceway from the CIC to the telephone location. Refer to Communications Specifications for cabling requirements.
3. Telephone, telephone cabinet and telephone equipment shall be provided in accordance with Specification 16851, Telephone Subsystem – Communications System.

C. Safety and Maintenance Equipment:
1. First Aid Kit: Provide a complete first aid kit for each Substation in accordance with the requirements of OSHA and the local ordinances. Provide Elmridge Protection Products 11 Pack First Aid System item 100-ARBBP or Authority approved equal.
2. Emergency Eyewash: Provide portable eye wash system that utilizes plastic bottles that maintain their sterilization unless used.
3. Personal Protective Equipment (PPE): Contractor shall furnish a complete set of PPE as required by the manufacturer and OSHA for each Substation. The PPE shall include at least:
   a. Arch flash protection suit.
   b. Eye protection.
   c. Acid/electrolyte resistant gloves and apron.
D. Table: Provide a fold down table. The location of the table may be changed to fit the final design and layout of the equipment.
E. Single Line Diagram: A Substation condensed single line diagram, 22 inch by 34 inch, in polyvinyl frame, shall be provided for each Substation. Provide complete with legend and symbols on a single sheet

2.19 ANCILLARY
A. This Section provides the requirements for Special Tools and Spare Parts for the Substations that shall be part of this Contract. In addition, requirements as outlined in this Section and the Contract Pricing Schedule shall provide for the provision of a recommended additional spare parts list to be used by the Authority in maintaining a complete spare parts inventory.
B. Special Tools: All special tools, lifting hardware, templates and gauges required to operate and maintain the TPSS shall be provided at each Substation. All special gauges and templates necessary for field erection shall be included. Equipment shall be included in the contract price, no additional compensation will be allowed.
C. Submittal: A detailed Spare Parts and Special Tools Listing. Provide a list (120 days prior to shipment) of all spare parts, special tools and test equipment for each piece of equipment, assembly, or sub-assembly. List by equipment and include tools and equipment designated specifically for use with the TPSS, or usual tools and equipment
required for operation and maintenance of the TPSS but not normally available to maintenance journeyman.

D. Lock-Out-Tag-Out Devices: A lock-out-tag-out device shall be provided for each circuit breaker. The device shall be capable of being secured by up to 6 padlocks.

E. Padlocks: A padlock shall be provided for each circuit breaker and disconnection switch. Two keys shall be provided for each padlock. Master lock or an Authority approved equal, verify keying with the Authority.

F. Keys: Two keys shall be provided for each door and removable panel.

G. First Aid and PPE Cabinet: Cabinet shall be provided for storage of the first aid kit and PPE equipment.

H. Document Cabinet: Install a wall-mounted cabinet with shelves for storage of instruction books, records, log books, switching tags, and other pertinent documents. Furnish the cabinet with doors and closing and latching mechanism. Select cabinet with dimensions 15 inches deep, 24 inches wide and 24 inches high, minimum.

I. Spare Parts Cabinet: Install a wall-mounted cabinet to store small spare parts. Furnish the cabinet with doors and closing and latching mechanism. Select cabinet with internal dimensions 14 inches deep, 24 inches wide and 24 inches high, minimum.

J. Work Desk:
   1. Each Substation shall contain a wall-mounted worktable with sliding drawer, storage cabinet and doors.
   2. Provide a replaceable, non-conducting composition board worktable surface.
   3. Provide table surface approximately 48 inches by 30 inches, minimum.

K. Drawing storage: Provide a hanging “plan holder”, wall mounted with a minimum capacity of 100 full size sheets.

L. Required Spare Parts (System Wide): In addition to any special tools and spare parts required elsewhere in this Specification, the Authority may choose from the following list based on the allocated spare parts budget. Contractor shall deliver the selected spare parts prior to delivery of the first TPSS.
   1. Main AC 15KV circuit breaker, truck mounted – Quantity: 1
   2. Main DC circuit breaker, truck mounted – Quantity: 1
   3. DC feeder breakers, truck mounted – Quantity: 2
   4. One complete set of all devices and components for a thyristor-rectifier assembly including control unit, circuit boards, protective devices, etc.
   5. Complete rectifier transformer of each type – Quantity: 1
   6. Station Service Transformer – Quantity: 1
   7. Signal Service Transformer – Quantity: 1
   8. Spare control relays of each size and type – Quantity: 5
   9. Spare relay of each type furnished – Quantity: 1
   10. Spare CT of each size and type – Quantity: 1
   11. Protective over-current relays of each size and type – Quantity: 5
   12. DPM of each size and type – Quantity: 2
   13. Interposing relays of each type – Quantity: 2
   14. PT of each size and type – Quantity: 1
   15. Instrument and control switches (each type) – Quantity: 2
   16. LA of each size and type – Quantity: 2
   17. Fuses of each size and type – Quantity: 10
   18. LV circuit breakers of each size and type – Quantity: 5
   19. LED indicator lights (each color) – Quantity: 5
   20. Terminal blocks of each type – Quantity: 5
   21. Unit space heaters – Quantity: 2
   22. One set of battery charger spare parts as recommended by the manufacturer.
   23. Ionization smoke detectors – Quantity: 2
   24. Photoelectric smoke detectors – Quantity: 2
25. Thermal detectors – Quantity: 2

26. Load measuring resistors – Quantity: 2

27. Complete set of opening and closing coils for each type of DC breaker and AC breaker – Quantity: 2

28. Complete set of main and arching contacts for each type of DC breaker and AC breaker – Quantity: 2

29. Spring charging motor for 15kv AC circuit breaker, main DC circuit breaker and DC feeder circuit breaker – Quantity: 1

30. Individual power thyristors of each type – Quantity: 12

31. Individual power diodes of each type – Quantity: 12

32. Air filters for HVAC system – Quantity: 160

33. Fifth wheel device for moving DC Feeder breakers, one for each Substation.

M. TPSS Spare Parts (for each TPSS):

1. Provide, for approval by the Authority, a complete list of spare parts that will be provided for each TPSS

2. Provide for each TPSS, spare parts as specified herein, and as recommended by the manufacturer of each TPSS assembly and sub-assembly.

3. Spare parts shall be delivered prior to or upon delivery of each TPSS.

4. For each TPSS include such items as required for normal and emergency use.

N. Recommended Spare Parts List:

1. In addition to the spare parts provided above and elsewhere in this Contract, the Contractor shall develop a list of recommended spare parts for the TPSS(s). The quantities in the list shall be as recommended by the fabricator for 2 years of revenue service. The list shall include current prices for all parts. Contractor shall certify that prices are the current prices for spare parts and are offered to others for the same quantity purchase. The Spare Parts List shall include the following information for each part:

a. Nomenclature.

b. Purpose.

c. Manufacturer's part number or drawing number.

d. Manufacturer's name and address.

e. Quantity recommended by manufacturer.

f. Recommended source of supply.

g. Estimated lead time.

h. Contractor's stock number.

i. Supplier and manufacturer's part number.

j. Name and address of supplier or manufacturer.

k. Assignment (type of assembly).

l. Drawing reference number.

m. Lead time for reorder.

n. Frequency and reasons for replacement based on records.

o. Each part or component shall be identified as being part of next larger assembly or subassembly.

PART 3 - EXECUTION

3.1 GENERAL

A. Contractor shall diligently pursue the execution of this Contract by:

B. Provide the final design, submittals, fabricate, manufacture, and testing for the new Substations as specified herein.

C. Coordinate with the Authority and other Agencies, Contractors to provide a complete and operational Traction Electrical System.

D. Provide factory testing and certification. Perform all phases of design, fabrication manufacturing by qualified and experienced personnel using proper tools and equipment under competent supervision.

E. Provide factory QC procedures and measures that will assure a complete and quality product. Use only products and materials free of asbestos and other potentially harmful substances.
F. Provide field acceptance and verification field-testing procedures, field testing and final certification for each Substation.

G. Using the specified guidelines and references, perform the design, production and conformance tests for each type and rating of transformer/rectifier; AC switchgear, DC switchgear and associated assemblies.

H. Provide on-site support for interface, troubleshooting and system integration with other Authority Contractors and system integration for each Substation.

3.2 DESIGN CONFERENCE

A. Contractor shall attend all meetings and conferences as specified in the Contract Documents.

B. During the first design conference the Contractor shall provide the following information:
   1. Certify overall dimensions and weights.
   2. Submit an initial drawing submittal list.
   3. Submit an initial production schedule.

3.3 FACTORY FABRICATION

A. General:
   1. Furnish, install and test all electrical equipment, equipment assemblies, conduit, cable tray, cables in accordance with the requirements of all Federal, State and Local codes and standards, manufacturer’s instructions and the Contract Documents.
   2. Unless approved otherwise by the Authority, the construction of all TPSSs shall be uniform and comply with the requirements as specified herein and elsewhere in the Contract Documents.

B. Cable and Wire: Control and power wiring shall be as specified herein and shall be neatly laced and properly supported. No splices will be permitted in any wiring. Control and instrument wiring shall be isolated from high-voltage compartments and shall be readily accessible. Wiring shall be protected as required from mechanical injury.

C. Connections:
   1. Connections shall be made only at terminals on the devices, on terminal blocks, or the ground bus. No splices or taps shall be made between these terminals points. Junction boxes shall not be used.
   2. Connections for wiring shall be made using ring-type compression connectors with insulated compression sleeves.
   3. Insulated sleeve shall firmly grip the wire insulation, and the metallic portion shall firmly grip the strands of the conductors.
   4. All control, metering and relay circuits requiring external connections and all unused terminals on auxiliary contacts, devices, relays, instrument transformers, and control switches shall be wired to conveniently located terminal blocks having washer head screw-type terminals, circuit marking strips, and phenolic-laminated dust covers.

D. Terminal Blocks:
   1. Terminal blocks shall have marking strips for wire identification.
   2. All internal wiring shall be identified with Contractor’s wire number at each terminal by means of a suitable plastic sleeve of yellow or white PVC with machine-printed black marking on a matte surface.
   3. Adequate identification for reconnection of control circuits, disconnected to meet shipping requirements, shall be provided on terminal blocks.
   4. Marking strips shall be an approved type.
   5. Shorting type terminals blocks shall be provided for CT connections. A minimum of 10 percent spare terminals but no less than 4 terminals shall be provided on each terminal block.

E. Surge Protection:
   1. Install the AC and DC surge suppressors and surge arrestors as required by the Contract Documents, the NEC and standard industrial practices, install as close as possible to the protected Circuit Breaker.
   2. Install the individual electronic equipment and transient voltage suppressors as close as possible to the protected equipment.
   3. For interior equipment grounding, use insulated green copper cable sized per the manufacturer recommendations for all live connections. Connections between surge
arresters and ground busbar or ground grid may be by bare copper conductors.

F. Substation Grounding:

1. Contractor shall make provisions for grounding of the Substation at the site by providing means to:
   a. Connect the rectifier transformer grounding pads to the Substation AC grounding grid.
   b. Connect the Substation housing grounding pads to the Substation AC grounding grid.
   c. Solidly connect the AC equipment grounding busbar to the Substation grounding grid by 4 corner connections.
   d. Connect the DC equipment grounding busbar to the SubstationDC grounding grid by 2 connections.
   e. Connect the utility surge protection to the utility Substation grounding point.
   f. Connect the DC surge protection to the DC grounding grid.
   g. Connect electronics equipment, such as the SCADA and PLC equipment, to the AC ground grid.

G. Protective Device Settings: Factory set and test all protective devices in accordance with the results of the approved Protective Device Coordination Study.

3.4 TESTING GENERAL REQUIREMENTS

A. General:

1. This section specifies the tests that shall be performed to demonstrate conformance of the TPSS to this Specifications, industrial standards and the Referenced Standards. The testing shall demonstrate that the TPSS conforms to the ratings as specified and meets the mechanical and electrical performance requirements of these Specifications.

2. These tests are defined as:
   a. Design Tests.
   b. Production Tests.
   c. Conformance Tests.
   d. Field Acceptance and Verification Tests.
   e. System Integration Tests.

3. Contractor shall be responsible for the design tests, production tests and conformance tests and field acceptance tests. Contractor shall support the final System Integration Testing.

4. Contractor shall perform the Field Acceptance tests for each TPSS and shall field certify each Substation to comply with these Specifications and to be ready for energization and service.
modifications of a previous design and to ensure that performance has not been adversely affected. The data from previous similar designs may also be used for current designs, where appropriate.

7. If requested by the Contractor, the Authority may waive the requirements for design tests on standard equipment and materials that are to be used in the fabrication of the TPSS. Contractor shall:

   a. Using the submittal process in the Contract Documents, the Contractor shall submit to the Authority the materials or equipment to be furnished that the Contractor is requesting a test waiver on.

   b. State the reason and basis for the waiver request.

   c. If required by the Authority, the Contractor shall submit to the Authority for review the test procedures, test results, and certified documentation of like equipment.

C. Production Tests:

1. Production tests shall be defined by the following:

   a. Production tests shall be made by the manufacturer or fabricator at the production facility as part of the process of producing the equipment, assembly or sub-assembly.

   b. Contractor shall provide confirmation that all required factory tests of systems, subsystems, assemblies and sub-assemblies supplied under this Contract have been successfully performed. These tests shall verify design, nameplate ratings, and adequate and proper performance.

   c. Production tests may be performed in association with other testing requirements if approved by the Authority. Production tests may be made on devices or representative samples, to verify the product meets the design specifications and applicable standards.

   d. The equipment specified in this Contract shall be completely assembled and tested prior to shipment, production tests may be made during assembly and prior to final assembly, but other tests can often be made more effectively on components and sub-assemblies after assembly.

   e. Production tests shall be made and shall include the following as appropriate for the type of equipment concerned:

      1) Current and linear coupler transformer tests.
      2) Bushing tests.
      3) Dielectric withstand tests.
      4) Pressure tests.
      5) Nameplate check.
      6) Leakage tests.
      7) Resistors, heaters, and coils check tests.
      8) Power frequency tests.
      9) Maximum voltage tests.

D. Conformance Tests. Conformance tests shall be defined in this Contract as:

1. Tests performed on the completed TPSS unit, assembly or sub-assembly to demonstrate that the unit will perform in compliance with the Contract Specifications. Conformance testing will be performed to show compliance with the basic requirements of these Specifications and the Referenced Standards. Conformance testing may be performed in association with other testing requirements if approved by the Authority.

2. Conformance tests shall be made on each TPSS unit and testing results shall be submitted to the Authority for approval.

3. In addition to the tests required herein and in the Referenced Standards, if requested by the Authority, additional conformance tests may be required to demonstrate compliance with the applicable standards. Note that prior to initiation of the conformance test all planned production tests will be performed.

4. The conformance tests may be similar to certain design tests. If approved by the Authority individual conformance tests may
be certified as completed upon successful performance as Design tests.

E. Field Testing:

1. General:
   a. After the TPSS has been completely assembled and installed at the job site, field energization testing and acceptance tests shall be performed by this Contract,
   b. System Start-up and commissioning support shall be provided by this Contract.
   c. Coordinate with each TPSS Installation Contractor for startup and testing coordination.
   d. This Contract shall coordinate with each TPSS Installation Contractor to perform the testing and acceptance in as timely a manner as possible. Contractor shall, without delay, test and energize each TPSS unit as it is placed on the site foundation.

2. Pre-Energization Testing:
   a. Each TPSS shall be received, off-loaded and placed on the foundation by the Line Section Contractor. This Contract shall witness the off-loading and utility service installation.
   b. After each Unit is installed on the site foundation and the service utility cables are installed, this Contract shall perform those tests required to verify that the Substation is ready for energization. This Contract shall energize the Substation. This Contract shall then certify that the Unit is ready for the TPSS Installation Contractor to connect the OCS feeder circuits, negative return cables, grounding cables and all other communications and external wiring and conduits.
   c. After completion of the Substation, installation the Section TPSS Installation Contractor shall notify the Procurement Contractor that the Unit is ready for “Acceptance” testing.

3. Acceptance Testing:
   a. TPSS Procurement Contractor shall complete all field-testing as required to “accept” the Substation and verify that the Substation conforms to the design and specifications. Substation energization may be performed prior to all incoming circuits being terminated. Coordinate each TPSS testing and energization with the TPSS Installation Contractor to minimize field-testing requirements.
   b. Testing procedures shall be designed to duplicate as nearly as possible all conditions of operations, and shall be carefully selected to ensure that the equipment is not damaged.
   c. Field acceptance testing shall not commence until all design affecting the respective equipment has been reviewed and accepted by the Authority.
   d. When the acceptance testing has been completed, the Substation has been energized, and all circuitry has been verified and documented, the Contractor shall notify the TPSS Installation Contractor that the Substation is ready for System Integration Testing.

4. Integrated System Tests:
   a. Integrated testing shall be performed during the Line Section start up. The startup and integrated testing of the Authority’s Light Rail System will be implemented in Sections with separate completion milestones as indicated in the Construction Schedule.
   b. TPSS Procurement Contractor shall be present during the startup period to assist in system integration, troubleshoot system failures, and assist in any problems that might arise. Contractor shall provide
support personnel to perform the integrated system tests for all line segments.

c. When a piece of mechanical or electrical equipment is found to be in conflict with specific criteria, an adjustment shall be made to the item by an experienced representative of the manufacturer.

d. If adjustments fail to correct the operation of a piece of equipment or fixture, the Contractor shall remove the equipment or fixture from the project site and replace it with a workable replacement that will meet the specification requirements.

e. Test support shall be provided for the following tests:

1) Train Starting Tests: Proper operation and coordination (i.e. no nuisance tripping) of the DC feeder circuit breaker relaying shall be verified during starting of two 3-car trains at the substation and at the midpoint between each substation. The weight of the vehicle to be simulated during this test shall be based on the worst loading condition of approximately 142 kips.

2) Load Sharing Tests: Proper load sharing between two TPSS shall be verified during starting of two 3-car trains halfway between the 2 substations.

3) Rectifier Short Circuit: (testing on 1 Substation only).

a) A short-circuit fault test shall be conducted to 1 Substation to prove the protective devices for the TPSS design. At a substation, to be selected by the Authority, the TPSS Installation Contractor shall apply a direct fault between 1 contact wire of the OCS and the associated running rail at the following approximate distances from the selected Substation DC feeder circuit breaker:

   (1) At the point of connection of the feeder positive circuit to the OCS.

   (2) A distance of 1/10 mile from the Substation.

   (3) A distance of 1/2 mile from the Substation.

   (4) A distance of 3/4 miles from the Substation.

b) Field Test Monitoring:

   (1) AC circuit breaker, DC main breaker, and DC feeder of each substation shall all be monitored simultaneously by a high-speed chart recorder to show the current, voltage and status of each circuit breaker during and after each short circuit application. In addition, current in each phase of the AC circuit breaker shall be monitored. Test results, such as total inrush current, steady-state fault current, impulse time of the faulted unit, clearing time of the faulted unit, and primary system capacity shall be recorded on oscillograph. All data recorded
on oscillograph shall be properly labeled and identified.

(2) All equipment, including the Substation enclosure, shall be inspected for damage including loose bolts after each short-circuit test. In addition, all breakers subjected to fault conditions shall be production tested in accordance with their applicable ANSI standards. Any reconditioning required returning these circuit breakers to original condition shall be at the Contractor's cost. Failure of the equipment to withstand these tests or to coordinate or meet specified requirements should be grounds for rejection of the equipment.

f. Remote control, indication and alarm functions for each Substation equipment and switching equipment through the SCADA interface shall be verified to demonstrate proper operation.

g. A report shall document the results obtained from the integrated system tests. Report format shall be similar to that specified herein.

5. Testing Plan:

a. TPSS Procurement Contractor shall prepare a “test plan” for each Substation. The most current edition of the NETA Acceptance Specifications shall be used as a guide. The “test plan” shall document the history of each Substation from assembly, factory testing to delivery and final acceptance by the Authority.

b. Provide a complete bound document for each Substation with the following sections:

1) Factory design tests.

2) Factory production tests.

3) Factory conformance tests.

4) Pre-energization testing.

5) Acceptance testing.

6) Integration testing.

7) Acceptance certification.

c. Maintain a record of the testing for all mechanical and electrical equipment specified, including interface with the supervisory and communication system and all alarm and operating modes for each piece of equipment (circuit breakers, rectifier, battery/charger, etc.).

d. Testing Plan shall outline in detail the test requirements and testing procedures that the Contractor shall complete to certify the Substation has been manufactured in accordance with these Specifications and the Referenced Standards.

e. Include detailed descriptions and operations of all electrical, mechanical and instrumentation equipment.

f. Testing Procedures shall address each control device, all mechanical, electrical, and control circuits. Present the Testing Plan in a stepwise, logical sequence to ensure that all equipment has been properly serviced, aligned, connected, calibrated and adjusted prior to operation.

g. Testing Plan shall identify:

1) The approach to be used for accomplishing each of the required tests.

2) The projected schedule and sequence for tests.
h. Field tests shall be conducted on the Substation equipment preceding Substation energization. Include as part of the Testing Plan a section that will list in detail the "steps" required for energization of the Substation. List in a systematic format or block diagram.

i. Testing Procedures shall be bound, containing all the forms, testing data, Referenced Standards, and other related items that will become a record document, provide 1 bound "Testing Plan" for use at each Substation.

6. Acceptance Testing Plan:

a. All Substations shall be factory tested prior to shipment. However, the Substations shall be Field (Acceptance) tested after each Substation has been placed on site.

b. Include in the Acceptance Testing Plan as a minimum the following:

1) Enclosure. Visual Inspection for:
   a) Painting conformance.
   b) Frame or metal deformation.
   c) Access doors operation.
   d) Locks and access.
   e) Equipment movement.
   f) Verify equipment with bill of material.

2) AC Switchgear:
   a) Visual Inspection.
   b) Mechanical functional operations test.
   c) Electrical functional operations test.
   d) Bus Insulation Test.
   e) Ground Continuity test.
   f) Perform Relay Calibration settings and tests.
   g) Verify instruments at 25, 50 and 100 percent scales.

3) Rectifier Transformer:
   a) Visual inspection.
   b) Megger tests.
   c) High-potential test on HV winding.
   d) High-potential test on LV winding.
   e) High-potential test HV to LV, HV & LV to ground.
   f) Verify winding temperature indication.

4) Rectifier:
   a) Visual inspection.
   b) High-potential test of AC and DC Bus.
   c) Rectifier frame insulation test.
   d) Rectifier start-up and calibration.

5) Transformer – Thyristor Controlled Rectifier Unit:
   a) Visual Inspection.
   b) Test and verify all control functions.
   c) Cabinet door operator interface and indicating lights.
   d) Verify rectifier bridge(s).
   e) Verify fan control.
   f) Annunciator interface.
   g) Temperature control.
6) DC Switchgear:
   a) Visual Inspection for each breaker section.
   b) Verify all field connections (control & power).
   c) Verify all ground connections.
   d) Verify that all similar breakers are interchangeable.
   e) Mechanical functional operations test.
   f) Electrical functional operations test.
   g) Ground continuity test.
   h) Relay calibration tests.
   i) Perform relay calibration settings and tests.
   j) High-potential test on DC bus.
   k) High-potential test on each DC circuit breaker.
   l) Verify instruments at 25, 50 and 100 percent scales.
   m) Test all load measuring devices.

7) DC Negative Switch:
   a) Visual Inspection.
   b) Verify mechanical operation.
   c) Verify interlock key operation.
   d) Contact resistance test.

8) Structural Ground (Device 64):

9) NRGU (Device 57NR):
   a) Test forward and reverse voltage detection pickup and drop off.
   b) Test forward and reverse current detection pickup and drop-off.
   c) Inject voltage between rail and earth ground to measure and record pickup voltages at 1/10, 1/4, 1/2, 3/4 miles from the TPSS. Then inject 845vdc in earth ground at 1/10, 1/4, 1/2, 3/4 miles from the TPSS to determine if the NRGU picks up.

10) Battery and Battery Charger
    Perform all tests as recommended by the manufacture including:
    a) Visual inspection.
    b) Check for proper polarity.
    c) Verify supply voltage.
    d) Verify and record cell voltages.

11) Annunciator:
    a) Visual inspection.
    b) Operational test for each alarm circuit.
    c) Operational test for each control circuit.

12) AC and DC Test Cabinets:
    a) Visual inspection.
    b) Verify polarity of DC supply.
c) Test "Close" and "Open" function.

d) Test plug/receptacle interlock.

13) Busways:
   a) Visual inspection.
   b) Verify all bus connections and insulation.
   c) High-Potential tests.

14) Distribution (Auxiliary Power) Transformers:
   a) Visual inspection.
   b) Verify fuse size and ratings.

15) Distribution Panels:
   a) Visual Inspection.
   b) Verify circuit breakers size and ratings with drawings.
   c) Verify input and output voltages.

16) Relays, Meters, and Instrument Transformers:
   a) Visual inspection.
   b) Calibrate, set and test each relay and relay function.
   c) Operational test of each relay by signal injection.

17) TPSS:
   a) Visual inspection.
   b) Verify correct operation of all interlocks.
   c) Verify correct operation of all Annunciator functions.
   d) Verify correct operation of all PLC functions.
   e) Test all lighting and AC power operations.
   f) Insulation to ground tests on the busses with circuit breakers and fused interrupter switches "racked" and "closed."
   g) Test for proper operation of all protective, control and annunciation devices.
   h) Functional test for all auxiliary equipment and alarms, such as air conditioning units, "house" wiring, SCADA, etc.
   i) Test all equipment grounding.
   j) Test all structure grounding.

18) Fire Detection System.  Perform all tests as recommended by the manufacturer including:
   a) Visual inspection.
   b) Functional test for each alarm point.
   c) Functional test for emergency trip scheme.
   d) After the smoke sensing fire detection system is completely installed, it shall be tested for continuity and correct operation in accordance with NFPA 72H.

19) Cooling equipment:
   a) Visual inspection.
   b) Perform functional tests of all cooling
20) Continuity and Control Function Tests. Perform control function tests of all circuits including relays, annunciation, indication circuits, shutdown circuit functions and alarms. As a minimum test:

a) For control circuits, include all equipment, devices, interconnecting wiring and cabling.

b) Control wiring shall be tested prior to the operational test with the controls energized, but with the controlled equipment and devices disconnected or otherwise made inoperable.

c) For these tests, the control functions shall be checked for proper operation by actuating each contact that initiates a control operation and then following the control sequence through the various affiliated devices to ascertain that the correct results are obtained with each condition of interlocking.

d) The actuating of contacts as required to initiate an operation and to set up the interlocking conditions should be performed by simulating operating conditions.

e) The minimum voltage required to operate breakers and the tap and time dial settings of all relays shall be verified in accordance with the relay coordination study.

f) All relays shall be bench tested in accordance with the relay manufacturers data and curves.

g) Minimum pickup and dropout of under-voltage relays.

h) Check interlocks on rectifier doors for proper functioning and operation of Substation shutdown circuits.

i) Check required setting of heater thermostats.

21) Rated Voltage Test:

a) The entire Substation shall be energized at rated voltage to verify functionality of all components, devices, relays, etc. including lighting, heating, battery chargers, RTUs, fire alarm panels, station service panels, AC breakers, thyristor rectifier, DC breakers, annunciator and any other installed hardware.

b) Contractor shall develop a check sheet and procedure for completing this function.

c) The test procedure shall be approved by the Authority prior to energization.

22) Grounding:

a) Perform insulation test on structure to ground and operation of ground relays.
b) Test all equipment grounds for continuity and resistance.

23) RTU's: Complete field functional, interface and performance testing shall be performed for all RTU software/firmware developed under this Contract.

24) SCADA RTUs. Perform all tests as recommended by the manufacturer including:
   a) Visual inspection.
   b) Operational test for each input signal.
   c) Operational test for each output signal.
   d) Operational test for each transfer trip point.
   e) Operational test for the Emergency Trip Scheme.

25) Negative Return and Drainage Assembly:
   a) Visual inspection.
   b) Verify connections and insulation.

26) Insulating Floor:
   a) Test the floor resistance using high voltage megger.
   b) Take 1 resistance reading for each 3 feet by 3 feet area of insulated floor. The average of all the resistance readings shall be at least 10 megohms.

2) Test Procedures shall include the following as a minimum:
   a) Objective and scope.
   b) A description of the required test set up, including diagrams, schematics.
   c) Illustrated drawings showing test equipment connection set.
   d) Test equipment to be used.
   e) Personnel required for the test.
   f) Estimated duration of test.
   g) Data sheets to be used.
   h) Step by step instructions for performing the test, identifying the points where data is to be recorded and the limits for acceptable data.
   i) Instructions for recording data on data sheets or verifying that individual procedure steps have been completed.
   j) Pass/fail criteria.
   k) Test results will be reviewed by the Authority and accepted, as submitted or additional tests may be required.
   l) If additional tests are required because test results submitted do not comply with the requirements of the Specifications, the Contractor will be requested to retest.
at no expense to Authority.

d) Test Reports. Test reports shall document the results obtained and be certified by the testing technician and the CQCR. Reports shall include the following:

1) Equipment tested, including model and serial numbers.

2) Title of test.

3) Objective of test and pass/fail criteria.

4) Summary and conclusions.

5) Location and date of test.

6) Test method and equipment used for test.

7) Results, including calculations, curves, photographs, and other supporting data.

8) Abbreviations and references.

9) Signature of CQCR.

7. Special Tests:

a) At the discretion of the Authority, on equipment provided under this Contract and in addition to the specified Acceptance tests and integrated system tests, special tests may be required.

b) Special tests shall be performed to verify compliance of the equipment and components with the Specifications.

c) The cost of such special tests required by the Authority on any equipment or component that is proven to comply with the Specifications will be at the expense of the Authority. The cost of special tests on any equipment or component that is proven not to comply with the Specifications shall be at the expense of the Contractor.

3.5 FACTORY FABRICATION, TESTING AND INSPECTION

A. Scope. The work described in this Section consists of tests and inspections to be performed to demonstrate that systems, subsystems, assemblies, subassemblies and components supplied under this Contract comply with the Specifications. Provide:

1. Provide complete fabrication services as specified herein and elsewhere in the Contract Documents.

2. Contractor shall supply complete testing, and operator training services to ensure operability of all equipment supplied.

3. This Section describes methods for performing tests specified (herein and in the Referenced Standards) for testing the Substation at the Contractors facilities. It is intended for use as a basis for performance, safety, and the proper testing of each Substation, the Contractor shall submit to the Authority for approval a “Factory Testing Plan and Procedures” for testing per these specifications.

4. All equipment, assemblies, and sub-assemblies supplied by the Contractor shall be installed in accordance with the manufacturer’s recommendations and instructions.

5. Each assembly and system shall operate as specified and to the Authority’s satisfaction.

6. Contractor shall be responsible for, and shall correct by repair or replacement, at its own expense, any system or assembly, which in the opinion of the Authority does not operate as specified.

7. Contractor shall correct by repair or replacement, at its own expense, any system or assembly that has been damaged by testing or by faulty mechanical or electrical assembly by…..

B. Shipment:

1. Prior to shipment from the factory, each Substation shall be completely assembled in its final field configuration and completely factory (conformance) tested. These tests shall be documented and signed by the testing technician and certified by the Contract Project Quality
Control Representative. Submit test procedure and test results to the Authority.

2. Upon completion of conformance factory tests and system verification, the substation assemblies shall be disassembled as required to provide shipping packages of size and weight compatible with the transportation modes selected and for compliance with traffic regulations. If site re-assembly is required, the re-assembly is the responsibility of the Contractor.

C. Delivery and Storage:

1. Delivery of each TPSS shall be by the Contractor. Receiving, off-loading and inspection of all equipment (including impact recorders) upon delivery shall be performed in accordance with Specification 16312, Traction Power System Substation Installation. All scratches or defects shall be recorded giving the nature and location of all scratches and defects. This record shall then be signed by the Contractor and witnessed by the Authority, each party shall retain a copy.

2. All scratches or defects noted shall be repaired by this Contractor.

3. Scratches or defects in the finish shall be repaired by painting, after properly preparing the surface. Only identical painting furnished by the manufacturer shall be used for such purposes.

4. Failure of the Contractor to protect the materials as outlined herein shall be grounds for rejection of the work.

5. Care shall be exercised during fabrication and delivery to avoid damage or disfigurement of any kind.

6. All equipment, parts and assemblies shall be protected from dust and moisture prior to and during fabrication.

7. Equipment stored in an outdoor environment shall be covered during delivery and during storage. All equipment stored over 10 days shall have heaters to prevent moisture.

D. Factory Test Program:

1. Provide to the Authority a Factory Testing Program for all mechanical and electrical equipment including the interfaces with the supervisory and communication system and all alarm and operating modes for each piece of equipment (circuit breakers, rectifier, battery/charger, etc.).

2. Tests shall be as specified herein or in the Referenced Standards and shall determine whether the equipment has been properly assembled, aligned and connected. Any changes, adjustments or replacements required to make the equipment operate as specified shall be carried out by the Contractor as part of the work.

3. Contractor shall submit a flow diagram indicating the logical sequence of the factory testing; however, this plan shall include for record information all testing, starting with design tests through the integrated testing. Provide this documentation for each Substation.

4. Submit a list of test procedures (by test procedure number) and a brief description of each test.

5. Submit with the Program a preliminary schedule of tests.
   a. Schedule shall show each test for each location with start and finish dates.
   b. Schedule portion of the Plan shall be a dynamic document to be updated as the fabrication progresses.
   c. Provide an organization chart and description of the Contractor's in-house and acceptance field-test organization.

E. Factory Test Procedures:

1. Contractor shall prepare and document a test procedure for each type of test. Test procedures shall be submitted to the Authority for review and approval per the submittal schedule and prior to the start of the tests.

2. Test procedures shall be structured in a systematic, building block manner with check points at critical functions. The procedures shall facilitate the reporting of test results and the re-creation of error conditions. Each procedure shall:
   a. Be submitted and identified as a separate and independent document for approval.
   b. Each test procedure shall be stapled or bound.
c. Each procedure shall be individually numbered in a logical sequence with all pages numbered.

d. First sheet of the procedure shall contain the title, date, and name of individuals who prepared and approved the procedure.

3. Based upon the results of the first items tested, the Contractor may initiate revisions to the test procedures if approved by the Authority. The modified test procedures shall be resubmitted to the Authority for approval.

F. Testing Format: As a minimum, the following information shall be included in the procedures for each function tested:

1. Title of test.

2. A test identification number and name.

3. A statement of test objective, scope and pass/fail criteria.

5. Location and date of test.

6. A list of equipment required to perform the test, including model and serial numbers.

7. A list of prerequisite tests that shall be completed before the test can be performed.

8. Abbreviations and references.

9. A description of the required test setup including diagrams illustrating test equipment connections identifying test points, where applicable.

10. Step by step instructions for performing the test, identifying the points where data are to be recorded and the limits for acceptable data.

11. Instructions for recording data on data sheets or verifying that individual procedure steps have been completed.

12. All test data sheets on which all results of testing are to be recorded.

13. Results, including calculations, curves, photographs, and other supporting data.

14. Pass or Fail indication with summary and conclusions for each test.

15. Provide signature of the Tester, Contractor's Project Manager and Quality Control representative.

G. Test Results:

1. Test results shall include all of the test procedure forms for the test, with all fields complete. Fields that are not applicable shall be so indicated.

2. Test results shall be submitted with a Test Summary Sheet that includes, as a minimum, the following:

   a. Test number and revision.
   
   b. Test completion date.
   
   c. Narrative summary of the test results.
   
   d. Listing of any procedure failures, observations and procedure field modifications.
   
   e. Signature of the Contractor's Testing Manager.
   
   f. Additional comments.
   
   g. Unless otherwise approved by the Authority, tests in which 1 or more procedures have failed shall be repeated in its entirety.

3. Regression Testing:

   a. Contractor shall identify and be responsible for any regression testing required due to software changes after the test program has started.
   
   b. Prior to commencement of regression testing, the Contractor shall submit a list of tests and procedures that require re-testing. Contractor shall also submit a revised test schedule for approval.

4. Qualification Tests:

   a. Contractor shall perform Qualification Testing (as part of the Production tests) on all equipment to verify that the equipment complies with the specified design and environmental requirements.
b. Qualification tests shall ensure that component(s) that are designated as vital will function in a manner necessary for fail-safe operation. Testing shall include a full range of known failures of interfaces to the tested equipment.

c. Qualification tests shall ensure proper operation over the temperature, humidity, vibration and shock ranges expected for a rail application in the Dallas area.

d. Qualification tests may not be required for unmodified equipment, which has a proven service in a similar operating environment. In lieu of qualification testing, the Contractor shall submit documentation of prior qualification testing.

H. Records and Reports:

1. Reports:
   a. Contractor shall develop, maintain, and update a test report for each test. This report shall include listings of all test deficiencies and their resolutions.
   b. If required by component failure, list system retesting requirements, and system design changes.
   c. Contractor shall submit final test reports for each TPSS 15 days after completion of testing. This report shall include all testing requirements as submitted in the test plan, including listings of all test deficiencies and their resolutions, and system retesting.

2. Records:
   a. Test data sheets shall be used to record applicable drawing numbers, test equipment, including serial numbers and calibration dates where applicable, discrepancies, corrective action required, and test data.
   b. Data entries shall be referenced to the applicable procedures and allowable limits for each entry and shall be indicated on the data sheets.
   c. The test data sheets shall be arranged in tabular form.

3.6 INDIVIDUAL EQUIPMENT TESTING REQUIREMENTS

A. Contractor shall perform design tests, production tests, and conformance tests as specified herein and in the Referenced Standards. Tests indicated herein are for reference only; the Contractor shall prepare and submit tests and testing procedure specific to the equipment furnished and standard industrial practices.

B. AC Switchgear: The following tests shall be performed on each class and rating of AC circuit breaker, fused load interrupted switch and switchgear assembly. For each AC circuit breaker and switchgear assembly all applicable tests as identified in these specifications and the Referenced Standards including but not limited to:

1. Design Tests:
   a. Maximum voltage.
   b. Power frequency.
   c. Continuous current.
   d. Short circuit rating.
   e. Rated operated duty.
   f. Rated permissible tripping delay.
   g. Rated interrupting time.
   h. Rated reclosing time.
   i. Rated control voltage.
   j. Load current switching.
   k. Mechanical life.
   l. Dielectric withstand.
   m. Radio influence voltage tests.

2. Production Tests:
   a. Current tests.
   b. Bushing tests.
   c. Leakage tests.
   d. Resistors, heaters, and coils check tests.
   e. Control and secondary wiring check tests.
f. Clearance and mechanical adjustment check tests.
g. Mechanical operation tests.
h. Timing tests.
i. Stored energy system tests.
j. Conductivity of current path test.
k. Power frequency withstand voltage tests on primary insulation components.
l. Power frequency withstand voltage tests on control, secondary wiring, and components, to include motors, release coils, etc.
m. Electrical resistance of current path.
n. Low-frequency withstand voltage.
o. Enclosures interchangeability test.
p. Nameplate check.

3. Conformation Tests:
   a. Lightning impulse withstand tests.
b. Continuous current carrying tests.
c. Mechanical endurance tests.
d. Load current switching tests.
e. Short-time current carrying tests.
f. Short-circuit current tests.
g. Conductivity of current path tests.
h. Power frequency withstand voltage tests.

C. Rectifier Transformer:

   1. Transformer, rectifier (thyristor) and TRU shall be subjected to design, production and acceptances tests as required by these Specifications, and the Referenced Standards. All testing shall meet or exceed the requirements for “Heavy-Traction Service”.

   2. General:
      a. Contractor shall perform the following tests to determine the “Performance Characteristics” for each type and rating for each transformer/rectifier specified, determine by test the:

         1) Rated output in KW.
         2) Voltage regulation.
         3) Efficiency.
         4) Power factor.
         5) Harmonic content.

b. Design tests shall be made on a single transformer, rectifier of each type and rating to be provided under this Contract.

c. Production and conformance tests shall be made on each transformer and rectifier to be provided under this Contract.

d. Design, Production and conformance tests shall be made on each Transformer-Rectifier Unit of each type and rating.

e. Testing may be accomplished at the manufacturer’s facilities if appropriately equipped to perform tests, or upon approval by the Authority at an independent testing facility.

f. Design and conformance tests for transformers and rectifiers may be combined with transformer-rectifier unit tests where feasible and approved in advance.

g. The Authority reserves the right to witness all tests, and shall have access to all test facilities.

1) Acceptance of the TRU shall be contingent upon successful completion of all test described herein and in the Referenced Standards.

2) Data from all tests shall be submitted to Authority for review and approval.

3) Test plans; procedures and scheduled test dates shall be submitted for approval at least 90 working days in advance of scheduled test dates.
4) No test results will be accepted prior to receipt and approval of test plans and procedures.

h. Mechanical repairs on transformers, coils, or magnetic circuits will not be accepted:

1) In the event of a test failure, within 30 days from the failed test date, the Contractor shall submit a detailed report describing the design deficiency and their corrective action including any drawings changes.

2) Failure of the transformer, rectifier and TRU to meet the design parameters as required by these Specifications, shall necessitate rejection of the transformer rectifier design in total, requiring the Contractor to redesign and remanufacture the unit to meet Contract specified parameters.

3. Design Tests:

a. Dielectric impulse.

b. Loss measurement.

c. Commutating reactance.

d. Low frequency dielectric.

e. Temperature rise (heat run).

f. Short circuit tests.

g. Rated voltage.

h. Rated current.

i. Rated load.

j. Harmonic load test:

1) Perform at loads of 25, 50, 100, 150, 200 and 300 percent.

2) Record and measure the harmonic voltages and currents though the 61st harmonic in 6-pulse mode and 12-pulse mode.

k. Phase control.

l. Excitation loss at rated voltage on the rated voltage connection.

m. Excitation current at rated voltage on the rated voltage connection.

n. Noise level:

1) Test at 50 percent, 75 percent, 100 percent, 150 percent, 200 percent, 250 percent and 300 percent load. The substation transformer shall have a maximum sound pressure level of 60dBA at 200 percent full load and 50dBA at normal load when tested in accordance with NEMA TR-1. Acoustical insulation, vibration isolation, and structural design techniques shall be used to minimize the continuous noise level of the assembled Substation.

o. Perform partial discharge test:

1) To certify the transformer has a minimum partial discharge-free voltage of 120 percent of rated voltage. Provide oscillograph recordings with the detailed report of the measured test.

2) Partial discharge tests shall be performed in accordance with the Referenced Standards for the detection of partial discharge and measurement of apparent charge in dry-type transformers, except as modified herein.

3) Measure partial discharge inception and extinction voltage during induced voltage test in accordance with the Referenced Standards and the following requirements:

a) Transformer shall be subjected to an induced voltage of 1.5 times the rated voltage at a frequency between 100Hz and 400 Hz.
b) Partial discharge measurements shall be performed with a selected instrument operating at a frequency of 1.9 MHz.

c) Partial discharge extinction level shall be reached at an induced voltage of higher than 1.2 times rated voltage.

d) Partial discharge extinction level will be considered to have been reached when the reading at 1.9 MHz is less than 10 microvolts or 13 picocoulombs.

p. Temperature test or tests shall be made on 1 unit when 1 or more units of a given rating are produced by one manufacturer at the same time, except that these tests shall be omitted when a record of a temperature test, made in accordance with these standards, on a duplicate or essentially duplicate unit, is available. The temperature test is a design test, not a conformance test.

q. Temperature loading cycle test to verify the temperature limits specified.

r. Perform equivalent RMS Heavy Duty overload cycle test to record temperature rise at end of overload cycle.

4. Production Tests:

a. Resistance measurements (windings): Resistance measurements of all windings on the rated voltage connection of each identical unit and in case of a production run, at the tap extremes of 1 unit of a given rating when produced by one manufacturer at the same time.

b. Ratio tests: Ratio tests on the rated voltage connection and on all tap connections.

d. No load loss.

e. Impedance voltage and load loss: Impedance and load loss at rated current on the rated voltage connections of each unit and on the tap extremes of one unit of a given rating when produced by one manufacturer at the same time.

f. Applied potential.

g. Induced potential.

h. Reduced, chopped and full-wave impulse test.

i. Dielectric low-frequency withstand.

5. Conformance tests:

a. Resistance measurement.

b. Transformer Turns Ratio (TTR) test.

c. Polarity and phase relation test.

d. No-load loss test and excitation current test.

e. Impedance voltage and load loss test.

g. Induced potential test.

h. Reduced, chopped and full-wave impulse tests.

i. Partial discharge test.

j. Efficiency.

k. Voltage regulation.

l. Power factor.

D. Thyristor Controlled Rectifier:

1. Perform rectifier tests in accordance with these Specifications and the Referenced Standards, and as follows.
2. Design Tests:
   a. Reduced voltage load test: Including specified overloads, after temperature stabilization at rated load. Test shall be conducted without exceeding safe junction temperature on the silicon-controlled rectifiers (SCR).
   b. Current balance test: Demonstrate proportional sharing between parallel thyristors, within plus or minus 10 percent at the 100 percent and specified overload rating.
   c. Loss measurement:
      1) Test in accordance with the Referenced Standards for 100 percent rated load.
      2) Efficiency, voltage regulation and power factor in 6-pulse mode and in 12-pulse mode.
      3) At loads of 1, 25, 50, 100, 150, and 300 percent of rated load, determine efficiency, voltage regulation and power factor in 6-pulse mode and 12-pulse mode.

3. Production Tests:
   a. Dielectric strength test.
   b. Rated voltage test.

E. Transformer/Rectifier Unit:

1. The following tests shall be completed on a complete TRU:
   a. Design Tests
   b. Rated Temperature Load Test:
      1) Contractor shall perform a Load Test as outlined in the Referenced Standards.
      2) Tests shall prove that the average temperature rise on the windings of the transformer does not exceed the design values or the Referenced Standards.

3) In addition, the test shall prove that the rectifier SCR temperature does not exceed 149 degree F for the copper bus and 104 degree F for the enclosure.

   c. Harmonic Spectrum Load Test:
      1) At loads of 25 percent, 50 percent, 100 percent, 150 percent, 200 percent and 300 percent of rated load, measure and record the harmonic voltages and currents though the 61st harmonic that would be sent back into the utility system in 6-pulse and 12-pulse mode to verify the rectifier-transformer harmonic limits comply with standard IEEE 519.

   d. DC fault relay testing: DC switchgear enclosure-to-positive bus fault detection relaying system shall be tested to prove that it can withstand the maximum available positive-to-ground short circuit current (including contribution from adjacent TPSS) for the duration of time to clear the fault.

   e. Test Acceptance Criteria:
      1) Transformers:
         a) Successfully pass all specified design, routine and TRU tests with no physical damage and meet all temperature limits, including the duty cycle.
         b) Satisfy all design criteria as demonstrated by measured test results.

      2) Rectifiers:
         a) Successfully pass all specified design, routine and TRU tests with no physical damage and meet all temperature limits.
         b) Satisfy all design criteria as
3) Transformer-rectifier units: Successfully pass all specified design, routine and transformer-rectifier unit tests with no physical damage and meet all temperature limits.

4) Satisfy all design criteria as demonstrated by measured test results.

2. Production Tests: Test per the Referenced Standards.

3. Conformance Tests:
   a. Functional test protective devices.
   b. Functional test TCR control system.

F. DC Switchgear:

   1. Design Tests: All applicable tests identified as design tests in the Referenced Standards for 1 DC circuit breaker and switchgear assembly of each size and rating. If tests are made outside the enclosure, a separate design test shall be made to verify that trip devices calibrated outside the circuit breaker enclosure maintain calibration within the enclosure. Design tests on the circuit breakers shall include the following, as indicated below:
      a. Short-time current test.
      b. Continuous current test.
      c. Load (low) current switching tests.
      d. Endurance test.
      e. AC dielectric withstand test.
      f. Trip device calibration check test.
      g. AC dielectric.
      h. Peak current test.
      i. Short-circuit current test.
      j. Production tests.
tested using 2,500 VDC megohms meter for 1 minute.

s. Proper operation and setting of all relays in accordance with approved relay coordination curves.

t. Check all operations and interlock functions.

G. Negative Bus Boxes:
1. Design Tests: None Required.
3. Conformance Tests: Shunts calibrated and tests in accordance with the Referenced Standards.

H. Annunciator. The following tests shall be performed in accordance with the control schematics and wiring diagrams:
1. Design Tests: None Required.
2. Production Tests: Manufacturer's standard production tests shall be performed on the Annunciator and the Annunciator components.
3. Conformance Tests: By means of insulation resistance, 100 percent point-to-point continuity, and operation tests, each local annunciator panel shall be checked for proper operation.

I. Busways:
1. Design Tests:
   a. Dielectric tests.
   b. Power frequency withstand.
   c. Lighting impulse withstand.
   d. Continuation current.
   e. Temperature rise tests.
   f. Momentary tests.
   g. Bus Bar Insulation.
2. Production Tests:
   a. Power frequency withstand voltage tests.
   b. Mechanical operation tests.
   c. Grounding of instrument transformer case tests.

3. Conformance Tests:
   a. Enclosure security tests.
   b. Dielectric test.
   c. Mechanical performance test.
   d. Continuous current test.
   e. Short-circuit current carrying test.
   f. Momentary current withstand test.
   g. Electrical operation and control wiring tests.
      1) Control wiring continuity.
      2) Control wiring insulation.

J. Distribution (Auxiliary Power) Transformers:
1. All applicable tests identified in the Referenced Standard shall be performed on one of the 15 kV class distribution transformers.
2. Design Tests:
   a. Temperature rise.
   b. No-load losses and excitation current.
   c. Dielectric tests.
   d. Short-circuit tests.
   e. Audible sound-level measurement.
   f. Mechanical design tests.
   g. Calculated data:
      1) Total losses.
      2) Efficiency.
      3) Voltage regulation.
3. Production Tests:
   a. Resistance measurements.
   b. Ratio tests.
   c. Polarity and phase-relation tests.
d. Load losses and impedance voltage.
e. Impedance voltage and load loss.
f. Dielectric.

4. Conformation Tests:
   a. Impulse.
   b. Insulation power factor.
   c. Insulation resistance.
   d. Partial discharge.

K. DC Control Power System (Battery and Battery Charger):
   1. All applicable tests identified in the Referenced Standard shall be performed on the DC Power Supply.
   2. Design Tests:
      a. Dielectric test.
      b. Voltage adjustment test.
      c. Temperature rise test.
      d. Current-limit test.
      e. Short-circuit test.
      f. Voltage deviation (Regulation) test.
      g. Efficiency measurement.
      h. Power factor measurement.
      i. Ripple voltage measurement.
      j. Audible noise test.
      k. Dynamic response test.
      l. Input and output surge test.
   3. Production Tests:
      a. Dielectric test.
      b. Voltage adjustment test.
      d. Ripple voltage measurement.

L. Distribution Panels: In addition to the following this Contract shall certify or perform all standard-manufacturing tests for panelboards as required by Industry Standards and the Referenced Specifications.
   1. Design Tests:
      a. Temperature rise test.
      b. Dielectric test.
      c. Short-circuit test.
      d. Environmental test.
      e. Applicable enclosure design tests.
   2. Production Tests: Manufacturer's standard production tests shall be performed on all AC and DC distribution panels.
   3. Conformation Tests:
      a. Energy distribution tests shall include the following:
         1) Verify size, type and ratings for all fuses and circuit breakers.
         2) Verify each circuit breaker size with that on approved circuit plans.
         3) All branch wiring shall be checked using resistance test instruments acceptable to the Authority to verify agreement with approved plans.
         4) Verify wire gauge with that on approved circuit drawings. All discrepancies in wire sizes shall be replaced with proper size wire.
         5) Each wiring circuit shall be tested against all other energy busses to ground to ensure that no shorts or faults exist.
b. Wiring verification test. All circuitry shall be checked for accuracy against approved circuit drawings. Tests may be done with energy on or off and shall verify the following:

1) Point-to-point wiring.

2) During wire verification test a wire count on each terminal, relay contact, etc. shall be taken to ensure that only the number of wires called for on the approved circuit plans is present at each terminal, relay contact, etc. Any discrepancies found shall be corrected.

3) Verify wiring tags and panel board nomenclature where applicable.

4) Verify that all components are as shown on approved circuit drawings and located in proper positions.

M. Relays, Meters, and Instrument Transformers: In addition to the following, the Contractor shall certify or perform all standard Design, Production and Conformance tests for relays, meters and instrument transformers as required by Industry Standards and the Referenced Specifications.

2. Production Tests: Manufacturer’s standard production tests shall be performed on all relays, meters and instrument transformers.

3. Conformance Tests:

   a. All relays, meters, and instrument transformers shall be checked for accuracy, performance, operation, proper setting, and calibration. Set and calibrate relays per the coordination study performed under this Contract.

   b. Relay checking, setting, and calibration shall be performed as a separate test element from the overall inspection and testing procedures. Tests shall include:

      1) Test Current: Test current shall be injected into the current circuits at the current transformer terminals to ensure protective relays operate properly by tripping their respective breakers and are polarized correctly, and to ensure that instruments read correctly and that meters are calibrated.

      2) Checking:

         a) Instruments shall be checked for accuracy at quarter, half, and full-scale points.

         b) Telemeter transducers shall be checked for accuracy at quarter, half, and full-scale points.

      3) Indicating Setting and Date: After relays have been set, a small white card stating the setting and date shall be placed within the relay case.

N. Traction Power Substation. Each individual Substation shall be tested unless otherwise approved by the Authority. The Authority or designated representative shall witness these tests; notify the Authority 30 days prior to testing. After all equipment is installed in the Substation Enclosure and prior to delivery, perform the following tests and checks on all completely assembled substations:

1. Design Tests:

   a. DC Short Circuit Tests:

      1) DC short circuit tests shall be performed on 1 Substation to verify proper calibration, function, and coordination of all protective devices, and to confirm adequate short-time capability of DC circuit breakers. One bolted fault shall be applied at each of the following locations:

         a) Load side of 1 DC feeder breaker.

         b) DC positive bus.

         c) Output of rectifier terminals.

      2) AC circuit breaker, DC main breaker and DC feeder
breaker of the Substation shall all be monitored and recorded simultaneously by a high-speed chart recorder to show the status of each circuit breaker during and after each short circuit application. In addition, each phase of the AC circuit breaker shall be monitored. Test results, such as total inrush current, steady-state fault current, impulse time of faulted unit, and primary system capacity shall be recorded on oscillograph. All data recorded on oscillograph shall be properly labeled and identified.

3) All equipment including the Substation Enclosure shall be inspected for damage including loose bolts after each short-circuit test. In addition, all breakers subjected to fault conditions shall be production tested in accordance with their applicable ANSI standards. Any reconditioning required returning these circuit breakers to original condition shall be at the Contractor's cost.

4) Equipment and the Substation Enclosure shall be inspected for damage after the test. Failure of the equipment either to withstand these tests or to coordinate or meet the specified requirements shall be grounds for rejection of the equipment. Contractor shall make repairs and retest failed components until units pass all tests.

5) This test may be performed as part of the Integrated Systems Tests as specified herein.

b. Noise Level Test:

1) Noise level tests shall be performed on 1 Substation at the factory or in the field.

2) The noise level measured at a distance of 50 feet from any point of the Substation Enclosure shall not exceed 45 dBA when the maximum load equivalent to 2 trains accelerating simultaneously is being drawn and with the Substation cooling equipment running.

3) The weight of the LRV to be simulated during this test shall be based on the worst loading condition.

c. Temperature Rise Test:

1) Contractor shall perform a temperature rise test to verify that the temperature rise inside the Substation Enclosure is maintained within operating limits of all Substation equipment.

2) The test shall be designated a design test, performed on the first Substation.

3) The test shall take place in direct sunlight at an equivalent ambient temperature of 115 degree F, plus and minus 20 degree F, doors closed, with the TRU operated at 100 percent full-load, with all auxiliary equipment energized and under load, ventilation fans thermostatically controlled, until inside temperature is stabilized, but not less than 6 hours.

4) This test may be performed as part of the transformer rectifier load cycle test.

5) Stabilized temperature is considered to have been reached when the temperature rise inside the Substation Enclosure changes no more than 35.6 degrees F in 1 hour. Measurements of temperature shall be from multiple locations as approved by the Authority.

6) Contractor shall provide a listing of all installed equipment with the manufacturer's specified
operating temperature limits along with a test procedure.

7) The test is considered successful if the inside temperature of the Substation Enclosure properly reflects the HVAC design required in Section 13121.

d. Production Tests: During construction, fabrication and assembly of the TPSS, perform testing as required to assure all components are comparable to assure a complete and operational unit.

2. Conformation Tests:

a. General Tests: Each Substation shall be energized and functional/operational tests performed on all devices, assemblies and circuits. The following tests shall be performed after installation of all switchgear assemblies in the Substation Enclosure, perform all tests after each unit is completely assembled and point to point wiring is complete.

1) Installation Tests:

a) Inspect and certify that each piece of equipment is installed according to approved installation drawings within acceptable physical tolerances.

b) Provide certification that “Quality of Installation” has been demonstrated by field tests for continuity, insulation resistance, resistance of ground connections, circuit breakdown, visual inspection and any other tests required by this Specification.

c) Prior to any work that conceals another installation, the installation shall be witnessed and certified by the CQCR unless otherwise directed by the Authority.

2) Verification of protective relay settings and trip circuits.

a) All relays shall be set in accordance with the approved protective device coordination study.

b) Each AC and DC switchgear and circuit breaker protective system shall be checked using primary injection.

c) The test shall simultaneously verify the current transformer, voltage transformer or shut ratio, secondary wiring, polarity, relay operation, tripping circuit, and circuit breaker operation.

d) Verify correct operation of auto-reclosing and transfer trip device operation.

3) Verify correct operation of all interlocks.

4) Verify correct operation of all Annunciator functions.

5) Verify correct operation of all PLC functions.

6) Verify all lighting and AC power operations.

7) Test for continuity and insulation of all busses and wiring.

8) Insulation to ground tests on the busses with circuit breakers and fused interrupter switches "racked" and "closed."
9) Test for proper operation of all protective, control and annunciation devices.

10) Functional test for all auxiliary equipment and alarms, such as air conditioning units, “house” wiring, SCADA, etc.

11) Test all equipment grounding.

12) Test all structure grounding.

b. Fire Detection System: After the smoke sensing fire detection system is completely installed, it shall be tested for continuity and correct operation in accordance with NFPA 72H.

c. Cooling Equipment: Perform functional tests of all cooling equipment and its control circuitry.

d. Continuity and Control Function Tests:

1) As a minimum, perform continuity and control function tests of all circuits including relays, annunciation, indication circuits, shutdown circuit functions and alarms.

2) For control circuits, include all equipment, devices, interconnecting wire and cable.

3) Control wiring shall be tested prior to the operational test with the controls energized, but with the controlled equipment and devices disconnected or otherwise made inoperable.

4) For these tests, the control functions shall be checked for proper operation by actuating each contact that initiates a control operation and then following the control sequence through the various affiliated devices to ascertain that the correct results are obtained with each condition of interlocking.

5) The actuating of contacts as required to initiate an operation and to set up the interlocking conditions should be performed by simulating operating conditions.

6) Minimum voltage required to operate breakers and the tap and time dial settings of all relays shall be verified in accordance with the relay coordination study.

7) All relays shall be bench tested in accordance with the relay manufacturer’s data and curves.

8) Minimum pickup and dropout of under-voltage relays.

9) Check interlocks on rectifier doors for proper functioning and operation of Substation shutdown circuits.

10) Check required setting of heater thermostats.

e. Rated Voltage Test:

1) The entire TPSS shall be energized at rated voltage to verify functionality of all components, devices, relays, etc., including lighting, heating, battery chargers, RTUs, fire alarm panels, station service panels, AC breakers, thyristor rectifier, DC breakers, annunciator and any other installed hardware.

2) Contractor shall develop a check sheet and procedure for completing this test.

3) Test procedure shall be approved by the Authority prior to commencement of test.

f. Grounding:

1) Perform insulation test on structure to ground and operation of ground relays.
2) Test all equipment grounds for continuity and resistance.

**g. RTU’s:**

1) Complete functional and performance testing shall be performed for all RTU software/firmware developed under this contract.

2) Burn-In: RTU equipment shall undergo a factory burn-in for at least 72 hours. Comprehensive diagnostics shall be performed on each RTU after the burn-in period.

3) Functional Tests:

   a) In conjunction with the System Factory Acceptance Test, complete functional tests shall be performed for each type of RTU subsystem. A full RTU factory functional test shall be performed for at least 2 RTUs per type.

   b) Tests shall include, as a minimum.

      (1) All I/O cables shall be checked for continuity at the factory.

      (2) All I/O addressable status points shall be verified for correct status reporting and address location.

      (3) All addressable control points shall be verified for correct output and point address.

      (4) A complete protocol command set test shall be performed verifying that each command and reply is executed as requested.

4) Physical Inventory: Physical inventory data shall be provided with each RTU.

**h. SCADA RTUs:**

1) Functional Input/Output Check.

2) Communications Verification Test.

**i. Software/Firmware Tests:** Complete functional and performance testing shall be performed for all RTU software/firmware developed under this Contract in accordance with the validation and verification plan.

1) Burn-In: RTU equipment shall undergo a factory burn-in for at least 72 hours. Comprehensive diagnostics shall be performed on each RTU after the burn-in period.

2) Functional Tests:

   a) In conjunction with the System Factory Acceptance Test, complete functional tests shall be performed for each type of RTU subsystem. A full RTU factory functional test shall be performed for at least 2 RTU’s per type.

   b) Tests shall include, as a minimum.

      (1) All I/O cables shall be checked for continuity at the factory.

      (2) All I/O addressable status points shall be verified for correct status reporting and address location.
status points shall be verified for correct status reporting and address location.

(3) All addressable control points shall be verified for correct output and point address.

(4) A complete DF-1 protocol command set test shall be performed verifying that each command and reply is executed as requested.

3) Physical Inventory: Physical inventory data shall be provided with each RTU.

j. Negative Return and Drainage Assembly:

1) Design Tests: Test the negative grounding unit to confirm that its operation is in accordance with the system Specification.

2) Production Tests:
   a) Dielectric test.
   b) Electrical operation test.

k. Insulating Floor:

1) Test the floor resistance using high voltage megger prior to switchgear installation.

2) Take 1 resistance reading for each 3 feet by 3 feet area of insulated floor. The average of all the resistance readings shall be at least 10 megohms.

l. Other Equipment: Perform applicable tests on the following Substation equipment.

   1) Indicating instruments.
   2) Relays and Transducers.
   3) Instrument transformers.
   4) Annunciators.
   5) PLCs.
   6) Batteries.
   7) Battery Chargers.
   8) Auxiliary Power Transformers.
   9) Insulated Wire and Cable.
   10) Busbars.
   11) Disconnect Switches.
   12) Surge Arresters.
   13) Cable Tray.
   14) Panelboards.
   15) Molded-Case Circuit Breakers.

m. Underwriters Laboratory (UL).

1) Prior to shipment of the Substation, the Contractor shall acquire inspection services from Underwriters Laboratory to perform a "Field Evaluated Product Label" inspection on the entire substation and equipment and provide applied "Field Evaluated Product Labels" on all equipment that does not bear the UL Listing Mark.

2) Any equipment found during the inspection requiring changes in order to meet the UL inspector's requirements, shall be made or corrected and re-inspected to acquire the UL Field Evaluated Product Label, at no additional cost to the Authority.
PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

A. Measurement for payment will be per the Contract Bid Schedule and shall be measured separately for each Traction Power Substation.

4.2 PAYMENT

A. Payment for the various TPSSs will be made at the respective lump sum prices quoted in the Pricing Bid Schedule; which prices shall include full compensation for all costs incurred in the complete fabrication, assembly, factory testing and delivery to the job site.

END OF SECTION 16311

**DC Feeder Circuit Breakers**

### 3:
- Feeder Breaker "XXXX" Remote Open
  - OCC remote control function to open the DC feeder circuit breaker (device 172).
- Feeder Breaker "XXXX" Remote Close
  - OCC remote control function to close the DC feeder circuit breaker (device 172).
- Transfer Trip, Receive, "Allow Reclosure" (85RX)
  - Feeder breaker "XXXX" receives "Allow Reclosure" signal from adjoining TPSS. * (RTU Output for 85RX)
- Transfer Trip, Receive, "Disallow Reclosure" (85NX)
  - Feeder breaker "XXXX" receives "Disallow Reclosure" signal from adjoining TPSS. * (RTU Output for 85NX)
- Transfer Trip, Transmit, "Allow Reclosure" (85R)
  - Feeder breaker 'XXXX' tripped by 176 or 150 device and transmits a transfer trip "Allow Reclosure" signal to adjoining TPSS.
- Transfer Trip, Transmit, "Disallow Reclosure" (85N)
  - Feeder Breaker 'XXXX' tripped by ETSA device and transmits a transfer trip "Disallow Reclosure" signal to adjoining TPSS.
- Feeder Breaker "XXXX" Breaker Open
  - Feeder breaker is in the open position.
- Feeder Breaker "XXXX" in "Local"
  - Indication for control status for Feeder DC circuit breaker.
- Feeder "XXXX" Reclosure Lock-Out
  - Feeder breaker has attempted to reclose and has reached its lock-out settings.
- Feeder "XXXX" Transfer Trip alarm
  - Feeder breaker has been "tripped" by the transfer-trip from an adjacent Substation.
- Feeder "XXXX" is Closed
  - Feeder breaker is in the closed position.
- Feeder "XXXX" line energized
  - Indication that the load side of the feeder breaker is energized.

### 4:
- Feeder Breaker "XXXX" Remote Open
  - OCC remote control function to "open" the DC feeder circuit breaker. (device 172)
- Feeder Breaker "XXXX" Remote Close
  - OCC remote control function to "close" the DC feeder circuit breaker. (device 172)
- Transfer Trip, Receive, "Allow Reclosure" (85RX)
  - Feeder breaker "XXXX" receives "Allow Reclosure" signal from adjoining TPSS. * (RTU Output for 85RX)

**Addition SCADA Points:**

| **Intrusion Alarm** | Substation has been entered by unauthorized personnel. |
| **Smoke/fire Panel Alarm** | Fire or excessive heat has been detected - Stage 1 (Alarm shall open the main AC and DC circuit breakers). |
| **Smoke/Fire Panel Trouble** | Notification of malfunction in Fire Detection system. |
| **Battery charger failure** | Battery charger has mal-functioned. |
| **Battery Undervoltage** | The battery system has reached a critical condition and needs immediate attention. |
| **Battery Pos/Neg. Ground Fault** | One leg of the battery has grounded. |
| **TPSS ambient high temp** | Ambient temperature "alarm" setting inside the TPSS has been exceeded. |
| **AC Station Service Power Loss (27A)** | AC station service power has been loss. |
| **AC Signal Power Loss (27B)** | AC Power has been loss at the Signal Service Panel. |
| **AC Switchgear Control Power Loss (27DC)** | DC control power to the DC switchgear has been interrupted. |
| **DC Switchgear Control Power Loss (27DCM)** | DC control power to the AC switchgear has been interrupted. |
| **ETS Trip** | One of the ETS pushbuttons has been activated inside the substation. |
| **Signal Power Cable Ground (64SG)** | One of the 480V signal power cables has to be grounded. |

**Notes:**

1. "XXXX" Circuit Numbers to be provided for each Substation.
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section describes in detail the requirements for the receiving, off-loading, placement, site preparation, and testing for the Traction Power Substations (TPSS). The requirements associated with this Specification include but are not limited to:

1. Receiving, off-loading, and placement of each TPSS Substation.
2. Substation final Ground Grid installation and testing.
3. Substation site work including access roads, grading and sub-surface preparation.
4. Substation foundation construction.
7. Support for “Acceptance Testing” performed by the Contractor.
8. Coordinate incoming Utility Primary Power requirements and service locations with the local utility. Provide and install Utility Power Cable and Conduits.
9. Coordinate the final Utility Meter Installation with the Utility Provider. Install wiring and conduit from Utility Meter to the TPSS.
10. Install and terminate all DC Feeder Cables, Negative Return Cables, and Conduits from the TPSS to each Feeder Pole location as indicated on the Contract Drawings.

B. Contractor shall install complete and operational Substations for use by the Authority as an integral part of the Traction Electrification System (TES).

C. Related Section:

1. Section 16110 – Conduit and Raceways

1.2 REFERENCED STANDARDS

A. Publications: The technical documents and publications pertaining to the requirements for the installation of the Substations are listed in this section and elsewhere in the Contract Documents, and are applicable to the extent cited in these Specifications.

B. Note that some references and publications may be “inactive.” However these Standards shall be used as guidelines and reference values, and therefore are considered for reference.

C. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM)

2. 29 CFR 1926 – Safety and Health Regulations for Construction

K. Underwriters Laboratory (UL)

1. UL 467 - UL Standard for Safety Grounding and Bonding Equipment

1.3 SUBMITTALS

A. Submit the following in accordance with these Specifications and Contract Documents.

B. Not later than (NLT) 180 calendar days prior to receipt of each Substation

1. Installation Work Plan

2. Substation Lifting and placing plan

C. NLT 30 calendar days after Testing

1. Acceptance test reports

2. Integration test reports

1.4 QUALITY ASSURANCE

A. Contractor shall perform the Work included in this section in compliance with the requirements of these Specifications and in strict accordance with the requirements of the Authority approved Contractor Quality Control Program. Contractor shall as a minimum:

1. Perform inspections and tests during Substation installation, site preparation, ground grid design and installation and conduit placement to guarantee proper and safe operation of systems and subsystems installed by the Contractor.
2. Perform on-site testing for the equipment and materials installed by this Contractor that shall assure that the installation is in compliance with these Specifications.

B. The Authority reserves the right to witness all tests, inspections, and test results.

C. In concurrence with the standard quality control functions, the Contractor shall:
   1. Notify the Authority of all testing, testing procedures, and inspection procedures.
   2. Supply and maintain all field test equipment of proper type, capacity, range, and accuracy required to perform the required tests and inspections.
   3. Maintain all testing equipment in good working order and properly calibrated.
   4. Advise the Authority a minimum of 14 calendar days in advance of each test.

D. When tests are to be conducted continuously, the Authority shall be advised at least 21 calendar days in advance of the start of such tests and duration period in which such tests shall be conducted.

E. Contractor shall perform Quality Control and Quality Assurance practices, procedures, methods, and policies in accordance with these Specifications during all phases of installation including:
   1. Foundation Installation
   2. Site Preparation
   3. Ground Grid Installation
   4. Conduit Placement
   5. Utility and Feeder Installation
   6. TPSS Receiving and Off-loading
   7. Storage (if required)
   8. Acceptance testing support
   9. Integration testing support

F. To demonstrate that the installed equipment conforms to the specified design requirement, the Contractor shall perform all tests for the equipment and cables installed by his Work. Tests shall be performed prior to energizing the equipment and cables.

G. All Substation Work and Site Preparation shall be by personnel with proven experience and who have been regularly engaged in this type of Work.

1.5 TPSS SITE INSTALLATION

A. Contractor shall receive and install the Authority provided Substations in accordance with the quantities, specific locations, and scheduled dates in the Contract Exhibits and Contract Drawings.

B. Each Substation shall be fabricated as a complete packaged Substation and shall include all equipment and materials from the utility termination point in the Substation utility service cubicle to the points of connection to positive feeder cables, and negative-return cables.

C. The Substations shall be factory tested and shall be ready for energization upon off-loading at the project site, placement, and connection to the utility feeder. The TPSS Procurement Contractor shall Field Test and energize each Substation.

D. If Substation final design requires shipping “splits,” the Contractor is responsible for on-site reassembly.

E. Each Substation shall be designed for below grade utility service. Contractor shall provide utility service cables, terminations, conduits, raceways, and miscellaneous hardware required for a full and complete utility service installation.

F. Each Substation shall be designed to provide DC positive service via underground conduits to an Overhead Contact System (OCS) with the negative return by the “running” rails. Contractor shall provide DC Positive feeders, Negative return feeders, terminations, conduits, raceways, and miscellaneous hardware required for a full and complete feeder installation.
   1. The TPSS Procurement Contractor shall provide Positive and Negative DC cable termination “lugs” with each TPSS Unit.

G. Fire apparatus access roads shall be provided and maintained in accordance with IFC D103.

1.6 INSTALLATION WORK PLAN

A. Contractor shall prepare and submit for Authority approval an “Installation Work Plan” for each TPSS site. The Work Plan shall be detailed and inclusive of all site activities from site preparation to Authority final acceptance.

B. Contractor shall schedule the Work activities using the Critical Path Method (CPM) and shall include critical path nodes.
C. The Work Plan shall be prepared using Authority approved software and shall include:

1. Tasking “activities” with task identification and description
2. A time line with activity milestone, activity duration, and completion dates
3. Resource requirements including labor, equipment and materials
4. Percent complete
5. Target start and completion dates for each activity
6. Equipment and material delivery dates

D. Upon beginning the first site activity, the Contractor shall provide monthly a revised CPM and flow charts that depict the most current information available.

E. With the Authority approval, the “TPSS Installation Work Plan” can be part of the overall Work Installation plan.

1.7 UTILITY SERVICE

A. Utility service (3-phase, 3-wire, and 12.47/13.2kV) will be provided by the local Utility Power Company(s).

B. Contractor shall coordinate with the Utility Power Company(s) to verify the nominal service voltage for each TPSS site.

C. Contractor shall coordinate with the Utility Power Company(s) to obtain the utility short circuit Megavolt-Ampere (MVA) and other utility data as required.

D. Contractor shall coordinate with the local Utility for the final “service meter” and shall pay all inspection and/or placement fees as required for final utility service. The Utility shall provide an Interval Data Record or (IDR) Power Factor type meter.

1.8 WARNING SIGNS

A. Contractor shall provide warning and identification signs for each site as required by the final site design. Site warning signs, operational warning, designation labels, and other signs shall be provided for all Substation Sites and equipment.

B. Contractor shall also provide “High Voltage” warning signs for all electrical equipment operating over 600 Volts.

C. Contractor shall install warning and identification signs on fences, pull boxes, catenary poles where appropriate, and other Substation site and feeder locations as required for the safe operation, access, and use of related facilities.

1.9 INSTALLATION

A. Contractor shall provide Substation site installations that are identical as much as possible.

1. Substations and site equipment shall be placed and installed per the individual Contract Drawing site plans. Contractor shall verify all equipment locations, conduit routing, and utility locations prior to installation.

2. Penetrations for conduit, grounding and access panels shall be located in a like manner as required by the equipment furnished.

3. Conduit routing, cable trays, and cables between equipment enclosures shall be by the shortest routing possible. Contract Drawings are for routing reference only.

4. Termination and mounting of hardware shall be located in a like manner.

5. Cables and wire terminations shall be located in a like manner.

1.10 SEISMIC DESIGN CONSIDERATIONS

A. Equipment, conduit, foundations, cable tray, and associate mounting hardware/anchors shall be designed to operate in a Seismic Zone 1 and shall comply with the special seismic design requirements as specified in the International Uniform Building Code (IUBC).

1.11 PRODUCT DELIVERY AND STORAGE

A. General:

1. Contractor shall receive and off-load each TPSS.

2. This section is a guide for Substation handling, storage, and installation. Contractor shall emphasize safety aspects and other considerations in working with this type of equipment. This section supplements, but does not replace, the manufacturer’s detailed instructions. The objective is to provide additional guidelines to promote and enhance a reliable installation.

3. Each Substation shall include 2 sets of instruction books and drawings. The
Operation and Maintenance Manuals (O&M) Manuals shall contain detailed recommendations for storage, handling, installation, operation, and maintenance for the Substation.

4. Personnel responsible for the off-loading, placement, and storage shall review these recommendations before handling the equipment. Particular attention shall be given to recommendations for the preparation of the foundation and forms on which the TPSS is to be installed.

5. One set of O&M Manuals shall remain with the Substation at all times, the second set shall be submitted to the Authority.

**B. Receiving**

1. Each completed TPSS shall be delivered to individual site locations as specified herein or to a storage area designated by the Authority.

2. Contractor shall employ a company fully experienced in handling, rigging and placement of this type of equipment. The Company shall be insured, bonded and approved by the Authority.

3. The Substations will have the following general characteristics. Contractor shall verify exact weights and dimensions prior to shipment:
   - **a. Weight:** 90,000 pounds
   - **b. Height:** 15 feet
   - **c. Width:** 16 feet
   - **d. Length:** 45 feet
   - **e. Lifting Points:** 4 or 6 point

4. Only authorized personnel shall be permitted to handle the equipment. Care shall be exercised in handling each piece of equipment (even if crated).

**C. After Receipt:**

1. Substations may be shipped fully assembled or in shipping sections. If shipping sections are required, no more than 2 shipping splits shall be permitted. Cost for reassembly of Substations at the job site shall be by the Contractor.

2. After receipt, each Substation shall be fully assembled (if shipped in shipping sections), placed on the site foundation, connected to the Utility system, feeders and communications installed, tested, energized and certified to be in full compliance with the Referenced Standards and these Specifications.

1.12 **RIGGING**

A. Contractor shall prepare and submit a rigging and lift plan for Authority approval. The Plan shall be consistent with 29 CFR PART 1910 and 29 CFR PART 1926.

B. Instructions for lifting and handling of the TPSS or each shipping section and/or piece of equipment shall be provided in the O&M Manual and drawings.

C. The rigging shall be adequate for the equipment size and weight.

1.13 **STORAGE**

A. Indoor units that cannot be installed immediately shall be stored in a dry, clean location and shall remain in crates and/or packing during the storage period. The longer the period of storage, the greater the care required for protection of the equipment.

B. Outdoor units shall be placed directly on the Substation foundation if possible. If unit is to be stored, the Substation shall be placed on proper cribbing or ties.

C. During storage, the TPSS shall be placed on a level surface to prevent unnecessary strain and possible distortion.

D. During the construction period, protection shall be provided against dust, dirt, falling objects, dripping water, excessive water, excessive moisture, and other possible causes of damage to the equipment.

E. Temporary covering shall not restrict ventilation and shall not be removed until the equipment is ready for installation.

1. Store equipment in a heated building. If this is not possible, special precautions shall be taken to keep the equipment sufficiently warm with adequate ventilation to prevent condensation during the storage period.

2. If required, temporary heating shall be installed in the equipment.

3. If outdoor switchgear cannot be installed and energized, temporary power must be provided for the operation of the space heaters to minimize condensation of moisture within the housing.
PART 2 -PRODUCTS

2.1 GENERAL

A. All Substations shall be factory tested prior to shipment by the Contractor.

2.2 ACCEPTANCE TESTING

A. AC Switchgear:
   1. Ground Continuity test.

B. DC Switchgear:
   1. Verify all field connections (control and power).
   2. Verify all ground connections.

C. Grounding:
   1. Test all equipment grounds for continuity and resistance.

2.3 INTEGRATION TESTING

A. Contractor shall support the Authority’s Systems Integration testing for each Substation.

B. Integrated testing shall be performed after Acceptance Testing has been completed and prior to acceptance by the Authority. The startup and Integrated testing of the Authority’s Light Rail System will be implemented in Line Sections with separate completion milestones as indicated in the Construction Schedule.

C. Contractor shall be present during the Integration testing to assist in performing system integration, troubleshoot system failures, and assist in any problems that might arise.

2.4 GROUNDING

A. Ground Grid Construction:
   1. The ground mats (AC and DC) that shall be contained within the Substation property lines such that the step-and-touch potentials at the rated short circuit current do not exceed the recommended safety limits of the referenced standards.
   2. The ground mats (AC and DC) shall be constructed from an assembly of driven rods and bare copper conductor. All connections shall be thermo welded and capable of carrying the rated short circuit current. The mats shall typically be located a minimum of 3 feet below finished grade, and shall be constructed and tested prior to the Substation installation.

B. Grounding for Personnel Safety:
   1. In substations, where applicable, bond exposed metallic structure, AC equipment enclosure, ductwork, fencing and metallic piping to the AC ground grid, using minimum of No. 6 AWG, 2000v, green insulated copper conductor for indoor connections and 4/0 AWG, 2000v, black insulated copper conductor for outdoor connections.
   2. In manholes, provide grounding to all metallic components except manhole cover, to a maximum of 25 ohms resistance to ground. If manholes are located within the AC ground grid area, then all manhole metallic components shall be connected to the grid.
   3. Bond and ground exposed metallic structures in open areas to separate grounding electrodes.
   4. Weld all grounding and bonding connections exothermically to metallic structures, metal cable troughs, and metal fences.

C. Field Quality Control:
   1. Test ground resistance of each ground grid after installation and before utility cable connection.
   2. Test each ground bus when connected to ground grid using an Authority approved test procedure. Submit results for Authority approval.
   3. At the conclusion of the Fall-Of-Potential Test for each Substation ground grid, a graph shall be plotted of resistance verses distance showing at least 7 test points that are equally spaced between
the ground grid and the current probe. If the graph does not flatten in the middle, then the current probe shall be relocated 150 feet from the current point and the test performed again. The testing shall end when a flattened portion within the graph is achieved.

4. To meet resistance requirements, install additional ground rods or use soldier piles as ground rods where available. Isolate piles used for grounding from those bonded for stray current and cathodic protection.

5. Test metallic conduit and raceways, equipment enclosures, metallic cable troughs, metal fences, metal hand railings, metallic structures, and light fittings for continuity to grounding system as required by each final site design.

6. Test resistance of connections and conductors between ground buses in TPSS(s) for electrical continuity.

7. Prepare and submit testing certifications for each TPSS site, testing shall be signed by the testing technician, and certified by the CQCR and/or a Professional Engineer licensed in the State of Texas.

2.7 TPSS FOUNDATIONS

A. Contractor shall construct Substation foundations for each TPSS site as required by these Specifications and at the locations indicated on the Contract Drawings.

2.8 AC FEEDERS

A. The electric utility company(s) shall provide to each TPSS 3-phase, 60 Hz power circuits as primary service. The utility power is expected to be provided at 13,200 Volts. However, the Contractor shall field verify each site voltage.

B. A single 3-phase feeder shall be provided to serve each substation. Utility feeder cable and installation shall be provided by this Contract and coordinated with the required electric utility for each substation.

C. The electric utility company(s) will provide the metering equipment.

D. Power Cable, service pole terminations and TPSS terminations shall be provided by this Contract. Connection to the Utility System shall be by the Utility Company.

2.9 DC FEEDERS

A. The DC feeder system shall be furnished and installed by this Contract for each Substation Site and shall include the positive DC feeders from the TPSS to the OCS, the negative DC feeders from the Substation to the rails or impedance bonds, and any underground along-track parallel feeders required to locally reinforce the overhead contact system’s electrical capacity.

B. The system shall also include raceways, pull boxes, manholes, and associated appurtenances for the routing of the feeder cables. Feeder conductors shall be insulated, conform to applicable industry standards and shall be suitable for both wet and dry locations. The raceway shall be underground and the design of the ductwork, the embedment depth, and the manhole spacing shall be in accordance
with the NEC requirements. The routing of the raceways and duct banks and locations of manholes and hand holes shall be as indicted on the final site design and coordinated with the civil and track way design.

C. The positive and negative traction power cables shall be installed in separate conduits and where possible separate manholes, however where installed in the same manhole or exposed locations, the positive and negative cables shall be isolated with barriers, and suitably routed and supported on insulated racks or trays to minimize the possibility of incurring physical damage.

D. Flame-resistant jacketed cables or tape shall be used in such installations. Insulated feeder conductors shall be protected against switching surges and lightning. Lightning arrestors for each feeder cable shall be required on all "riser" poles.

E. No cable splices shall be permitted unless specifically approved by the Authority.

PART 3 - EXECUTION

3.1 FIELD TESTING

A. General Field Testing:

1. The TPSS Procurement Contractor shall perform Substation Field Acceptance Testing.

2. Contractor shall test all equipment and materials that was provided and installed by this Contract.

3. Contractor shall receive, off-load, store as required, and place the TPSS on the site foundation. Contractor shall notify the Authority when the Substation is in place. Contractor shall then inspect and test for shipping damage and shall certify that the Substation is ready for cable and conduit installation.

4. Contractor shall install all utility cables, communications cables, feeder cables, conduits, equipment and other items as required to complete the Substation connection to the utility, communication facilities, and the overhead contact system as required in the Contract Drawings.

5. Contractor Final Field Acceptance testing shall not commence until all Substation field wiring, cable installation, and equipment installation has been completed and accepted by the Authority.

6. Contractor shall prepare all test procedures and test report forms for cables and equipment that the Contractor installs. Contractor shall submit procedures and reports for Authority approval. Procedures and report forms shall be Authority approved prior to commencement of testing.

B. Testing Plan for Contractor Installed Equipment:

1. Contractor shall prepare an installation and testing plan that details the testing procedures that the Contractor shall use in testing the Contractor installed equipment and materials.

2. The Testing Procedures shall address field-installed equipment, cables and other equipment. Present the Plan in a stepwise and logical sequence to ensure that all equipment has been properly installed and ready for service.

3. Field Tests shall be conducted on the Substation field installed equipment and cables preceding energization.

4. The Plan shall identify the approach to be used for accomplishing each of the required tests. The projected schedule for test installation verification procedures, test execution, and submittal of test results shall be included.

5. Testing procedures shall be bound, containing all the forms, testing data, referenced standards, and other related items that will become the record document, "Installation Verification and Acceptance Testing Report." Provide one bound "Testing Plan" for each Substation. With the approval of the Authority the "TPSS Installation Work Plan" can be part of the overall Work Installation plan.

C. Field Testing shall include but will not be limited to:

1. General Field Tests:
   a. Visual conformation checks
   b. Ground verification test
   c. Integrated test support
   d. Field wiring verification of all circuitry
   e. Resistance of ground connections
f. Field wire tags, nameplates, and other identification’s shall be verified for proper nomenclature and location.

g. Each field wiring circuit and bus shall be tested against all other energy buses to ensure no short circuits or faults exist.

2. Grounding Systems:
   a. Verify that grounding system at each Substation is installed in accordance with the Grounding Design.
   b. Verify continuity of ground connections to ground grid and to isolated ground rods.
   c. Test each grounding system using the fall-of-potential method to measure the total resistance to remote ground of the system.

3. SCADA Interface:
   a. This Contract shall perform Field Testing of all cables and connectors to the point of interface with the communications system. It shall be the responsibility of the Contractor to coordinate installed equipment with other Authority Contractors to assure that a complete and operational system is installed.
   b. This Contract shall provide onsite personnel to assist in the Authority Systems Interface testing.

D. Test Procedures:
   1. Contractor shall provide Field Test Procedures and report forms. They shall include:
      a. Objective and scope.
      b. A description of the required test setup, including diagrams, schematics, illustrating test equipment connection set.
      c. Test equipment to be used.
      d. Personnel required for the test.
      e. Estimated test duration.
      f. Data sheets to be used.
      g. Step by step instructions for performing the test, identifying the points where data are to be recorded and the limits for acceptable data.
      h. Instructions for recording data on data sheets or verifying that individual procedure steps have been completed.

E. Test Reports:
   1. Test reports shall document the results obtained and shall be certified by the testing technician, and the Contractor Quality Control Representative (CQCR). Reports shall include the following:
      a. Equipment tested, including model and serial numbers.
      b. Title of test.
      c. Objective of test and pass/fail criteria.
      d. Summary and conclusions.
      e. Location and date of test.
      f. Printed names and signatures of the testing and QC personnel.
      g. Test method and equipment used for test including dates of last calibration and calibration due date.
      h. Results, including calculations, curves, photographs, and other supporting data.
      i. Abbreviations and references.
      j. Include minimum and maximum test values for each test and actual test value with a pass/fail statement.
k. The final report shall be signed and certified by a Professional Engineer licensed in the State of Texas.

3.2 SPECIAL TESTS

A. Contractor shall support Authority’s Special Testing Requirements.

B. The Authority may require special tests on equipment provided under this Contract. These tests are in addition to the Acceptance tests and the Authority Integrated system tests.

C. Special tests shall be performed to verify compliance of the equipment and components with these Specifications.

D. The cost of such special tests required by the Authority on any equipment or component that is proven to comply with the Specifications will be at the expense of the Authority. The cost of special tests on any equipment or component that is proven not to comply with these Specifications shall be at the Contractor’s expense except equipment and components that are Authority provided.

PART 4 - MEASUREMENT and PAYMENT

4.1 GENERAL

A. The payment for the Work, as specified, shall be full compensation for the Work described in this Section. The price shall be full compensation for installing the TPSS complete in place including designing and installing ground grids, duct banks, manholes, shop drawings, submittals, testing, and inspection; and for all Work as described in the Contract Drawings and in this Section and related Specification sections; and for all operations, materials, tools, labor, equipment and incidentals required to complete the specified Work.

4.2 PAYMENT

A. The Work described in this Section will be paid as a lump sum.

END OF SECTION 16312
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes specifications for the basic materials and methods for electrical work specified in these Specifications. Requirements contained therein shall prevail over this Section 16350, “Overhead Contact System Basic Electrical Materials and Methods”, in cases of conflict.

B. The work of this Section consists of providing the following basic electrical materials and equipment:

1. Conduit Expansion and Deflection Fittings
2. Metal Framing and Wire ways
3. Hangers and Supports
4. Concrete Inserts
5. Grounding and Bonding Materials
6. Insulated Wire, Cable, and Accessories

1.2 REFERENCED STANDARDS

A. American National Standards Institute (ANSI)

1. ANSI/ASME B1.1 – Unified Screw and Pipe Threads
2. ANSI/ASME B1.13M – Metric Screws: M Profile
3. ANSI C29.1 - Test Methods for Electric Insulators
4. ANSI C37.46 - High Voltage Expulsion and Current-Limiting Type Power Class Fuses and Fuse Disconnecting Switches
5. ANSI C80.1 - Rigid Steel Conduit, Zinc Coated
6. ANSI Z55.1 – Gray Finishes for Industrial Apparatus and Equipment

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM)

1. ASTM A36 - Structural Steel
2. ASTM A48/ A48M - Gray Iron Castings
3. ASTM A108 - Steel Bars, Carbon, Cold-Finished, Standard Quality
4. ASTM A123/A123M - Zinc (Hot-Dip Galvanized) Coatings for Iron and Steel Products
5. ASTM A153/A153M - Zinc Coating (Hot-Dip) on Iron and Steel Hardware
6. ASTM A167 - Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip
7. ASTM A569/A569M - Steel, Carbon (0.15 Maximum, Percent) Hot Rolled Sheet and Strip Commercial Quality
8. ASTM A575 - Steel Bars, Carbon, Merchant Quality, M-Grades
9. ASTM A576 REV B - Steel Bars, Carbon, Hot-Wrought, Special Quality
10. ASTM B3 - Soft or Annealed Copper Wire
11. ASTM B8 - Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft
12. ASTM B173 REV A - Rope-Lay-Stranded Copper Conductors Having Concentric-Stranded Members, for Electrical Conductors
13. ASTM B187/B187M - Copper Bus Bar, Rod, and Shapes
14. ASTM B33 - Tin-Coated Soft or Annealed Copper Wire for Electrical Purposes
15. ASTM B633 - Electrodeposited Coatings of Zinc on Iron and Steel
16. ASTM D570 - Water Absorption of Plastics
17. ASTM D635 - Rate of Burning and/or Extent and Time of Burning of Self-supporting Plastics in a Horizontal Position
18. ASTM D638 - Tensile Properties of Plastics
19. ASTM D695 REV A - Compressive Properties of Rigid Plastics
20. ASTM D790 - Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials
OVERHEAD CONTACT SYSTEM BASIC ELECTRICAL MATERIALS AND METHODS

21. ASTM D2000 - Classification System for Rubber Products in Automotive Applications (SAE J200)

22. ASTM D2240 - Rubber Property - Durometer Hardness

23. ASTM D2802 - Ozone-Resistant Ethylene-Propylene Rubber Insulation for Wire and Cable

C. American Railway Engineering and Maintenance-of-Way Association (AREMA)
   1. AREMA CH 33-7 - Rail Bonding (Manual of Railway Engineering, Volume II)

D. Federal Supply Service
   1. FS FF-B-588 - Bolt, Toggle; and Expansion Sleeve, Screw
   2. FS FF-S-325 - Shield, Expansion; Nail Expansion; and Nail, Drive Screw (Devices, Anchoring, Masonry)
   3. FS L-P-387 - Plastic Sheet, Laminated, Thermosetting (For Design Plates)

E. Insulated Cable Engineers Association (ICEA)
   1. ICEA S-19-81 - Rubber-Insulated Wire and Cable for Transmission and Distribution of Electrical Energy

F. Institute of Electrical and Electronics Engineers (IEEE)
   1. IEEE 81 - Guide for Measuring Ground Impedance of a Ground System
   2. IEEE 383 - IEEE Standards for Quality Class 1E Electric Cables and Field Splices for Nuclear Power Generating Stations
   3. IEEE 1202 - IEEE Standards for Flame Testing of Cables for Use in Cable Trays In Industrial and Commercial Occupancies

G. International Conference of Building Officials (ICBO)

H. National Electrical Manufacturers Association (NEMA)
   1. NEMA AB 1 - Molded Case Circuit Breakers

   2. NEMA RN 1 - Polyvinyl-Chloride Externally Coated Galvanized Rigid Steel Conduit
   3. NEMA TC 2 - Electrical Plastic Tubing (EPT) Conduit
   4. NEMA TC 3 - PVC Fittings for use with Rigid PVC Conduit and Tubing
   5. NEMA VE 1 - Metal Cable Tray Systems
   6. NEMA WC 57 - Standard for Control, Thermocouple Extension and Instrumentation Cables
   7. NEMA WC 70 - Standard for Power Cables Rated 2000 Volts or Less for the Distribution of Electrical Energy
   8. NEMA WC 71 - Standard for Nonshielded Cables Rated 2001-5000 Volts
   9. NEMA WD 1 - General Color requirements for Wiring Devices

I. National Fire Protection Association (NFPA)
   1. NFPA 70 - National Electric Code (hereinafter referred to as NEC)

J. Underwriters Laboratories (UL)
   1. UL 5 – Standard for Safety Surface Metal Raceways and Fittings
   2. UL 6 - Standard for Safety Electrical Rigid Metal Conduit
   3. UL 83 - Standard for Safety Thermoplastic-Insulated Wires and Cables
   4. UL 467 - Standard for Safety Grounding and Bonding Equipment
   5. UL 651 - Standard for Safety Schedule 40 and 80 Rigid PVC Conduit
   6. UL 870 - Standard for Safety Wire way, Auxiliary Gutter and Associated Fittings
   7. UL 1277 - Electrical Power and Control Tray Cables with Optional Optical-Fiber Members
   8. UL 1479 - Fire Test for Through – Penetration Firestops
1.3 SUBMITTALS

A. Submit the following in accordance with these Specifications:

1. Manufacturer’s descriptions, catalog data, shop drawings, run sheets, and product information, including cut sheets showing model numbers or item identification.

2. Samples of each type of cable.

3. Manufacturer’s installation instructions.

4. Certified test reports demonstrating that materials comply with the specified requirements and the referenced ANSI, AEIC, ASTM, FS, ICEA, IEEE, NEMA, NFPA and UL standards.

5. Shop drawings of warning signs as required herein under Article 3.6.

1.4 QUALITY ASSURANCE

A. Contractor shall perform the work included in this Section in strict accordance with the requirements of the Contractor’s Quality Assurance Program as Authority approved and in compliance with the requirements of these Specifications.

B. Contractor shall perform the following in accordance with these Specifications:

1. Material qualification testing and certification for acceptance of materials, components, and assemblies.

2. Job control testing of in-progress work being performed in shops, factories, and on-site.

3. On-site inspection of specified work elements.

2.3 METAL FRAMING AND WIREWAYS

A. Metal Framing (Continuous Slot Metal Channel System): Comply with the following requirements:

1. Channel:
   a. Steel, ASTM A569, where used as a raceway, channel shall be listed by UL as complying with UL 5 for use as surface raceway.

2. Configuration:
   a. Single channel or 2 single channels welded together. Channels shall accept spring-held steel nuts.

3. Single Channel Dimensions:
   a. 1-5/8 inch by 1-5/8 inch, 12-gauge

4. Double Channel Dimensions:
   a. 1-5/8 inch by 3-1/4 inch, 12-gauge

5. General Fittings Dimensions, for Flat, Angular and U Shapes:
   a. 1/4 inch thick by 1-5/8 inch wide, unless otherwise indicated.

6. Channel, Pipe Clamps, and General Fittings Finish: Hot-dip galvanized after fabrication, ASTM A123 or A153, as applicable.

2.4 HANGERS AND SUPPORTS

A. Hanger Rods:
1. ASTM A575 or ASTM A576. Threaded, hot-rolled steel, 3/8-inch diameter minimum with electro-deposited zinc coating, conforming to ASTM B633, Fe/Zn 5, Type III.

B. Insulated Tie Plate Assemblies:
1. Fabricated of 2 or more galvanized steel hanger rods, a steel channel horizontal member and U-bolts, clamps and other attachments required for securing hanger rods and conduits.
2. Horizontal Member:
   a. Continuous slot galvanized metal channel single or double, as required.

2.5 CONCRETE INSERTS

A. Continuous Insert:
1. Steel single channel with concrete anchors and continuous slot to accept springheld steel nuts. Channel hot-dip galvanized to ASTM A123 or A153 and filled with expanded polystyrene. Nuts and springs electro-deposited zinc coating according to ASTM B633.

B. Expansion Anchors:
1. FS FF-S-325, Interim Amendment 3, Group VIII, Type 1. Metal shall be ASTM A108 steel with electro-deposited zinc coating according to ASTM B633.

C. Equipment Anchorages:
1. Steel leveling plates, angles, and studs shall comply with ASTM A36.

2.6 GROUNDING AND BONDING MATERIALS

A. Grounding and bonding materials shall comply with UL 467.

B. Ground Rods:
1. Medium carbon steel core, copper-clad by the molten weld casting process and have a conductivity of not less than 27 percent of pure copper. Rods shall be not less than 3/4-inch diameter with lengths as indicated in the Contract Drawings.

C. Ground Conductors:
1. ASTM B3, Class B stranded annealed copper and sizes as indicated.

D. Connectors:
1. Exposed ground connections shall be bolted type of high copper alloy. Terminal lugs on cable ends shall be compression or exothermic-weld type.
2. Buried ground connections shall be exothermic-weld type.

2.7 INSULATED WIRE, CABLE, AND ACCESSORIES

A. High-Voltage Alternating Current (AC) Power Cable:
1. Type: Cables shall be single-conductor, shielded, and required for use on 13.2 KV or 12.47 KV, 3-phase, 60 Hz systems. Cables shall comply with NEMA WC70, type MV-90 or MV-105 and AEIC CS6, and shall be suitable for installation in conduit and ducts. Conductor size shall be as required, but not less than No. 2/0 AWG and the maximum continuous operating temperature rating shall be 194 degrees F.
2. Conductors: Shall be uncoated copper wire in compliance with ASTM B3 and Class B stranded conductor conforming to ASTM B8.
3. Strand Screen: Extruded semiconducting ethylene-propylene-rubber (EPR) thermosetting compound, which shall be clean stripping from the conductor and firmly bonded to the overlying insulation.
4. Insulation: The insulation shall be a flame-resistant, EPR thermosetting compound with minimum average insulation thickness for 133 percent insulation level in accordance with the applicable standards.
5. Insulation Screen: An extruded semiconducting, EPR cover shall be applied directly over the insulation. It shall be plainly identified as being conductive.
6. Insulation Shield: Bare 5 mils thick minimum, copper tape shall be helically
applied over the insulation screen with a minimum overlap of 25 percent.

7. The nonmetallic jacket shall consist of a durable lead-free moisture and sunlight resistant low-smoke, zero-halogen polyolefin (LSZH) compound, with a thickness of not less than 80 mils.

8. Cable Identification: The following information shall be printed on the jacket, in contrasting color, at approximately 2-foot intervals:
   a. Manufacturer's name
   b. Year of manufacture
   c. Conductor size
   d. Voltage rating
   e. Insulation type
   f. Jacket type

9. Cable shall have a written warranty of not less than 40 years.

B. Direct Current (DC) Cable:

1. Type: NEC Type RHW-2, 2000-Volt, single-conductor, non-shielded, suitable for wet or dry installation in conduit, underground ducts, and cable trays. Continuous operating temperature rated at 194 or 221 degrees F, wet and dry, with a hot spot temperature of 230 degrees F.

2. Conductors: Shall be coated, D or G stranding, soft copper wire as specified below. The conductor shall be in compliance with ASTM B8 and B189. Conductor size shall be as shown on the plans and as specified:
   a. Main Feeder (TPSS to Disc Switch): Class D
   b. Catenary Feeder (Disconnect Switch to Catenary wire): Class G
   c. Negative Returns: Class D
   d. DC Surge Arrester: Class D

3. Insulation: The insulation shall be a flame-retardant, ozone-resistant, ethylene-propylene-rubber compound in compliance with ASTM D2802 and NEMA Standards. The minimum average insulation thickness shall be 80 to 90 mils.

4. Jacket: The jacket shall be flame-retardant, ozone-resistant, nonhalogen, cross-linked polyethylene compound, meeting the flame test requirements of UL 1581, IEEE 383 and IEEE 1202. Maximum overall diameter shall not be more than 1.47 inches. The jacket shall be tested in accordance with ICEA Standards.

5. Cable Identification: The following information shall be printed on the jacket, in contrasting color, at approximately 2 foot intervals:
   a. Manufacturer's name
   b. Year of manufacture
   c. Conductor size
   d. Voltage rating
   e. Insulation type
   f. Jacket type

C. Low-Voltage Wire and Cable:

1. UL listed for the intended purpose.

2. Conductors: Soft or annealed copper complying with ASTM B3:
   a. Power Circuits
      1) Size No. 12 AWG, minimum, shall be ASTM B8, Class B stranded conductor.
   b. Control Circuits
      1) Size No. 14 AWG, minimum, ASTM B8, Class B stranded, minimum.
   c. Fixture wiring:
      1) Size No. 16 AWG, minimum, ASTM B8, Class C stranded.
   d. Wire that crosses hinge points shall be flexible Class C stranded.
   e. The conductors shall be insulated with a flame retardant dielectric based on an ethylene-propylene type elastomer meeting UL 1581. The jacket overall shall be mechanically rugged cross-linked polyethylene or thermoplastic.
compound to comply with UL 1277.

D. Color Coding of Conductors:

1. Color code of single-conductor control wires shall be as follows:
   a. 2000 V circuits: black
   b. 480/277 V circuits: blue with yellow tracer
   c. 208/120 V circuits: yellow with blue tracer
   d. Color-coded with base colors and tracers per ICEA and NEMA Standards.

2. Color code of multiple conductor control cables shall conform to NEMA Standards, using colors with stripes on one side and alphanumeric printing on the other side.

3. All external equipment ground wire insulation shall be minimum No. 6 with green insulated jacket.

E. Terminations for Low-Voltage Wire and Cable:

1. Terminal connections shall be UL listed and have capacity and insulation voltage ratings of not less than the ratings of the wire or cable terminated.
   a. Terminals for No. 10 AWG and Smaller Wire:
      1) Except as noted, vinyl-insulated, electro-tin-plated, electrolytic copper locking spade or ring type.
         a) Except as noted, vinyl-insulated, electro-tin-plated, electrolytic copper locking spade or ring type.
      2) Terminals for No. 8 to No. 3/0 wire
         a) Compression-type, tin-plated copper lug.
      3) Terminals for No. 4/0 and Larger Wire
         a) Long-barrel, tin-plated copper,

   4) Connections to the catenary will be by means of parallel clamps with full current carrying capacity.

F. Terminations for 2,000 V Cables:

1. At DC Catenary Disconnect Switches and Feeder Terminations:
   a. Provide cable terminations rated for the maximum current rating of the cable, provide long-barrel, double-indentation, compression-type, non-insulated, tin-plated copper sleeve connectors, with an inspection window.
   b. Provide each connector with 2-hole lug for positive cables and one-hole or 2-hole lugs for negative power circuits. Hole sizes and spacing shall be provided per NEMA standards.
   c. Each connector shall be stamped with the manufacture name, wire size, catalog number and die index number.
   d. The connector shall be color coded so that the proper installing die and crimping tool is selected by matching the die color to the connector color.
   e. All electrical connections shall be cleaned and installed using a compression tool. Connectors shall be installed using an electrical joint compound such as Penetrox or Authority approved equal. Install each connection using a torque wrench. Proper torque shall be per the manufacture recommendations.
   f. Installation hardware shall be as indicated on the Contract Drawings and as recommended by the Manufacturer.

G. Insulation Sleeves:

1. For 2,000 V cable terminations provide heavy-wall, flame-retardant, flexible, heat-shrinkable cable sleeves with thermoplastic adhesive.
H. Wire Identification Markers:

1. Feeder Identification Marker:
   a. Fungus and water-resistant, self-laminating vinyl, with opaque blank write-on section and transparent adhesive section to wrap around the cable and protect printing. Identify cable at both ends.

2. Control Wire Identification Marker:
   a. Fungus and water-resistant, factory-printed, self-adhesive vinyl with printing protected by clear, permanent overcoat. Identify cable at both ends.

I. Wire Tie Wraps:

1. Stainless steel, with stainless steel locking barb and taper, capable of supporting up to three 750 Kcmil insulated feeder cables on cantilever tubes, headspan wires or feeder support wires. A separate, UV resistant, protective cable sleeve shall be provided with each tie wrap for protecting the insulation of the cables against damage from the stainless steel tie wrap.

J. Factory Testing:

1. All UL, ICEA, and NEMA production tests including standard dielectric withstand tests shall be performed on each reel of cable prior to shipment. A certified copy of the design and production test report for each reel of cable shall be provided to the Authority prior to shipment. A copy of the test report shall also be packed with each reel. Test voltage and insulation test requirements shall be in accordance with ICEA and NEMA Standards. Tests may be witnessed by the Authority.

K. Reels and Packing:

1. The cable shall be provided on returnable or non-returnable reels. Reels shall be constructed of rugged materials, and shall afford proper protection to the cable during shipment and handling.

2. A watertight seal shall be applied to each end of the cable to prevent the entrance of moisture during transit or outdoor storage.

3. A durable label shall be securely attached to each flange of each reel. Each label shall indicate the purchase order number, name of manufacturer, reel number, length of cable on reel, description of cable, weight of reel and rolling direction, and source of manufacture.

2.8 SEALING COMPOUND

A. A 2-part silicone foam shall be used to prevent passage of fire, smoke toxic gases and water. Sealing compound shall be rated for 2 hours and UL 1479 listed. Authority approved products include:

1. Dow Corning 3-6548 Silicone RTV Foam, as manufactured by Dow Corning Corporation, Midland, Michigan 48640; or

2. Chase-Foam, CTC PR-855, as manufactured by Chase Technology Corporation, 168 Railroad Street, Huntington Station, New York 11746.

B. Sealing compound shall be installed in accordance with the manufacturer's written instructions.

2.9 CONDUIT CABLE SEALS

A. Provide watertight seal between 750 Kcmil cables and feeder riser conduit on catenary poles and in manholes on all conduits (occupied & empty leading directly to the Traction Power Substation (TPSS).

B. Pressure disc of PVC-coated steel and sealing ring of neoprene.

C. O-Z Gedney type CSBI, CSBE or Authority approved equal. Size as shown, drilled to accommodate cables.

2.10 WORKMANSHIP

A. All equipment surfaces shall be smooth and free of defects, which detract from safe performance and neat appearance. Such defects include, but are not limited to gaps, burrs, sharp edges, wrinkles, waves, and blemishes. Enclosing structures shall possess sufficient reinforcement to maintain structural integrity as well as the safety of their contents through transport, handling, installation and operation.

B. Equipment Metal Enclosures:

1. Enclosures shall be fabricated according to the requirements of the cited references listed in the specifications.

C. Threaded Fasteners:

1. Fasteners shall be Unified-type screw threads with dimensions in inches conforming to ANSI B1.1 (ISO-inch-
Fasteners shall be Authority approved, and the Contractor may use metric fasteners to ANSI B1.13M (ISO-metric) for internal assemblies, or components.

2. Each assembly or component containing ISO-metric threaded fasteners shall be indelibly identified and Authority approved. Additionally, all maintenance manuals shall be conspicuously marked on each page where metric threaded fasteners are used to assemble the component. Spare parts shall contain all required replacement ISO-metric fasteners of the correct size and grade.

D. Surface Treatment:

1. Exposed non-wearing metal surfaces shall be painted. The surface shall first be thoroughly cleaned and treated with an anti-rust coating. The metal finish shall be a semi-gloss paint system that is the manufacturer's standard for the service specified.

2. Unfinished metal surfaces shall be coated with a layer of grease. The grease shall be removable by a petroleum-derived solvent.

E. Finish Color:

1. Enclosures shall have an exterior finish of light gray color No. 61 in accordance with ANSI Z55.1. Interior colors of enclosures shall be the manufacturer's standard for the intended service.

F. Touch-Up:

1. Equipment shall be provided with sufficient finish coat touch-up paint to cover five percent of the metal surfaces.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION REQUIREMENTS

A. Installation work shall be in accordance with applicable requirements of NEC, comply with the regulations of International Conference of Building Officials (ICBO) and Public Utility Company (PUC) for electrical service connections.

B. Materials and equipment shall be applied, installed, and connected as recommended by the manufacturer.

3.2 CABLE TRAYS, METAL FRAMING, AND WIREWAYS

A. Trays and wireways shall be supported by cantilever type metal frame support or hangers of sufficient strength to carry combined weights of tray and cable and the dynamic loads imposed during cable pulling.

B. Electrical continuity shall be maintained between sections of steel tray by bolted copper braid and the steel tray connected to local grounding system by green colored insulated wire.

3.3 GROUNDING

A. General:

1. Provide local grounds and connections to DC disconnecting switch enclosures installed at project site.

B. Buried Ground Conductors:

1. Grounding grid conductor shall be as specified. Final design, ground rods, size of conductor, depth of burial, and arrangement of grid shall be by the Contractor and generally conform to the design as indicated on Contract Drawings.

2. Conductor splices, joints, and connections shall be made by the exothermic copper-oxide reduction weld method. Welds shall only be performed by welders experienced in the use of the exothermic welding materials.

3. Finish welds shall be cleaned and coated with an Authority approved cold applied bituminous resin compound. Primer shall be as recommended by the coating manufacturer.

C. Ground Rods:

1. Ground rods shall be driven vertically to a depth required to acquire the calculated ground resistance. Rod point shall be provided with a steel alloy cone and driven end provided with removable driving stud. Problem areas shall be immediately brought to the Authority's attention.

2. For rod lengths greater than 15 feet, sections of standard rod shall be joined with couplings. Top of driven rod shall be at same depth as buried conductor.

3. Ground rods shall be separated from adjacent buried metallic structure or pipe by a minimum of 2 feet.

D. Ground risers shall be fitted with exothermic weld or compression lugs. Lugs shall be 2-hole, attached to equipment by means of bolts.
E. Grounding Grid Resistance Measurement:

1. Ground grid resistance measurement shall be taken by the fall of potential method in accordance with IEEE 81. Contractor shall measure each substation ground resistance to verify that the resistance is as calculated but not more than 2 ohms. If the resistance is greater than 2 ohms, remedial action must be implemented such as adding ground rods to lower the resistance in compliance with this requirement.

2. DC ground grid resistance shall be three ohms or less.

3.4 INSULATED WIRE, CABLE, AND ACCESSORIES

A. General:

1. Wire and cable shall be installed by means of equipment, devices, and methods recommended by manufacturer. High-voltage cable terminations shall be performed by qualified personnel.

2. External wiring and cabling to the TPSS, remote mounted traction power equipment, and other facilities shall be provided in field as indicated. Wiring and cabling shall be terminated and connected, except as indicated, by means of connectors, lugs, and other methods specified.

3. Wire and cable shall be installed, supported and segregated in cable tray, raceway or conduit within manholes and handholes. Contractor shall route cables inside each manhole to allow unobstructed access into manhole. Channel cable supports, racks, an other cable supporting devices shall be used for securing cables to manhole walls. In manholes, cable seals shall be used to seal all occupied or empty conduits that route to the TPSS.

4. Wiring and cabling shall be run end to end without splices, except where indicated otherwise on the Contract Drawings. Each cable shall be identified at each end, and at any intermediate pullbox, by markers as specified in Paragraph 2.7.H in this Section.

5. Interconnecting circuit wiring between equipment panels and cubicles shall be terminated at terminal blocks.

6. Suitable installation equipment shall be provided, to prevent cutting and abrasion of conduit and wire during the pulling of feeders.

7. Masking or other means shall be used to prevent obliteration of cable identifications when solid-color coating or colored tracers are used.

8. Cables to be installed in a single conduit shall be pulled together.

9. The manufacturer’s recommended pulling tension or sidewall pressure shall not be exceeded.

10. Refer to these Specifications for cable testing requirements.

B. Power Cabling:

1. AC and DC circuits consisting of multiple single conductors shall be grouped and pulled together in the designated raceway. Conductors shall be continuous from end to end without splices, except where indicated. Adequate slack shall be provided at terminations and in pullboxes, handholes, and manholes.

2. Bundle circuit conductors neatly and securely to cable trays with specified strap. Cables entering equipment panels and cubicles shall be spaced and tied to supports provided.

3. Cables shall be identified at each end of circuit and at any intermediate pullbox, handhole, or manhole by specified markers. Cables shall also be identified at 10 feet intervals in cable trays.

C. Control Wiring:

1. Unless otherwise specified, multiconductor control wiring with 600 V or 2000 V insulation between equipment panels and cubicles shall be installed in designated conduits and raceways separate from those used for power cables. Multiconductor cables installed in the same conduit shall be pulled together.

2. Control wiring shall be run from end to end without splices. Each multiconductor cable shall be identified at each end, and at any intermediate pullbox, handhole, or manhole by specified markers. Control wiring shall be identified at 50 foot intervals in cable trays.

3. Control cable shall be neatly laid and grouped in cable tray and secured by specified strap. Cable entering
equipment panels or cubicles shall be supported and secured to prevent tension on terminations. Adequate slack cable shall be provided and each wire terminated shall be double looped.

4. Interconnecting circuit wiring between equipment panels and cubicles shall be terminated at terminal blocks.

5. Equipment panel and cubicle wiring shall be run in wireways and each conductor shall be continuous without splices or taps from terminal to terminal.

6. Wiring within DC switchgear and disconnecting switch compartments and cubicles shall be shielded from primary current conductors by flame-resistant insulating barriers.

7. Wiring within high-voltage AC equipment compartments shall be shielded by a grounded metal screen.

8. Interior wiring within equipment panels and cubicles shall be identified at each termination with the equipment manufacturer’s wire number by a marker as specified with imprinted identification.

3.5 WARNING DEVICES

A. Wire Termination:

1. Power wiring shall be terminated with specified connector. Provide adequate slack wire, one loop minimum, to prevent strain on termination.

3.6 WARNING SIGNS

A. Attach specified warning signs to exterior surfaces of DC disconnecting switch enclosure access doors with tamperproof mechanical fasteners.

3.7 FIELD TOUCH-UP

A. Galvanized Metal Surfaces:

1. Coat damaged surfaces, to the strength and finish of the original coating, with polystyrene organic rich compound containing not less than 91 percent by weight metallic zinc powder in dried film.

B. Painted Metal Surfaces:

1. Clean, treat, and coat damaged surfaces with required rust inhibiting undercoating and finish coat paint system in accordance with manufacturer's instructions.

C. Fiberglass:

1. Reinforced Polyester Enclosures: Repair damaged surface with materials and methods recommended by manufacturer.

PART 4 – MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this Section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith will be considered incidental to the Work specified under Section 16371 “Overhead Contact System.”

END OF SECTION 16350
PART 1 - GENERAL

1.1 DESCRIPTION

A. The Work specified in this Section includes providing, installing, and testing complete grounding and bonding systems.

B. For related Work specified elsewhere, refer to these Specifications.

1.2 REFERENCE STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM)
   1. ASTM A666 - Standard Specification for Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar
   2. ASTM B8 - Standard Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft
   3. ASTM B187/187M - Standard Specification for Copper, Bus Bar, Rod, and Shapes and General Purpose Rod, Bar and Shapes

B. Institute of Electrical and Electronics Engineering (IEEE)
   2. IEEE 81 - Guide for Measuring Earth Resistivity, Ground Impedance, and Earth Surface Potentials of a Ground System
   4. IEEE 142 – Grounding of Industrial and Commercial Power Systems
   5. IEEE 367 (R2000) - Recommended Practice for Determining the Electrical Power Station Ground Potential Rise and Induced Voltage from a Power Fault
   6. IEEE 837 – Standard for Qualifying Permanent Connections used in Substation Grounding

C. National Electrical Safety Code (NESC)

D. National Fire Protection Association (NFPA)
   1. NFPA 70 - National Electrical Code (NEC)

E. Underwriters Laboratories (UL)
   1. UL 467 - Standard for Safety Grounding and Bonding Equipment.

F. Source Quality Control
   1. Each Item UL- Listed

1.3 SUBMITTALS

A. Submit the following for approval in accordance with these Specifications, and with the additional requirements as specified for each.

B. Shop Drawings
   1. Thirty days prior to installation, submit procedures and equipment for testing resistances and electrical continuity.

C. Certification
   1. Seven days after testing has been completed, submit certified test reports verifying that ground resistance of each ground grid when installed and each ground bus when connected to the ground grid does not exceed specified values.

D. Traction Power Substation (TPSS) Final Design
   1. Provide site-specific final grounding design for each TPSS Site. Employ the services of a firm experienced in “ground grid” design. The final design shall be developed with grounding analysis software to formulate a design that consists, as a minimum, of the following:
      a. Site testing for soil resistivity
      b. Ground system resistance
      c. Ground potential rise
      d. Step, touch, and absolute potential inside and outside the grid
      e. Installation drawings compatible with the Authority CADD system
      f. Grounding system compliance testing
      g. A complete Bill of Material
2. Provide drawings, calculations, and final design for Authority approval for each TPSS site 90 days prior to beginning site work for each TPSS.

3. All calculations shall be signed and sealed by a Licensed Texas Professional Engineer.

1.4 QUALITY ASSURANCE

A. The following codes, regulations, Reference Standards, and Specifications apply to the Work included in this Section:

1. The codes and regulations of the jurisdictional authorities
2. NEC
3. UL: 467
4. ASTM: B187, A666, B8
5. IEEE 80/81
6. NESC
7. NFPA

PART 2 - PRODUCTS

2.1 PRODUCTS AND MATERIALS

A. Grounding and Bonding Equipment:

1. General Requirements: UL 467
2. Ground Rods
   a. Copper clad steel or other material as shown on drawings. Minimum dimensions: 3/4 inch diameter by 15 feet long unless otherwise indicated.
3. Grounding Electrode Conductors
   a. Stainless steel or copper conductor, as shown on drawings.
   b. Size unless otherwise shown:
      1) For use in ground grid and for connecting of ground grid to ground bus and OCS pole base to ground rod: No. 4/0 AWG or as shown on Drawings.
      2) For other grounding electrode conductors: In accordance with NEC Table 250-94.
4. Equipment Grounding Conductor
   a. Sized in accordance with NEC Article 250-95 unless otherwise shown on Drawings.
   b. Equipment grounding insulated conductor.
   c. Equipment grounding bare conductor integral with multiple-conductor cable.
5. Terminal Lugs
   a. For No. 4/0 AWG and Smaller Conductors: Cadweld or copper compression terminal lugs as indicated.
   b. For 250 kcmil and Larger: Long barrel, copper, double-compression terminal lugs.
6. Ground Connector
   a. O-Z Gedney, Type KG or approved equal.
   b. Two-piece, designed for connecting grounding conductor to bus bar.
   c. Copper alloy body and silicon bronze bolt, nut and washer with interlocking clamp.
   d. Exothermic Weld: Size and type per manufacturer’s recommendations.
7. Jumpers
   a. Insulated copper braided or leaf-type flexible jumper, size as required.
8. Coal Tar Epoxy
   a. Polyamide cured coal tar epoxy, Dupont Corlar 823 CTE, Koppers Company No. 300M, PPG Industries 97-640 or 97-641 or approved equal, applied to a dry film thickness of 8 mils. per coat.
9. Epoxy Resin Encapsulation
   a. Two-Component epoxy resin type with plastic snap mold, as manufactured by Duriron Company, 3-M Company or approved equal.
PART 3 - EXECUTION

3.1 GROUNDING

A. Ground Connections:

1. Weld buried ground connections exothermically, in accordance with manufacturer's recommendations. Clean and coat with coal tar epoxy applied with a 32 mils dry film thickness using multiple coats. Allow drying between coats and before backfilling. Encapsulate with epoxy resin, all buried ground connections of grounding electrode conductors running to ground buses as shown.

2. Use two-hole terminal lug to connect grounding conductor to equipment enclosure. Secure connector or terminal lug to the conductor so as to engage all strands equally by using tools and pressure recommended by the manufacturer.

3. Exothermically weld connections for ground rods in manholes and handholes, as shown.

4. Splices shall not be permitted in grounding conductors.

B. Equipment Grounding:

1. Disconnect Switches
   a. Connect continuous equipment ground bus by copper ground wire to building or facility ground bus.
   b. Provide ground wire equal in size to largest conductor in line feeding equipment, but not less than No. 6 AWG, nor larger than No. 4/0 AWG.
   c. Install ground wire in rigid steel conduit bonded at both ends.

2. Wiring, channels, metallic conduit, rigid galvanized steel, flexible conduits, metallic boxes, panelboards, and transformer enclosures: Ground the ground bus with copper ground conductors sized as specified.

3. Overhead Catenary System Surge Arrestors
   a. Surge arrestors shall be installed to protect the OCS system at connection points to feeders, disconnect switches and on each track at interlockings. Ground in accordance with drawings and with requirements of these Specifications. Provide rigid steel conduit from lightning arrester ground connection extending down to the base of the catenary pole for connection to the ground electrode.

4. Grounding for Personnel Safety
   a. In manholes, provide grounding to all metallic components except manhole cover, to a maximum of 25 ohms resistance to ground.
   b. Weld all grounding and bonding connections exothermically to metallic structures, catenary poles, cable troughs, and fences.

3.2 FIELD QUALITY CONTROL

1. Test ground resistance of each ground grid after installation and each ground bus when connected to ground grid, using approved test procedure.

2. To meet resistance requirements, install additional ground rods or use soldier piles as ground rods where available. Isolate piles used for grounding from those bonded for stray current and cathodic protection.

3. Test metallic conduit and raceways, equipment enclosures, metallic cable troughs, fences, hand railings, metallic structures, and light standards for continuity to grounding system.

4. Conduct tests in presence of the Authority.

5. Prepare and submit certifications as specified.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this Section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith will be considered incidental to the Work specified under Section 16371 "Overhead Contact System."

END OF SECTION 16351
PART 1 - GENERAL

1.1 DESCRIPTION

A. The Work specified in this Section includes the final design, providing all labor, materials, tools, equipment, services, and incidentals for the installation, testing and commissioning of the Overhead Contact System (OCS) in conformance with the project requirements as defined in the Contract Documents including Drawings and these Specifications.

B. This OCS Work includes, but is not limited to, the following elements:

1. Final OCS design based on the Drawings and Specifications.
   a. The catenary system shall consist of the conductors, hangers, feeders, jumpers, and other assemblies from which the light rail vehicles collect electrical power.
   b. The physical support system shall consist of steel poles to be installed on concrete foundations, pole bonding, pole bands/attachments, cantilevers, pull offs, cross-spans and headspans and other assemblies and components required to support the OCS.
   c. The OCS feeder system shall consist of the following facilities:
      1) Feeder System: Provide 750 kcmil, 2000 V DC feeder and negative return cables from the substation to the OCS. The Work shall include all connections from the substation to the clamped connections at the OCS. Contractor shall supply 750 kcmil, 2000 V DC cables, lugs, cable supports in manholes, conduits, clamp connectors, tie wraps, and hardware for the performance of the Work.
      2) OCS Sectioning: Provide pole-mounted hand operated disconnect switches, 750 kcmil, 2000 V DC feeder cables, including assemblies, operating mechanism, and components to terminate, connect and support the cables from the pole-mouted hand operated disconnect switches to the OCS.

3) Where indicated, provide motor operated disconnect switches including 125 V DC control cables, 2000 V DC feeder cables including assemblies, conduits and components required to support, terminate and connect the cables from the disconnect switches to the OCS.

C. Contractor shall be responsible for the OCS final engineering details, to include the following:

1. Verification of existing field conditions and location of the OCS pole and anchor foundations shown on the Contract Drawings.
2. Selection and/or design of OCS assemblies and components, meeting the dimensional, loading and performance requirements included in the Contract Documents. Design details of assemblies and components by the Contractor shall conform to the requirements of the North Central Texas Council of Governments (NCTCOG) - Standard Specification for Public Construction. Double insulation shall be required.
3. Pole design modifications, if required, by the Contractor shall comply with the loadings specified on the Contract Drawings.
4. All OCS support attachments.
5. Preparation of Contractor-related designs in support of installation including working drawings, structural erection drawings, checking of installation and technical charts shown on the Contract Documents, and preparation of as-built.
6. Preparation and submittal of shop drawings, calculations and data to verify the adequacy of any designs.
7. Engineering design related to any substitutions requested by the Contractor shall be Authority approved.

D. Contractor shall be responsible for procurement and installation of all materials and components required in the Work, in conformance with the project requirements as defined in the Contract Drawings and Specifications.
E. The Work includes field support for integrated system test and startup, testing and commissioning of the completed OCS, including any modifications and adjustments found required for satisfactory performance.

F. The Work includes training of the Authority staff responsible for operating and maintaining the OCS, including preparation of operation and maintenance manuals, and on-site technical support as required.

G. Related Sections:
1. Section 05124 - Overhead Contact Systems - Steel Pole Wide Flange
2. Section 05125 - Overhead Contact System - Fabricated Metal Supports
3. Section 05126 - Overhead Contact System - Steel Tubular Poles
4. Section 16350 - Overhead Contact System Basic Electrical Materials and Methods

1.3 SUBMITTALS

A. Proof of Prior Service of Equipment: All proposed materials, components, equipment, and hardware items shall be service proven, with a record of at least 5 years successful use on similar light rail installations. Submit evidence of said service-proven history as requested by the Authority. A lesser period of service record will be allowed only if satisfactory performance can be guaranteed by the supplier; and, if Authority approved.

B. Shop Drawings: Shop drawings shall be submitted prior to fabrication. Included as a minimum shall be:
   1. Final design and calculations for all OCS assemblies.
   2. Physical and electrical characteristics of conductors.
   3. All OCS Manufacturer's arrangement drawings.
   4. Catalog data.
   5. Erection drawings.

C. Samples:
   1. Samples of conductors from each manufacturing batch shall be provided in lengths and quantities requested by the Authority or specified in the applicable standard.
   2. Samples of nameplates for disconnect switch enclosures.

D. Certification: A certification shall be provided by the manufacturer, verifying that the conductors, cable, wire rope, hardware, switches, insulators, and surge arresters have been designed, manufactured, inspected and tested in accordance with applicable portions of the referenced standards and these Specifications.

E. Test Reports: 6 certified copies of manufacturer's test reports for the specific conductors or equipment provided and any other test reports as may be requested by the Authority.

F. Section Insulators:
   1. Shop drawings shall include as a minimum:
      a. Creepage length (inches)
OVERHEAD CONTACT SYSTEM

b. Insulation level (impulse withstand test voltage, kV)
c. DC test voltage (kV)
d. Attachment centers or overall length (inches)
e. Shed diameters (inches)
f. Core diameters (inches)
g. Breakdown of weights, insulator and fittings (pounds)
h. Tensile withstand load (pounds)
i. Cantilever withstand load (pounds)
j. Recommended Maximum working tensile load (inch-pounds)
k. Recommended Maximum working cantilever load (inch-pounds)
l. Material (including end caps and touch-up insulator sealants)

2. Manufacturer's design safety factors.
3. Drawings of hardware and components.
4. Listing and description of components and hardware.
5. Drawings and specifications required for field forming and setting of contact wire into items, including gliders.
6. For assemblies, list values of BIL, ultimate tensile strengths, ultimate torsional strength, weights (including weight of components), and electrical characteristics.
7. Instruction Manual: Instruction Manuals shall be provided covering complete instructions for installation, maintenance and testing. Complete replacement parts lists shall be included.
8. Test Reports: 6 certified copies of reports of the following tests shall be provided.
   a. Prototype tests
   b. Production tests
   c. Field tests
9. The manufacturer shall submit full information, with supporting documentation, on the in-service history of the section insulators to be provided in accordance with these Specifications.

G. Surge Arresters:
   1. Complete manufacturer's descriptions, catalog data, and information including model number.
   2. Manufacturer's general detail and arrangement drawings, and installation instructions.
   3. Schematic wiring and interconnection diagrams.
   4. Method for attaching surge arrester to the pole and routing of the conduit from the surge arrester to the grounding system.
   5. Operation and Maintenance Manual with list of spare parts.

H. Jumpers
   1. Formulas used to establish the overall jumper lengths
   2. Actual field jumper length measurements

I. Cantilevers
   1. Heel settings for each cantilever and steady arm.
   2. Details of the temporary restraints.

J. Cross-span and Headspan Assemblies: Field changes from the design.

K. Messenger and Contact Wire
   1. Proposed methods of wire stringing installation.
   2. Method of prestressing the conductors.

L. Section Breaks
   1. Proposed procedure for construction of section breaks, including type and installation of the 4 bolt contact wire clamp, insulated hangers and insulation.

M. Disconnect Switches
   1. Test plan, which demonstrates that each switch is correctly wired from the Traction Power Substation (TPSS). Plan shall include continuity, voltage measurement and point-to-point verification.
2. Wiring schematic for motor operated disconnects.

N. Feeder Risers
1. Data describing the proposed riser material.
2. Methods proposed to support and attach the conduit risers to the OCS pole.

O. Insulated Cables: Pull tension calculations.

P. Cable Terminations
1. Data on the termination method, when a special type of termination is recommended by the equipment supplier.
2. Samples and test data for new or untried termination devices, including on-site tests and demonstrations when requested by the Authority.
3. Schedule of proposed wire tagging.

Q. Special Tools for OCS Installation
1. Shop drawings showing details and dimensions of all products and assemblies, together with complete specifications of materials proposed for components.
2. Certified statements verifying that the height/stagger gauges and super-elevation/step gauges conform to the performance requirements.

R. OCS Testing and Commissioning
1. Test Program Plan: Contractor shall submit, a Test Program Plan for Authority approval. The purpose of this plan is to ensure that the Contractor has considered all of the testing requirements contained in this and other sections of the specifications, and has made adequate provisions for testing in his overall program plans and schedules, and to achieve an early mutual understanding on the range, depth and other aspects of tests to be conducted. The Test Program Plan shall contain as a minimum the following data:
   a. A flow diagram indicating the logical sequence of tests, starting with factory tests and continuing on to conclude with field demonstration tests.
   b. A list of test procedures (by test procedure number) to be submitted, preliminary submittal schedule, a preliminary schedule of tests, and a brief description of each factory and field test. The schedule portion of the program plan shall be a dynamic document to be updated as the program progresses.
   c. An outline and format of the procedure and test data sheets for each type of test.
   d. Requirements and recommendations for witnessing by the Authority or designated representative.
   e. A description of the Contractor's in-plant and field test organization.
   f. A detailed Safety Program defining all precautions to be taken, notices, signs and barriers to be posted concerning the safety of the public, work personnel and equipment. The program shall define precautionary measures to be taken prior to, during and following the test until such time as normal Work is resumed.
2. Test Procedures: Test procedures shall be submitted for Authority approval at least 45 days in advance of the scheduled test. The test procedure shall include, as a minimum: Objective and scope; test setup; test equipment to be used; personnel required for the test; estimated duration of the test; pass/fail criteria; and samples of data sheets to be used.
3. Test Reports: 6 certified copies of Test Reports shall be submitted for Authority approval within 15 days after completion of tests. Test reports must contain all the data obtained during tests, an analysis of the data and conclusions relating to the test pass/fail criteria outlined in the test procedure.
4. Insulated Telescoping Height Measuring Sticks: Contractor shall supply a catalog cut of the specified insulated telescoping height measuring stick, or a complete technical description of any proposed alternative.
5. Optical Stagger Gauges: Contractor shall supply complete catalog information on the specified optical stagger gauges, or shop drawings and a working description of any proposed alternative.
6. Mobile Height and Stagger Gauges: Contractor shall supply shop drawings and outline specifications for the mobile height and stagger gauges, fully describing the following:
OVERHEAD CONTACT SYSTEM

a. Materials used
b. Construction
c. Assembly/Disassembly
d. Operation without clearance "ears"
e. Installation of clearance "ears", and safeguards for use
f. Track superelevation compensation
g. Means for keeping gauge in adjustment
h. Proposed spare parts

7. Completed Acceptance Measurements Tables

1.4 QUALITY ASSURANCE

A. Comply with the Codes and regulations of the local jurisdictional authority.

B. Contractor shall perform the Work included in this section in strict accordance with the requirements of the Contractor’s Quality Control Program as Authority approved. Comply with the requirements of the Quality Control Sections of these Specifications.

C. Appearance of OCS: All proposed components, equipment, and hardware items shall have a neat and attractive appearance when installed as part of the OCS. Individual components, equipment, and hardware items shall uniformly blend together in line and color, with a minimum number of fittings and discontinuities, to make up complete, neat and attractive assemblies.

D. Contractor shall perform the following:

1. Material qualification testing and certification for approval of materials, components and assemblies.
2. Job control testing of in-progress Work being performed in shops, factories and on-site.
3. On-site inspection of specified Work elements.

E. Functional tests shall be performed on each component assembly and shall be designed to demonstrate that the equipment will perform correctly for its intended application.

F. Materials and components manufactured to applicable foreign standards, including metric standards, will be Authority approved, provided that the Contractor submits written evidence, in the English language, that they are equal or superior to those complying with the standards listed above, and that written approval is obtained from the Authority. Weights and dimensions shall be converted to English units.

1.5 CONSTRUCTION SEGMENTS AND COORDINATION

A. Contractor shall be responsible for scheduling and construction phasing, including coordination with other contracts. Construction of the OCS shall be performed as shown on the Drawings and specified herein.

B. Interface Control: In addition to the requirements specified in the specifications, the Contractor shall:

1. Manage the physical, functional, and schedule interfaces between the OCS and other light rail transit system element contracts.
2. Verify form, fit and function between and among the subsystems, assemblies, and components comprising this OCS element.
3. Contractor shall verify compatibility of the OCS with other affected system elements.

C. Coordination: Contractor shall interface with other contractors through the office of the Authority. Contractor shall respond in writing to information and data requests from the Authority within 5 days of written receipt. Information and data shall be exchanged freely.

D. Contractor’s Responsibility:

1. Contractor shall design, fabricate, install and commission equipment so that the equipment and their elements perform their intended functions in concert with equipment and facilities provided under other contracts. In addition, the Contractor shall perform coordinating functions to assure compatibility of equipment provided by subcontractors under control of the Contractor.

2. Contractor shall assure that Authority approved changes are correctly implemented.

3. Contractor shall participate in formal reviews of the Work with the Authority. The management and control of interfaces will be agenda items at these reviews.

E. Other Construction Contracts: Contract Drawings and Specifications for other construction contracts, which interface with the OCS construction, will be made available for reference only at a location designated by the Authority.
1.6 TYPES OF OCS

A. Simple Catenary Auto-Tensioned (SCAT) System: The SCAT system used shall be supported from cantilevers or headspans attached to wide flanged or tubular tapered galvanized steel poles anchored to cast-in-place reinforced concrete pier foundations. The catenary shall be tensioned by means of counterweights. SCAT shall be used in the main line open route.

B. Simple Catenary Fixed Termination (SCFT) System: The SCFT system shall be supported from existing and new cross-spans, headspans, new cantilevers and 2 track cantilevers attached to wide flange and tapered tubular poles. The catenary shall have fixed ends and the conductor tensions shall vary with changes in temperature.

C. Single Wire Fixed Termination (SWFT) System: The SWFT system shall be supported from cross-spans, backbones and cantilevers attached to galvanized steel poles, anchored to cast-in-place reinforced concrete pier foundations.

PART 2 - PRODUCTS

2.1 MATERIALS - GENERAL

A. Materials provided for the OCS shall be standard products of manufacturers regularly engaged in the production of the materials specified. Materials specified in the Contract Specification shall be used in the OCS where applicable. In case of conflict between requirements specified in other Contract Specifications and this Contract Specification Section 16371 “Overhead Contact System”, the provisions of this Section shall prevail.

2.2 GROUNDING AND BONDING SYSTEM

A. The Work specified in this Article includes the providing of the grounding and bonding systems for the OCS, as shown on the Contract Drawings and specified herein.

B. Grounding and bonding materials are described in these Specifications and as specified herein.

C. The grounding and bonding systems shall be installed in accordance with the Contract Drawings and Specifications, and shall meet the requirements of the NEC and the technical and safety recommendations of ANSI and IEEE.

D. Connectors and Clamps: Connectors shall be as specified in these Specifications. Bolts, washers, and stop nuts shall be of high-copper alloy, Everdur, Durium, Duronze or silicon bronze. Ferrous hardware will not be Authority approved.

F. Exothermic Welding Materials: All tools, molds and other required materials for exothermic welding shall be manufactured or recommended by one supplier to insure consistent and satisfactory quality of welds.

2.3 BARE CONDUCTORS

A. The Work specified in this Article includes providing conductors used in the OCS as messengers, contact wire, jumpers, bare feeders and ground wire, as shown on the Contract Drawings and specified herein.

B. All material shall be of such composition, quality, and purity, that the finished product will have the properties and characteristics described in this Specification.

C. For installation see Article 3.10 of this Section.

D. Contact Wire: 350 kcmil hard drawn copper cable, solid grooved, conforming to ASTM B47.

E. Messenger Wire: 500 kcmil hard drawn copper cable, 19 strand, conforming to ASTM B1 and B8, Class AA, bare.

F. Messenger Potential Equalizing and In-Span Jumpers: 500 kcmil annealed copper cable, stranded, conforming to ASTM B3 and B8, Class H, bare.

G. Full Section Feeding and Jumpers: 500 kcmil annealed copper cable, stranded, conforming to ASTM B3 and B8, Class H, bare, or as shown on the Contract Drawings.

H. Ground Wire: The following types shall be used as shown on the Contract Drawings:

1. Annealed copper conductor, bare, Class B, stranded, conforming to ASTM B3 and B8.

2. Bare copper conductor cable, No. 4/0 AWG used for grounding catenary poles.

3. No. 2/0 AWG, 2000V insulation for surge arrester to messenger connections and to ground.

I. Bonding Wire: No. 1/0 AWG Copperweld, bare, 40 percent conductivity

J. Performance: The physical, mechanical and electrical properties of the conductors shall conform to the requirements of this Specification and the pertinent provisions of all Standards referenced in this Section.

K. Inspection and Testing:
1. The Authority reserves the right to witness the manufacture, testing and packing of all conductors. The manufacturer shall notify the Authority not less than 30 days in advance of manufacturing and testing operations.

2. All conductors shall be subject to factory quality control tests as required in the applicable standards. Tests shall be performed on each reel prior to shipment. A certified copy of the test report for each reel shall be submitted to the Authority prior to shipment. A copy of the test report shall be packed with each reel.

3. Grooved contact wire provided in accordance with ASTM B47 shall be subject to the ASTM B47 twist test in addition to other required tests. The twist test shall be performed as specified for round wire, except that 6 twists shall be required. Contact wire not meeting this test shall be rejected.

4. Contact wire factory splices shall be free of any kinks and shall be marked with bright orange paint for visual check and identification.

5. Splices shall be made and tested in factory in accordance with the manufacturer's recommendations. In field splicing hardware shall not in any way interfere with or impede the smooth running of the vehicle pantograph.

L. Packaging and Marking:

1. All conductors shall be shipped on reels, suitable for the weight of the conductors and the conductors shall be protected from damage. The diameter of reels shall be sufficiently large to eliminate difficulty with waves or kinks when the conductor is strung.

2. Each reel shall have a strong weatherproof tag securely fastened to it, showing the physical, mechanical, and electrical properties as well as type designation, ASTM designation, the name and mark of the manufacturer, the purchase order number, the component number and the wire run number.

3. Messenger wire and contact wire shall be packed so that no splices are required in the tension sections as installed.

4. Contact wire reels shall be packed with the vertical axis of the wire perpendicular to the axis of the reel, with the contact surfaces facing inward and the top (grooved) side outward.

2.4 INSULATED FEEDER CABLE

A. The Work specified in this Article includes providing insulated feeder cable for the OCS, as shown on the Contract Drawings and specified in this Specification. For installation see Article 3.19 of this Section.

2.5 CABLE TERMINATIONS

A. The Work specified in this Section includes providing and installation of cable terminations for the OCS feeder cables and electrical equipment cables, as shown on the Contract Drawings and specified herein.

B. Basic electrical materials and methods are specified in these Specifications. Feeder cable installation are specified in these Specifications, and specified herein.

C. 2000-Volt Power Cable Terminations:

1. Terminations shall be provided for connecting feeder cables to the electrical equipment terminals or studs.

2. Terminations for connecting feeder cables to messengers and contact wires of the OCS:

   a. Trolley wire clamp, Dossert Type JBCV or Authority approved equal.

   b. Two U-bolt parallel clamps, Dossert Type UP or Authority approved equal.

3. Terminations connecting jumper cables to the contact and messenger wires:

   a. Three bolt feeder trolley clamps, Ohio Brass No. 20618 or Authority approved equal.

   b. Feeder trolley clamp, Dossert Type DTAFU or Authority approved equal.

   c. Messenger parallel clamp, Dossert Type PC or Authority approved equal.

D. Power Cable Splices:

1. These Specifications require that all 2000 V cables shall be installed in continuous runs without splices. Contractor shall not splice 2000 V cables.

2. The Authority may approve 2000 V cable splices. Unless prior approval is granted by the Authority, the Contractor shall not splice 2000 V cables.
3. The following paragraphs apply to Authority approved splices:
   a. Splice connectors for 2000 VDC circuit connections in manholes and splice boxes shall be compression type, UL-listed. Splices shall be made moisture-proof and watertight, covered with a flame retardant, cold shrinkable sleeve complete with sealing adhesive, suitable for installation in locations periodically submerged in water. The cold shrink rubber splicing kit shall be as manufactured by 3M, 5740 Series, or Authority approved equal.
   b. Splices shall be installed with care in order to ensure a watertight fit. The Authority shall be notified of each splice completion that is ready for visual inspection.

E. 600-Volt Wire and Cable Terminations: Terminations for Low-Voltage Wire and Cable: Terminal connections shall conform to these Specifications.

F. Wire and Cable Identification Markers: Markers shall conform to the requirements of these Specifications

2.6 GALVANIZED STEEL WIRE AND WIRE ROPE

A. The Work specified in this Article includes providing all grades of galvanized steel wire, preforms, and wire rope for use as support wires and guys for the OCS, as shown on the Contract Drawings and specified herein. For installation see Article 3.6 of this Section.

B. Components: The zinc-coated stranded wire shall be manufactured and tested in accordance with ASTM A475.

C. Performance: Physical properties of the zinc-coated stranded wire shall conform to the description in Table 1 of ASTM A475.

D. Materials: The material used for stranded steel wire shall conform to ASTM A475.

E. Zinc Coating: The weight of coating for zinc-coated steel wire shall not be less than that specified in Table 4, under Class C of ASTM A475.

F. Types: Galvanized steel wire rope shall be of the following types:
   1. Cantilever Top Ties: 3/8 inch diameter, high strength grade.

G. Delivery and Marking: Materials shall be protected against damage in ordinary handling and shipping. Each reel shall have a strong, weatherproof tag securely fastened to it showing the physical and mechanical properties as well as the steel type designation, ASTM designation and the name and mark of the manufacturer.

2.7 STAINLESS STEEL WIRE AND WIRE ROPE

A. The Work specified in this Article includes providing stainless steel wire and wire rope for use as hangers and support wires for the OCS, as shown on the Contract Drawings and specified herein. For installation see Article 3.6 in this section.

B. Materials: Solid stainless steel wire shall be manufactured and tested in accordance with ASTM A493 and ASTM A555. Stainless steel wire rope shall be composed of a multiplicity of round wires manufactured and tested in accordance with ASTM A555, ASTM A368, and ASTM A492. The physical and mechanical properties of the stainless steel wire rope and solid stainless steel wire shall conform to the required tables of the ASTM standards referenced in Article 1.6 of this Section. Stainless steel wire shall be Type 304.

C. Types: Stainless steel wire, rod and wire rope shall be of the following types:
   1. Hangers: Messenger to Contact Wire 0.19 inch diameter rod. Other hangers 1/4 inch diameter, 7 X 19 construction, 6,600 pounds breaking strength.
   2. Bridle and backbone Cables, headspan and cross spans Wires: 1/2 inch diameter, 7 X 19 construction, 21,600 pounds breaking strength.
   3. Counterweight Support Cables: 1/2 inch diameter, non-spinning cable, 7 X 19 construction, 21,600 pounds breaking strength.
   4. Wire and wire rope shall be non-lubricated.

D. Delivery and Marking: Materials shall be protected against damage in ordinary handling and shipping. Each reel shall have a strong, weatherproof tag securely fastened to it showing the physical and mechanical properties as well as steel type designation, ASTM designation and the name and mark of the manufacturer.
2.8 OCS ASSEMBLIES, FITTINGS AND HARDWARE

A. The Work specified in this Article includes providing of assemblies, fittings and hardware for cantilevers, registration arms, pull offs/push offs, and other components required as part of the OCS hardware, as shown on the Contract Drawings and specified herein. For installation see Article 3.3 of this Section.

B. Contractor shall prepare detailed designs for each of the required assemblies, based on the performance requirements, working loads and basic dimensions as shown on the Contract Drawings and specified herein. Contractor’s designs for the assemblies shall be subject to the Authority review and approval.

C. The OCS assemblies shall comply with the NCTCOG - Standard Specification for Public Construction, particularly the requirement for double insulation. All OCS support assemblies shall clear the pantograph dynamic envelope.

D. General: Material for fittings shall comply with the description in the applicable Standards referenced in these Specifications. Substitutions will be considered if the requirements of the Contract Documents are satisfied.

E. Malleable Iron: Fittings or components made of malleable iron shall be Grade 32510 or better, and shall conform to ASTM A47. All components and fittings shall be galvanized in accordance with ASTM A153.

F. Forged Steel: Material for forged steel shall comply with AISI Types C-1035 to C-1045 SBQ and ASTM A711 or A668. All components and fittings shall be galvanized in accordance with ASTM A123.

G. Cast Iron: Cast iron weights and counterweights, if used, shall be of gray cast iron, in accordance with ASTM A48/A48A. Alternatively, lead or concrete weights and counterweights may be provided by the Contractor, if Authority approved.

H. Ductile Iron: Fittings or components requiring higher yield strength shall be of ductile iron, grade 60.40.18 or better and shall conform to ASTM A536. All fittings and components shall be galvanized in accordance with ASTM A153.

I. Stainless Steel: Stainless Steel hardware shall be AISI Type 302 or 304.

J. Nonferrous Metals: Copper alloys for fittings and components shall comply with ASTM B584 and B148.

K. Copper: All copper components shall conform to ASTM B248 or B249.

L. Copper-Clad: Grounding components shall be the Manufacturer’s standard items and shall conform to the IEEE definition of copper-clad materials.

M. Lead: Lead for balance weights in counterweight assemblies shall be casting grade, conforming to ASTM B29.

N. Manufacture and Performance:

1. The designated metals shall be produced by an Authority approved method that will meet the requirements of the ASTM standards and this Specification.

2. Castings shall be of uniform quality and shall be made in such a manner that the material of the casting conforms to the chemical and mechanical properties prescribed in the applicable ASTM standards.

O. Sampling and Testing:

1. For tension tests, a minimum of 3 test bars shall be poured from each lot of metal.

2. For chemical analysis, each lot of castings shall be analyzed for conformance with the chemical composition specified in the ASTM standards.

3. A lot shall consist of all castings produced from 1 furnace melt.

P. Galvanizing

1. Structural steel and plate, strips and bars, pipes and tubing shall be galvanized in accordance with ASTM A123.

2. Castings, fasteners, rolled, pressed, and forged products, and miscellaneous threaded objects that will be centrifuged, spun, or otherwise handled to remove the excess zinc shall be galvanized in accordance with ASTM A153.

Q. Workmanship, Finish, and Appearance:

1. The castings shall be free of adhering sand, visual cracks, surface porosity and shrinkage.

2. Contractor shall be responsible for the dimensional accuracy of castings and forgings.

3. Casting repairs shall be permitted only to the extent allowed by ASTM standards. If welding or repair of a greater magnitude is required, the Contractor shall obtain the Authority approval prior to proceeding.
OVERHEAD CONTACT SYSTEM

R. Marking and Shipping:

1. The identification mark of the foundry and the pattern numbers assigned by the supplier shall be cast into all castings, of sufficient size, in such a position that they will not interfere with the further processing and serviceability of the casting.

2. Castings shall be packed in accordance with the best commercial practice, adequate to ensure approval and safe delivery.

2.9 FASTENERS FOR OCS ASSEMBLIES

A. The Work specified in this Article includes providing various types of fasteners (bolts, nuts and washers) for general use and structural connections on the OCS, as shown on the Contract Drawings and specified herein.

B. Ferrous Metal Fasteners:

1. Material: The material for ferrous metal fasteners not specifically called out on the Contract Drawings shall comply with the applicable portions of the referenced standards, or where not covered in referenced standards shall be commercial products of proven performance in similar service as this system.

2. Anchor Bolts: Anchor bolts used for anchoring structures to their foundation shall comply with ASTM F1554. Nuts shall comply with ASTM A563, Grade D.

3. Structural Joint and Fitting Connections: Ferrous fasteners used with structural connections and fittings shall comply with ASTM A325.

4. U-bolt and Stud Connections: U-bolts and studs shall comply with ASTM A449. Washers shall comply with ASTM F436, and nuts shall comply with ASTM A563, Grade B.

5. Galvanizing: Ferrous fasteners shall be galvanized in accordance with ASTM A153, Grade C

C. Stainless Steel Fasteners:

1. Stainless steel bolts, screws, studs, and nuts shall be used for connections between ferrous and nonferrous metals, and in other applications where shown on the Contract Drawings.

2. Stainless steel bolts, screws, and studs shall comply with ASTM F593. Stainless steel nuts shall comply with ASTM F594.

D. Nonferrous Metal Fasteners:

1. Nonferrous metal fasteners shall be manufactured from material conforming with the applicable portions of the referenced standards.

2. Nonferrous bolts and studs shall comply with ASTM F468. Nonferrous nuts shall comply with ASTM F467. Nonferrous washers and lock washers shall be the manufacturer's standard product.

E. Bolted Connections:

1. Bolted connections using standard fasteners in accordance with ASTM A307 shall conform to the applicable requirements of AISC specification for structural joints using ASTM A307 bolts.

2. Bolted connections using high tensile strength bolts in accordance with ASTM A325 shall conform to the applicable requirements of AISC specification for structural joints using ASTM A325 or A490 bolts.

F. Galvanizing: Bolts, nuts, washers, anchors and other items of iron or steel hardware shall be hot-dipped galvanized as follows:

1. Structural steel, flat bar, pipe, tubing, and wire shall comply with ASTM A123.

2. Castings, fasteners, rolled, pressed, and forged products, and miscellaneous threaded objects that will be centrifuged, spun, or otherwise handled to remove the excess zinc, shall comply with ASTM A153.

3. Perform galvanizing in accordance with ASTM A153, as applicable. The weight of the zinc coating shall not be less than 1.25 ounces per square foot.

4. Threads of nuts shall be retapped after galvanizing. Bolts and nuts shall be assembled immediately after the retapping of nuts to retard corrosion of uncoated female threads.

5. Hardware items provided already galvanized shall be delivered with the required certificates of conformance with ASTM A153 and the required zinc coating specified.

G. Manufacture and Performance: Fasteners shall be produced by a method of manufacture that will meet the requirements of ASTM standards and this Specification.
OVERHEAD CONTACT SYSTEM

H. Testing: Fasteners shall be tested in accordance with the ASTM mechanical testing requirements for the applicable type, length of product and minimum tensile strength.

I. Marking: Bolts shall be marked according to ASTM standards.

J. Source Quality Control:

1. The fastener manufacturer shall provide a certified copy of the latest test report for each stock size in each shipment.

2. Fasteners shall be shipped in sturdy boxes, which are clearly marked with the manufacturer's name, lot number, purchase order number, size and material.

2.10 GUY GUARDS

A. The Work specified in this Article includes providing and installation of prefabricated single piece, full round, elastomeric snap-on guy guards for pole down guys, as shown on the Contract Drawings and specified herein.

B. The guy guards are required to provide high-visibility protection of pole down guys against accidental contact with persons and vehicles, particularly at night when the pole down guys are hard to see.

C. Guy guards shall be manufactured units, fabricated from UV stabilized high impact polyethylene, 96 inches long by 1-1/2 inch diameter, full round snap-on units for all sizes of guy cable, high-visibility yellow color, provided complete with integral locking straps for installation on guy cables without using special tools. Guy guards shall conform to: NESC Rule 264E - Guy Markers (Guy Guards).

D. Manufacturers: Guy guards shall be as manufactured by Preformed Line Products, Cleveland, Ohio; A. B. Chance No. 96-FRG-YEL as manufactured by A. B. Chance Co., Centralia, Missouri; or Authority approved equal.

2.11 DISCONNECT SWITCHES (NO LOAD BREAK)

A. The Work specified in this Article includes providing of DC manual and motorized disconnect switches and accessories for the OCS as shown on the Contract Drawings and specified herein. For installation, see Article 3.14 of this Section.

B. Contractor shall prepare detailed designs for each of the required assemblies, based on the performance requirements, working loads and basic dimensions as shown on the Contract Drawings and specified herein. Contractor's designs for the assemblies shall be subject to the Authority review and approval.

C. Tests - General: Disconnect switches shall be tested at the factory prior to shipment, as specified herein:

1. Qualification Tests: Qualification tests shall be performed to prove compliance with Specifications. Tests shall be conducted generally in accordance with those described in IEEE C37.34, including the following:
   a. Dielectric withstand voltage tests
   b. Short-time current test
   c. Temperature-rise test

2. Production Tests: Production tests shall be performed on switches to check the quality and uniformity of workmanship and materials used. Tests shall include the following:
   a. Operation of all components
   b. Power frequency dielectric withstand
   c. Electric resistance of current path

3. Submit 6 certified copies of all test reports.

D. Equipment: Each DC disconnect switch shall be an outdoor type, either a single-pole or double pole, single-throw, grounding or non-grounding, and non-fusible air switch, double insulated, with arcing horns, either manual or motor operation as indicated in the Contract Drawings. The switches shall be exposed pole mounted or enclosed pad/wall mounted as indicated on the Contract Drawings. Design shall comply with the applicable requirements given in ANSI and NEMA specifications. The switches shall be capable of breaking load currents under emergency conditions.

E. Ratings: Switches shall be rated for 1500 VDC operation with 3.0kV, rms, minimum insulation level. Continuous current ratings shall be 1200 amps without exceeding 122 degrees F rise above a maximum ambient temperature of 104 degrees F. Switches shall have a momentary current withstand rating of not less than 100kA, rms.

F. Motor Drive Mechanism:

1. The motor operated disconnect switches shall be suitable for pole or pad mounting with a motor drive mechanism connected to the switch by means of an insulated operating rod. The motor drive mechanism shall be mounted at approximately 4 feet above ground level when mounted on poles.
2. Each motor operated disconnect switch shall be locally (electrically and mechanically) and remotely controlled. The motor drive mechanism shall be totally enclosed in a NEMA-3R, fiberglass, aluminum or stainless steel enclosure. The unit shall be equipped with an internal motor starter circuit, motor contactor, motor unit, control power transformer (as required), fuses, relays, overloads, limit switches, pushbuttons, emergency operating handle, surge protectors and terminal blocks for power, control, indication and OCS voltage sensing circuits. Motors shall operate from a 125VDC supply, originating from the traction power substation. Voltage for the motor controls shall be derived from the 125VDC distribution panel source. The motor control shall be equipped with surge protection of 1.5 kV. The motor drive mechanism shall be equipped with a forward and reverse operating mode with enclosed pushbuttons for local electrical operation including stop, forward, and reverse. A slip clutch shall be provided to protect against motor overloads. An integral, insulated, emergency operating handle with motor shaft disengager shall be provided for each switch to operate the switch mechanism manually.

3. Remote Supervisory Control and Indication: Switch operating device shall be provided with 125 VDC auxiliary relays for interface with the substation disconnect switch control panel. Auxiliary switches shall be provided having 2 independent contacts for remote supervisory status indication of switch-blade OPEN and CLOSED positions. Status indication circuits shall be wired to terminal blocks for connection of external wiring.

4. Electrical interlocks: An electrical interlock circuit shall be provided to prevent operation of the motor operated disconnect switch with voltage on either side of the contacts. The interlock shall prevent local and remote electrical operation of the switch motor. Emergency manual operation shall not be prohibited.

5. Permanent weatherproof nameplates shall be attached to the outside of each enclosure. Samples shall be submitted for Authority approval before installation.

a. Switch positions shall be labeled "OPEN" and "CLOSED" in 7/8 inch silver letters. "OPEN" to have a green background and "CLOSED" to have a red background.

b. There shall be a label on the switch operating mechanism reading "DO NOT OPERATE WHILE ENERGIZED" in 3/4 inch black letters on a yellow background.

c. Each switch shall be numbered in accordance with the switch numbers as indicated on the Contract Drawings. The identification label shall indicate the switch number and letters in 7/8 inch, high blue characters on a white background.

G. Switch Contacts:

1. Moving and stationary contact surfaces shall be silver plated copper. All other current-carrying parts shall be of high-conductivity copper. Contacts shall be self-aligning, wear compensating, and with initial wiping action.

2. Switch contacts shall be bolted pressure type, or equal.

H. Manual-Operated Disconnect Switch Assembly:

1. Each switch shall be provided with an insulated operating rod, with operating handle located and an Authority approved height from ground level. Operating handles shall be provided with heavy duty lugs to accept padlocks in the fully open and closed switch positions. Switch positions shall be indicated with "OPEN" and "CLOSED" signs clearly visible from ground level.

2. Each switch shall have a permanent weatherproof identification nameplate attached at a suitable location near the switch handle. The nameplate shall have the switch identification number, as indicated on the Contract Drawing, on 7/8 inch high blue numbers on a white background.

3. All non-current carrying metal parts shall be hot-dip galvanized steel.

I. Cable Termination: The line and load side disconnect switch terminals shall be provided with silver-plated copper buses complying with ASTM B187, to accommodate the number and size of copper cables as indicated on the Contract Drawings. The switch terminals shall have provision for NEMA drilled (2 hole or 4 hole) cable terminal lugs.

2.12 SECTION INSULATORS

A. The Work specified in this Article includes providing section insulators for the OCS, as shown on the Contract Drawings and specified herein. For installation see Article 3.12 of this Section.
B. Contractor shall prepare detailed designs for each of the required assemblies, based on the conductor tensions and electrical stresses shown on the Contract Drawings. The basic dimensions of the section insulators shall be as recommended by the manufacturer. Contractor’s designs for the assemblies shall be subject to the Authority review and approval.

C. Assemblies, insulators, fittings and hardware are specified in Articles 2.8 and 2.13 of this Section.

D. Submittals as indicated in Article 1.3 of this Section.

E. Section insulators shall be as shown on the Contract Drawings and recommended by the manufacturer as service-proven units capable of providing smooth current collection, with minimum interruption, by 1 to 3 pantographs running at a speed of up to 65 miles per hour maximum for simple catenary auto tension (SCAT) and simple catenary fixed termination (SCFT) installations, and 35 miles per hour maximum for single wire fixed terminations (SWFT) installations. The section insulators shall be rated for these speeds in normal and reverse directions. The section insulators shall meet or exceed the following design requirements:

1. The design shall be for the SCAT, SCFT, and SWFT systems as indicated on the Contract Drawings.

2. The design shall ensure that electrical separation between catenary wires of adjacent sections is maintained at all times, electrically isolating one section from the other.

3. Section insulators in service and inspection facility buildings shall be of the non-bridging type.

4. The section insulator shall be designed to remain stable (dynamically and structurally) under sustained crosswinds of 55 miles per hour for SCAT, SCFT, and SWFT installations.

5. The section insulator shall be designed to withstand cross-winds of up to 70 mph without failure, including permanent deformation.

6. The design shall assure smooth passage of the pantograph across the section insulator. Tilting during pantograph passage shall not be so severe as to damage pantograph contact surfaces. The skids shall be set as high as possible, consistent with ensuring that the pantograph does not strike the runners. Allowance shall be made for the springiness of the skids on impact of a fast-moving pantograph. The section insulator shall be free of “hard spots.”

7. The design shall ensure that the moving pantograph is continuously in contact with the section insulator.

8. The section insulator shall be positioned close to a supporting structure, but with sufficient clearance maintained from the section insulator center to allow for registration of the contact wire.

9. The design shall be such that when the section insulator is positioned in span, the central point is directly over the centerline of a static pantograph at normal temperature (70 degrees F, open route). The mid-span offset of the contact wire shall be equal to zero or shall be within limits approved by the Authority.

10. Pantographs drawing current while traversing the section insulator shall not create excessive arcing, which could damage the section insulator, contact wire or pantograph.

11. Where the design does not require continuity, the section insulator shall be fitted with suitable arc traps/extinguishers. Where the section insulator is provided with parallel runners, the continuity jumpers shall be removed to provide a neutral zone between the adjacent electrical sections. The traps/extinguishers shall be placed as recommended by the manufacturer, so as to ensure minimal arc tracking across the insulator surface.

12. The design shall allow for torsional forces resulting from the passage of multiple pantographs combined with lateral wind loads at service speed.

13. Contact wire skids shall provide a smooth transition from one section to another.

14. Design factors of safety shall be consistent with those used in the design of the catenary system, and as specified by NCTCOG - Standard Specification for Public Construction.

15. The design shall comply with the following electrical requirements:

   a. Nominal voltage 750 V DC
   b. Voltage range 525 V to 900 V DC

16. The design shall satisfy the environmental conditions as given in the Special Provisions.
17. The design shall provide full performance within a conductor temperature range of 4 to 165 degrees F.

F. Components: Components shall be provided as shown in the manufacturer's catalog and as follows:

1. Arcing Horns and Arc Traps: Skids shall be designed with each end upturned to form arcing horns. A flashover shall take place across the body unit and not across the insulation.

2. Magnetic Arc Extinguishers: The magnetic arc extinguishers, when required, shall include all components required to fasten the extinguisher to the section insulator, and to protect the section insulator from damage by a pantograph passing through while drawing current.

3. Arc Catcher: The tips of the arc catcher shall be replaceable.

4. Hardware: Hardware shall consist of the manufacturer's recommended items and shall include, but shall not be limited to, bolts, U-bolts, washers, clamps (including contact wire clamps), turnbuckles, support connectors, braces, insulators and insulating beams.

G. Protective Finish: Section insulator components shall have an Authority approved protective finish or shall be inherently self-protecting. Ferrous metal components shall be galvanized as specified in Article 2.8 of this Section.

2.13 SUSPENSION, STRAIN, AND STAND-OFF INSULATORS

A. The Work specified in this Article includes providing and testing of suspension, strain, and stand-off insulators for the OCS, as shown on the Contract Drawings and specified herein. For installation see Article 3.2 of this Section.

B. Contractor shall prepare detailed designs for each of the required assemblies, based on the performance requirements, working loads, and basic dimensions shown on the Contract Drawings and specified herein. Contractor's designs for the assemblies shall be subject to the Authority review and approval.

C. The OCS insulators shall comply with the NCTCOG - Standard Specifications for Public Construction, particularly the requirement for double insulation. All insulators shall clear the vehicle pantograph dynamic envelope.

D. Synthetic insulators shall be used. Porcelain insulators shall be acceptable only if so indicated on the Contract Drawings and/or Authority approved.

E. Submittals: Submittals required pursuant in accordance with these Specifications, and shall include manufacturer's certification provided to show compliance with the applicable requirements of the referenced Standards, and the Contract Drawings as to materials, design, manufacturing and testing of the insulators.

F. Porcelain Insulators:

1. The insulators shall be made of the best commercial-grade wet-process porcelain, in accordance with ASTM D116.

2. The entire porcelain surface of the insulators that will be exposed after assembly shall be glazed in No. 70 light gray color as specified in ANSI Z55.1.

3. The surface shall be free of imperfections. Pieces with imperfections in the glaze, which were repaired by re-coating and re-firing, as well as those pieces repaired by retouching with paint, will be rejected.

G. Synthetic Insulators:

1. General: Synthetic insulators shall be fabricated from any of the following materials, or combinations thereof, depending on type or application:

   a. Molded ethylene propylene copolymer with hydrated alumina filler.

   b. Fiberglass-reinforced epoxy solid rod.

   c. Composite type, with molded ethylene propylene copolymer jackets or skirts formed over a fiberglass-reinforced epoxy core.

2. Insulators shall be provided complete with integral galvanized or stainless steel hardware for connection to supports or catenary hardware. Synthetic insulators shall be products of WABCO (Westinghouse Air Brake Company), ABB (ASEA-Brown Boveri), Siemens, or Authority approved equal.

3. Types and Applications: Specific types and applications of synthetic insulators for use with cantilevers, cross-spans and tunnel or structure ceilings, or for use as strain insulators, shall be as shown on the Contract Drawings.

H. Metal Parts: The metal parts of the insulators shall be made of malleable iron, Grade 35018, to
conform with ASTM A47, or open-hearth or electric furnace steel. All ferrous metal parts shall be galvanized in accordance with ASTM A153. Insulator fittings shall provide for connections as shown.

I. Cementing:
1. Cement used for assembling porcelain to metal shall meet or exceed the requirements of ASTM C150 and C151.
2. Cement for synthetic insulators shall be of the types recommended by the insulator manufacturer for use with its materials.

J. Painting: To protect the galvanizing from harmful chemical action of the cement, the hardware, which is in contact with cement, shall be coated with a bituminous paint, or shall be otherwise finished as recommended by the insulator manufacturer for use with its materials.

K. Performance and Testing:
1. Insulators shall be tested in accordance with ANSI C29.1.
2. The mechanical strength of suspension and strain insulators shall exceed the ultimate strength of the conductor or guy to which it is attached.
3. The insulators shall be suitable for both horizontal and vertical mounting and installation, unless otherwise specified.
4. The manufacturer shall provide a certificate of compliance with the applicable portions of the referenced ANSI Standards, and these Specifications.
5. Types and suggested electrical values and minimum mechanical characteristics for OCS insulators are shown on the Contract Drawings.

L. Marking: Each insulator shall bear the manufacturer's name or trademark and year of manufacture, clearly and permanently imprinted, without affecting the appearance or the function of the item.

M. Electrical Ratings:
1. All insulators shall have the following ratings:
   a. Nominal System Voltage: 750 V DC
   b. Insulation Level: 4.87 kV AC, rms
   c. Creepage Distance: 1.88 inch (min.)
2. Synthetic spool insulators shall withstand a 25 kV flashover across 2-1/2 inch leakage distance.

2.14 SURGE ARRESTERS
A. The Work specified in this Article includes providing of surge arresters for the OCS, as shown on the Contract Drawings and specified herein. For installation see Article 3.15.
B. Each surge arrester shall incorporate an individual grounding system for connection to a ground rod or ground mat.
C. Contractor shall prepare detailed designs for each of the required assemblies. Contractor's designs for the assemblies shall be subject to Authority approval.
D. Submittals as indicated in Article 1.3 of this Specification.
E. Equipment:
1. Surge arresters shall be designed and installed on each substation feeder at its connection point with the OCS, at each disconnect switch at its connection point with the OCS, on each track at low overhead bridges, and on each track at interlockings. Contractor to provide design drawings identifying disconnect switch locations.
2. Surge arresters shall be of the metal oxide varistor type. Each surge arrester shall have an energy discharge capability of 2.6 kJ/kV for currents of 500 A or less, Type MCOV, 1280 V, Model No. 6007-006 as manufactured by SMC, or Authority approved equal.
3. Each surge arrester shall be connected to an individual grounding system, ground rod or ground mat, by means of a No. 2/0 AWG insulated cable installed in a GRS conduit attached to the OCS pole as shown on the Contract Drawings.
4. Each grounding connection shall have a grounding resistance of 5 ohms or less or as specified by the surge arrester manufacturer for the type of unit provided.
5. Each grounding connection shall be tested individually in accordance with the required procedures specified in Article 3.23 of this Specification.
2.15 SPECIAL TOOLS FOR OCS INSTALLATION

A. The Work specified in this Article includes providing special tools required for the OCS installation Work, including height/stagger gauges, super-elevation/step gauges, grounding jumpers, live wire tools, slings, hoists, and ladders.

B. Height/stagger gauges, and super-elevation/step gauges shall be special designs fabricated by the Contractor in accordance with the performance requirements specified herein. All other materials and equipment items shall be standard manufactured items, as specified herein, unless otherwise noted.

C. All special tools specified herein shall be used by the Contractor, and shall remain their property, throughout the construction period of the OCS, and during its subsequent testing and commissioning as specified in Article 3.23 of this Specification. Following acceptance of all segments of the completed system, all gauges and special tools (except for consumable items) shall become the property of the Authority, and shall be delivered to the Authority, in good working condition, as directed by the Authority.

D. Submittals as indicated in Article 1.3 of this Specification.

E. Applicable Standards: Pertinent provisions of the following listed standards shall apply to the Work of this Article, except as they may be modified herein, and are hereby made a part of this Specification to the extent required:

1. NCTCOG - Standard Specification for Public Construction
2. Federal, State and Local Authorities: All applicable codes and regulations

F. Materials, General:

1. All materials proposed for use shall meet the applicable performance requirements, and shall be noncorrosive and durable.
2. Guy ropes shall be of synthetic materials.
3. Height/stagger gauges, and super-elevation/step gauges shall be fabricated from aluminum alloy sections, and shall incorporate 2000 V cross track insulation to maintain track polarity and eliminate interference with track circuits during gauging.

G. Height/Stagger Gauges

1. General: The height/stagger gauges, each including 2 interchangeable gauge heads (stagger gauge and pantograph gauge), shall be used to measure heights and staggerers of the catenary system when the system is not energized.
2. Description: Height/stagger gauges shall be compact, lightweight construction, rigidly mounted on rail vehicles without springs or side play, and shall be designed to simulate the dynamic profile envelope of the pantograph. Contractor shall have the option of providing each gauge with a mechanical tilting and/or linkage system to simulate the dynamic envelope, or providing a simplified fixed profile envelope gauge with attachments which provides an equivalent simulation. Contractor shall submit data on the estimated level of variance from theoretical values for Authority approval. The height/stagger gauges shall be designed to measure the following:
   a. Pantograph sway from top of Light Rail Vehicle (LRV)
   b. Cross-track level tolerance
   c. Cross-track displacement of LRV and cross track level tolerance
   d. Contact wire uplift
   e. Combined mechanical and electrical clearance requirements from pantograph dynamic outline envelope
3. Weight: The height/stagger gauges shall be lightweight, for handling by 2 persons in lifting the gauges off the track or placing them on top of the super-elevation/step gauges.
4. Fabrication: Height/stagger gauges shall be fabricated and assembled in conformance with the reviewed and approval required submittals.
5. Strength: The height/stagger gauges shall be strong enough to withstand light impact loads, normal handling and use procedures, under moderate (30 MPH) wind conditions, without deflection, buckling, or permanent deformation.
6. Adjustability: The height/stagger gauges shall be easily adjustable for calibration purposes.
7. Readability: The calibration shall be in inches and easily readable, with 20-20 vision, within a distance of 30 feet.
8. Vertical Operating Range: The height/stagger gauges shall be capable of measurement over a contact wire height
range of from 13 feet to 24 feet above track level.

H. Super-elevation/Step Gauges

1. General: Super-elevation/step gauges shall be used for purposes of adjusting the inclination of the height/stagger gauge by placing the step gauge on the rail under the height/stagger gauge.

2. Description: Super-elevation/step gauges shall be used to emulate the actual track super-elevation for the purpose of adjusting the position of the contact wires.

3. Adjustability: Super-elevation/step gauges shall be designed for use with a calibrated spirit level system, with the levels placed crosswise on the top surfaces or steps of the gauges for direct reading.

4. Readability: Spirit levels to be used with super-elevation/step gauges shall be calibrated in inches and easily readable, with 20/20 vision, within a distance of 5 feet.

I. Manufactured Items: Contractor shall provide the following manufactured items, or Authority approved equal:

1. Cable Cutters: Manufacturer - H.K. Porter, Model 8690FH; Quantity: 3 each

2. Compression Splicing Tools, with 2 die sets of each type for splicing the following: 500 kcmil messenger cable, 500 kcmil feeder cable, 750 kcmil feeder cable, 1/2 inch diameter steel flexible wire, 3/8 inch diameter steel flexible wire, any additional wire size which may be used and spliced: Manufacturer - Burndy Hypress, Model Y35; Quantity: 2 each

3. Chain Ratchet Hoists, 3 ton capacity: Manufacturer - Tugit, Model R292E; Quantity: 3 each

4. Utility Slings, 3 ton capacity: Manufacturer - A. B. Chance or Rhino; Quantity: 6 each

5. High Voltage Protective Gloves, 1000 V insulating capacity per NSI/ASTM D1050: Manufacturer - Salisbury Rubber Co., Model 480Y/277; Quantity: 6 pairs (various sizes)

6. Grips (line pulling) 8,000 lb. capacity: Manufacturer - Klein "Chicago Grips", Model 1656-50; Quantity: 6 sets

7. Grips (line pulling) 15,000 lb. capacity: Manufacturer - Klein "Chicago Grips", Model 1628-16 BP; Quantity: 6 sets

8. Snap-on Grounding Clamps, complete with applicator: Manufacturer - A. B. Chance, Model T600-0806, HG.3706-1; Quantity: 12 each

9. Flat Face Grounding Clamps: Manufacturer - A. B. Chance, Model C600-2232; Quantity: 3 each

10. Flat Face Grounding Clamps: Manufacturer - A. B. Chance, Model C600-0436; Quantity: 3 each

11. Copper Ferrules (shrouded plain-plug type, 1 unit): Manufacturer - A. B. Chance, Model C600-2633; Quantity: 12 each

12. Copper Ferrules (shrouded threaded plug, 1 unit): Manufacturer - A. B. Chance, Model C600-2625; Quantity: 12 each

14. Grounding Cable, No.4/0 AWG, 2107 strands, clear PVC jacket: Manufacturer - A. B. Chance, Catalog No. S6451; Quantity: 400 linear feet

15. Telescoping Tools, epoxy glass: Manufacturer - A. B. Chance, Model C403-1021; Quantity: 3 each

2.16 COUNTERWEIGHT ASSEMBLY

A. The assembly shall maintain constant tension in the SCAT system conductors notwithstanding changes in ambient, solar or current heating temperatures. Changes in the lengths of conductors shall be compensated for by an equivalent movement of the counterweights (upward or downward). Low and high temperature stop devices shall be provided such that movement of the counterweights due to conductor expansion and/or contraction under temperature conditions below 20 degrees F and above 120 degrees F or an increase in system weight due to ice formation is eliminated. Contractor shall submit, for Authority approval, the methods to be used to restrict the counterweight movements outside of the above referenced temperatures.

B. The counterweight assembly shall operate at a nominal pulley ratio of approximately 3:1.

C. The counterweight assembly shall have pulleys with self-lubricating bearings. The bearings shall be sealed to prevent the ingress of moisture or other contaminants, or the loss of lubricant.
D. The counterweight assembly shall operate freely under all climatic conditions within the limits specified above and shall function freely when a weight differential of plus/minus 25 pound is applied to the counterweight stack.

E. The assembly shall incorporate a safety feature to prevent the weights falling to the ground in the event of a failure of the tensioned wires. It shall also have provisions for continuity to ground under electrical fault conditions.

F. Counterweights shall be fabricated of cast iron, or other Authority approved material, with a vandal-proof assembly.

G. Weight sets may be either 1 casting or made up from individual castings. If individual castings are used they shall be of an interlocking design to prevent slippage. The assembled stack of weights shall be as compact as possible and shall fit between the flanges of the wide flange anchor poles.

H. Tolerance on the complete balance weight set shall be 0 pounds +50 pounds

I. Weights shall be compact allowing for the required vertical movements and shall incorporate a guide tube arrangement to prevent the weights from freely moving in the horizontal direction.

J. The counterweight assembly shall have a minimum design life of 30 years and shall not require maintenance or inspection at intervals of less than 12 months. The design shall permit disassembly and reassembly of an in-place unit by standard maintenance crews.

K. Assemblies and component parts shall be designed for ease of maintenance, replacement, assembly, and disassembly, which shall be accomplished with a minimum of special tools. Component parts shall be properly identified for this purpose.

L. The assembly shall incorporate provisions for adjustment due to wire elongation (stretch).

M. All materials and design shall have been proven by the manufacturer's experience to be suitable for the purpose of which they are intended. They shall be suitable for the loads and climatic conditions existing in the project.

N. All external ferrous parts shall be stainless steel or hot-dip galvanized in accordance with the required ASTM specification. Any ferrous parts that are not stainless steel or cannot be galvanized shall be painted with an Authority approved epoxy coating with color to match ANSI No. 61, light gray.

O. Each tensioning device shall bear the manufacturer's name or trademark and year of manufacture clearly and permanently imprinted.

P. Contractor may offer other alternatives for consideration by Authority at no expense to Authority. Such alternatives may include a differential pulley arrangement.

PART 3 - EXECUTION

3.1 OCS INSTALLATION - GENERAL

A. General Description:

1. The Work specified in this Article includes the installation of the complete OCS, including overhead structure suspension systems, anchor bolts, pole guys, cantilevers, headspans and cross-spans, backbones, door bridges, wiring, surge arresters, insulators, disconnect switches, feeder wire and cable, and other components required to provide a complete operating system.

2. Reference is made to the OCS pole foundations in the Specifications and these shall be closely coordinated with installation of the OCS.

3. Steel poles shall be shipped from the factory as complete assemblies with bases, attachment fittings, nuts, counterweight pulleys and guides, where required, and other accessories included, disassembled as required for shipment, and delivered to the Work site in shipping packages providing adequate protection for contents and including identifying labels and instructions for assembly and installation at the site.

B. Quality Control: Contractor shall perform the installation Work included in this Article in strict accordance with the requirements of the Contractor's Authority approved Quality Control Program and the requirements of these Specifications.

C. Submittals: In addition to shop drawings, erection drawings, samples, and operation and maintenance instructions required by Article 1.3 of this Specification, 6 certified copies of reports of all field tests shall be submitted to the Authority as required or recommended by these Specifications and referenced standards, or as required to establish compliance with the Contract Documents.

D. Applicable Standards:

1. Standards applicable to products covered in this Article have been listed in other articles of this Section, and apply here.

2. All OCS installations shall comply with the requirements of NCTCOG - Standard Specification for Public Construction.
E. Appearance of Completed Installation: The completed OCS shall have a neat and attractive appearance, with minimum adverse impact on fixed facilities and surrounding areas, after all components, equipment, and hardware items are installed in place and final adjustments made. To ensure this, the Contractor shall submit to the Authority, prior to starting on-site Work, information on its proposed components and installation methods, accompanied by photographs of existing overhead contact systems constructed similarly.

F. Location of Structures:

1. Reference points for location of OCS structures and facilities are as shown on the Contract Drawings.

2. Actual locations of OCS structures will be determined by the installer who is responsible for installation of the OCS structure foundations, OCS structure guy anchors, underground ducts, handholes and manholes.

3. Before installing poles the Contractor shall check the pole foundation locations and attachment provisions, and advise the Authority of any deficiencies that could result in an unacceptable OCS installation if not corrected. The Authority will advise the Contractor of remedial action to be taken.

4. Contractor shall measure and record the actual location and elevation of each OCS foundation in relation to the referenced and associated track(s), and the superelevation magnitude and the curve direction of the tracks at each foundation, prior to starting the installation of poles, cantilevers, and other OCS structures and assemblies. The above referenced measurements must be taken to insure that, in all locations, these structures are installed with the correct geometrical relationship to the final track alignment as shown on the Contract Drawings.

5. The reference point for locating structures with respect to the track shall be the design position, as shown on the Contract Drawings together with any allowable tolerances. Any deviations in the actual position of the track from the design position shown on the Contract Drawings shall be referred to the Authority.

6. The setting dimensions for each structure with respect to the reference point shall be as given in the layout plan schedule. Structure offsets shall generally be at right angles to the track centerline.

7. All major structures that might interfere with OCS installation shall be clearly identified in terms of location and elevation, referenced to the adjacent track.

8. Contractor shall notify the Authority of any OCS poles that may obstruct wayside signal equipment from being seen by the train operator.

G. Structure Numbering:

1. All new structures shall be clearly and permanently numbered, using the reference numbers as shown on the Contract Drawings and specifications. The pole numbering characters, letters and numbers, shall be not less than 1-1/2 inch high and shall have a color and be of the type as shown on the Contract Drawings. Steel poles located between tracks shall normally be numbered with the numbers on the sides of the pole facing in the along track direction. At poles which have counterweights installed, the numbers shall be located on the sides of the pole facing the tracks. Numbers shall be installed 8 feet above track level, to the underside of the numbers, as indicated on the Contract Drawings. Side poles shall only have 1 set of numbers and the numbers shall be installed facing normal direction of travel.

2. Elevated poles, wall attachments and OCS supports under bridges, shall be numbered in the same size and style as required for poles and specified in these Specifications. In areas of low illumination, luminous numbers or background shall be employed as required to improve visibility.

3. In locations where it is impractical to number the pole or OCS assembly, numbers may be applied to the adjacent structural wall, as Authority approved, in a manner and order that will clearly identify the item to which the number applies.

4. Center poles shall have 2 sets of numbers, 1 set for each track.

H. Installation Tolerances

1. Installation tolerances shall be as follows:

   a. Bowing effect on pole: Less than 2-1/2 percent of height or 2 inches maximum at contact wire height

   b. Cantilever along track offset: within plus or minus 6 inches

   c. Hanger length: within plus or minus 1/2 inch
OVERHEAD CONTACT SYSTEM

d. Hanger spacing: within plus or minus 6 inches

e. Messenger and contact wire locations:

1) Overbridges: within plus or minus 1 inch Lateral; within plus or minus 1/2 inch Vertical

2) Overlap Locations (between parallel wires): within plus or minus 1 inch Lateral; within plus or minus 2 inches Vertical

3) All Other Locations: within plus or minus 1 inch Lateral; within plus or minus 2 inches Vertical

2. The tolerance given at the conductor height is only applicable provided the conductor gradient between adjacent structures is approved. The tolerances given are subject to electrical clearances.

3.2 INSULATOR INSTALLATION

A. Contractor shall provide double insulation, and installation shall be in accordance with the NCTCOG - Standard Specifications for Public Construction.

B. All insulators shall be clean before installation. Only clean rags, free from any abrasive material shall be used for cleaning insulators. Wire brushes shall not be used for cleaning any parts, metal or otherwise. In the completed line, all insulator assemblies and hardware shall be clean, bright and free from nicks, chips or other marks.

C. After installation of the OCS Support System, but prior to the Hi Pot Tests stated in Article 3.23 of this Specification, "OCS Testing and Commissioning", all insulators shall be megger tested. Insulators, which are found to be defective, shall be replaced.

D. Insulators with slight damage shall be repaired as recommended by the manufacturer. If the damage is appraised by the Authority as excessive, the insulator shall be replaced. Cracked insulators shall be replaced.

E. Porcelain insulators shall be used only in locations specified on the Contract Drawings. An equivalent synthetic insulator may be used as an alternate to a porcelain insulator subject to Authority approval.

F. Porcelain guy strain insulators and other types of porcelain insulators shall not be used for crossspans/headspans, or in any other locations (except for down guys) where they are exposed to vandals and their appearance might be objectionable.

G. Johnny Ball strain insulators shall not be used for cross spans, or in any other locations (except for down guys) where they are exposed to vandals and their appearance might be objectionable.

3.3 HARDWARE INSTALLATION

A. Hardware shall be installed in accordance with the manufacturer's Authority approved shop drawings. Bolts and nuts shall be properly tightened in accordance with the manufacturer's torquing recommendations using indicating torque wrenches. All bolts shall be of sufficient length for a minimum of a full thread to extend beyond the nut and locknuts. The total length of thread shall not protrude beyond the nut and locknut by more than 1-1/2 inches. Bolt ends shall not be cut off.

B. Locknuts shall be installed according to manufacturer's instructions.

C. Hardware shall be installed using tools and methods specified by the manufacturer and Authority approved.

D. Hardware shall be inspected for cleanliness and damage. Any item that does not fit, creates scraping of galvanizing during or after installation, or is found defective, will be rejected.

E. All turnbuckles shall be adjusted such that a minimum of 1 inch of thread remains in the body after final adjustment.

3.4 INSTALLATION OF ANCHOR BASE POLES

A. Poles shall be installed as shown on the Contract Drawings and as specified in these Specifications.

B. The type, location, setting height, offset of each pole shall be as specified in the Catenary Layout Plans.

C. Contractor shall determine the pole rake based on the proposed pole loadings and shall rake the pole as required as described in these Specifications.

3.5 INSTALLATION OF DOWN GUYS

A. Down guys of the sizes and types shown shall be installed as indicated on the Contract Drawings.

B. Down guys shall be installed before the catenary wires are strung. They shall be pulled taut, and secured in place with provisions for future adjustment as required to hold the structure in proper alignment after wires are pulled up.

C. Down guy attachments shall be installed as recommended by the manufacturer.
D. Each guy to an anchor shall have an 8 foot guy guard, installed as shown on the Contract Drawings.

3.6 INSTALLATION OF GALVANIZED STEEL AND STAINLESS STEEL WIRE AND WIRE ROPE

A. Galvanized steel and stainless steel wire and wire rope shall be used as shown on the Contract Drawings.

B. Galvanized steel and stainless steel wire and wire rope shall be cut and installed using tools and methods specified by the manufacturer.

C. Galvanized steel and stainless steel wire and wire rope shall extend no more than 4 inches from crimped terminations and shall have all free ends lashed to prevent fraying.

D. Splicing of the galvanized steel and stainless steel wire and wire rope will not be permitted. This includes all applications shown on the Contract Drawings.

3.7 INSTALLATION OF CANTILEVERS

A. Contractor shall determine the type of cantilever to be installed on each pole or support. The Contract Drawings for the cantilever assemblies are general in nature and the Contractor is responsible for the detail design based on the type of OCS and the loads applied. Double insulation shall be provided in accordance with NCTCOG - Standard Specifications for Public Construction.

B. Cantilevers shall be designed to clear the pantograph dynamic envelopes. Contractor shall request from the Authority the actual vehicle pantograph dimension prior to the cantilever final design. Steady arms shall extend no less than 3 inches and no more than 6 inches past the contact wire clamp. The heel settings for each cantilever and steady arm shall be determined by the Contractor and submitted to the Authority for approval.

C. The wire height and stagger values given on the Contract Drawings are related to the reference point and the superelevation, as shown on the Contract Drawings.

D. For stability during stringing, the cantilevers shall be temporarily restrained to prevent collapse due to swinging. The details of the restraint shall be submitted to the Authority for approval.

E. The along-track offset of the cantilever for various temperatures shall be as shown on the Contract Drawings, after the information has been confirmed by the Contractor. The along-track offset of the cantilever on completion shall be in accordance with its distance from the midpoint anchor for the prevailing temperature.

F. Cotter pins and nuts on each cantilever shall be located on the same side of the structure to assure uniformity along the line.

G. Assemblies fitted with pins, cotters, bolts and nuts shall be oriented where possible in such a manner as to lock these components together by gravity if the pins or nuts should become detached under service conditions.

H. Components employing a hinge or swivel shall be greased before assembly of the rubbing surfaces and cleaned of excess grease.

I. Defects in the galvanizing of the completed cantilevers assemblies shall be repaired by the application of a suitable zinc-rich, cold-galvanizing repair paint, ZRC Cold Galvanizing Compound or Authority approved equal, in accordance with these Specifications.

J. After installation of cantilevers and stringing of conductors, adjustment may be required to the stagger, heel setting, contact wire height and cantilever inclination to be within the specified design tolerances.

K. Conductor interfaces of all clamps for feeder terminations, equalizing jumpers and continuity jumpers shall be coated with conductive grease and cleaned of extra grease.

L. Conductive lubricating grease shall be applied to the retainer bars of cross contact bridges and cleaned of extra grease.

M. The cross-track alignment of the vertical centerlines between messenger, contact or bridle wires shall be within 1/2 inch per foot of vertical separation.

N. Authority approved conductive lubricating grease shall be applied to swivels, hinges, and other parts requiring lubrication.

O. End caps shall be installed on all cantilever and steady arms.

3.8 INSTALLATION OF CROSS-SPAN AND HEADSPAN ASSEMBLIES

A. Prior to installation of the headspan/cross-span assemblies, the Contractor shall record the following field details along the axis of the span(s) for review by the Authority:

1. Centerline to centerline measurement between Poles, track-to-track centerline dimensions, and adjacent track to pole centerline measurements.

2. Elevation of foundation finish levels and all tracks (rail) levels.
OVERHEAD CONTACT SYSTEM

3. Track superelevations and its directions taken facing towards increasing station locations.

B. Contractor shall review and note all field changes from the design, and submit these changes to the Authority for consideration.

C. The type of headspan/cross-span assemblies are given on the Contract Drawings as reference and are general in nature. Contractor is responsible for the detail design.

D. Double insulation shall be installed in accordance with the requirements of the NCTCOG - Standard Specifications for Public Construction.

E. Headspans/cross-spans shall be designed to clear the pantograph dynamic envelope. Contractor shall request from the Authority the actual vehicle pantograph dimension and verify the clearances of all assemblies and items prior to the headspan final design and construction directions. Steady arms shall extend no less than 3 inches and no more than 6 inches past the contact wire clamp.

F. Minor field adjustments of hangers, contact and messenger heights and headspan/cross-span wires shall be performed by the Contractor as directed by the Authority at no cost to the Authority.

G. Hangers shall be plumb within plus or minus 1/2 inch.

3.10 MESSENGER AND CONTACT WIRE STRINGING

A. All conductors shall be installed in accordance with good overhead line practice, and the manufacturers' recommendations, subject to Authority approval. Contractor shall submit, for Authority approval, the proposed methods for messenger and contact wire stringing installation. Due regard shall be made for conductor creep and in order to reduce creep prestressing of the conductors shall be used. The prestressing method of the conductors shall be submitted, for Authority approval, for the applicable conductor prior to installation. The initial stretch and the 10 year creep shall be removed at the time of installation.

B. Conductor tensions, cantilever settings, and counterweight settings are temperature related. During stringing, actual conductor temperatures as measured by contact thermometers shall be used in conjunction with the stringing charts to ascertain the various stringing parameters. The stringing charts on the Contract Drawings shall be checked by the Contractor for conformity to the actual wire data before messenger and contact wire stringing is started.

C. It shall be the Contractor's responsibility to ensure that the installation complies with approved OCS requirements as specified in Article 3.23 of this Specification. In addition the Contractor shall provide any temporary poles, foundations and down guys which are required to facilitate the system installation and construction staging at no additional expense to the Authority.

D. Splices in wire runs of new messenger and contact wires shall not be installed except as directed by the Authority. Splices shall be allowed where existing wire is to be extended, however they shall be kept to a minimum, and eliminated wherever possible. Before proceeding with installation, the Contractor shall submit a conceptual wiring plan showing proposed splice...
locations. All splice locations shall be Authority approved.

E. Splices for catenary conductors in auto-tensioned sections where installed shall comply with the following conditions, unless directed otherwise by the Authority:

1. Not more than 1 splice in 1 span (between any 2 supports).
2. Splices shall not be located within 25 feet of a support and shall be at least 1 foot from a hanger location and 20 feet from crossing points.
3. Splices shall not be permitted at grade crossings.
4. No more than 2 splices shall be allowed in any tension length.

F. Care shall be taken to avoid kinks in the wires. Destranding (birdcaging) of stranded conductor is unacceptable. Kinks in the contact wire will not be accepted.

G. The contact wire shall be free of twists from anchor clamp to anchor clamp. Splices in auto-tensioned sections shall be as specified and installed in accordance with the manufacturer's recommendations. Splices shall be located at least 25 feet from support points. Use and acceptability of splices shall be subject to Authority approval.

H. In-running contact wires crossed by another in-running contact wire shall be fitted with a cross contact bridge. The cross contact bridge shall be of sufficient length to ensure that the contact wires are allowed to move freely.

I. Potential equalizing (in-span), continuity and feeder jumpers shall be installed as shown on the Contract Drawings.

J. All termination fittings shall be oriented in accordance with the manufacturer's recommendations.

K. Both contact and messenger wires shall be grounded during and after the stringing process prior to energization.

3.11 INSTALLATION OF MIDPOINT ANCHORS

A. Midpoint anchor assemblies and contact wire restraint assemblies shall be installed at the locations indicated on the Contract Drawings and as recommended by the manufacturer.

B. Midpoint guy assemblies shall be installed in accordance with the Contract Drawings.

3.12 INSTALLATION OF SECTION INSULATORS

A. Section insulator types and locations shall be located as shown on the Contract Drawings.

B. Section insulators shall be installed as recommended by the manufacturer and as required to meet the design requirements specified in Article 2.12 of this Section.

C. The manufacturer's representative shall assist the Contractor in supervising the installation of the Section Insulators.

D. After installation, adjustment may be required to insure proper operation. This shall be performed as required and as directed by the Authority.

3.13 INSTALLATION OF SECTION BREAKS

A. Section breaks shall be installed at locations as indicated on the Contract Drawings.

B. Contractor shall submit, for Authority approval, the proposed procedure for construction of the section break, including type and installation of the 4-bolt contact wire clamp, insulated hangers and cut-in insulation.

C. Contractor shall install all hardware and fittings in accordance with the manufacturer's recommendations and procedures.

D. After installation and during live wire running tests, adjustment of the section break, including wire separations (vertical and horizontal) and the parallel running portion of the section break may be required to insure proper operation. This shall be performed as required and as Authority approved. All adjustments required shall be performed at no additional cost to the Authority.

3.14 INSTALLATION OF OCS DISCONNECT SWITCHES

A. Switches shall be field installed as shown on the Contract Drawings and specified herein and in Article 2.11 of this Section. Special attention shall be given to the orientation of the switch at each location. Field mounted switches shall be installed in accordance with the manufacturer's instructions. Anchor bolts and anchorage items shall be provided as required. External field wiring shall be performed as indicated. Clearance from the vehicle and pantograph shall be maintained at all times.

B. Contractor shall prepare a test plan for the motorized disconnect switch, which demonstrates each switch is correctly wired from the TPSS. Test shall include provisions for proper operation from the control panel in the substation with simulated Supervisory Control and Data Acquisition (SCADA) functions. Test plan shall include continuity, voltage measurement and
point-to-point verification. The testing shall also demonstrate the correct operation of the electrical interlocks.

C. Contractor shall ensure adequacy of walls for supporting and mounting the disconnect switches and accessories.

D. Prior to energization of the OCS, the Contractor shall verify correct operation of all disconnect switches installed under this Contract, and shall demonstrate to the satisfaction of the Authority the intended operation of the switch and the interlocks.

E. All wiring shall be provided as required. Conductor sizes, composition and insulation shall be as indicated on the Contract Drawings. All required additional hardware such as electrical conduits, clamps, junction boxes, bushings, connectors, grounding conductors, and all basic electrical materials needed for the installation of the equipment and accessories, including switch number as shown on the Contract Drawings, shall be provided and installed by the Contractor.

F. The installation shall conform to National Electrical Code (NEC) and National Electrical Safety Code (NESC).

G. Disconnect switches shall be arranged and installed as recommended by the manufacturer to meet the design requirements specified in Article 2.11 of this Section.

H. Disconnect switches shall be fitted, by the Contractor, with temporary locks, during installation, in order to prevent unauthorized operation of the switches.

3.15 INSTALLATION OF SURGE ARRESTERS

A. Surge arresters for the OCS shall be installed as shown on the Contract Drawings.

B. Each surge arrester shall be bonded to the grounding system by a No. 2/0 AWG copper wire with 2000 V-rated insulation, as shown on the Contract Drawings. The grounding conductor shall be installed in a conduit, which shall be attached to the pole. Contractor shall submit for Authority approval the proposed method for attaching to the pole and routing of the conduit from the surge arrester to the grounding system.

C. Bonding cable connections between the surge arresters and the OCS, and between the surge arresters and the grounding system, shall be installed, as shown on the Contract Drawings, with a minimum number of bends and the shortest possible length.

D. Bonding connections between the surge arresters and the grounding systems shall be of the exothermic weld type.

E. Refer to Subsection 2.2 of this Section, Grounding and Bonding System, for general requirements on grounding and bonding connections.

3.16 COUNTERWEIGHT ASSEMBLY INSTALLATION

A. Counterweight assemblies shall be installed at locations indicated on the Contract Drawings.

B. The type of counterweight assembly at each location shall be as indicated on the Contract Drawings.

C. A chart showing counterweight assembly height attachments referring to a reference level for various wire temperatures and tension lengths is included on the Contract Drawings. Contractor shall check, confirm and verify the information prior to the installation of the counterweight.

D. Counterweight assemblies shall be free moving between conductor temperatures of 20 degrees F and 120 degrees F. A mechanical stop shall be provided to restrain the counterweights from moving at temperatures above 120 degrees F and below 20 degrees F.

E. Special care shall be taken during installation of counterweight assemblies to obtain correct wire temperature and travel clearance for the counterweight and pulley assemblies. Preliminary tensioning of the OCS to remove 10 year creep shall be completed prior to finalization of the counterweight settings.

F. Weights for counterweight tensioning shall be standard cast iron, or steel/concrete composite units, as shown on the Contract Drawings, adjustment weights to be stacked as required to make up the required tension in each assembly. Weights shall be sized to ensure that they fit inside the web of the wide flange poles.

G. Authority approved lubricating grease shall be applied to pulley bearings, swivels, guideways, guide rods, and wire ropes as recommended by the manufacturer and as Authority directed and approved.

3.17 JUMPERS

A. Configurations of all types of jumpers shall be Authority approved.

B. Jumper wires shall have cut and tied ends projecting not more than 1/2 inch through open clamps. Stainless steel tie wraps shall be used for securing the cut ends of jumpers.

C. Feeding and full section jumpers in auto-tensioned catenary shall be of a length and configuration required to accommodate the anticipated differential movement of the conductors. Contractor shall determine and submit for Authority approval the calculations used to
establish the overall lengths of jumpers, based on actual field measurements.

D. In all cases, jumpers shall be installed and trained so as to avoid conflicts with the pantographs, adjacent cantilevers, and hangers.

E. Each cable end shall be cleaned with an accepted decontaminant immediately prior to making connections.

F. Connectors shall be as indicated and shall be installed in accordance with the manufacturer's recommendations.

G. Bolts in bolt-type connectors shall be lubricated with conductive grease as recommended by the manufacturer, and torqued to the bolt manufacturer's recommendations, using a calibrated torque wrench.

3.18 FEEDER RISERS

A. Where underground conduits are required, Galvanized Rigid Steel conduit risers, as shown on the Contract Drawings, shall be provided and installed as part of this Contract. Contractor shall provide and submit data for Authority review and approval, information which describes the material Contractor proposes to use and the methods used to support and attach the conduits to the OCS pole, to complete the feeder risers.

B. Contractor shall provide the feeder cable, conduit, conduit riser clamps, bolts, nuts, washers, conduit fittings, weather heads, and other hardware to complete the riser installation.

C. Riser conduit-end fittings shall provide for the mechanical support of the cable using a Kellums grip or Authority approved equal as well as a watertight cable seal.

3.19 INSTALLATION OF INSULATED CABLES

A. Insulated cables shall be installed by the Contractor in underground ducts, handholes and manholes, and in above ground feeder risers and conduit provided under this Contract, as shown on the Contract Drawings.

B. Care shall be exercised in pulling cables in conduit to avoid kinking, putting undue stress on the cable, compressing, distorting, or otherwise abrading cable insulation. A lubricating compound shall be used while pulling cables. Cable pulling tension applied during the pulling process shall not exceed the manufacturers' written recommendations. Pull tension calculations including maximum sidewall pressure, weight correction factor, coefficient of friction, conduit fill ratio, jam probability, and other relevant engineering factors shall be submitted to demonstrate this requirement. Rollers, jam, and quadrant blocks shall be used as required to facilitate cable installation.

C. Cable pull lengths shall be maximized so as to prevent splices.

D. Cables in the manholes shall be supported by galvanized steel hangers, racks and clamps, spaced a maximum of 3 feet apart. Negative cables shall be supported separately from the positive feeder cables. All cable supports shall be provided and installed by the Contractor.

E. Insulated cables shall be supported from headspans, support wires and cantilevers using stainless steel tie wraps with a maximum support spacing of 2 foot intervals as specified in these Specifications and as shown on the Contract Drawings.

F. Terminus: Terminations in manholes, pole and pad-mounted sectionalizing switches and to the feeder breaker buss(es) and negative return buss in the TPSS will be made by the Contractor. Terminations shall be made as specified in Article 3.20 of this Section, using the required termination kits specified in Article 2.5 of this Section.

G. Inspection and Tests: An insulation test shall be performed at 2.5 KVDC by the Contractor, and the results recorded and submitted to the Authority as specified.

3.20 INSTALLATION OF CABLE TERMINATIONS

A. General: Cable and conductor terminating devices shall be applied only to conductor sizes within the size ranges for which the devices are designed. Terminating devices shall be rated for the full ampacity of the cables.

B. Terminations No. 8 AWG and Larger:

1. Conductors shall be terminated by means of the specified pressure grip (solderless) lugs of the indented barrel type. Manual or hydraulic tools shall be utilized as specified for the size of wire by the lug manufacturer. The correct size jaws shall be used for the indenting tools so that a full stroke is required for proper indentation. To install the lug, the insulation shall be stripped from the conductor for the minimum length required to insert the conductor the full depth of the lug.

2. Unless otherwise specified, terminations of power conductors may be made directly in box-type lugs, without terminals, where such lugs are part of the electrical equipment or device as manufactured, provided that the lugs are of adequate capacity and rating, and are service proven for the specific application.
3. Where a special type of termination is recommended by an equipment supplier, data on the termination method shall be submitted to the Authority for approval.

4. Wherever possible, service proven terminations shall be used. Where new or untried devices are proposed, the Contractor shall submit samples and test data to the Authority, as required, for Authority approval to use, including on-site tests and demonstrations where required.

C. Terminating Tools: Terminals and connectors shall be installed with the tools recommended by the manufacturer.

D. Tagging Conductors: 2000-volt DC positive feeder cables, position indication, and 480V cable shall be tagged at each end, and in each handhole and manhole over the cable insulation. Tags shall be secured at both ends with nylon ties. Designations shall be by the circuit designation shown on the Contractor's Authority approved shop drawings and the Contract Drawings. Contractor shall provide a schedule of proposed wire tagging for review prior to printing of the sleeves.

3.21 INSTALLATION OF GROUNDING AND BONDING SYSTEMS

A. Grounding and bonding, including bonding between poles and pole foundations shall be installed in accordance with the Contract Drawings and as specified herein.

B. The Work shall be arranged in such a manner that each part of the grounding system, which is laid below finished grade, shall be completed and inspected before backfilling is undertaken. All precautions shall be taken to assure that no damage is done to the grounding and bonding conductors or connections during backfilling, compacting and concreting operations. Testing for ground resistance shall be performed in accordance with the requirements of this Specification before any finish surfacing is laid above the grounding and bonding conductors.

C. Grounding conductors shall be copper, of the size indicated on the Contract Drawings, unless otherwise shown or specified. Except where otherwise indicated by the Contract Drawings, grounding conductors shall be bare copper.

D. Subgrade grounding connections shall be of the exothermic heavy-duty type, unless otherwise noted on the Contract Drawings. Conductors and molds shall be prepared in accordance with the manufacturer's instructions before making these welds. With the Authority approval, brazing may be used where exothermic welds are not practical.

E. All exposed grounding connections between ground conductors and from ground conductors to equipment shall be made by bolted clamps. Pressure connectors may be used with the Authority's approval.

F. Ground tap connections to equipment shall be made at the points provided on the equipment for grounding and in accordance with the manufacturers' recommendations. Where ground pads are not provided, equipment or structures shall be drilled and connections made by means of bolts and nuts, or the equipment or structure shall be drilled and tapped and connected by means of a cap screw or post-type connector, as Authority approved. All paint, scale, rust, oxidation, or other foreign material shall be thoroughly removed from the points of contact on all metal surfaces before any ground connections are made. Galvanizing which is damaged or removed shall be repaired in accordance with the Authority approved procedure using cold applied galvanizing compound such as Galvalloy by Metalloy Products Co., Hardhat 2185 by Rust-Oleum or ZRC by ZRC Chemical Products or Authority approved equal.

G. Metallic conduit systems, whether embedded or exposed, shall be electrically continuous and thoroughly grounded. Wherever slip joints are used, suitable bonding shall be provided around the joint to insure a continuous ground circuit. Metallic boxes shall also be grounded to the bonding conductor, preferably by compression-type terminals bolted to boxes, unless the conduit connections to the box are threaded and the grounding conductor is brazed to the box. Screwed and brazed joints shall be carefully painted with bituminous paint.

H. Grounding systems required for connection to surge arresters mounted on the OCS poles shall consist of interconnecting ground rods, with a ground resistance of 5 ohms or less or as required by the surge arrester manufacturer. OCS pole ground resistance shall be as indicated in Article 3.23. Suggested ground rod configurations are shown in the Contract Drawings.

I. Local conditions shall dictate the configuration and location of the grounding system.

3.22 OCS TESTING AND COMMISSIONING

A. The Work specified in this Article includes final OCS testing and commissioning including providing Authority approved measurement and test equipment and all staff required to support Contractor and Authority tests.

B. Contractor shall provide the following items, which may be additions to the items in Article 2.15 in this Section, "Special Tools for OCS Installation," to be used as Authority approved measurement and test equipment:
1. Two insulated telescoping height measuring sticks, calibrated in feet and inches.

2. Two optical stagger gauges, calibrated in inches.

3. One mobile height and stagger gauge, constructed and provided as an integral unit on a track mounted cart or trolley, including demountable clearance "ears" simulating the shape and position of a raised pantograph current collector.

4. Contractor shall make available 1 high-rail platform truck along with a driver and platform operator to perform high-level inspections of the OCS. The platform shall be articulated, have OSHA conforming railings and shall be capable of being raised and lowered from the platform. This truck and operator(s) shall be made available for up to 120 hours of high-level inspections (day and/or night including weekends) by the Authority.

C. Quality Assurance: Contractor shall perform the testing and commissioning in accordance with Paragraph 1.4.D of this Section.

D. Submittals shall be in accordance with Paragraph 1.3.R of this Section.

E. All tests must be performed in accordance with the acceptance test procedures. No deviations shall be allowed unless Authority approved.

F. A test that fails shall be repeated and any corrective action taken to pass the retest shall be outlined in a new test report.

G. Contractor shall maintain configuration of OCS including tensioning, throughout the complete duration of Contractor and Authority testing. This includes adjustments to components of the system as required to maintain configuration and protect vehicle and vehicle component systems.

H. Applicable Standards:

1. Pertinent provisions of the following listed standards shall apply to the Work of this Section, except as they may be modified herein, and are hereby made part of this Specification to the extent required: NCTCOG - Standard Specification for Public Construction.

2. Federal, State and Local Authorities: All applicable codes and regulations.

I. Equipment:

1. General: Contractor shall provide the height and stagger gauges, and all other equipment required to make Acceptance Measurements. All measuring equipment will be as Authority approved.

2. Insulated Telescoping Height Sticks: Hastings Model 806-5, each with Catalog No. C-8104 carrying case, as manufactured by Hastings Fiber Glass Products, Inc., 770 Cook Rd., PO Box 218, Hastings, MI 49058, Tel. (616) 945-9541; or Authority approved equal, with 30 foot extended length, 50 inch collapsed length, weighing 6-1/2 pounds, marked in English graduations.

3. Optical Stagger Gauges: Type 1968 as manufactured by the Allgemeine Electricitats Gesellschaft (AEG), Frankfurt, Germany, or Authority approved equal, each comprising a measuring rod, an adjustable measuring bar, and a lens carriage called an "optic", modified to read in English graduations (inches and feet), and not in centimeters, and equipped for night measurement with built-in lighting and spare batteries.

4. Mobile Height and Stagger Gauge: Vehicle mounted, with demountable clearance "ears", and shall be custom fabricated. The unit shall be constructed to include a rigid tow bar for coupling to a track mounted "bucket" truck. The mobile height and stagger gauge shall comply with the Authority requirements for insulation between rails.

5. High Rail Inspection Vehicle: Contractor shall make available, for OCS Visual Inspection Requirements, a High Rail Inspection Vehicle. The inspection vehicle shall have a platform capable of accommodating a minimum of 8 people. The platform shall be able to adjust hydraulically (or electrically) to suit all contact wire heights and shall include all safety aspects including handrails and access ladders.

J. Test Procedures and Equipment:

1. The acceptance measurement and test equipment provided by the Contractor for his use shall be made available to the Authority for checking the location of the contact wire, and verifying that the registration assemblies conform to the clearance requirements of the pantograph clearance envelope. Each item of equipment will be used as follows:

   a. Insulated telescoping height measurement sticks will be used by the Authority to measure the heights of conductors and guys, track clearances to undersides of
b. Optical stagger gauges will be used by the Authority to verify the measurements given by the Contractor in the Acceptance Measurement Form.

c. The mobile height and stagger gauge will be used by the Authority only on electrically de-energized catenary, and for two purposes:

1) For visually checking the location (height and stagger) of the contact wire throughout the completed new electrified lines.

2) To confirm that the contact wire registration assemblies are installed in conformance with the requirements of the pantograph clearance gauge.

d. One insulated telescoping height measuring stick, and 1 optical stagger gauge, shall be readily available for use by the Authority at any time during the construction and acceptance measurement periods.

e. All measuring tapes, poles, sticks, and other equipment used to collate data when the OCS is energized must be non-conducting. Under no circumstances will use of metallic or conductive measuring tapes, chains and other devices be permitted.

2. Acceptance Measurements:

a. Upon completion of all construction, the Contractor shall measure the contact wire height, stagger, and other required dimensions and record the readings on an Acceptance Measurement Form, in the presence of the Authority.

b. Contractor shall prepare the Acceptance Measurements Table and it shall include the following information:

1) Track designation
2) Wire Run Number
3) Drawing number(s) where the structures of the Wire Run are shown
4) Name(s) of person(s) responsible for performing the acceptance measurements.
5) Sheet number of a Wire Run set.
6) Equipment or catenary style being measured
7) Temperature of the conductor in degrees F during the time of measurement
8) Weather condition during time of measurement, e.g., windy, raining
9) The date measurement was made
10) Structure number identification
11) Station location of the structure in feet as indicated on the Contract Drawings
12) Distance of the pole to the rail measured from the centerline of the nearest track to the face of the pole
13) Height of the foundation relative to the rail measured from the top of the low rail to the top (crown) of the foundation.
14) Cross-level difference of the 2 rails measured to the structure station (actual superelevation at the structure)
15) For use by the Authority
16) Distance measured at the structure from the contact wire to the vertical or superelevated centerline of the track (referred to as stagger)
17) For use by the Authority
18) The vertical distance between the contact wire and the track at the structure measured from the mean rail level (referred to as contact wire height at the support)
19) Distance between supporting structures measured along the track centerline

20) Same as subparagraph 3.22.I.2.b.14) above, except measured at midspan

21) For use by the Authority

22) Distance between the contact wire and the vertical or superelevated centerline of the track measured at midspan (referred to as midspan)

23) For use by the Authority

24) The average of the contact wire heights of the structures at each end of the span minus the contact wire height at midspan (referred to as sag)

25) For use by the Authority

26) The rate of change of contact wire height between the structures. This is equal to the difference of contact wire heights at each structure divided by the span (referred to as gradient)

27) Vertical distance measured at the structure between the contact wire and the messenger wire

28) Rise or fall of counterweight from median position

29) For counterweight - ambient temperature

30) Positions of counterweight stops

31) The vertical distance between the underside of the bridge and the vertical or superelevated centerline of the track

32) Electrical clearance from messenger or contact wire support to underside of bridge or tunnel roof with uplift force of 50 pounds on the contact wire at the point of measurement

33) At overlaps, section breaks and turnouts - height of in-running and out-of-running contact wire above rail-referenced level at each structure (Separate columns should be provided for in-running and out-of-running contact wire)

34) Comments or remarks as required

c. The Authority will use the Acceptance Measurements to determine compliance with the design and will inform the Contractor of required corrections.

d. Contractor shall execute corrections at no further cost to the Authority, except for adjustments required by the Authority that are changes beyond the requirements specified in the Contract Documents.

e. After execution of corrections, the Contractor shall re-measure and record affected data and submit the results to the Authority.

f. The Work of this Section will not be complete until corrections are completed and Authority approved.

3. Visual Inspection of Completed OCS:

a. At Contact Wire Level, the Contractor shall make the following checks, and remedy unsatisfactory conditions found during these checks:

1) Check fit and tightness of all components

2) Check split pins and locknuts are secure

3) Check contact wire for kinks, rolls, and damage

4) Check messenger wire for damage to strands

5) Check correct steady arm fittings

6) Check heel settings

7) Check that jumpers are of correct type, have adequate travel capability, are properly fitted, and are well formed to
reduce fatigue failure and interference with the vehicle pantograph

8) Check posture of pulley terminating plates

9) Check that hinge fittings have freedom to move under load

10) Check that a wire passing through a cantilever and not attached to it will clear any part of this cantilever by at least 3 inches throughout the range 4 to 120 degrees F

11) Check for clearance and separation between adjacent or crossing catenaries

12) Check installation for locations of possible interference with the passage of pantographs, including spots where pantographs could tangle with wires or suspension assemblies

b. From the Ground, the Contractor shall make the following checks:

1) Check that counterweights have freedom to travel and that the counterweight band does not bear on guide pipe.

2) Check that cantilevers have correct along-track offset.

3) Check that hangers are plumb and within design position.

4) Check that NCTCOG - Standard Specification for Public Construction and other applicable safety code requirements have been met.

5) Check pole rake

4. Contractor shall perform the following OCS Electrical Tests:

a. Circuit Continuity and Loop Resistance:

1) The Circuit Continuity and Loop Resistance test shall be performed before the Hi-Pot Test.

2) General: The purpose of this test is to obtain the DC loop resistance of each OCS section. This test checks both the OCS and the rail return system for electrical continuity and the absence of high resistance connections or inadvertent ground connections.

3) Procedures: The test entails short circuiting a discrete section of the OCS by connecting the OCS to its rails at one end, and applying a DC voltage at the other end. The length of section under test should be about 1 to 2 miles. The test shall be carried out in the following steps:

   a) Along-track feeders, which are electrically common to the OCS, shall be connected to the OCS.

   b) A DC source is required which will provide a current of nominally 300 amperes with an applied voltage of 24 volts, e.g., 2 car batteries connected in series.

   c) Measurements shall be made of the DC voltage at the points where the Test Circuit cables connect to the Positive Feeder and Negative Return cables so as not to include the resistances of the Test Circuit cabling. DC current shall be measured by placing an appropriate sized 50mv shunt in series with the Test Circuit. The circuit resistance shall be calculated from the measured values of voltage and current and shall be compared with the design values that are recorded on the test form. Apply test Voltage 3 times for
OVERHEAD CONTACT SYSTEM

approximately 5 seconds allowing 1 minute intervals between tests for component cooling. Average the 3 readings and record on Table C-1, DC Loop Resistance Test.

d) Any section having a discrepancy of more than 20 percent between the design value and the measured value shall be rechecked to ensure that all electrical connections are correctly made, or that there are no inadvertent ground connections to the OCS which are reducing the total length of the loop.

e) DC voltage shall be applied as shown in attached Figure C-1, DC Loop Resistance Test.

f) Record all items for each section on attached Table C-1, DC Loop Resistance Test. Compare calculated values with actual test results.

b. Hi-Pot Insulation Testing:

1) Hi-Pot testing shall not be performed until the Loop Resistance Testing is complete.

2) General: DC Hi-Pot tests shall be performed on the OCS. The Hi-Pot tests serve the following purposes:

a) Components such as insulators and feeders are checked for leakage.

b) The electrical withstand of minimum clearance areas, such as tunnels or overhead bridges, are verified under static conditions.

c) The electrical withstand of section insulators and disconnect switches are verified.

d) The test provides a means of periodically checking for any reduction in the insulation level of the OCS sections, by comparing voltage and leakage current with previously measured values.

e) A nominal DC Hi-Pot voltage of 2 x OCS rated voltage plus 1 kV shall be used for 5) DC loop resistance tests may be performed without disconnecting cables from the DC feeder positive busses and negative return buss by connecting test circuit directly to appropriate buss work after disconnecting all associated wiring and opening associated breakers and switches. The contractor shall submit for Authority approval a written procedure to accomplish the test configuration.
the test. Hi-Pot tests shall be carried out on the OCS sections as soon as possible after the continuity tests have been completed, in order to ensure that all of the section being tested is electrically continuous and is subjected to the test voltage. Maximum leakage current of 1 mA per mile can be expected for section lengths of 1 to 2 miles.

3) Procedure for Main Line Tracks: Along-track feeders which are electrically common to the OCS but disconnected from the substations. Adjacent OCS sections which are electrically isolated from the section under test shall be grounded by connecting the OCS to the rails. All surge arresters shall be disconnected from the section under test. A DC test voltage shall be applied to each OCS section in 500 VDC increments up to the nominal test voltage. The test voltage shall be held for 30 seconds at each increment. Circuit connections shall be as shown in attached Figure D-1, Hi-Pot Measurement. The leakage current at each value shall be measured and recorded as shown in attached Table D-1, DC Hi-Potential Tests, together with the weather conditions and temperature.

4) Precautions: The Hi-Pot measurements require application of high voltage to the OCS. Proper regard must be paid to safety. Test zones shall be clearly identified. All safety requirements established in the Safety program concerning the public, work personnel and equipment shall be strictly enforced. Personnel not directly associated with the tests should be clear of the tracks. Sections of OCS and associated feeders under test shall be isolated from the adjacent sections of the system, and all OCS sections adjacent to the section under test shall be grounded.

c. Ground Resistance Measurement at Surge Arresters:

1) General: The purpose of this test is to measure the ground resistance at each surge arrester location where the arrester is connected to a ground rod(s).

2) Procedures:

a) The ground resistance megger shall be connected as shown in attached Figure B-1, Ground Resistance Measurement. The lead from P1/C1 shall be as short as possible, and the electrodes and the ground rod should be in a straight line. It is not essential that the electrodes are parallel to the track, but this configuration will probably be the most convenient.

b) The electrodes shall be positioned at distances as shown in attached Table B-1, Ground Resistance, test position one, i.e., with \( x = 66 \text{ ft.} \) and \( y = 105 \text{ ft.} \) Current and potential electrodes shall be inserted into the earth to about 6 to 10 inches. For very dry soil, water shall be poured around the current electrodes. To ensure acceptable values of resistance, the ratio of distances \( x/y \) shall be approximately 62 percent. The resistance shall be
c) Keeping the x dimension the same as in step b, the current electrode shall be repositioned to y + 6 feet (test position two), and the resistance measured and recorded.

d) The resistance values obtained in steps b) and c) shall be compared and recorded on Table B-1, Ground Resistance. If the readings obtained are within 5 percent of each other, no further measurements are required, and the average value shall be used as the actual resistance. If the readings differ by more than 5 percent, x shall be increased by 10 feet and y made equal to \((x + 10)/0.62\) approximately (test position 3), and Steps b, c, and d shall be repeated as required.

e) This procedure shall be repeated for each surge arrester location for which a ground resistance measurement is required.

f) A measured ground resistance value of 5 ohms or less is desirable. Values ranging between 5 ohms and 20 ohms, or as recommended by the manufacturer, may be acceptable with the Authority's approval, while values greater than 20 ohms will require remedial action.

5. Contractor shall perform Clearance Envelope Tests for Pantograph and Vehicle:

a. General: The purpose of these tests is to verify the mechanical and electrical clearances of the LRV units on each section of the system. The tests shall be conducted after all installations are complete. Any section found to have insufficient clearance shall be adjusted to provide the required clearance.

b. Pantograph Clearance Envelope: Tests shall be performed initially with a rail mounted height and stagger gauge having the same profile as the vehicle pantograph. This gauge shall be used to verify the mechanical clearances between the pantograph and OCS components such as the heel settings of steady arms and contact wire clamps, and the electrical clearances between the OCS/pantograph combination and civil structures such as over bridges. Following these tests, final tests shall be performed with an actual LRV to verify the initial simulated results.

c. LRV Clearance Envelope: Tests shall be performed with an LRV towed or pushed through each track section. The following tests shall be performed:

  1) Dead Slow Tests at Walking Speed: The driver of the towing unit shall be prepared to stop at short notice during these tests.

  a) Trackside Structural Clearances to LRV Body and Pantograph: This includes poles, bridges, awnings, wayside signaling and electrical equipment housings.

  b) LRV body clearances shall be checked at the ends of each unit and at the midspan between trucks.

  2) Slow Speed Tests: Tests listed above under Subparagraph 5c1a shall be repeated at higher LRV speeds. Test speeds shall
be raised in successive increments recommended not to exceed 5 mph each. The maximum LRV dead wire run speeds shall be as recommended by the LRV manufacturer.

6. Live Wire Run Testing:

a. Contractor shall support Authorities System Integration Testing.

b. General: The purpose of these tests are to evaluate:

1) The current collection performance between the LRV and the OCS.

2) The adequacy of the power provided by the OCS for required vehicle performance.

c. Procedures:

1) Current collection performance tests shall be performed at LRV speeds in increasing increments of 20 mph each. LRV test speeds shall not exceed the specified track speed limits or as directed by the NCTCOG regulations for test vehicles.

2) During the current collection performance tests, particular attention shall be paid to:

a) Behavior of the pantograph on various contact wire profiles for signs of loss of contact.

b) Overlaps, section breaks, cross-contacts, turnouts, bridge approach spans, and section insulators for smooth running and takeover.

c) Takeover points at overlaps, section breaks, cross contacts, turnouts and section insulators for smooth transitions.

d) Dynamic clearances at bridge fittings, facias, crossing and parallel contacts, clearances to uplifted steady arms and supports.

e) Midspan offsets, stagger effects, and contact wire sweep.

3) Contractor shall provide video equipment for recording of the current collection performance tests. These tests will facilitate detailed analysis of the OCS after the tests have been performed. If an LRV is required to perform video taping, the Contractor shall coordinate LRV availability and scheduling with the Authority.

4) If adjustments are made to the OCS or to track alignment after the initial tests, the tests shall be repeated on the affected sections, and their results documented in the same manner as detailed in the preceding paragraphs.

7. Analyses of Results:

a. Analyses of test results shall be performed jointly by the Authority and the OCS designer.

b. Recommendations of system changes shall be jointly evaluated for feasibility by the above listed parties.

8. Acceptance Records:

a. Contractor shall produce records of all tests performed under these Specifications and in accordance with the following requirements:

1) NCTCOG - Regulations Engineer

2) OCS Designer

3) The Authority
3.23 FIELD TESTING

A. Field testing shall be thorough, continuing throughout the installation, fully documented, with the following as a minimum:

1. Electrical resistance tests shall be made during installation to verify continuity of the grounding system.

2. Measure, record and report the resistance to earth of each portion of the grounding system as soon as possible after installation so that corrective measures, if required, may be made with minimum disruption of construction. The required ground resistance for the OCS poles shall be 25 ohms or less and shall be 5 ohms or less for surge arresters or as required by the manufacturer. Where the resistance exceeds 25 ohms, ground rods, up to a maximum of 3, shall be provided. If the resistance then still exceeds 25 ohms, the Authority shall be advised.

3. Measure, record, and report the ground resistance at each pole.

4. Resistance-to-earth tests shall be witnessed by the Authority or designated agent and the written results of these tests shall be submitted to the Authority or designated agent for evaluation and instructions regarding any corrective action, which may be deemed required.

5. Ground resistance tests shall be made with a James G. Biddle Company Model 250220, Heavy-Duty, Megger Ground Resistance Tester, or Authority approved equal, using the 3-probe method described in IEEE Standard 81.

6. Section insulators shall be field tested as recommended by the manufacturer.

7. Field tests shall be witnessed by the Authority. Certified copies of the test results shall be submitted as required by Part 1 of this Specification Section.

3.24 SPARE PARTS

A. Contractor shall furnish the following Spare Parts to the Authority prior to final acceptance. All cable and wire material shall be in continuous lengths.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work described in this section shall be full compensation for providing and installing the Overhead Contact System complete in place as specified including finalizing design, shop drawings, submittals, testing, and inspection; and for all Work as described in the Contract Drawings and in this Section and other related Specification sections; and for all operations, materials, tools, labor, equipment and incidentals required to complete the specified Work.

4.2 PAYMENT

A. The Work described in this section will be paid as a lump sum.

- **NOTE**: For performing DC loop resistance tests, the power source should be disconnected. Each test shall be repeated at least 3 times, and the average shall be taken. The test shall be performed with the system in the normal operating condition.

- **CAUTION**: When performing this test, ensure that the system is not in a critical state. Discharge the system before performing the test.

- **Warning**: The test shall be performed in a well-ventilated area to prevent the buildup of hazardous gases.

- **Preparation**: Before performing the test, ensure that all safety measures are in place, and the test personnel are properly trained.

- **Procedure**: Follow the recommended test procedures, ensuring that all readings are taken accurately and recorded.

- **Reading**: Ensure that the readings are taken accurately and recorded.

END OF SECTION 16371
SECTION 16425
LOW VOLTAGE SWITCHBOARDS

PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies furnishing and installing low voltage switchboard, 600 volts and less, and supporting devices as shown.

1.2 REFERENCE STANDARDS
A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM B187/B187M - Standard Specification for Copper Bar, Bus Bar, Rod, and Shapes and General Purpose Rod, Bar and Shapes
B. National Fire Protection Association (NFPA):
   1. NFPA 70 - National Electrical Code (NEC)
C. National Electrical Manufacturers Association (NEMA):
   1. NEMA PB2 - Deadfront Distribution Switchboards
D. Underwriters Laboratories, Inc. (UL):
   1. UL 489 - UL Standard for Safety Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit-Breaker Enclosures
   2. UL 891 - UL Standard for Safety Dead-Front Switchboards

1.3 SUBMITTALS
A. Product Data.
B. Shop Drawings.
C. Testing: Perform the following tests at the manufacturer's plant or submit evidence to the Contracting Officer's satisfaction, that similar equipment has passed the tests.
   1. 60 Hz dielectric tests.
   2. Mechanical operations tests.
   4. Transformer case tests.
   5. Electrical operations tests.
   6. Control wiring checks.
   7. Rated current test.
   8. Momentary current test.
   10. Sequence test.

D. Field Testing: Submit a detailed plan of the proposed methods of and scheduling of the required field testing at least 30 calendar days before initiating the tests.
E. Test Reports: Submit certified test reports for tests at the manufacturer's plant and field tests.
F. Operation and Maintenance Manuals and Training: In accordance with Section 16001, "Electrical Systems - General".

1.4 QUALITY ASSURANCE
A. Experience:
   1. Manufacturer: Select a firm regularly engaged in the manufacture of low voltage switchgear and switchboards of the types and sizes specified in this section.
   2. Incorporate equipment into this work which essentially duplicates equipment that has been in satisfactory use for a period of five years prior to the bid opening of this project.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING
A. Location of Equipment: The Contract drawings are diagrammatical and not intended for use in determining the exact locations of the components of mechanical and electrical systems.
B. Assembly for Shipment:
   1. Design enclosures to permit lifting by jacks or slings and moving horizontally on rollers or skidding in any direction.
   2. Coordinate maximum dimensions of shipping sections with dimensions of access hatches, corridors, and doors to ensure shipping dimensions will allow movement of switchgear through structure without damage to equipment or structure, or undue difficulty.
   3. For shipping, disconnect interconnecting wiring. Coil one side of split with matching

DART - September 2004 16425 - 1
terminal block on either side. Identify wiring and terminal block points for reconnection.

PART 2 - PRODUCTS

2.1 GENERAL

A. Provide switchboards consisting of an assembly of free standing enclosed steel structures. Furnish each structure containing a group of molded case circuit breakers or instrument compartments in the front and a full height rear compartment for buses, incoming cable connections, and feeder-cable connections. Enclose the circuit breaker compartments completely with sheet steel barriers to segregate the breakers. Provide switchboards complying with applicable codes and standards. Furnish the switchboards with an Underwriters Laboratories label, permanently affixed.

B. Ratings:

1. Nominal Voltage: 208 or 480 volts.
2. Phase: 3.
3. Wire: 3 or 4.
4. Frequency: 60 Hertz.
5. Rated continuous current and short circuit rating as indicated on the drawings.

C. Furnish switchboards consisting of the required number of vertical sections bolted together to form one rigid switchboard, completely assembled, wired, and tested at the manufacturer's plant. If approved by the Contracting Officer, switchboards may be broken down into convenient shipping sections subsequent to the completion of the factory tests.

2.2 INSULATION STRUCTURE

A. Provide insulation structure which will not support combustion, produce toxic gases, or absorb moisture.

B. When insulation structure is subjected to electric arc, limit emission of conducting materials so as not to interfere with performance of circuit breakers.

2.3 BUS BARS

A. General Requirements: ASTM B187/B187M.

B. Continuous current rating of bus bars as indicated on the drawings.

C. Provide bus bars capable of withstanding mechanical stresses and heat due to maximum short-circuit current as stated on drawings.

D. Bus contact surfaces: Silver-plated at connection.

E. Neutral bus ampere rating: 50 percent of phase bus rating, unless indicated otherwise.

2.4 GROUND BUS

A. Copper bus, not less than 2 inches by 1/4 inch furnished secured to each vertical section structure and extending throughout the entire length of the switchboard section.

B. Make joints in ground bus with 4 bolts and overlap of 4 inches.

C. Switchboards to be used for service entrance equipment shall be provided with ground-to-neutral link in accordance with NFPA 70 (NEC) for grounding of neutral. For services in same AC switchboard room, single grounding electrode connection to tie-point of neutral from each power source is permitted.

2.5 CONTROL WIRING

A. Rate insulation at 600 volts, Type SIS as per NFPA 70 (NEC), copper, 14 AWG minimum. Flexible, Class C or higher, stranded wire used for wiring across hinged joints.

B. Use one continuous length of wire between terminals without splices or taps.

C. Terminal blocks: With screw-type terminals, circuit marking strips for indicating wire number, phenolic laminated dustcover and 10 percent minimum space terminal points.

D. For each individual wire, use same identification as is used on each terminal block marking strip.

E. Make connections at terminal of device, on terminal blocks or at control bus, using tinned copper clamp compression terminals with insulated sleeves.

F. Terminate interconnect wiring between compartments on terminal blocks before being wired to components.

G. Provide fuse blocks and fuses as required.

2.6 CIRCUIT BREAKERS

A. Provide molded case circuit breakers, thermal magnetic type, manually operated, and bolt-on.
B. Equip breakers 250 amperes frame and above with solid-state trip complete with built-in current transformers, solid-state trip unit and flux transfer shunt trip. Provide breakers with easily changed trip rating plugs with trip ratings as indicated on the drawings. Interlock rating plugs so they are not interchangeable between frames and interlocked such that breaker cannot be latched with rating plug removed. Provide breaker with built-in test points for testing long delay and instantaneous and ground fault (where shown) functions of the breaker by means of a test kit operated at 120 volts. Provide one test kit capable of testing breakers 250 ampere and above.

1. Provide solid-state instantaneous element continuously adjustable from approximately four to eight times the trip rating, with short time adjustment from instantaneous to ten cycle delay for coordination purposes.

2. Provide short delay override feature providing for instantaneous tripping on high magnitude faults.

C. Provide molded case circuit breakers with symmetrical RMS interrupting capacity as indicated.

D. Provide molded case circuit breakers with overcenter toggle-type mechanisms having quick-make, quick-break action. Calibrate breakers for operation in an ambient temperature of 40 deg. C. Provide each circuit breaker with trip indication by handle position. Provide 100 ampere frame size circuit breakers with a permanent trip unit containing individual thermal and magnetic trip elements in each pole. Provide a push-to-trip button on the cover for mechanically tripping the circuit breaker.

E. Provide current limiting circuit breakers rated at maximum standard symmetrical RMS interrupting capacity for each frame size at 480 volts. Current limiting circuit breakers must protect molded case breakers downstream as shown on the drawings. No deviations from this provision are acceptable. Submit manufacturers test data proving the protection from both peak currents and RMS energy of down stream devices.

2.7 GROUND-FAULT PROTECTION SYSTEM

A. Provide ground-fault protection as required per NFPA 70 (NEC), unless noted otherwise on the drawings.

2.8 ENCLOSURE

A. Dead-front, free-standing indoor steel enclosure designed for lineup with 480 or 208 volt switchboard, where applicable.
B. Furnish anchor bolts and anchorage items where required and field check to insure proper alignment and location. Provide templates, layout drawings, and instructions to insure correct placing of anchorage items in concrete. Check and verify dimensions of embedded items for correctness of location and detail before concrete is placed.

C. Install supporting members, fastening, framing, hangers, bracing brackets, straps, bolts, and angles as required to set and rigidly connect the work.

D. Provide temporary bracing, guys, and other devices as required to accomplish erection and to provide safety and stability until work is in final position and approved.

E. Align mismatched holes by reaming or replacing of clip connectors. Do not cut with torches.

F. Connect space heaters to temporary electrical service as soon as equipment arrives on the site.

3.2 FIELD TOUCH UP PAINTING

A. After installations are complete, clean thoroughly surfaces where shop paint coating is missing or abraded, bare steel, including bolts, nuts, washers, and welds, and paint each surface and item with the same paint as used for shop coating.

B. Field touch up shall be in accordance with Section 09920, “Interior Painting” for interior locations and Section 09970, “Coatings for Steel” for exterior locations.

3.3 TESTING START-UP

A. Provide testing in accordance with Section 16030, “Testing of Electrical Systems”.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 16001, “Electrical Systems - General”.

END OF SECTION 16425
SECTION 16450
GROUNDING AND BONDING

PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies furnishing, installing, and testing complete grounding and bonding systems.
B. Grounding and bonding systems for Communications Facilities and Systems are specified in Section 16876, “Grounding and Bonding - Communication System”.

1.2 REFERENCED STANDARDS
A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
1. ASTM B187 - Standard Specification for Copper Bar, Bus Bar, Rod, and Shapes
B. Institute of Electrical and Electronics Engineers (IEEE):
1. IEEE 142 – Recommended Practice for Grounding of Industrial and Commercial Power Systems
C. National Fire Protection Association (NFPA):
1. NFPA 70 - National Electrical Code (hereinafter referred to as NEC)
D. Telecommunications Industry Association (TIA):
1. TIA J-STD-607-A - Commercial Building Grounding (Earthing) and Bonding Requirements for Telecommunications
E. Underwriters Laboratories, Inc. (UL):
1. UL 467 - UL Standard for Safety Grounding and Bonding Equipment

1.3 SUBMITTALS
A. Shop Drawings:
1. Locations of ground rods, connectors, cables, etc., and details of connections, terminations and access points.
B. Product Data:
1. Manufacturer's catalog data for proposed materials with installation recommendations.
2. Procedures and equipment for testing resistances and electrical continuity.
C. Certification: Certified test reports verifying that ground resistance of each ground grid when installed and each ground bus when connected to the ground grid does not exceed specified values.

1.4 QUALITY ASSURANCE
A. Source Quality Control: Each Item UL-Listed, or approved equal.
B. Comply with TIA J-STD-607-A. Grounding system resistance is 25 ohms maximum unless otherwise noted.
C. Materials conforming to requirements of NEC and IEEE 142d. Furnish products listed and approved by UL listed or approved equal.

PART 2 - PRODUCTS

2.1 EQUIPMENT AND MATERIALS
A. Grounding and Bonding Equipment: Conform to UL 467 or approved equal and additional requirements specified herein. Provide for compatibility for all components, equipment, and systems among all elements of the new systems and provide for compatibility for all components, equipment and systems with existing systems.
B. Ground Electrodes:
1. Ground rods: Copper clad steel or other material as shown on drawings. Minimum dimensions: 5/8 inch diameter by 10 feet long.
2. Ground rod installations where rock prevents the installation of standard ground rods: In areas where ground rods are shown to be installed and the presence of rock prohibits the installation of standard ground rods for an effective path to ground, install UL approved vertical or horizontal chemical ground rods.
C. Grounding conductor:
1. Grounding electrode conductors:
   a. Stainless steel or copper conductor, as shown on drawings, in accordance with the following: As specified in Section 16120, “Wires and Cables”, for single-conductor cable, 600 volts.
   b. Size unless otherwise shown:
      1) For use in ground grid and for connecting of ground grid to ground bus: No. 4/0 AWG or as shown on drawings.
      2) For connection of ground bus in the operation control center and communication rooms to main ground bus in ac switchboard rooms: No. 2/0 AWG.
GROUNDING AND BONDING

3) For other grounding electrode conductors: In accordance with NEC Table “Grounding Electrode Conductor for AC Systems”.

2. Equipment grounding conductor:
   a. Sized in accordance with NEC Article “Size of Equipment Grounding Conductors” unless otherwise shown on drawings.
   b. Equipment grounding insulated conductor: Single conductor stranded copper, with insulation, as specified in Section 16120, "Wires and Cables".
   c. Equipment grounding bare conductor integral with multiple-conductor cable: Section 16120, "Wires and Cables".

D. Bus bar: ASTM B187, size 2 inches wide by 1/4 inch thick, length as required.

E. Terminal lugs:
   1. For No. 4/0 AWG and smaller conductors: Copper compression terminal lugs.
   2. For No. 250 KCMIL and larger: Long barrel, copper, double-compression terminal lugs.

F. Ground connector:
   1. O-Z Gedney, Type KG or approved equal.
   2. Two-piece, designed for connecting grounding conductor to bus bar.
   3. Copper alloy body and silicon bronze bolt, nut and washer with interlocking clamp.
   4. Exothermic weld: Size and type per manufacturer’s recommendations.

G. Jumpers: Insulated copper braided or leaf-type flexible jumper, size as required.

H. Bus bar insulators: Fibrous glass reinforced polyester insulator with 1/2 inch diameter threaded holes at both ends for bus bar installation, size per manufacturer’s recommendations.

I. Coal Tar Epoxy: Polyamide cured coal tar epoxy, Dupont Corlar 823 CTE, Koppers Company No. 300M, PPG Industries 97-640 or 97-641 or approved equal, applied to a dry film thickness of 8 mils per coat.

J. Epoxy Resin Encapsulation: Two-component epoxy resin type with plastic snap mold, as manufactured by Duriron Company, 3M Company or approved equal.

K. Exothermic Welds and Coatings: Metal alloy consisting of copper oxide and aluminum provided in individual plastic tubes equal to Cadweld products. Weld molds shall be made of solid graphite.

PART 3 - EXECUTION

3.1 GROUNDING

A. Ground Connections:
   1. Weld buried ground connections exothermically, in accordance with manufacturer’s recommendations. Clean and coat with coal tar epoxy applied with a 32 mils dry film thickness using multiple coats. Allow drying between coats and before backfilling. Encapsulate with epoxy resin, buried ground connections of grounding electrode conductors running to ground buses as shown.
   2. Use terminal lug to connect grounding conductor to equipment enclosure. Secure connector or terminal lug to the conductor so as to engage strands equally by using tools and pressure recommended by the manufacturer.
   3. Exothermically weld connections for ground rods in manholes and hand holes, as shown.
   4. Splices in grounding conductors are not permitted.
   5. Where ground rods are required, they shall be installed in accordance with manufacturer’s recommendations. See Section 16001, “Electrical Systems - General”, Article 1.12 - Operation and Maintenance (O & M) Manuals.

B. Ground Grid:
   1. Install ground grid consisting of bare stranded copper conductors as shown on Drawings and ground rods buried in earth, in pattern and at locations shown. Install ground rods vertical if possible. If this is impossible, rods may at an angle or (as a last resort) buried horizontally 24 inches (minimum) below grade.
   2. Bury top of ground rod 30 inches minimum below grade or as shown.
   3. Provide 24 inch minimum separation between ground rods and concrete structures.
   4. Interconnect ground rods using bare stranded copper conductors.
   5. For connecting ground grid to ground bus in each traction power substation provide 4 No. 4/0 AWG copper conductors.
   6. For connecting ground grid to ground bus in electrical room, tie-station, ac switchboard room or cooling tower fan shaft, and drainage pumping station, provide 4 No. 4/0 AWG copper conductors.
7. For additional grounding of power transformers provide 1 insulated copper conductor from nearest ground grid for each transformer ground pad. Provide 1 insulated copper conductor for service transformer between the transformer ground pad and nearest ground grid.

8. Unless otherwise shown, leave a pigtail of ground conductor of sufficient length, above finished floor for connection to ground bus, ground plates, or service entrance equipment.

C. Ground Bus:

1. Install ground bus bar, as required or as shown on drawings. The ground bus for the power substation a.c. switchboards and chiller plant equipment shall be 2 inches wide by 1/4 inch thick and length to cover the area of equipment as required.

2. Install ground bus bar, as per Item 1 in train control center and communications rooms and where shown.

3. Mount ground bus bar on insulators 2 feet above finished floor, unless otherwise shown, using cap screws and expandable threaded anchor.

4. Provide insulator support at each end of ground bus and at intervals not exceeding 3 feet.

5. In power substations, ac switchboard rooms, chiller plants, fan shafts, and drainage pumping stations, connect the ground bus to No. 4/0 AWG insulated copper conductors running from associated ground grid.

6. In train control center, communication, electrical, and mechanical rooms, kiosk (if used), and other locations shown, connect ground bus to main ground bus in associated ac switchboard room, using No. 2/0 AWG insulated copper conductor. Connections shall be mechanical and/or exothermic, manufacturer to be approved by the Authority.

7. Install No. 4/0 AWG insulated copper conductor, with one end connected to the ground bus in the ac switchboard room, at the following locations:

   a. In each tunnel for main line track, support grounding conductor on channel inserts in tunnel wall.

   b. Install grounding conductor in cable trough area and conduit reserved for ac power.

D. Equipment Grounding Conductor: Provide equipment grounding copper conductor for following services and as shown:

   1. Feeders.

2. Three-phase branch circuits.

3. Emergency lighting branch circuits.

4. Parking lot lighting branch circuits.

5. Circuits feeding load centers.

E. Grounding of Service Equipment:

1. Ground in accordance with NEC.

2. Ground enclosure and ground bus in switchgear, switchboard, motor control center and panel boards to ground bus provided in substation or room, using insulated ground conductor.

3. Install copper bonding jumper between neutral and ground bus as shown.

F. Grounding of Separately Derived AC System:

1. Ground in accordance with NEC.

2. Ground secondary neutral and enclosure of transformers to nearest ground bus or insulated grounding electrode conductor.

3. For transformer located outside of buildings, install additional grounding connector between transformer secondary neutral/enclosure and ground bus or grid using insulated copper conductor.

G. System Neutral Grounding: Provide 3-phase alternating current secondary distribution systems wye point connected with neutral grounding at the source.

1. Install system neutral and ground bus and equipment ground conductor or both as indicated.

2. Solidly ground neutral deriving equipment.

3. Connect secondary wye neutral points to ground:

   a. At Equipment: Connect neutral points to primary source equipment ground and secondary ground bus where required.

   b. At power transformers and load centers: Provide copper conductors, sized, as indicated, but in no case smaller than that required by NEC.

   c. At Dry Type Transformers: Use equipment ground conductor for connection of equipment and neutral to ground system.
H. Equipment Grounding:

1. Alternating current panelboard, disconnect switches, switchgear, switchboards, and motor control centers:
   a. Connect continuous equipment ground bus by copper ground wire to building or facility ground bus.
   b. Provide ground wire equal in size to largest conductor in line feeding equipment, but not less than No. 6 AWG, nor larger than No. 4/0 AWG.
   c. Install ground wire in rigid steel conduit bonded at both ends.

2. Wiring, channels, metallic conduit, rigid galvanized steel, flexible conduits, metallic boxes, panel boards, and transformer enclosures. Ground the ground bus with copper ground conductors sized as specified.

3. Motors, Lighting Fixtures, and Equipment: Ground in accordance with NEC.

I. Grounding for Personnel Safety:

1. In substations, tie stations, electrical and mechanical rooms, chiller plants, fan shaft, and pumping station, bond exposed metallic structure, motor frame, AC equipment enclosure, ductwork, and metallic piping to local ground bus, using minimum of No. 6 AWG insulated grounding conductor.

2. Bond escalators and elevators motor frames, AC equipment enclosures and metallic structures to equipment grounding conductor in AC power feeder. Where feasible, supplement such grounding by a connection to ground bus using No. 1/0 AWG insulated grounding conductor.

3. Bond metallic ladders, walkways, handrails, and stairs at locations as shown, to local ground bus, using insulated copper conductor, No. 6 AWG minimum, except where these metallic objects are located within 6 feet of the edge of the platform (adjacent to track ways). These metallic objects shall not be grounded and shall be protected from touch shock potential by other trades.

4. Bond and ground exposed metallic structures in open areas to separate grounding electrodes in accordance with the following requirements:
   a. Light standards: Bond and ground each light standard to a ground grid or to 1 or more separate ground rods. Provide maximum resistance to ground of 25 ohms, for each light standard.

b. Cable troughs alongside track: Bond and ground metal cable troughs to 1 inch diameter by 10 foot long ground rod, buried with top 2 feet below grade, at approximate 50 foot intervals and at each end with a minimum 2 foot separation from reinforced or buried metallic structures whenever possible, using No. 4 AWG insulated copper conductor. At expansion and contraction joints, install No. 4 AWG jumper for electrical continuity.

c. Railings, metal guard rails and fences alongside track: Bond and ground fence to 5/8 inch diameter by 10 foot long ground rod, buried with top 2 feet below grade, at approximate 500 foot intervals and at each end, with 2 foot separation from fence post footing and other reinforced structures, using No. 4 AWG copper insulated grounding conductor. For electrical continuity install No. 4 AWG insulated jumper.

d. Railing, metallic cable trough, catenary poles, and metallic deck structure on aerial structure:
   1) Hand railing as shown. Provide electrical continuity with No. 6 AWG insulated copper jumper.
   2) At each end abutment and mid span piers where shown, install No. 4/0 AWG insulated copper conductor between the bonded deck structure and the ground grid via the weatherproof junction box or manhole as shown.
   3) Provide electrical continuity and ground rods for catenary pole foundations as shown.

e. Wayside metal equipment (equipment mounted along the guide way adjacent to tracks) including, but not limited to, cabinets, poles, pull boxes, and junction boxes: Bond and ground each item to 1 or more ground rods to provide 25 ohms or less resistance to ground.

5. In underground locations, bond and ground hand railing at each end and at approximate 50 foot intervals to nearest ground bus or ground conductor, using No. 6 AWG insulated copper conductor. For electrical continuity, where necessary, install No. 6 AWG insulated copper jumper.

6. Weld grounding and bonding connections exothermically to metallic structures, catenary poles, cable troughs, hand railings, and fences.
7. Deck structures (provided with standard internal rebar): At each end abutment and mid span, install No. 4/0 AWG insulated copper conductor between the bonded deck structure and the ground grid via a weatherproof junction box or a manhole as shown on the drawings.

8. Deck Structures (provided with epoxy coated internal rebar, as shown on drawings): Do not provide grounding conductors and/or ground rods/electrodes.

3.2 FIELD QUALITY CONTROL

A. Test ground resistance of each ground grid after installation and each ground bus when connected to ground grid, using approved test procedure.

B. Ground resistance not to exceed the following:

1. Maximum resistance to ground indicated in Table 16450-1, Maximum Resistance to Ground.

C. To meet resistance requirements, install additional ground rods or use soldier piles as ground rods where available. Isolate piles used for grounding from those bonded for stray current and cathodic protection (See Section 13100, "Corrosion Control").

D. Test metallic conduit and raceways, equipment enclosures, metallic cable troughs, fences, handrailings, metallic structures, and light standards for continuity to grounding system.

E. Test resistance of connections and conductors between ground bus in train control center rooms/communications rooms and ground bus in associated AC switchboard rooms, traction power substations, and dc tie stations for electrical continuity.

F. Conduct tests in presence of the Contracting Officer.

G. Prepare and submit certifications as specified.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 16001, “Electrical Systems - General”

PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies furnishing and installing of interior dry type transformers, and oil filled pad mount transformers and supporting devices.

1.2 REFERENCE STANDARDS

A. American National Standards Institute (ANSI):
   1. ANSI C57.94 - Recommended Practice for Installation, Application, Operation, and Maintenance of Dry-Type General Purpose Distribution and Power Transformers

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM D635 - Standard Test Method for Rate of Burning and/or Extent and Time of Burning of Plastics in a Horizontal Position
   2. ASTM D3145 - Standard Test Method for Thermal Endurance of Electrical Insulating Varnishes by the Helical Coil Method

C. Institute of Electrical & Electronics Engineers (IEEE):
   1. IEEE C57.12.00 - Standard General Requirements for Liquid-Immersed Distribution, Power, and Regulating Transformers
   2. ANSI/IEEE C2 - National Electrical Safety Code (NESC)

D. National Fire Protection Association (NFPA):
   1. NFPA 70 - National Electrical Code (NEC)

E. National Electrical Manufacturers Association (NEMA):
   1. NEMA TR1 - Transformers Regulators and Reactors

1.3 SUBMITTALS

A. Certification: Prior to purchase, submit for approval certified manufacturer's test data for each type and rating of transformer from each manufacturer, of the following tests conducted within the past two years:
   1. Applicable IEEE C57.12.00 routine and optional tests

   2. Noise level tests.

   3. Performance and Test Data. Submit guaranteed performance data consisting of losses, no load and full load, percent impedance, percent regulation of 1.0 and 0.8 power factor, and the average sound level in dB; and test data. Correct data to the appropriate NEMA reference temperatures.

B. Product Data and Shop Drawings: Include drawings or catalog cuts showing dimensions, weight, wiring diagrams, or catalog cuts showing primary and secondary connections, taps, ratings and characteristics, anchor bolt plan or mounting brackets or platforms furnished separate from the transformer, and grounding requirements.

C. Submit evidence of UL listing or label.

D. Operations and Maintenance Manuals, and Training: In accordance with Section 16001, "Electrical Systems - General".

E. Manufacturer's Data: At least two weeks before start of any shop coating work, submit to the Contracting Officer for approval three each of the following:
   1. Complete Data Sheets with surface preparation and the coating materials to be used, identified by the manufacturer, brand name, and product number.

1.4 QUALITY ASSURANCE

A. Experience:
   1. Manufacturer: Select a firm regularly engaged in the manufacture of dry transformers and pad mounted transformers of the type specified in this section.

   2. Equipment: Provide that the transformers incorporated into this work essentially duplicate transformers that have been in satisfactory use for a period of five years prior to the bid opening of this project.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Identify and tag electrical terminations and connections prior to shipping. Do not remove identification tags prior to installation.
PART 2 - PRODUCTS

2.1 GENERAL

A. General:

1. Provide nameplate on each transformer in accordance with Section 16040, "Identification of Electrical Equipment".

2. Build transformers incorporating thermally stabilized UL Class H insulation to permit continuous operation at 240 deg. F in an ambient of 105 deg. F without loss of life expectancy in accordance with NEMA TR1.

3. Insulating materials to be in accordance with NEMA Standard for a 430 deg. F UL component recognized insulation system.

4. Construct the transformer cores with high grade, non-aging steel laminations having high magnetic permeability, and low hysteresis and eddy current losses. Keep magnetic flux densities well below the saturation point. Clamp the core laminations together with heavy, structural steel angles.

5. Noise level: Not to exceed NEMA TR1 sound levels.

6. Transformer taps (unless otherwise shown on drawings) 25 kVA and smaller: minimum four standard 2-1/2 percent taps, two above and two below rated voltages. Larger than 25 kVA: minimum standard 2-1/2 percent taps, two above and four below rated voltages.

7. Furnish suitable wall brackets for each transformer that is to be wall mounted.

8. Provide a UL label on each transformer.

9. Provide lifting eyes or brackets.

10. Transformer materials: Conform to ASTM D635.

B. Buses: Provide transformers with adequately supported copper buses, having the following additional requirements:

1. Bus bar silver-plated at bolted connection point.

2. Joints welded or bolted for mechanical and electrical short circuit stresses.

C. Grounding Pad: Equip enclosure with grounding pad, drilled, and tapped for connection to station grounding system. Refer to Section 16450, "Grounding and Bonding", for complete grounding requirements.

D. Finish: Degrease metallic surfaces and thoroughly clean. Prime with zinc primer and finish with light gray enamel; minimum dry film thickness two mils.

2.2 INDOOR TRANSFORMERS

A. NEMA type, indoor, dry, double-wound, with insulated copper conductor, suitable for operation on 60 Hertz.

B. Rating:

1. kVA rating: As indicated on the Drawings.

2. Voltage rating:

   a. Three-phase transformers: 480 volts delta primary to 208Y/120 volts secondary neutral brought out.

C. Impregnate transformer coils and cast under vacuum into molds with epoxy resin. Cast each phase separately.

D. Protect the core against corrosion by a resin coat. Hot dip galvanize iron parts of transformer except the core.

E. Core and coil:

1. Completely isolate from the enclosure by means of vibration absorbing mounts with no metal-to-metal contact between the core and coil and the enclosure.

2. The vibration isolating system: Design to continually secure the core and coil unit to the enclosure. Sound isolating systems requiring the removal of tie-down facilities are not acceptable.

F. Ventilating openings: Louvered type; do not use expanded metal coverings.

G. Transformer enclosures: Construct of 14-gauge sheet steel, with lifting eyes. Holes in the enclosures requiring the use of spreader bars are not acceptable.

H. In addition to standard accessories, include winding temperature indicator with alarm and trip contacts.
2.3 **PAD-MOUNT OUTDOOR TRANSFORMERS**

A. Compartmental type, oil cooled, tamperproof, and weatherproof without exposed screws or bolts, suitable for mounting on a concrete pad.

B. Sealed tank construction with a welded cover. The tank to remain sealed with an oil temperature range of 120 deg. F to 225 deg. F.

C. Temperature rise not to exceed 150 deg. F at full load in an ambient temperature of 102 deg. F and conform to NEMA TR1.

D. The high and low compartments: Locate side by side separated by a steel barrier with high voltage door fastenings not accessible until the low voltage door has been opened. Provide the doors with a single padlock. Provide tank grounding provisions in each compartment. Provide lifting eyes and jacking pads.

E. High voltage compartment: Consist of a two position, load-break gang operated oil switch, current limiting fuses and three 15 kV or 25 kV distribution class lightning arresters as required.

F. Low voltage compartment: Consist of a main molded case secondary circuit breaker.

G. Accessories: In addition to standard accessories, include dial type thermometer, liquid level gauge, pressure relief valve, and mounting provisions for low voltage current and potential transformers.

3.2 **TESTING START-UP**

A. Provide testing in accordance with Section 16030, “Testing of Electrical Systems”.

3.3 **TOUCH UP**

A. Touch up nicks and scratches incurred in shipping and installation. Damage to paint shall be neatly refinished after installation and before commissioning.

3.4 **NAMEPLATES**

A. Provide nameplate on each transformer in accordance with reference standards, Section 16040, “Identification of Electrical Equipment”.

4.1 **GENERAL**

A. In accordance with Section 16001, “Electrical Systems - General”
SECTION 16470
POWER AND LIGHTING PANELBOARDS

PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies furnishing, installing, and making electrical connections in the electrical panelboards as shown.

1.2 REFERENCE STANDARDS
A. National Fire Protection Association (NFPA):
   1. NFPA 70 - National Electrical Code (NEC)
B. Underwriters Laboratories, Inc. (UL):
   1. UL 50 - UL Standard for Safety Enclosures for Electrical Equipment
   2. UL 67 - UL Standard for Safety for Panelboards

1.3 SUBMITTALS
A. Product Data: Panelboards.
B. Shop drawings: For Panelboards; 1 inch scale for elevations and details to scale to reflect graphically the construction elements. Submit scaled plans and elevations of electrical rooms, closets and enclosures with lighting and power panelboards located.
C. Certification: Certify that completed components comply with standards referenced.
D. Operation and Maintenance Manuals, and Training: In accordance with Section 16001, "Electrical Systems - General".
E. Manufacturer's Data: At least two weeks before start of any shop coating work submit to the Contracting Officer for approval two each of the following:
   1. Complete Data Sheets with surface preparation and the coating materials to be used, identified by the manufacturer, brand name, and product number.

1.4 QUALITY ASSURANCE
A. Source Quality Control:
   1. Manufacturer: Select a firm regularly engaged in the manufacture of power and lighting panelboards of the type specified herein.

PART 2 - PRODUCTS

2.1 PANELBOARDS
A. General:
   1. UL-listed and UL-labeled (unless shipped as a factory-mounted component of a UL labeled enclosed type panelboard) not over 48 inches high.
   2. Main bus, neutral bus, separate ground bus, and a main circuit breaker where indicated on drawings.
   3. Buses of copper and terminals rated solderless type, suitable for either copper or aluminum conductors sized at maximum rated terminal capacity.
   4. Provide panelboards with a metal directory frame. Directory to be legible and indicate panelboard designation, source from which feed originates, and equipment controlled from each circuit breaker.
   5. Construct panelboards cabinets of UL 50 code gage sheet steel, bearing the manufacturer's nameplate or stamp and the Underwriters' Laboratories inspection label. Cabinets shall be NEMA 1 for indoor locations and NEMA 3X for outdoor locations, unless noted otherwise.
   6. Provide panelboard cabinets with means for securing, supporting, and adjusting the panelboards and trim.
   7. Factory-clean panelboard cabinets and coat with one coat of zinc primer, and paint with one coat of gray baked-on enamel except DC panelboard cabinet color to be OSHA red.
   8. Procure panelboard cabinets without knockouts.
   9. Equip panelboard cabinets with sheet steel trim and hinged door with catch and lock.
   10. Provide panelboards with space, terminals, and bus capacity, for future addition of circuit breakers as indicated on the drawings.
   11. Provide panelboard gutter space as required by the NEC.
12. Where gutter spaces are occupied by feeder cables, increase gutter spaces as required.

13. Markings per UL 67.

14. Permanent numerical identification at each breaker space.

B. Distribution Panelboards: 480/277 volts or 208/120 volts, three-phase, four wire with molded case circuit breakers in the quantities, sizes, rating, and number of poles indicated.

C. Power and Lighting Panelboards:
1. 208/120 volts, three-phase, four wire, or 480/277 volts, three-phase, four wire with molded case circuit breakers in the quantities, sizes, rating, and number of poles as indicated.
2. 240/120 volts, single-phase, three wire with single pole or two pole molded case circuit breakers in the quantities, sizes, and ratings as indicated.

D. DC Panelboards: Rated for 125 volts DC, two wire with two pole molded case circuit breakers in the quantities and sizes indicated.

E. Circuit Breakers:
1. Provide molded case branch circuit breakers, and where called for on drawings, a main circuit breaker of the ampere rating and number of poles as called for.
2. Unless otherwise shown, provide circuit breakers having short circuit current interrupting capabilities in excess of available fault current at the panelboard, but no less than:
   a. 22,000 amperes symmetrical for 120/208 volts or 120/240 volt service.
   b. 22,000 amperes symmetrical for 277/480 volts service.

F. Circuit Breaker Enclosure: Where a single circuit breaker is required (not in a panelboard) provide an individual enclosure of the type called for on drawings. If type is not stated on drawings, provide one of the following types, according to locations:
1. In tunnels and other underground locations not in enclosed rooms: NEMA type 4X (non-metallic) or NEMA type 4 (stainless steel).
2. Outdoors: NEMA type 4X (non-metallic) or NEMA type 4 (stainless steel).
3. Other locations (including electrical and mechanical rooms in substations or subway stations): NEMA type 1.

G. Load Centers: For applications where the main circuit breaker (or other main overload protection) is rated 100 amperes or less, a load center may be used instead of a panelboard as described above. The load center shall meet or exceed requirements shown on the drawings. In load centers, plug-in branch circuit breakers are acceptable.

H. Manufacturer: Square D, General Electric, Siemens or approved equal.

I. Nameplate: Provide nameplate on each transformer in accordance with reference standards, Section 16040, “Identification of Electrical Equipment”.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Surface mount panelboards unless otherwise indicated.

B. Mount panelboard cabinets rigidly in place with top of cabinet 6'-6" maximum above finished floor unless otherwise indicated. Bottom of cabinets shall be 6 inch minimum above floor.

C. Install panelboards in enclosures in accordance with manufacturer's instructions, if practicable, before mounting enclosure.
D. Adjust cabinets and panelboards straight and plumb and fasten securely in place.

E. Verify that circuit breakers have correct rating for the applicable circuit application as indicated.

F. Perform wiring in accordance with UL 67, NFPA 70 (NEC) and manufacturer's instructions.

G. Make conduit connections in accordance with Section 16111, "Conduits".

H. Provide grounding as specified in UL 67, NFPA 70 (NEC), and Section 16450, "Grounding and Bonding". Connect neutral wire directly to neutral bus, and ground wire to ground bus, in the same panel as circuit interrupting device.

I. Route, harness, and support conductors in gutters, wiring spaces, and compartments with bending radii not less than recommended by conductor manufacturer.

J. Install bonding jumpers from conduits entering cabinets to ground bus.

K. Identify each circuit in cabinet, record identity of each circuit and type circuit identity on directory card and place card in frame on door panel. Information on the directory card shall be neatly typed.

L. Attach identification tabs bearing the number of the circuit to wires in panelboard gutters.

M. Apply field touch-up paint as provided by the manufacturer.

N. In wet locations mount surface mounted panel boards and circuit breaker enclosures on standoffs, so they are a minimum of 1/2 inch from the wall. Use non-corrosive material for standoffs. If continuous strips or channels are used for standoffs, mount them vertically, to minimize areas for collection of water. Provide drip pan where required by Authority Having Jurisdiction (AHJ).

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 16001, “Electrical Systems - General”

END OF SECTION 16470
PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies furnishing and installing switches and receptacles, as shown.

1.2 REFERENCED STANDARDS
A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

B. National Electrical Manufacturers Association (NEMA):
1. NEMA WD1 - General Color Requirements for Wiring Devices
2. NEMA WD6 - Wiring Devices - Dimensional Specifications

C. National Fire Protection Association (NFPA):
1. NFPA 70 - National Electrical Code (hereinafter referred to as NEC)

D. Underwriters Laboratories, Inc. (UL):
1. UL 98 - UL Standard for Safety Enclosed and Dead-Front Switches

1.3 SUBMITTALS
A. Product Data: Provide manufacturer's standard catalog data for all items described in this section indicating conformance and compliance with standards and codes indicated.

PART 2 - PRODUCTS

2.1 LIGHTING SWITCHES
A. Unless otherwise specified, provide specification grade switches which meet or exceed all requirements of NEMA WD1 and WD6, and are UL listed. Voltage and amperage ratings of all switches must equal or exceed voltage and amperage of the circuit to be switched.

B. Provide single pole interior lighting switches of specification grade, 20 amperes, 120-277 volts, quiet type, with solid silver cadmium oxide contacts, clamp type terminals, and wide toggle handle with neoprene bumper pads.

C. Provide three way interior lighting switches of specification grade, 20 amperes, 120-277 volts, quiet type, with solid silver cadmium oxide contacts, clamp type terminals, and wide toggle handle with neoprene bumper pads.

D. Provide switch and pilot light of specification grade, 20 amperes, 120-277 volts with solid silver cadmium oxide contacts, clamp type terminals, and rugged lexan handle that is lighted red when the switch is in the ON position (unless noted otherwise on the drawings).

E. Provide single pole exterior lighting switches similar to the interior switches except equipped with a hinged cast aluminum gray cover plate and fiber shield for weatherproofing.

F. Provide white switches for normal lighting circuits.

G. Provide red switches for emergency circuits served from generator or Central Emergency Lighting Power Supply (CELPS).

2.2 HEAVY DUTY SAFETY SWITCHES IN INDIVIDUAL ENCLOSURES
A. Provide safety switches of heavy duty type and UL listed, rated at 240 volts or 600 volts, as required.

B. Provide switches with switch blades which are fully visible in the "OFF" and "ON" positions when the switch door is open. Plate all current carrying parts to resist corrosion and promote cool operation. Construct switches with removable arc suppressors where necessary to permit easy access to line side lugs. Provide front removable type lugs, UL listed for 194 degrees F copper wires.

C. Provide quick-make, quick-break switches such that, during normal operation of the switch, the operation of the contacts shall not be capable of being restrained by the operating handle after the closing or opening action of the contacts has started. Provide operating handle as an integral part of the box, not the cover. Make provisions for padlocking the switch in the "OFF" and "ON" positions. Provide switches with a dual cover interlock to prevent unauthorized opening of the switch door when the handle is in the "ON" position, and to prevent closing of the switch mechanism with the door open. The handle position shall indicate whether the switch is "ON" or "OFF".

D. Where called for on the drawings, furnish switches in NEMA 4X, NEMA 12, or code gauge UL 98 stainless steel NEMA 4 enclosures without knockouts. Provide positive means of sealing the cover. Provide quick release latches. Provide covers with pin type hinges and gaskets. Unless noted otherwise, provide enclosures as follows:
1. In tunnels and other underground locations not in enclosed rooms: NEMA Type 4X or stainless steel NEMA Type 4.

2. Outdoors: NEMA Type 4X or stainless steel NEMA Type 4.

3. Other Locations (including electrical and mechanical rooms in substations or subway stations): NEMA Type 1.

E. Furnish switches horsepower rated for AC and/or DC as indicated by standard drawings. For fusible switches rated 100 through 600 amperes at 240 volts and 30 through 600 amperes at 600 volts, provide a UL listed method of field conversion from standard Class H fuse spacing to Class J fuse spacing. These switches also must accept Class R fuses and have provision for field installation of a UL listed rejection feature to reject all fuses except Class R. Provide the UL listed short circuit rating of the switches at 200,000 RMS symmetrical amperes when Class R or Class J fuses are used with the appropriate rejection scheme. Provide the UL listed short circuit rating of the switch, when equipped with Class H fuses, of 10,000 RMS symmetrical amperes.

F. The enclosure shall be finished completely in the shop in accordance with Section 05130, "Structural Steel -Buildings" and Section 09970, "Coatings for Steel". Paint and Coatings System No. 1, except complete coatings of paint will not be applied in the field. Field painting shall be limited to touch up of nicks and scratches incurred in shipping and installation. All damage to paint shall be neatly refinished after installation and before commissioning.

2.3 RECEPTACLES

A. Unless otherwise specified, provide receptacles which meet or exceed all requirements of NEMA WD6 and are UL listed. Provide heavy duty receptacles, specification grade.

B. Provide single convenience receptacles of 20 amperes, 125 volts AC, 2-pole, 3-wire grounded, consisting of a heavy-duty reinforced molding, grounding screw, side and back wired, straight blade type.

C. Provide duplex convenience receptacles similar to the single type.

D. Provide single outlet, weather-proof convenience receptacles, 20 amperes, 125 volts AC, 2-pole, 3-wire grounded, consisting of a heavy-duty reinforced molding, grounding screw, side wired and turn-to-lock type with matching plug complete with cast box, hinged cast aluminum gray cover plate and fiber shield for weatherproofing.

E. Provide single outlet, heavy duty turn-to-lock receptacles rated at 30 amperes 208/120 volts with 2-poles, one neutral pole and ground pole back wired consisting of a black phenolic base complete with matching plug.

F. Provide welding receptacles 60 ampere, 480 volts, 4-pole grounded type complete with malleable iron box with cadmium finish, pressure terminals, phenolic insulating blocks, watertight gasket, grounding detent springs, and neoprene gasket with matching plug cable grip assembly. Provide receptacles meeting OSHA requirements.

G. Provide special purpose outlet in traction power substations 20 amperes, 240 volts, 3-pole grounded type with malleable iron box with cadmium finish, pressure terminals phenolic insulating blocks, watertight gasket, grounding detent springs, and neoprene gasket with matching plug cable grip assembly.

H. Provide clock outlets at 15 amperes, 120 volts AC, heavy duty, hanger type consisting of a brown phenolic body and stainless steel plate.

I. Equip receptacles for use in restrooms, washrooms, tunnels, and outdoor locations with solid-state ground-fault circuit interrupter actuating at 5mA. Provide receptacles with integral interrupters - not interrupters at the circuit breaker. Connect receptacles with interrupters so that the interrupter will not affect any other receptacles.

J. Provide white receptacles for normal general receptacles.

K. Provide red receptacles for emergency circuits served from generator or CELPS.

2.4 COVER PLATES

A. Unless otherwise specified, provide cover plates conforming to NEMA WD1 and WD6.

B. Furnish a cast feraloy plate to suit the device, gasketed for exterior mounting on surface mounted interior and exterior Type FS or FD boxes for switches and receptacles.

C. Furnish cover plates of stainless steel minimum 0.032 inch thick, brush finish on flush mounted switch and receptacle boxes.

D. In public areas provide cover plates fabricated of stainless steel ASTM A167 Type 302, No. 4 satin finish.

E. For special purpose outlets commercially produced using special material, configuration, and size, use plate of brushed stainless steel and of a design for the particular application.
F. Provide engraved red filled, recessed lettering stainless steel “EMERGENCY” cover plates for emergency circuits served from generator or CELPS.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install receptacles rigidly to outlet boxes at the location shown on the Drawings.

B. For exterior locations, mount receptacles in watertight cast type outlet boxes with threaded hubs or bosses and equipped with gasketed cover and captive cap of the screw or twist type.

C. Adjust devices to the vertical and flush with front of boxes.

D. Install cover plates on switches and receptacles.

E. Install switches, receptacles, and cover plates complete plumb, square, and tight in accordance with NEC and Local Electrical Codes.

F. Where switch enclosures are surface mounted in wet locations, provide standoffs so they are a minimum of 1/2 inch from the wall. Use non-corrosive standoff material. If continuous strips or channels are used for standoffs, mount them vertically.

G. Provide circuit identification at each receptacle and switch in accordance with reference standard, Section 16040, “Identification of Electrical Equipment”.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 16001, “Electrical Systems - General”

END OF SECTION 16490
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies the furnishing, transporting, repairing, and installation of lighting fixtures, mounting poles, and control devices.

1.2 REFERENCED STANDARDS

A. American Association of State Highway and Transportation Officials (AASHTO):

1. AASHTO LTS - Standard Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):

1. ASTM A123 - Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products
2. ASTM A276 – Standard Specification for Stainless Steel Bars and Shapes
3. ASTM A325 - Standard Specification for Structural Bolts, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength
4. ASTM A507 - Standard Specification for Drawing Alloy Steel, Sheet and Strip, Hot-Rolled and Cold-Rolled
5. ASTM A575 – Standard Specification for Steel Bars, Carbon, Merchant Quality M-Grades
8. ASTM B137 - Standard Test Method for Measurement of Coating Mass per Unit Area on Anodically Coated Aluminum
10. ASTM B221 - Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes
11. ASTM D635 - Standard Test Method for Rate of Burning and/or Extent and Time of Burning of Plastics in a Horizontal Position

C. National Fire Protection Association (NFPA):

1. NFPA 70 - National Electrical Code (hereinafter referred to as NEC)

D. The Society for Protective Coatings ( Formerly known as Steel Structures Painting Council) (SSPC):

1. SSPC-SP 10 - Near-White Blast Cleaning

E. Underwriters Laboratories, Inc. (UL): UL Standards shall apply unless Authority authorizes an approved equal.

1. UL 496 - UL Standard for Safety Edison-Base Lampholders
2. UL 508 - UL Standard for Safety Industrial Control Equipment
3. UL 542 - UL Standard for Safety Lampholders, Starters, and Starter Holders for Fluorescent Lamps
4. UL 773 - UL Standard for Safety Plug-In Locking Type Photocontrol for Use with Area Lighting
5. UL 935 - UL Standard for Safety Fluorescent-Lamp Ballasts
6. UL 1029 - UL Standard for Safety High-Intensity-Discharge Lamp Ballasts
7. UL 1598 - UL Standard for Safety Luminaires

1.3 SUBMITTALS

A. Product Data: Include photometric curves from a nationally known independent photometric laboratory for each fixture type. The manufacturer's data is not an acceptable substitute. Fixture substitutions must meet or exceed photometric performance of the fixture specified. All components shall be compatible to all other components within system or equipment. Unless determined to be beneficial to the Authority, all components, equipment and systems shall be fully compatible with DART's electronic and built environments.
B. Shop Drawings: Submit scaled plans and elevations of electrical enclosures with locations of lighting control equipment (time clocks, lighting contactors, terminal strips, hand-off-automatic switches, etc.) in relation to electrical panelboards and other electrical gear.

C. Wiring diagrams and bill of materials.

D. Samples: 1 of each type of fixture, as requested or directed by the Contracting Officer.

E. Documentation:
   1. Verification that each fixture is in compliance with applicable codes, regulations, reference standards, and specifications for the location at which it is to be used. Indicate requirements that each fixture meets.
   2. Calculations: Submit calculations by a Professional Engineer, registered in the State of Texas, certifying that assemblies of foundation, anchor bolts, pole, arms, and luminaire will withstand specified wind pressure, wind speed, stress, deflection, vibration, and fatigue.

F. Templates: Submit a template for the anchor bolt pattern of the mounting poles.

G. Mounting details and installation instructions.

H. Field Testing:
   1. Submit a detailed plan of the proposed methods of and scheduling of the required field testing at least 30 calendar days before initiating the tests.
   2. Submit certified test reports.

I. Manufacturer’s Data: At least 2 weeks before start of any shop coating work, submit to the Contracting Officer for approval 2 each of the complete data sheets with surface preparation and the coating materials to be used, identified by the manufacturer, brand name, and product number.

1.4 QUALITY ASSURANCE

A. Comply with applicable AISI, ANSI and NAAMM standards.

B. Each lighting fixture: UL-labeled or listed.

C. Experience:
   1. Installer: Select a firm regularly engaged for 5 years or more in the installation of the products described herein.

2. Manufacturer: Select subcontracting firms regularly engaged for 5 years or more in the manufacture of the products described herein.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Transport and place lighting fixtures and mounting poles into cartons or crates to provide protection during transit and storage to the Worksite.

B. Inspect lighting fixtures and mounting poles upon delivery for damage. Repair minor damage provided the finish items are equal in all respects to new work; otherwise, remove and replace damaged items as indicated. If damaged, polycarbonate panels shall not be repaired but shall be replaced.

C. Store lighting fixtures and mounting poles at the site under cover. Place units on at least a 4-inch high sills on floors in a manner that will prevent damage and rusting. Avoid the use of non-vented plastic or canvas shelters which could create a humidity chamber.

D. Hardware shall be provided and stored in original unopened packages, clearly labeled with manufacturer’s name, brand, specification identification data, and identification as shown on approved shop drawings or submittals.

E. Hardware for lighting fixtures, mounting poles, and control devices shall not be stored at any location unprotected from contact with soil and from exposure to the elements.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Subject to compliance with requirements, provide products of one of the manufacturer’s on the Lighting Fixture Schedule unless otherwise noted, and as follows:

   1. For lighting fixtures where only one manufacturer is listed, the Contractor shall provide either the product listed or an approved equal product.

   2. For lighting fixtures where more than one manufacturer is listed, the Contractor shall select one for each fixture type and shall use that fixture on the entire project.

2.2 PRODUCTS AND MATERIALS

A. General Requirements for Lighting Fixtures:

   1. Interchangeability: Components of same type, size, rating, functional characteristics and make are to be interchangeable.
2. Ground mounted HID light fixtures shall have cold weather ballasts (negative 4 to negative 22 degrees F minimum starting temperature).

3. Specialty light fixtures shall be as scheduled and shown on drawings.

4. In accordance with UL 1598.

5. All light fixtures shall have the capability of automated monitoring.

6. Both Metal-Halide and LED fixtures shall be Energy Star or Lighting Consortium rated and approved.

7. Materials:
   a. Steel:
      1) Sheet: ASTM A507, 22-gauge minimum
      2) Bar: ASTM A575.
   b. Steel pipe: ASTM A53, Type S.
   c. Stainless steel:
      1) Sheet: Comply with ASTM Standards for 22-gauge minimum.
      2) Bar: ASTM A276, Type 316.
      3) Finish: AISI Alloy 304, NAAMM Finish No. 4, unless otherwise shown.
   d. Aluminum: Alloy as recommended by manufacturer, unless otherwise shown or specified.
      1) Sheet and plate: ASTM B209.
      2) Extrusion: ASTM B221, 0.109 inch minimum thickness, unless otherwise shown.
      3) Cast:
         a) Die cast: ASTM B85, 0.1875 inch minimum thickness, unless otherwise shown.
         b) Sand cast: ASTM B26/B26M, 0.1875 inch minimum thickness, unless otherwise shown.
   e. Plastic:
      1) Resin: As shown.

8. Lamps:
   a. In accordance with applicable ANSI Standards.
   b. Fluorescent:
      1) Wattage and size: As shown or specified.
      2) Color: Cool white, unless noted otherwise.
      3) Type:
         a) Preheat start: Lamps rated 20 watts or less.
         b) Rapid start: Lamps rated above 20 watts.
      4) Rated life minimum:
         a) Super high output (SHO), very high output (VHO) and high output (HO), lamps: 12,000 hours.
         b) F6T5/CW: 6,000 hours.
         c) Preheat start lamps other than F6T5: 9,000 hours.
         d) Rapid start lamps: 18,000 hours.
         e) Other types: 12,000 hours.
   c. Metal-halide:
      1) Wattage: As shown.
      2) Size: As shown.
3) Color: Clear unless otherwise noted.

4) Lamp operating position: As shown.

5) Base: Mogul.

6) Rated life:
   a) 175 watts: 10,000 hours.
   b) 250 watts: 10,000 hours.
   c) 400 watts: 20,000 hours.
   d) 1,000 watts: 12,000 hours.

d. LED:
   1) Wattage: As shown.
   2) Size: As shown.
   3) Color: Clear unless otherwise noted.
   4) Lamp operating position: As shown.
   5) Base: As shown.
   6) Rated life:
      a) 50,000 hours (minimum) for all lamps

4) Metal Halide:
   a) Rated 660 watts, 600 volts: Medium screw base.
   b) Rated 1,500 watts, 600 volts: Mogul screw base.

b. Fluorescent:
   1) In accordance with UL 542.
   2) Rated 660 watts 600 volts.
   3) Integral starter holder for preheat type lamps, with starter.
   4) White thermosetting phenolic compound base and body, silver plated phosphorous bronze contacts, self-aligning neoprene gasket face.

c. Provide mechanical self-retaining neoprene gasket for dust and moisture proof seal between lamp and lampholder.

9. Lampholders for Metal Halide:
   a. Incandescent and metal-halide:
      1) In accordance with UL 496.
      2) Black or white thermosetting phenolic compound, glazed porcelain, or neoprene base and body as shown. Neoprene unit molded in one piece, weatherproof, oil-resistant, with vibration-absorbing socket construction.
      3) Incandescent: Rated 660 watts 250 volts for medium screw base.

   b. Fluorescent lamps:
      1) UL 935, Class P thermally-protected and high power factor type.
      2) Operable on 120 volts or 277 volts, 60 Hertz as shown or necessary, type and rating suitable for associated lamp.
3) Maximum utilization of 2-lamp ballasts in public are lighting fixtures.

c. LED Lamps:

1) LED lamp wattage shall provide adequate lighting to meet or exceed agency requirements for light spread and illumination.

2) All components shall be compatible with all other components within a system or equipment. LED fixtures shall have the capability of automated monitoring.

3) LED luminaires shall be Type SB3; Kim-AR3P70-80L4K for single luminaires or Type 2SB3; Kim-AR3P70-80L4K for dual luminaires, or Authority approval equal.

4) LED fixtures shall be Energy Star or Lighting Consortium rated and approved. LED fixtures could qualify for the Oncor Incentive Program funding.

11. Fixture body and housing: Shape size and material as shown.

12. Reflector: Shape, size, and material as shown. Aluminum or stainless steel polished to mirror finish unless otherwise shown. Minimum thickness 22-gauge unless otherwise shown.

13. Fixture wire: Per NEC, suitable for maximum temperature of fixture operating in 115 degrees F ambient.

14. Gasket:

a. Keyed gasket: One-piece extruded solid neoprene having Shore A durometer hardness of 30 plus or minus 5 when tested in accordance with ASTM D2240.

b. Self-retainig gasket:

1) One-piece, extruded EPDM molded gasket.

2) Resistant to aging, heat, ultra-violet light, water, oil, weathering, and setting as determined by ASTM D1056, NEMA 12.

3) Cemented to component with resilient neoprene sealing compound compatible with finish. Adhesive not applied to diffuser.

c. Silicone gasket equal to neoprene, at Contractor’s option.

d. Provide gaskets for fixtures located in tunnels having UL labeling for wet locations and able to withstand water hose spray cleaning with 100-psi water pressure.

15. Hardware:

a. Latches, catches, release mechanism, hinges, screws, bolts, studs, nuts, rivets, washers, and springs. Heavy-duty stainless steel or bronze, as shown.

b. Latches and catches: Captive type.

c. Operating hardware: Self-retaining type.

16. Construction:

a. Fixture body, reflectors, wiring channels, end caps, and castings formed to prevent buckling or distortion.

b. Minimum of 2 wire clips provided in wiring channel to support wiring.

c. Seams and joints continuously welded and ground smooth.

d. When aluminum is in contact with dissimilar metal, separate contact surfaces with gasket, non-absorptive tape, or coating to prevent corrosion.

17. Finish: Electrostatic powder coating: Prepare surfaces by sandblast cleaning complying with SSPC-SP 10 near white blast cleaning, applying coating promptly after cleaning. Ground material to be coated. Apply coating as electrostatically-charged dry powder using electrostatic spray gun to produce DFT of 6 mils within plus or minus 2 mils. Cure by heat treatment.

18. Mark each fixture and its components in accordance with applicable reference standard.

19. Fasteners: Size and type shown or as approved by Contracting Officer.

a. Provide Type 304 or 316 stainless-steel fasteners.
B. General Requirements for Mounting Poles:

1. Mounting poles: Steel, straight, round, and as shown. Complete assembly of anchor bolts, pole, arms, and luminaire designed to withstand wind pressure (P) developed by wind speed (V) of 80 MPH, in accordance with AASHTO LTS. Pole assembly to be designed in accordance with AASHTO requirements for permissible stresses, deflection, vibration, and fatigue. Ratio of deflection to pole height under action of applicable static loading not to exceed 1/60. Poles assembly is to be designed to support an additional 18-pound attachment at a height of 10 feet above grade. Maximum dimension of attachment 16.5 inches (L) by 15.6 inches (W) by 9.44 inches (H).

2. Grout: Section 03305, “Portland Cement Concrete”, non-shrink. Where recommended by manufacturer, prime surfaces to be grouted.

C. General Requirements for Control Devices: Contractor shall provide the following:

1. Lighting Contactors:
   a. UL 508, electrically held (unless noted otherwise), equipped with silver alloy contacts, designed to control incandescent, tungsten, halogen, fluorescent, high-intensity discharge lamp load.
   b. Number of poles: As shown.
   c. Continuous current rating: As shown.
   d. Line and load voltage: 480 or 208 volts 3-phase ac, or 277 or 120 volts single-phase ac, 60 Hertz as shown.
   e. Control coil rated 120 volts ac, 60 Hertz.
   f. Control:
      1) Heavy-duty 3-position, selector switch with positions labeled HAND/OFF/AUTO for lights controlled by photoelectric cell and/or time clock.
      2) ON-OFF switch for indoor lights.
   g. Enclosure: NEMA 1; fabricated from steel, cleaned, degreased, primed with zinc primer and finished with light gray enamel; minimum dry film thickness, 2 mils.

2. Photoelectric Control:
   a. UL 773, designed to respond to natural daylight with 15-second inherent delay to prevent functioning due to sudden bright light such as vehicle lights or lightning and to operate in ambient temperature from 0 degrees F to 125 degrees F.
   b. Adjust to turn lights ON within plus or minus 2 or 1 foot-candles, unless otherwise specified. ON to OFF ratio: 1 to 3.
   c. Rating: 1800 VA at 120 volts or 277 volts, 60 Hertz, as shown.
   d. Contacts: SPDT; one NC, one NO.
   e. Cells: Hermetically sealed.
   f. Enclosure: Weatherproof and tamperproof aluminum enclosure equipped with locking receptacles when mounted on fixture or designed for mounting on outlet box as shown and as necessary.

3. Limit Switches:
   a. NEMA ICS, industrial-control.
   b. Suitable for mounting in folding gate cabinet. Switch contacts closed when cabinet door is fully closed and latched. Switch contacts opened when respective cabinet door is not fully closed.
   c. Voltage rating: 120 volts ac.
   d. Current rating: 10 amperes continuous.
   f. Actuator: Lever-operated and adjustable, with spring return.
   g. Mounting: Plug-in type with receptacle tapped for conduit size as shown.
   h. Contacts: Single-pole double-throw; one NO, one NC; snap action.

4. Time Switch:
   a. Intermatic Series T170CR, specifically, Model No. T173CR.
b. 24 hour, 7 day dial time switch with skipper, UL-listed, heavy-duty type suitable for controlling type of lighting fixtures shown. Provide for continued operation (auto-carryover) during power failure if called for on drawings.

c. Type: As shown, with contacts capable of switching continuous load of 40 amperes per pole at 120 or 277 volts as required. Switch function to be double pole-single throw.

d. Providing up to 6 automatic ON/OFF operations each day.

e. Removable ON/OFF trippers designed for minimum ON period of 1 hour and minimum 2 hour period between one OFF operation and next ON operation.

f. Provision for manual ON and OFF operation of switch by hand without disturbing weekly preset schedule.

g. Provision for omitting operation of switch on selected days.

h. Provide only if called for on drawings or in other specifications: Spring-driven reserve power suitable for operation of switch for 16 hours minimum in the event of a power failure; upon restoration of power, switch transfers to synchronous motor drive, or similar carryover mechanism, and automatically resets.

i. Terminals designed to accommodate up to No. 8 AWG conductor cable.

j. Clock motor operation at 120 volts, 60 Hertz as shown and within temperature range of minus 40 degrees F to 130 degrees F.

k. Enclosure:

   1) NEMA 1, steel, surface-mounted, unless otherwise noted.

   2) Hinged flush front door with catches and spring loaded door pull.

   3) Finish: Metallic surfaces cleaned, degreased, primed and finished with 1 coat of enamel.

   5. Guards: Where called for on drawings provide metal guards (cast or fabricated of heavy wire) to protect fixtures from physical damage. Guard shall be supplied by the supplier of the fixture.

2.3 LIGHTING FIXTURES

A. Lighting fixture types shall be as scheduled in the drawings.

B. Platform Pole Base Cover: Kim

C. Lighting, PRA, round, 11-7/8 inch diameter, 2 piece cast aluminum full cover of 319 alloy, secured by tamperproof, stainless steel screws, custom cast to accommodate standard 5 inch outside diameter round, non-tapering steel pole or Authority approved equal.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install lighting fixtures of types indicated at locations as follows:

   1. Mount fixtures rigidly in place. Use expansion anchors and machine screws for concrete surfaces and toggle bolts for hollow concrete masonry surfaces. Use appropriate fasteners for attachment to other surfaces. Support lighting fixtures independent of suspended acoustical panel ceiling systems.

   2. Use stainless steel fasteners. Where a metal contacts concrete or a dissimilar metal, separate contact surfaces with gasket, non-absorptive tape, or bituminous coating to prevent corrosion.

   3. Mount fixtures plumb, level, and in straight lines. Install stems of suspended fixtures plumb. Group-mounted continuous rows of fluorescent fixtures to appear as one unit.

   4. Install 12-inch minimum length of liquid-tight flexible conduit for connection between fixture and outlet box unless otherwise shown. Use fixture wire from outlet box in branch circuit to lighting fixture and connect fixtures to branch circuit in accordance with Section 16120, "Wires and Cables".

   5. Install chase nipple where fluorescent fixtures are installed in continuous groups.

   6. Clean lamps, diffusers, globes, reflectors, and exposed-to-view surfaces of fixtures after aiming and adjusting has been approved.
B. Installation of Pole-Mounted Fixtures:

1. Form concrete base as shown, in accordance with Division 3, "CONCRETE". Use templates provided by the pole manufacturer for setting anchor bolts.

2. Install mounting pole of type shown. Use double nuts to erect poles plumb. Pack void between concrete base and pole base plate with non-shrink grout, as specified in Section 03305, "Portland Cement Concrete", and install as specified in Section 05130, "Structural Steel - Buildings".

3. Install conductors, leaving 3-foot minimum lengths of conductors for fixture connections; tape or otherwise secure in place pending final connection.

4. Install lighting fixtures in accordance with approved shop drawings.

5. Connect wiring using pressure connectors.

C. Install photoelectric controls and time switches as shown or in accordance with manufacturer's instructions.

D. Ground lighting fixtures, mounting poles, time switches, photoelectric controls, and lighting contactor enclosures in accordance with NEC and Section 16450, "Grounding and Bonding".

E. Touch up nicks and scratches incurred in shipping and installation. Damage to paint shall be neatly refinished after installation.

3.2 FIELD QUALITY CONTROL

A. Ensure that earth foundation for mounting poles is prepared and compacted in accordance with Section 02220, "Grading, Excavating, and Backfilling".

B. Testing:

1. Furnish necessary personnel and equipment and perform tests and adjustments in the presence of the Contracting Officer. Schedule adjustment of exterior installations to occur during hours of darkness.

2. Test lighting circuits for continuity and proper operation.

3. Test fixtures, mounting poles, and equipment enclosures for continuity of grounding system.

4. Aim and adjust fixtures to provide distribution pattern approximately as shown and as approved.

5. Test time switches, control devices, and contactors for connection in accordance with wiring diagram.

6. Check tightness of cable connections of time switches, lighting contactors, photoelectric controls, and limit switches.

7. Test operations of circuits, control devices, and contactors.

8. Test foot-candle levels with a precision light meter to assure that design requirements are met in all areas. Pole lights will be measured at 4 equidistant points of 90 degree intervals around the pole. Actual foot-candle levels shall meet or exceed those shown on the Designer’s photometric analysis.

3.3 INSPECTION

A. Materials furnished in this Contract shall be presented for inspection at the place of manufacture. Contractor shall provide the Contracting Officer all necessary facilities to examine the work during its progress as well as the finished product to verify that the materials comply with the Specifications.

3.4 PERFORMANCE REQUIREMENTS

A. Contractor shall be responsible for the compatibility of the lighting fixtures and mounting poles during installation with the plans and Specifications.

B. If LED fixtures are utilized, the project could be eligible for the ONCOR Incentive Program and funds.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 16001, “Electrical Systems - General”

END OF SECTION 16500
SECTION 16502
ANCHOR BOLTS AND FOUNDATIONS FOR LIGHTING POLES

PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies providing and installing the anchor bolt with washers and nuts for lighting mounting poles.

1.2 REFERENCE STANDARDS
A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM A153/A153M - Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware
   2. ASTM A563 - Standard Specification for Carbon and Alloy Steel Nuts
   3. ASTM F436 - Standard Specification for Hardened Steel Washers
   4. ASTM F1554 - Standard Specification for Anchor Bolts, Steel, 36, 55, and 105-ksi Yield Strength

1.3 SUBMITTALS
A. Copies of templates of anchor bolt patterns.
B. Samples: One set of anchor bolts with nuts and washers.

PART 2 - PRODUCTS

2.1 PRODUCTS AND MATERIALS
A. General Requirements for Mounting Poles: Anchor bolts: Bolts, nuts, and washers:
   1. Anchor Bolts: ASTM F1554, Grade 55, unless noted otherwise on drawings. ASTM A563, Grade A for nuts. ASTM F436, Type 1 for washers.
   2. Galvanized per ASTM A153/A153M
   3. Bolts hooked, unless otherwise shown or recommended by manufacturer of pole or structure being anchored.
   4. Two nuts and one washer for each anchor bolt for plumbing pole or leveling structure.
B. Template: In accordance with mounting pole manufacturer and the plan.

PART 3 - EXECUTION

3.1 INSTALLATION
A. Installation of Pole-Mounted Anchor Bolts and Foundation:
   1. Form concrete base as shown, in accordance with Division 3, "CONCRETE". Use templates provided by the pole manufacturer for setting anchor bolts.
   2. Install anchor bolt plumb and in accordance with the plans.
   3. Install conduit and grounding devices in accordance with Division 16, "ELECTRICAL" and the plans.

3.2 FIELD QUALITY CONTROL
A. Ensure that earth foundation for mounting poles is prepared and compacted in accordance with Section 02220, "Grading, Excavating, and Backfilling".
B. Ensure that concrete for mounting pole foundation is prepared and placed in accordance with Section 03300, "Cast-In-Place Concrete", Section 03200, "Concrete Reinforcing", and Section 03100, "Concrete Formwork".

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL
A. In accordance with Section 16001, "Electrical Systems - General"

END OF SECTION 16502
PART 1 - GENERAL

1.1 DESCRIPTION

A. Provide battery operated units consisting of batteries, battery charger, and switching mounted in a case and with lamps mounted in or on the case, and/or remote heads and concealed light units as shown on the drawings. Provide unit for operation on 277 volts and/or 120 volts supply and for supplying emergency light automatically and instantly upon failure or interruption of normal electric power.

B. Provide a battery powered alternating current 277/480 volts central emergency lighting power supply (CELPS) including battery, battery charger, inverter, and static bypass switch for both linear and non-linear lighting.

1.2 REFERENCED STANDARDS

A. National Fire Protection Association (NFPA):
   1. NFPA 70 - National Electrical Code (hereinafter referred to as NEC)
   3. NFPA 130 - Standard for Fixed Guideway Transit and Passenger Rail Systems

B. Underwriters Laboratories, Inc. (UL)
   1. UL 1778 - UL Standard for Safety Uninterruptible Power Systems
   2. UL 924 - UL Standard for Safety Emergency Lighting and Power Equipment
   3. UL 924A - UL Standard for Safety Emergency Lighting and Power Equipment (15-minute duration)

1.3 SUBMITTALS

A. Product Data and Shop Drawings:
   1. Include photometric curves of emergency lighting fixtures.
   2. Outline dimensions, mounting details, and installation instructions for each equipment furnished.
   3. Equipment arrangement drawings including battery rack.

B. Technical data:
   1. Storage Battery:
      a. Ampere-hour rating of battery at a 90 minute discharge rate.
      b. Maximum available short circuit current.
      c. Charge rate from fully discharged state to fully charged state within 24 hours.
   2. Inverter:
      a. Efficiency at rated load.
      b. kVA rating at 0.8 power factor and unity power factor.

C. Certification: Provide certificates which certify values for the following:
   1. Design tests.
   2. Output voltage and frequency of AC emergency power system are within specified limits.
   3. Output voltage of inverter has sine wave with maximum of 10 percent total harmonic distortion under load condition.
   4. The operational performance of the automatic transfer switch.
   5. Each emergency lighting unit is in compliance with applicable codes, regulations, and standards for the location at which it is to be used.

D. Operational and Maintenance Manuals, and Training: In accordance with Section 16001, "Electrical Systems - General".

E. Field Testing:
   1. Supervisory Control And Data Acquisition (SCADA): Refer to Section 16030, "Testing of Electrical Systems".
   2. Submit a detailed plan of the proposed methods and scheduling of the required field testing at least 30 calendar days before initiating the tests.
   3. Submit certified test reports.
1.4 QUALITY ASSURANCE

A. UL-labeled or listed each emergency lighting unit.

B. Comply with applicable AISI, ANSI and NEMA standards.

C. Experience:
   1. Manufacturer: Select a firm regularly engaged in the manufacture of the products described herein.
   2. Furnish products in this section which essentially duplicate products by the same manufacturer, that have been in satisfactory use for a period of 5 years prior to the Bid Opening of this Project.

D. Factory Testing: Prior to shipment, manufacturer shall fully and completely test system to assure compliance with specifications. These tests shall include operational discharge and recharge tests on internal battery to guarantee rated performance.

PART 2 - PRODUCTS

2.1 TYPES OF LIGHTING

A. Emergency Lighting Units: TYPE I
   1. Provide 12 volts sealed maintenance free lead-calcium type battery.
   2. Provide each battery encased and permanently sealed in a heat and impact resistant case to operate unattended without requiring water for a period of not less than 5 years.
   3. Furnish the battery charger consisting of a 2-rate and constant voltage type, completely solid state with no moving parts.
   4. Operation of battery charger is as follows:
      a. Charger shall operate on input voltage of 120 or 277 volts, as stated on drawings.
      b. Apply the supply voltage through the internal circuitry until such time as the charging current drops to a predetermined value, at which time the charger will switch “off” and a bleeder load be placed upon the battery.
      c. As the battery voltage falls, the battery charger automatically switches ON at a predetermined voltage which is set lower than the float voltage specified by the manufacturer.
   5. The battery charger automatically and continually samples the battery throughout its life. This sampling rate will vary with type of battery, being as often as once every 15 seconds to once every half-hour.
   6. During charging, the indicator light will be on until such time as the battery charger switches from high to OFF.
   7. Upon switching to OFF, the indicator light will extinguish and then gradually increase in intensity until the battery charger is switched to the high rate for the next sample.
   8. While the unit is charging the indicator light will burn steadily.
   9. During the final phases of charging, the light will blink at a comparatively high rate several times per minute. As the charge is completed, the blinking rate will slow down as well as the length of time the battery charger is ON at each sample. This indicating lamp will indicate by burning brightly should the battery charger open up for any reason.
   10. Provide units capable of operating in emergency mode for a minimum of 1.5 hours at not less than 87.5 percent of normal battery voltage.
   11. Provide completely solid-state switching, which energizes the sealed beam lamps, when an interruption of the 120 volts or 277 volts power occurs or a power failure occurs.
   12. Provide lamps of 12 volts, with wattage, diameter, and beam spread as described on drawings. Provide that lampheads, mounted on case, or remote heads, are adjustable both vertically and horizontally.

B. Self-Contained Emergency Lighting Units: TYPE II
   1. Completely self-contained, fully automatic, fluorescent, halogen, quartz, or incandescent lamps, suitable for recess, semi-recess, or surface mounting.
   2. Designed to provide automatic emergency lighting for a minimum of 90 minutes upon failure of normal power.

   d. The supply voltage will then be applied to the battery and the current drawn from the charger by the battery measured.

   e. If this current exceeds a predetermined value, the charger will lock on at the higher rate until the current drops to the specified flow at which time the charger will automatically switch OFF.
3. Units that will operate at 120 volts or 277 volts.

4. Unit equipped with automatic solid-state charger and sealed lead-calcium, maintenance free, 12-volt battery.

2.2 CENTRAL EMERGENCY LIGHTING POWER SUPPLY (CELPS)

A. Provide a solid-state standby power supply for emergency operation of fluorescent, high intensity discharge (HID), halogen lighting at 277 volts, 60 Hertz. Distribution of standby power to lighting to be 277/480 volts, 3-phase, 4-wire. Unit kVA rating as shown.

B. The CELPS lighting power supply shall provide uninterruptible power during modes of operation. There shall be no interruption of power to the critical load when the CELPS transfers to and from battery operation. The unit cabinet shall be forced air cooled by internally mounted fans.

C. The CELPS unit shall meet the following:

1. Input voltage range: Plus 15 percent to minus 20 percent of nominal input voltage.
2. Input Frequency: 60 Hertz plus 5 percent
3. Input current: Sinusoidal, 95 percent power factor under line/load conditions
4. Output voltage regulation: Plus 3 percent No Load to Full Load, High Line to Low Line
5. Output frequency: 60 Hertz plus 0.5 Hertz when on inverter
6. Output waveform: Sine wave
7. Output harmonic distortion: Less than 5 percent single harmonic
8. Output crest factor: 2 to 1
9. Output overload: 125 percent of rated for 10 minutes; 150 percent per 10 seconds
10. Output protection: Fault current limited
11. Modes of Operation:
   a. NORMAL: During normal operation, utility (or generator) power is converted to DC, drawing sinusoidal input AC current at unity power factor under load conditions. This converter supplies DC power to the inverter and battery charger sections. The inverter supplies the load through the static bypass switch (SBS) without using the energy stored in the battery section.
   b. EMERGENCY: Upon loss of input power or when power exceeds the specified input limits, the control logic shall allow the inverter to draw energy from the batteries without interruption to the load and disconnect the input line. The transfer to the batteries shall be uninterrupted “no break” power transfer. The inverter shall supply power from the batteries, through the static bypass switch to the critical load. The output shall be sinusoidal and without specified limits. If power is not restored before the batteries have been exhausted, the CELPS shall completely shutdown protecting the batteries from possible damage.
   c. FAILURE: In the event of a CELPS component failure in either the rectifier converter or the inverter, the unit’s static bypass switch will transfer the load, without interruption to the utility power and will alarm providing visual and closed contacts for remote annunciation. Upon loss of utility AC power, a summary alarm for the CELPS shall report to the Train Control Center (TCC) through a set of dry contacts connected to the terminal blocks of the demarcation panel.
   d. RECHARGE: Upon restoration of input utility power and before the batteries are completely exhausted, the CELPS shall automatically return to normal operation. This transfer to normal operation shall be uninterrupted. The battery charger shall automatically recharge the batteries to full capacity while the CELPS is maintaining the full critical load.

D. Where 3-phase distribution is indicated, provide single 3-phase supply with a 3-phase static switch and a control to keep the 3-phase outputs synchronized and approximately 120 degrees apart, so they can share 1 neutral conductor without overloading.

E. The complete CELPS system includes batteries, battery charger, inverter, and controls necessary or indicated.

1. Battery:
   a. Provide sealed lead acid or lead-calcium, maintenance-free batteries with absorbed electrolyte, requiring no special attention for shipping or storage, in high-impact plastic cases.
b. The batteries shall have an expected life of 10 years. The batteries shall be fully wired and contained within either the CELPS cabinet or a separate battery cabinet. Battery run time (based on 120 percent full load) shall be no less than the specified time of 90 minutes, or 15 minutes where an emergency standby generator provides 90-minute requirement. The battery float voltage shall be 2.25 volts per cell unless specified otherwise. Battery shall be protected with fuses, DC disconnect or circuit breaker. Optional extended battery run times shall be available from the manufacturer.

2. Battery Charger: Provide a battery charger of solid state construction with ferroresonant transformer and full wave bridge rectifier, with 3 rates of charge: "fast charge" to replenish the battery after use, "equalizing charge" to complete the charge evenly in cells, and "trickle charge" for continuous maintenance of charge. Furnish solid state timer to provide an equalizing charge at intervals of approximately 90 days. Input to charger shall be 277/480 volts, 60 Hertz. Charger shall recharge batteries in 10 times discharge time maximum.

3. Inverter:
   a. Provide a solid-state inverter which provides 277/480 volts, 3-phase, 4 wire power, at 60 Hertz, having tolerances of 5 percent for voltage and 3 percent for frequency. Output: sinusoidal with maximum of 10 percent total harmonic distortion, suitable for a lighting load of fluorescent, HID and halogen lamps. Automatic controls and protection include: low battery voltage disconnect, short circuit protection, brownout protection, current limiting, and overload protection of 130 percent.
   b. Inverter shall convert power supplied, from the utility or generator, when within specified limits or from the batteries, when within the battery manufacturer's specified limits, to alternating current (AC) power. It shall be a pulse width modulated (PWM) type design without the need of a transformer. The unit shall have a single power PCB for maximum reliability.

4. Provide static transfer switch to accomplish the load transfer operation described above.

5. The unit shall contain a static bypass switch (SBS) as a standard feature. The normal operating mode of the SBS is to connect the inverter to the critical load with the utility in a standby mode; in case of any converter/rectifier or inverter failure, the SBS will transfer to the utility without interruption to the critical load. The use of a transformer, to convert the utility, is permitted when the input utility voltage does not match the CELPS output voltage requirements.

6. Provide enclosures for the entire system to meet NEMA 1 requirements. Enclosures: free-standing or wall-mounted having maximum dimensions of 42 inches wide, 80 inches high, and 24 inches deep with hinged doors on front of cabinets. Provide nameplates in accordance with Reference Standard, Section 16040, “Identification of Electrical Equipment”.

7. CELPS:
   a. The CELPS shall be hardwired input and output. Optional output distribution circuit breaker panels shall be available from the manufacturer when required.
   b. The CELPS system status panel shall have a 160-character liquid crystal display (LCD). The LCD display shall indicate CELPS operating information such as input voltage, input current, output voltage, output KW, etc. The monitoring system shall include the following:
      1) Menu driven display with text format
      2) Real time clock (time and date)
      3) Alarm history with time and date stamp
      4) Battery back-up memory
   c. The following metering parameters shall be displayed:
      1) Input AC voltage line-to-line and line-to neutral for each phase
      2) Input AC current for each phase
      3) Input frequency
      4) Battery voltage
5) Battery charge/discharge current
6) Output AC voltage line-to-line and line-to-neutral for each phase
7) Output AC current for each phase
8) Output frequency
9) Percent of rated load being supplied by the CELPS
10) Battery time left during battery operations
d. The following alarm messages shall be available:
   1) Input power out of tolerance
   2) Input phase rotation incorrect
   3) Incorrect input frequency
   4) Charger in reduced current mode
   5) Battery charger problem
   6) Battery failed test
   7) Low battery warning
   8) Low battery shutdown
   9) DC bus overvoltage
   10) Bypass frequency out of range
   11) Load transferred to bypass
   12) Excessive retransfers attempted
   13) Static switch failure
   14) UPS output not synchronized to input power
   15) Input power single phased
   16) Input voltage single phased
   17) Input voltage sensor failed
   18) Inverter leg overloaded
   19) Output under voltage
   20) Output overvoltage
   21) Output overcurrent
   22) System output overloaded
   23) Load transferred to bypass due to overload
   24) Overload shutdown
   25) Control error
   26) Critical power supply failure
   27) Load transferred due to internal protection
   28) Fan failure
   29) Over temperature shutdown pending
   30) Over temperature shutdown

e. The following status messages shall be displayed:
   1) Normal operation
   2) Load on maintenance bypass
   3) Load on UPS
   4) Load on static bypass
   5) System shutdown
   6) UPS on battery
   7) Normal input power present
   8) CELPS on battery operation
   9) Low battery condition
   10) CELPS in bypass mode

f. Three communications ports shall be available. One port shall be provided for dry contact closures for the following parameters:

   1) Normal input power present
   2) CELPS on battery operation
   3) Low battery condition
   4) CELPS in bypass mode

    g. The second and third ports shall be based upon RS-232 and RS-485 protocol. Operating parameters, including input and output data and unit status, shall be available for remote monitoring via the RS-232 and S-485 ports.

    h. SCADA Alarm Contacts: Provide 1 set of fail-safe, closed loop logic,
Form C normally open and normally closed dry contacts in the CELPS. The normally open contact to be connected to the Station Demarcation Terminal Cabinet for the following alarm functions:

1) CELPS system failure alarm.

**PART 3 - EXECUTION**

**3.1 INSTALLATION OF EMERGENCY LIGHTING UNITS**

A. Install emergency lighting units of types shown at locations shown as follows:

1. Mount units rigidly in place. Use expansion anchors and machine screws for concrete surfaces and toggle bolts for hollow concrete masonry surfaces. Use appropriate fasteners for attachment to other surfaces. Support units independent of suspended acoustical panel ceiling systems.

2. Where aluminum contacts concrete or dissimilar metal, separate contact surfaces with gasket, nonabsorbptive tape or coal tar epoxy coating to prevent corrosion. Use only stainless steel fasteners.

3. Install wiring in accordance with NEC and Section 16120, "Wires and Cables".

4. Clean lamps, heads, reflectors, and exposed-to-view surfaces of units after aiming and adjusting has been approved.

**3.2 INSTALLATION OF AC POWER SUPPLY**

A. Install and secure equipment in cabinets.

B. Connect components and make connections to other equipment as indicated.

C. Provide for a factory service representative to inspect and test the complete system, including field tests described below.

**3.3 TESTING**

A. Refer to Section 16030, "Testing of Electrical Systems" for testing requirements.

**PART 4 - MEASUREMENT AND PAYMENT**

**4.1 GENERAL**

A. In accordance with Section 16001, "Electrical Systems - General"

END OF SECTION 16605
SECTION 16620
STANDBY POWER SYSTEMS

PART 1 - GENERAL

1.1 DESCRIPTION

A. This section describes the basic minimum technical requirements for furnishing and installing of natural gas engine generator set and associated auxiliary equipment providing standby power to the essential loads.

B. The work includes complete fabrication, inspection, testing, and delivery of electrical and mechanical equipment and systems, structures, materials, and appurtenances covered by the specification. Provide on-site installation, testing, and start-up.

C. Work includes, but not limited to:

1. Natural gas engine generator set rated 277/480 volts, 3-phase, 4-wire, 0.8 power factor, 60 Hertz, (capacity as stated on drawings), completely assembled and wired with:
   a. Natural gas engine generator, exciter-voltage regulator, automatic starting equipment, intake air filters, lube oil coolers, water pumps, exhaust muffler(s) and related instruments and accessories necessary for operation.
   b. An engine-generator control panel for instruments and accessories.
   c. Integral skid support.
   d. Neutral grounding connection for generator.

2. An automatic load transfer switch installed and wired in the 480 volts motor control center to provide automatic starting and stopping of the engine and switching the load.

3. Main circuit breaker at generator capable of carrying the full load of the unit plus 25 percent safety margin.

4. A complete set of special tools or equipment for installation and maintenance of the equipment. This includes equipment not readily available in stores.

5. Battery and battery charger complete with rack.

6. Electrical and mechanical connections external to the natural gas engine generator set, control panel and motor control center.

7. Install the generator outdoors and the automatic transfer switching equipment indoors. Location elevation is approximately 500 feet above sea level, outside air temperatures range 0 deg. F to 115 deg. F.

1.2 REFERENCE STANDARDS

A. Institute of Electrical & Electronics Engineers (IEEE):
   1. IEEE 112 - Standard Test Procedure for Polyphase Induction Motors and Generators

B. Military Standards (MIL):
   1. MIL-STD-705C - Generator Sets, Engine Driven Methods of Tests and Instructions

C. National Electrical Manufacturers Association (NEMA):
   1. NEMA MG1 - Motors and Generators

D. National Fire Protection Association (NFPA):
   1. NFPA 70 - National Electrical Code (NEC)
   2. NFPA 110 - Standard for Emergency and Standby Power Systems

E. Underwriters Laboratories, Inc. (UL):
   1. UL 1008 - UL Standard for Safety Transfer Switch Equipment

1.3 SUBMITTALS

A. Product Data and Shop Drawings:
   1. Final layout drawings with dimensions.
   2. Control, wiring, and connection drawings.

B. Manufacturer's Data: At least two weeks before start of any shop coating work, submit to the Contracting Officer for approval three each of the following:
   1. Complete Data Sheets with surface preparation and the coating materials to be used, identified by the manufacturer, brand name, and product number.
C. **Test Reports:** Submit 6 copies of each test report, signed by a responsible representative of the Contractor to the Contracting Officer as a proof of compliance with the inspection and test requirements of this Specification.

D. **Certified Performance Certificates:** Provide the Contracting Officer with 6 copies of certificates which certify values for the following:

1. Design tests.
2. Stability, full power, voltage, and frequency regulation of the standby system.
4. The operational performance of the automatic transfer switch.

E. **On-Site Test Procedures:** Prepare and submit on-site test procedures as per requirements of Paragraph 1.2 in this section for service and approval.

F. **Operation and Maintenance Manuals, and Training:** In accordance with Section 16001, "Electrical Systems - General".

G. **SCADA Alarm System Testing:** Refer to Section 16030, "Testing of Electrical Systems".

**1.4 QUALITY ASSURANCE**

A. **Experience:**

1. Manufacturer: Select a firm regularly engaged in the manufacture of standby power systems of the type specified in this section.
2. Incorporate equipment into the system which duplicates equipment that has been in satisfactory use for a period of five years prior to Bid Opening of this Project.

B. **Source Quality Control:**

1. Factory tests:
   a. Inspect the engine generator set, automatic transfer switch, and their auxiliaries for the requirements of this specification particularly in regard to workmanship, materials, dimensions, finish and markings, and to assess its conformance with other requirements stated or reasonably implied and not covered by specific tests.

b. Carry out production and conformance tests in accordance with the relevant standards and, in addition, perform the following tests:

   1) Continuity test.
   2) Operation and mechanical adjustment tests.
   3) Maximum motor starting capacity (maximum kVA) and maximum power level (maximum kW).
   4) High potential test on field and armature.
   5) Torsiograph analysis per MIL-STD-705C, Method 504.2.
   6) Fuel consumption (no load, 1/2, 3/4 and full load).
   7) Engine: Generator cooling air flow.
   8) Transient and voltage dip response and steady state governing.
   9) Single step load pickup per NFPA 110, Paragraph 5-13.2.6.
   11) 3-phase short circuit test for mechanical and electrical strength.
   12) Compliance with Underwriter’s Laboratory Standard for Safety, Automatic Transfer Switches, UL 1008.
   13) Vibration tests:
       a) Engine alone.
       b) Engine and generator coupled for various loading.
   14) Temperature rise per NEMA MG1 definition.
   15) Insulation resistance.
16) Carry out a full load test on the set for a period of 4 hours and followed immediately by 2 hours at 10 percent overload.

17) Overspeed trip.

C. At the conclusion of test procedures, inspect the equipment for wear, cracks, distortion, or deficiency prior to shipment.

PART 2 - PRODUCTS

2.1 STANDBY POWER SYSTEM

A. Provide a standby power system meeting requirements of NFPA 110 including design, fabrication, specifications, prototype tests, one-step full-load pickup, and installation acceptance and the following:

B. Suitable for outdoor installation and having the capacity to operate the generator and accessories at full load on a standby basis.

C. Free from harmful torsional vibrations within the normal operating speed range in accordance with Manufacturer's Standard design.

D. Capable of operating at 110 percent load for two hours of any 24 consecutive hour period with outside air temperature range as specified in Paragraph 1.1 of this section.

E. Provide ample insulation and mufflers to minimize noise.

F. Provide means to allow mechanics access to the engine for major overhauls.

2.2 NATURAL GAS ENGINE

A. 4 or 2 cycle, water cooled as required, of the manufacturer's standard design with proven service reliability, for natural gas.

B. Direct coupled to the generator and the complete set mounted on a steel skid type base frame with suitable anti-vibration mountings and anchor bolts.

C. The brake horsepower rating of each engine: Not less than that required to produce continuous rated generator output at 1800 RPM and under specified service conditions.

D. Equip the engine with a high performance electronic governor to maintain frequency within limits, as specified below, by controlling engine and generator speed.

1. Stability: Plus or minus 0.5 percent maximum variation at any constant load from no load to full load.

2. Regulation: Four percent maximum frequency deviation between no load steady-state and full load steady-state, unless otherwise specified.

E. Engine accessories include, but not limited to the following:

1. Necessary speed, pressure, and temperature sensors and devices for indicating alarm and safety trip functions.

2. Flexible hose connections necessary to isolate the engine from piping and equipment not mounted on the engine.

3. Thermostatically controlled heaters to lube oil and jacket water at warm start temperature if required.

4. Local indicating devices including:
   a. Fuel pressure gauge.
   b. Lube oil pressure gauge.
   c. Jacket water temperature indicator.
   d. Engine tachometer.
   e. Engine hour-meter.

5. Local engine alarms (only) including low lube oil level.

7. Exhaust silencer and duct.

8. Air inlet cleaner (dry type) and air manifold.

10. Lifting eyes for handling of engine.

F. Engine cooling water system includes as a minimum the following:

1. An engine-mounted radiator with blower type fan with guards.

2. Jacket water pump, engine driven.
3. An engine-mounted, thermostatically controlled electric immersion heater. Heater: Single phase, 60 Hertz at 120 volts.

G. Engine Lubricating System:
1. Complete lubrication system which supplies oil to the driven equipment and auxiliaries.
2. Provide full details of the lube oil system.
3. Furnish the specifications of the lubrication oil to be used and the maintenance procedure compatible with the lubrication oil used and schedule of oil changes required.

H. Engine Fuel System: Furnish with the engine a complete fuel line system including but not limited to the following:
1. Fuel lines, as specified in Section 15060, “Piping and Accessories”.
2. Necessary controls.
