I. Exhaust System: Engine exhaust pipe shall be schedule 40 black steel, welded from each engine exhaust manifold and extended to a suitable weatherproof terminal located as shown.

2.3 ENGINE STARTING SYSTEM

A. Equip engine with an electric starting system of sufficient capacity to crank the engine at a speed which will allow for full start of the engine. Arrange the starting pinion to disengage automatically when the engine starts.

B. A 24 volts battery of the lead-calcium, maintenance free type for the starting with a current output not less than 150 percent of the engine cranking requirements based on a minimum of 6 cranking cycles, each of 10 seconds duration.

C. Mount battery in an acid resistant battery rack.

2.4 GENERATOR

A. Synchronous-salient pole type designed and constructed in accordance with NEMA Standard MG.1.

B. Design the generator and excitation system to provide for operation at the overload capability of the engine, at rated power factor, frequency and voltage, with a temperature rise not exceeding 195 deg. F at 105 deg. F ambient for NEMA Class F insulation.

C. Solidly ground the star point of the generator windings.

D. Securely brace and protect generator power leads from mechanical damage where they pass through the stator frame. Provide means to prevent hot air from the generator entering the terminal box. Provide protective non-magnetic bushings where the generator leads pass through sheet metal plates.

E. The exciter-voltage regulator system: Solid state, brushless complete with components necessary to provide remote and manual voltage control, automatic voltage regulation, parallel compensation, exciter shutdown, automatic field flashing, and positive surge protection for any solid state components utilized in the system.

F. Provide a terminal box of sufficient size and space for AC Power leads (line & neutral). Provide terminal boxes with appropriate terminal blocks for disconnection and testing of electrical connections.

G. Provide 120 volts, 60 Hertz, single-phase heaters of a capacity to prevent condensation when the generator is not operating. Provide means to energize the heaters when the generator is not running. Automatically de-energize the circuit when the generator is running.

H. Provide surge capacitors and arrangement so their terminals are located between feeder cable terminations and phase windings.

2.5 BATTERY CHARGER

A. Provide a battery charger to operate from 120 volts, 60 Hertz, supply to automatically recharge the battery and be of the current-limiting constant-voltage type. The solid-state charger consists of a voltmeter, ammeter, and an alarm light which floats at a voltage per cell and equalizes at a voltage per cell as recommended by the battery manufacturer. It includes overload protection, AC failure alarm feature with a set of alarm contacts for remote indication, silicon diode full wave rectifiers, voltage surge suppressors, DC ammeter, and fused AC input. Voltage regulation conforms to battery manufacturer’s recommendations.

B. Provide ampere output with automatic cut-out during engine starting.

C. The charger contains the capabilities to maintain and charge the battery in full compliance with the battery manufacturer’s recommendations and warranty restrictions.
2.6 INSTRUMENT AND CONTROL PANEL

A. Furnish engine-generator control panel, lighted, and mounted with vibration isolators.

B. The control panel includes the following items, mounted and wired, in addition to those normally supplied.

1. A complete start-stop control which starts the engine on closing contact, and stops the engine on opening contact.

2. A manual selector switch providing 3 control positions, RUN-STOP-REMOTE. The RUN position permits the engine to be started locally at the set and run unloaded; the STOP position prevents local starting or automatic starting of the engine; the REMOTE position readies the system for automatic start or stop on demand of the automatic transfer switch or on programmed exerciser. Provide for remote indication and control.

3. An adjustable solid state temperature compensated cranking control circuit that provides a minimum of 10 seconds cranking period followed by a minimum of 7 seconds rest time. A sensing device automatically disconnects the starting circuit when the engine has started. If the engine has not started in approximately 60 seconds or 3 cranking tries, lockout the engine starting control, and indicate with the overcranking signal. No further starting attempts take place until the overcranking device has been manually reset.

4. The engine shuts down and gives visual remote indication with alarm lights for the following faults:
   a. Low lube oil pressure.
   b. High engine temperature.
   c. Overspeed.
   d. Engine overcrank.
   e. Generator faults.

5. Provide visual and audible alarms for the following battery and charger faults:
   a. Loss of 120 volts, 60 Hertz supply.
   b. Low DC volts.

6. Provide control and indication systems on separate circuits and fuse each circuit.

7. Engine lock-out relay and alarm relays and circuits.

8. Control for heaters in the generator.

10. Lube oil temperature gauge.

11. Ammeter with ammeter switch.

12. Voltmeter with voltmeter switch.

13. Tachometer.

14. Voltage level adjustment.

15. Panel illumination lights and switch.

C. SCADA Alarm Contacts: Provide one set of fail-safe, closed loop logic, Form C normally open and normally closed dry contacts in the generator control panel. The normally open contact to be connected to the Station Demarcation Terminal Cabinet for the following alarm functions:

1. Generator failure for any of the alarm conditions.

2.7 BRUSHLESS EXCITER - STATIC VOLTAGE REGULATOR

A. Furnish with a fast response static voltage regulator combination mounted on the generator.

B. Automatic voltage regulator shall be within plus or minus 1 percent for a load variation from no load to full load, power factor variation from 0.8 lagging to unity and generator field heating from ambient to rated operating temperature rise.

C. Manual operation to be independent of the automatic voltage regulator control circuitry.

D. The output voltage level: Adjustable within plus or minus 5 percent of the rated voltage.

E. The solid-state regulator module: Shock-mounted and epoxy encapsulated for protection against vibration.

F. Provide ventilation and cooling to maintain proper operating temperature inside the equipment.

G. A series boost to sustain generator excitation during any combination of fault conditions and sustaining a minimum of 300 percent rated current for a minimum period of 15 seconds.
H. Ensure the silicon rectifiers are not subjected to peak inverse voltages in excess of 80 percent of their rating under any operating conditions. Provide surge protection as required.

2.8 MAIN CIRCUIT BREAKER
A. Provide main circuit breaker enclosed in a NEMA 1A enclosure mounted on the skid close to generator. Equip circuit breaker with thermal and magnetic trip elements and, if required, with current limiters. Rate circuit breaker for carrying the full load of the unit plus minimum 25 percent safety margin.

2.9 SKID SUPPORT
A. Support the engine and generator, and control panel on a heavy duty rigid skid.
B. Provide a heavy duty skid of rigid fabricated steel construction for engine operation and to withstand twisting. Provide means for lifting and hauling at each end of the skid. Provide vibration isolators between the engine-generator set and skid.

2.10 GROUNDING
A. Electrically ground engine, generator, control panel, and other metallic components mounted on the structural base to the skid.
B. Provide the structural base skid with two copper compression type grounding lugs (for up to #4/0 AWG copper bare cable) located at diagonally opposite corners for connection to the grounding system.

2.11 AUTOMATIC TRANSFER SWITCH
A. Capacity:
1. Supply an automatic transfer switch with a continuous electrical rating of sufficient amperage capacity to meet the requirements of both the maximum standby power system output and normal power service, 480 volts AC, and compatible with the standby power system. Furnish the complete automatic transfer switch from the manufacturer of the standby system to insure system compatibility between the generator and the automatic transfer switch.
2. The automatic transfer switch rating shall be not less than the value shown on the drawings.

B. Operation:
1. Supply the automatic transfer switch with precision calibrated voltage sensors to monitor the normal power source and signal the standby power system on a partial loss of power on any phase where feedback voltages exist. The voltage sensors:
   - Adjustable to signal startup when line voltage drops 5 percent to 20 percent below pickup voltage setting and to signal shutdown when line voltage returns to 75 percent to 100 percent of normal voltage and factory adjusted to start at 70 percent of normal voltage and shutdown at 100 percent.
2. A time delay relay, adjustable from 0.5 to 10 seconds, to avoid nuisance start-ups on momentary voltage dips or power outages. Factory set at 5 seconds.
3. When the standby system has reached a proper related voltage and frequency, provide a transfer time delay, adjustable from 0.5 to 10 seconds, to allow the standby system to stabilize. Factory set at 2 seconds.
4. The automatic transfer switch voltage sensors sense the return of normal power and a time delay, adjustable 0 to 15 minutes to delay the retransfer of the load to normal to avoid short term normal power restoration. Factory set at 10 minutes.
5. After the load has been retransferred to normal source, a time delay, adjustable 0.5 to five minutes, permits the standby system to run unloaded to cool down before shutdown. Transfer is to be automatic, either in actual power interruption or automatic exercise. Factory adjustment set at 5 minutes.
6. Provide the operation current for transfer and retransfer from the source to which the load is to be transferred. Ensure that an automatic bypass retransfers the load from the standby system to the normal source if the standby system output interrupts after the normal source voltage has been restored.
7. Provide a test switch to simulate an interruption of power from the normal source.
8. Furnish an automatic exerciser to operate the system at pre-selected intervals for pre-selected time periods: intervals to include once per week, and operating time to be 15 minutes or any multiple of 15 minutes.
selector switch permits selection of "without load" or "with load" operation. "Without load" the electric set runs unloaded and "with load" the automatic transfer switch transfers the load to the standby system after proper time delays, the same as it would for an actual source interruption.

9. Provide a device to electrically disconnect the control section from the transfer switch for maintenance service during normal operation.

10. Provide the automatic transfer switch with a means of safe manual operation.

11. SCADA Alarm Contacts: Provide one set of fail-safe, closed loop logic, Form C normally open and normally closed dry contacts in the automatic transfer switch. The normally open contact to be connected to the Station Demarcation Terminal Cabinet for the following alarm functions:
   a. Loss of normal AC utility power.

C. Rating and Performance:

1. Rate the automatic transfer switch for continuous full load duty, for all classes of load, both inductive and non-inductive, at 480 volts, enclosed in a non-ventilated NEMA 1 enclosure. Design, build, and test to close on an inrush current up to and including 20 times the continuous rating of the switch without welding or excessive wear of the switch contacts. The automatic transfer switch: capable of enduring 6000 cycles of operation, at rated current, at a rate of 6 cycles per minute, without failure. A cycle shall consist of 1 complete opening and closing of both sets of main contacts on an inrush current of 10 times the continuous rating of the switch.

2. Construct the automatic transfer switch to withstand the effects of a fault current available at 480 volts and a testing rating of withstanding a short circuit current for a minimum of 6 cycles (0.1 second) without main contact damage, from a test circuit having an open circuit voltage at 600 volts RMS, 60 Hertz with a power factor per the connected load and in conformance of UL 1008, "Standard for Safety Automatic Transfer Switches".

2.12 CONTROL AND PROTECTION

A. Furnish control and protective equipment as required for the complete operable system.

B. Produce a suitable control scheme to integrate with the 480 volts, 3-phase, 4-wire motor control center.

2.13 NAMEPLATES

A. Furnish nameplates for each instrument and device. Identify devices such as relays, fuses, and terminal blocks.

B. Provide a nameplate for each piece of equipment with appropriate data such as equipment number, rating, serial number, and manufacturer. Fix nameplates in a conspicuous position.

C. Provide nameplates in accordance with Reference Standard, Section 16040, “Identification of Electrical Equipment”.

2.14 PAINTING

A. Thoroughly clean and degrease before priming metal surfaces. Cover prime coat with 2 air-dried coats of finish paint to provide an average dry thickness of 4 mils.
B. Apply the surface finish free of runs, drops, ridges, waves, and laps, and paint in such a manner as to provide an even film covering corners and crevices. Provide exterior finish of manufacturer's standard color and white interior finish coating thickness of minimum 2 mils.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Secure the engine generator set to the concrete pad with anchors. Install and wire the automatic transfer switch completely in the 480 volts motor control center or as indicated on drawings. Hand clean exterior surfaces and apply touch up paint as required after electrical and mechanical connections are made.

3.2 ON-SITE TESTS

A. Refer to Section 16030, “Testing of Electrical Systems” for testing requirements.

3.3 COMMISSIONING

A. After installation, perform acceptance load-test on the Engine Generator set with maximum essential load connected for a minimum period of 2 hours in the presence of the Contracting Officer.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 16001, “Electrical Systems - General”

END OF SECTION 16620
SECTION 16670
LIGHTNING PROTECTION

PART 1 - GENERAL

1.1 DESCRIPTION
   A. This section specifies furnishing and installing lightning protection systems and supporting devices, as shown.

1.2 REFERENCE STANDARDS
   A. Lightning Protection Institute (LPI):
      1. LPI 175 - Lightning Protection Institute Standard of Practice
   B. National Fire Protection Association (NFPA):
      1. NFPA 70 - National Electrical Code (NEC)
      2. NFPA 780 - Standard for the Installation of Lightning Protection Systems
   C. Underwriters Laboratories, Inc. (UL):
      1. UL 96 - UL Standard for Safety Lightning Protection Components
      2. UL 96A - UL Standard for Safety Installation Requirements for Lightning Protection Systems

1.3 SYSTEM DESCRIPTION
   A. Design, furnish, install, and test work associated with providing a lightning protection system. Use the lightning protection system described herein and shown on the Contract Drawings as a guide. Modify the system specified as required to obtain the Master Label.

1.4 SUBMITTALS
   A. Shop Drawings: Show locations of air terminals, conductors, ground rods, and systems connections. Show devices with dimensions on shop drawings.
   B. Product Data: Include manufacturer's literature.
   C. Provide certification that the system and system components are UL listed.
   D. Operation and Maintenance Manuals, and Training: In accordance with Section 16001, "Electrical Systems - General".

1.5 QUALITY ASSURANCE
   A. Experience:
      1. Manufacturer: Select a firm regularly engaged in the manufacture of lightning protection systems of the type specified herein and listed by Underwriters Laboratories.
      2. Installer: Have the work performed by an installer certified by the Lightning Protection Institute as a Master Installer.

1.6 JOB CONDITIONS
   A. When required to install items supplied by others:
      1. Complete field assembly and internal connections.
      2. Provide all supporting members, fastenings and fittings, to adapt the system to the architectural and structural conditions.
      3. Mount in place and make connections required to the building systems.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS FOR LIGHTNING PROTECTION MATERIALS
   A. Comply in weight, size, and composition with the applicable requirements of the UL96, UL 96A, NFPA 780, NFPA 70, and LPI 175, relating to the type of building on which the lightning protection system is installed. Provide air terminals, cables, ground rods, and connectors used in the lightning system with an Underwriters' Laboratories, Inc. label.

2.2 AIR TERMINALS
   A. Provide air terminals of solid copper, tapered to a point, except when mounted on aluminum surfaces use aluminum air terminals. Sizes of the air terminals shall be 12 inches long by 3/8 inch diameter unless shown otherwise on the drawings.
   B. In locations exposed to smoke and gas emissions, provide air terminals with lead coating, 1/16 inch minimum.

2.3 CONDUCTORS
   A. Provide conductors consisting of commercially pure copper cable, except when installed on aluminum surfaces use aluminum cable with
transition to copper downleads. Sizes of conductors are as shown on the Drawings, or if not shown, comply with NFPA 780.

2.4 **THROUGH ROOF AND THROUGH WALL FITTING**

A. For penetrations of roofs and walls, provide fittings with solid brass or stainless steel rods with provision for attaching conductors at each end, and provision for watertight sealing.

2.5 **GROUND RODS**

A. Provide copper clad steel ground rods not less than 3/4 inch in diameter and 10 feet long.

2.6 **CONNECTORS**

A. Above grade connectors: Bolted type, specifically designed for lightning protection systems. Use bronze connectors with copper conductors, and aluminum connectors for aluminum conductors. Use bimetal clamps (bronze and aluminum) for transition from aluminum cable to copper cable. Connections below grade: As specified in Section 16450, "Grounding and Bonding". Connectors below grade and concealed connectors shall be exothermic type.

**PART 3 - EXECUTION**

3.1 **INSTALLATION ERECTION**

A. Install the lightning protection system as shown on the Drawings. Firmly attach the air terminals to the roof with anchor bolts or with other suitable means. Secure roof conductors by means of clip fasteners and concrete anchors as required. On built-up roofing an approved adhesive conductor holder may be used. Space fasteners or conductor holders not more than 3 feet apart.

B. Do not run cables continuously through roofs or walls; use thru roof and thru wall fittings.

C. Properly flash where fittings or air terminals pass through roof or walls, to conform with the roofing and wall requirements. Fasten materials to eliminate any possibility of displacement and need for subsequent maintenance.

D. Bond all grounded sizeable metallic objects located within 6 feet of the system or metal connected to the system with approved fittings and conductor. Use bimetal connectors between dissimilar metals. Include bonding of all required metal work on roof in this work.

E. Install grounding cable connections to prevent compromise between corrosion control insulators and systems.

F. Perform installation work under the supervision of an installer listed with Underwriters Laboratories.

3.2 **TESTING START-UP**

A. Test lightning protection system for continuity to the grid, or to the ground rod, and also in accordance with all applicable codes and standards.

3.3 **MASTER LABEL**

A. Prepare an application for a MASTER LABEL plate conforming to UL 96A and mail it to the Underwriters' Laboratories, Inc. The MASTER LABEL plate will be received by the Authority directly from Underwriters' Laboratories. The lightning protection system will not be accepted until the "MASTER LABEL" plate has been received by the Authority.

B. If a "Master Label Certificate" is provided instead of the "MASTER LABEL" plate, the certificate shall be laminated and installed at the appropriate location.

**PART 4 - MEASUREMENT AND PAYMENT**

4.1 **GENERAL**

A. In accordance with Section 16001, "Electrical Systems - General"
SECTION 16721
FIRE ALARM AND DETECTION SYSTEMS

PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies the minimum technical requirements for design, fabrication, testing, and installation of fire alarm and detection system.

1.2 REFERENCED STANDARDS
A. American Society for Quality (ASQ):
1. ASQ Z1.11 - Quality Assurance Standards

B. National Fire Protection Association (NFPA):
1. NFPA 70 - National Electrical Code (hereinafter referred to as NEC)
2. NFPA 72 - National Fire Alarm Code
3. NFPA 90A - Standard for the Installation of Air Conditioning and Ventilating Systems
4. NFPA 130 - Standard for Fixed Guideway Transit and Passenger Rail Systems

C. Underwriters Laboratories, Inc. (UL):
2. UL 193 - UL Standard for Safety Alarm Valves for Fire-Protection Service
3. UL 217 - UL Standard for Safety Single and Multiple Station Smoke Alarms
5. UL 464 - UL Standard for Safety Audible Signal Appliances
6. UL 539 - UL Standard for Safety Single and Multiple Station Heat Detectors
7. UL 864 - UL Standard for Safety Control Units for Fire-Protective Signaling Systems
8. UL 1480 - UL Standard for Safety Speakers for Fire Protective Signaling Systems
10. UL Fire Protection Equipment Directory
11. UL Electrical Appliance and Utilization Equipment Directory.

1.3 SUBMITTALS
A. Product Data and Shop Drawings to show as a minimum:
1. Final layout drawings with outline dimensions.
2. Control, wiring, and connection diagrams.
3. Bill of materials
4. Details of mounting methods for detectors and initiators.
5. Standby battery and circuit voltage drop calculations.
6. Fire alarm equipment data sheets.

B. Provide detail drawings prepared and signed by a Texas Licensed Fire Safety Professional Engineer for the design and installation of the fire alarm system.

C. Certification of source quality control:
1. Provide certification that each piece of equipment meets the requirements of ASQ Z1.11 quality assurance program and also satisfies safety related quality requirements imposed by regulating agencies.
2. Perform design, production, and operational tests, and submit certified test reports for each type of equipment.
3. Verify that each piece of equipment is in compliance with applicable codes, regulations, standards, and UL listings.
4. Submit a certificate of approval from the local fire department.
5. Submit shop drawings, including all notes and comments, approved by local fire department or local jurisdictional Authority.

D. Field Testing:
1. Supervisory Control and Data Acquisition (SCADA) Alarm: Refer to Section 16030, “Testing of Electrical Systems”.
2. Submit a detailed plan of the proposed method and scheduling of the required field testing at least 21 calendar days before initiating the tests.
3. Submit certified test reports of operational performance of fire alarm and detection system.

E. Operation and Maintenance Manuals, and Training: In accordance with Section 16001, "Electrical Systems - General".

1.4 QUALITY ASSURANCE

A. Experience:

1. Furnish products of a manufacturer regularly engaged in the manufacture of fire alarm and detection systems.

2. Incorporate equipment into the system which duplicates equipment that has been in satisfactory use for a period of 5 years prior to the Notice To Proceed.

PART 2 - PRODUCTS

2.1 FIRE ALARM CONTROL PANEL

A. Provide a fire alarm control panel with IP communications for reporting and monitoring to a remote IP compatible Digital Alarm Communication Receiver (DACR). Coordinate equipment and communications compatibility with DART IP DACR for transmission of alarm and trouble and supervisory signals to SCADA Monitoring System and Central Station. Refer to Section 16854, “Fire Alarm Subsystem – Communications System” for additional system information.

B. The system shall be two wire” with “end-of-line” device at the end of each circuit. Provide Class B, Style 4 Signaling Line Circuits (SLC) and Class B, Style Y Notification Appliance Circuit (NAC). Provide standard keying of all equipment. Construct the control panel with solid state electronic modules consisting of light emitting diode (LED) type high contrast visual indicators and the following minimum features as required:

1. Initiation device circuits.

2. Alarm indicating circuits.

3. Supervised annunciator circuits.

4. Earth ground supervision circuits.

5. Form C alarm contacts (2.0 amps at 24 VDC each).

6. Form C trouble contacts (2.0 amps at 24 VDC each).

7. Form C supervisory contacts (2.0 amps at 24 VDC each).

8. Set of dry contacts per zone, as required, (SPDT 2.0 amps at 24 VDC each).

9. SCADA Alarms: Provide sets of dry contacts (for Fire Alarm, Supervisory and System Trouble) for input to the SCADA system, at the Station Demarcation Terminal Cabinet. Three sets of dry contacts (for Fire Alarm, Supervisory and System Trouble) to be provided as an input to the Fire Alarm Control Panel.

10. Automatic battery charger and sealed maintenance free storage battery with all required devices providing 24 VDC, for 48 hours operation on loss of normal 120 volts, AC supply.

12. Form C output contact for remote station or local energy connection.

13. Provision for remote testing of the complete system.

14. Provision for remote transmission of alarms and indications from each subway station or a facility using data transmission system and also remote automatic activation of alarm devices. Use normally closed contacts at demarcation panel for normal operation and open for alarm conditions so panel failure results in an alarm condition.

C. Construct the panel to display the following visual indications:

1. Zone in which fire alarm condition is detected.

2. Zone in which there is a malfunction of a detector circuit.

4. AC power failure

5. Battery charger failure, battery voltage, and battery current.

D. Power Supply:

1. Provide integral power supply for panel and fire alarm peripherals. Provide control panel and peripheral needs with filtered power.

2. Design power supplies to meet UL and NFPA requirements for power-limited operation on external signaling lines, including initiating circuits and indicating circuits. Provide UL listing for power-limited circuit applications and use positive temperature coefficient devices for current limiting.
3. Provide input power rated at 120 volts, 60 hertz. Provide internal supervised batteries and automatic charger. Provide both positive and negative ground fault supervision, battery/charger fail condition, AC power fail indicators. Provide supervision of modular expansion power supplies as may be required.

2.2 FIRE MANAGEMENT PANEL

A. Provide a fire management panel as shown on the Contract drawings. Construct the panel to graphically display each area of the station or facility with zone annunciation devices.

B. Fabricate the fire management panel with the following features:
   1. LED type visual indicators.
   2. Display trouble and alarm for each initiated device.
   3. Lamps behind graphic display.
   4. Graphic display behind a clear plexiglass pane.
   5. Key operated test switches.
   6. Suitable for 48 hours operation after loss of normal 120 volts, AC Supply.
   7. Zones shall be color coded.

C. Provide space as shown on drawings for fire hot-line phone and public address microphone equipment, as provided by others.

2.3 MANUAL FIRE ALARM STATIONS

A. Construct the manual stations to be double action type. Provide the stations with high impact polycarbon or metallic, red enclosure with raised white lettering and a smooth high gloss finish. Make provisions for two separate and distinct actions to activate an alarm. Provide a common key to reset the station.

2.4 COMBINATION RATE OF RISE AND FIXED TEMPERATURE DETECTORS

A. Provide plug-in, twist-lock type combination rate of rise and fixed temperature detectors to operate when the rate of rise of the temperature exceeds 15 degrees F per minute, or the temperature of the surrounding air exceeds 190 degrees F. Provide the unit a high intensity LED alarm to remain lit after activation until manually reset.

B. Construct the detector with two independently operated thermal elements. Make the rate-of-rise element as self-restoring and the fixed temperature element as non-restorable.

2.5 SMOKE DETECTORS

A. Provide solid-state, photoelectric type smoke detectors in accordance with UL 268. Provide a locking screw to discourage unauthorized removal of the head from the base. Ensure that the removal of the detector head causes the interruption of the supervisory circuit of the alarm loop and also activates a trouble signal.

B. Provide detectors with insect screens and completely closed backs to restrict entry of dust and air turbulence. Ensure that the electronics of the unit are completely shielded to protect against false alarms from electro-magnetic and radio-frequency interferences.

C. Provide a red LED in each unit with a flashing status to indicate power on and a steady glow to indicate alarm. Provide a functional test switch in each unit.

2.6 DUCT SMOKE DETECTORS

A. Provide duct-mounted photoelectric smoke detectors downstream of air filters on air supply system with capacity greater than 2,000 cfm per NFPA 90A. Provide detectors capable of operating in velocities of 300 to 4,000 feet per minute without adverse affects on detector sensitivity and with direct interface to the system without interface zone modules.

B. Provide a noryl molded plastic enclosure with integral conduit knockouts and housing with gasket seals to ensure proper seating to the ductwork. Provide sampling tubes that extend a minimum of 75 percent across the width of the duct. Provide porosity filters to reduce sensor/camber contamination and provide integral single pole double throw auxiliary control contacts for air-handling unit shutdown. Coordinate with mechanical subcontractor for interface and verify shutdown is achieved upon an alarm signal from the duct smoke detector. Connect duct detectors to fire alarm panel to initiate a supervisory signal.

2.7 AUDIO/VISUAL ALARMS

A. Provide horn/light combination units suitable for low voltage operation from the fire alarm panel. Provide the horn output rating not less than 87 dBA, per UL 464, and not less than 15dB above ambient noise level. Provide a red Xenon strobe light for visual signal. Ensure that the horn and light operate only when a fire alarm signal is annunciated. Provide weatherproof enclosures installed outdoors or below grade. Provide white enclosure with red lettering.
FIRE ALARM AND DETECTION SYSTEMS

2.8 KNOX BOXES
A. Connect to Knox box tamper switch; refer to Section 10525, "Fire Department Key". Connect switch to fire alarm panel to initiate a supervisory signal.

2.9 FIRE SPRINKLER SWITCHES
A. Connect to fire sprinkler water flow switches to initiate an alarm signal and valve tamper switches to initiate a supervisory signal. Refer to Section 15300, "Fire Protection Systems", as necessary.

PART 3 - EXECUTION

3.1 INSTALLATION
A. Install the fire alarm and detection system in accordance with the drawings, Specifications, all applicable codes, manufacturer's recommendations, and with the following requirements:

1. Install wiring in accordance with NEC and NFPA 72.
2. Use galvanized rigid steel conduit and fittings.
3. Paint junction and pull boxes red and label FIRE ALARM, identify circuit present using black marker.
4. Connect the fire alarm and detection system to 120 volts, AC, single phase, power supply.
5. Use color coded wires throughout.
6. Connect alarms and indications to interface terminal blocks, where shown on Drawings. Use normally closed contacts at non-alarm conditions.
7. Coordinate the installation with other pertinent systems.
8. Install copy of as-built plans at Fire Alarm Control Panel.

B. Field Testing:
1. Refer to Section 16030, "Testing of Electrical Systems".
3. Furnish equipment to perform tests.
4. Test the completed system in accordance with NFPA 72.
5. Test each device and equipment individually for its operational performance.
6. Test that in the event of loss of normal 120 volts, AC power supply, storage batteries are capable of supplying power to the complete system for 48 hours in stand by mode. After 48 hours in stand by mode, system must capable of indicating an alarm condition (audio/visual devices activated) for minimum of 5 minutes.
7. Test each output and input circuit to and from the remote terminal unit (RTU).
8. Provide test of the interface between the Fire Alarm Control Panel and remote IP DACR.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL
A. In accordance with Section 16001, “Electrical Systems - General”.

END OF SECTION 16721
SECTION 16722
INTRUSION ALARM AND DETECTION SYSTEMS

PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies the minimum technical requirements for design, fabrication, testing, and installation of intrusion alarm and detection system.

1.2 REFERENCE STANDARDS

A. National Fire Protection Association (NFPA):
   1. NFPA 70 - National Electrical Code (NEC)
   2. NFPA 130 - Standard for Fixed Guideway Transit and Passenger Rail Systems

B. Underwriters Laboratories, Inc. (UL):
   1. UL 464 - UL Standard for Safety Audible Signal Appliances

1.3 SUBMITTALS

A. Shop Drawings to show as a minimum:
   1. Final layout drawings with outline dimensions.
   2. Control, wiring, and connection diagrams.
   4. Details of mounting methods for detectors and initiators.
   5. Details of all sensor devices and access control systems.

B. Certification of Source Quality Control:
   1. Provide certification that each piece of equipment meets the requirements of ASQ Z1.11 quality assurance program and also satisfies safety related quality requirements imposed by regulating agencies.
   2. Perform design, production, and operational tests, and submit certified test reports for each type of equipment.
   3. Verify that each piece of equipment is in compliance with applicable codes, regulations, standards and UL listings.

C. Field Testing:
   1. SCADA Alarm: Refer to Section 16030, "Testing of Electrical Systems".

PART 2 - PRODUCTS

2.1 INTRUSION ALARM CONTROL PANEL

A. Provide an intrusion alarm control panel as shown on Contract Drawings. Construct the panel with solid state modules, suitable for multi-zone keypad programmable control with digital communicator, or for card type with magnetic strip or bar code. Design the panel with the following minimum features and quantity as required:
   1. Circuit supervision, detection, and indication.
   2. Output expansion circuits.
   3. Zone expansion circuits.
   4. Siren driver.
   5. Battery voltage and charging current indication.
   6. Automatic battery charger and sealed maintenance free storage battery with all required devices providing 24 volts DC with capacity to carry the system on standby for 48 hours with the normal 120 volts AC power off.

2. Submit a detailed plan of the proposed methods and scheduling of the required field testing at least 21 calendar days before initiating the tests.

3. Submit certified test reports of operational performance of intrusion alarm and detection system.

D. Operation and Maintenance Manuals, and Training: In accordance with Section 16001, "Electrical Systems - General".

1.4 QUALITY ASSURANCE

A. Experience:
   1. Furnish products of a manufacturer regularly engaged in the manufacture of intrusion alarm and detection systems.
   2. Incorporate equipment into the system which duplicates equipment that has been in satisfactory use for a period of five years prior to the Notice to Proceed.
7. Vandal resistant enclosure with tamper switches as required for Grade A, Grade B UL listings.

8. Additional remote keypads.

9. Light emitting diode (LED) annunciators.

10. Provision for remote testing of the complete detection system.

11. Other ancillary controls as required for operation of the system

B. Construct the panel to indicate the following alarms and indications:

1. Alarm from each intrusion detection zone.
2. Zone in which there is a malfunction of a detector circuit and devices.
3. AC power failure.
4. Battery charger failure or low battery voltage.

C. Provisions for remote transmission of alarms and indications from each subway station or a facility using Data Transmission system and also remote automatic activation of alarm devices.

D. SCADA Alarm Contacts: Provide five sets of fail-safe, closed loop logic, Form C normally open and normally closed dry contacts in the intrusion Alarm control panel. The normally open contacts to be connected to the Station Demarcation Terminal Cabinet for the following alarm functions:

1. Consolidated Services Building Intrusion Alarm, TVM No. 1, 2, 3 and 4 Intrusion Alarms.

2.5 DETECTOR DE-ACTIVATION SWITCHES

A. Provide keypad detector de-activation switches.

1. Integrated with intrusion alarm control unit or separate wall-mounted unit.
2. Labeled 0 - 9, * and #
3. Resistant to entry of dirt and moisture.
4. Keypad shall provide tactile feedback of operate; membrane keypads are not acceptable.
5. Powered by intrusion alarm control panel.
6. Have LED indications of status:
   a. Ready.
   b. Armed.
   c. Alert.

2.6 END OF LINE DEVICES

A. Provide end of line devices as required for each detector circuit for a fully supervised system. Provide devices of the type and characteristics which are in strict accordance with the manufacturer's recommendations and design.

2.7 AUDIBLE ALARMS

A. Provide inside and outside audible alarms of the horn type operating on 18-30 VDC. Provide those for outside installation in weatherproof enclosures. Provide horns which measured at ten feet, have an output rating of no less than 87dBA, per UL 464. Provide a different sound than the fire warning alarms sound. Provide Authority approved sound characteristics of the device.

B. Provide unit with tamper switches mounted and wired. Construct the unit with heavy material to resist attack. Provide supervision for unit against cover removal.

2.8 ULTRASONIC MOTION DETECTORS

A. Provide ultrasonic motion detectors which sense intruder presence by transmitting ultrasonic energy into a protected zone. Provide the ultrasonic energy at a frequency higher than 20 kHz. Provide the system for selective filtering to minimize breaking glass. Provide sensors which protect a 10 feet radius of glass area. Provide each sensor with a latching LED to indicate the appropriate detector in alarm.
nuisance alarms due to external sources of ultrasonic energy. Provide a system that adapts to changing levels of air turbulence and consists of a control unit and transceivers as required. Facilitate testing of the unit with a test/alarm LED.

2.9 INFRARED MOTION DETECTORS

A. Provide infrared motion detectors which detect intruder presence by monitoring the level of infrared energy emitted by the objects within a protected zone. Provide detector which is sensitive to infrared energy emitted at wavelengths corresponding to the human body and objects at ambient temperatures.

B. Provide sensors that have tamper switch to supervise cover removal. Facilitate unit testing with a walk test/alarm LED. Operating range from 0 deg. F to 120 deg. F. Provide sensors with a required wide angle of protection or by flipping the optic lens provides a required barrier pattern. Include as required an optional long range lens.

2.10 MICROWAVE MOTION DETECTORS

A. Provide microwave motion detectors which sense intruder presence by transmitting electromagnetic energy into a protected zone. If more than one device is used in an area, provide different frequencies of operation. Provide a system for selective filtering to minimize nuisance alarms.

B. Provide an LED for test/alarm verification of the microwave sensor. Provide suitable sensor for the required wide angle and trap pattern protection. Provide detector that is programmable to default to alarm.

2.11 PHOTOELECTRIC DETECTORS

A. Provide photoelectric detectors that sense intruder presence by establishing a series of infrared or ultraviolet beams and detecting beam disruptions. Provide the beam transmitters that are designed to emit no perceptible light. The beam may be reflected by mirrors before being received and amplified. Provide uniquely modulated transmitted beam to prohibit an intruder from shining another light source into the receiver to escape detection.

B. Provide the operational range between transmitter and receiver up to 500 feet and allow 180 degree horizontal and 40 degree vertical aiming capability for the movable optic. Facilitate testing of the unit with a test/alarm LED. Provide for testing of alignment and tolerance of dust and dirt on covers.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install the intrusion alarm and detection system in accordance with the drawings, Specifications, all applicable codes, the manufacturer's recommendations as approved by the Contracting Officer, and with the following requirements:

1. Install wiring in accordance with NFPA 70 (NEC).

2. Use galvanized rigid steel conduit and fittings.

3. Connect the intrusion alarm and detection system to 120 volts, AC, single phase, 60Hz power supply.

4. Use color coded wires throughout the system.

5. Connect alarms and indications to interface terminal blocks.

6. Install audio/visual alarm units a minimum 8 feet above finished floor. If ceiling is too low to permit 8 foot mounting height, mount the unit as high as possible.

7. Coordinate the installation with other pertinent systems.

3.2 FIELD QUALITY CONTROL

A. Field Inspection: Prior to field testing, check equipment installation in accordance with manufacturer's recommendations and including verification of the following:

1. Connection of circuits in accordance with wiring diagrams.

2. Tightness of wire, cable, conduit, and terminal blocks.

3. Check the installations of sensors and detectors as per manufacturer's strict recommendations and specified requirements.

B. Field testing:

1. Refer to Section 16030, "Testing of Electrical Systems".

2. Provide service of manufacturer's engineering representative and supporting
field crew to conduct tests in the presence of the Contracting Officer.

3. Furnish equipment to perform test.

4. Test the completed intrusion alarm and detection system including line supervision tests; testing of all sensors, switches, annunciators, consoles, and power supplies.

5. Test each device and equipment individually for its operational performance.

6. Test that in the event of loss of normal 120 volts AC power supply, storage batteries are capable of supplying power to the complete system for 48 hours.

7. Test each output and input circuit to and from the remote terminal unit (RTU).

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. In accordance with Section 16001, “Electrical Systems - General”

END OF SECTION 16722
SECTION 16750
STATION COMMUNICATIONS DEVICES

PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies station communications devices and required accessories, intended for patron use, located on station platforms and concourse levels, station elevators, pedestrian underpasses, pedestrian overpasses, and other publicly accessible locations as shown on the Contract Drawings.

B. The Contractor shall furnish, install, wire, terminate, and test station communications devices, consisting of Passenger Emergency Call (PEC) Telephone Units and Elevator Emergency Telephones as described in this specification, from station pedestal and elevator locations to a common station demarcation panel as shown on Contract Drawings.

C. New communications devices furnished and installed under this contract shall be compatible with standard analog PABX extensions delivered from either existing or new DART owned and operated voice network switches over the Communications Transmission System.

1.2 REFERENCE STANDARDS

A. American Society of Mechanical Engineers (ASME):
   1. ASME A17.1 - Safety Code for Elevators and Escalators

B. Military Specification (MIL):
   1. MIL-DTL-915/1F - Cable, Power Electrical, 600 Volts, for Outboard Use Only (Not for Inboard Use), Type CVSF

C. National Fire Protection Association (NFPA):
   1. NFPA 130 - Standard for Fixed Guideway Transit and Passenger Rail Systems

1.3 SUBMITTALS

A. Material Specification Data Sheets and Product Samples: The Contractor shall submit within 120 days after NTP complete specification data sheets and product samples (as requested by DART) for approval, for the following equipment and material:
   1. Communications devices, including PEC and elevator emergency telephone
   2. Equipment Enclosures
   3. Protected Terminal Block Assemblies and Protector Modules
   4. Telephone Cable
   5. Power Cable (for Blue Light)

B. Mechanical Drawings: The Contractor shall submit drawings for approval, at least 30 days prior to fabrication or factory inspection. Drawings shall include the following:
   1. Location Marker Detail
   2. Enclosure Identification Details (including painting and lettering)
   3. Operating Instructions or Details
   4. Mounting and installation details for PEC and Elevator Telephones

C. Electrical Drawings and Calculations: The Contractor shall submit the following Single Line Drawings and calculations within 120 days after NTP:
   1. Blue-light light power and control circuit end-to-end wiring details
   2. Telephone cable end-to-end wiring and termination details to include each device and the station demarcation panel
   3. Protector terminal and equipment grounds to station ground grid end-to-end wiring details
   4. Power cable voltage loss and telephone cable loop voltage loss calculations to confirm proper device operation at designed cable lengths

D. Product Documentation: The Contractor shall submit, within 30 days of installation, the following documentation for communications devices and other equipment furnished and installed under this contract.
   1. Operations and Maintenance Manuals
   2. Installation and Troubleshooting Guides
   3. Product part numbers, cut-sheets, and installation manuals for hardware, software, and accessory equipment associated with the remote maintenance package (as described in Section 2.1.B.14 of this specification) designated for use with communications devices furnished and installed under this contract

E. Default or As-built Configuration and Provisioning Information: The Contractor shall submit, within 30 days of installation, detailed information for each installed communications device to allow system integration by follow on contractors and consultants. Information should include:
   1. Programming passwords
   2. Programmable feature settings
3. Board level switch/strap settings

4. Other configuration or provisioning which deviates from manufacturers default state

F. Test Procedures: The Contractor shall submit, at least 30 days prior to any testing, complete procedures for each cable test and functional testing requirement listed in Sections 3.2.A and 3.2.B of this specification section.

G. Training Procedure and Plan: The Contractor shall submit, at least 120 days prior to final acceptance, a complete training plan and procedure provided by the manufacturer representative to satisfy the requirement listed in Section 2.6 of this specification section.

H. Field Testing:
   1. Station Demarcation Terminal Cabinet Testing: Refer to Section 16030, “Testing of Electrical Systems”.

1.4 QUALITY ASSURANCE

A. Communications devices shall be registered under FCC Regulations, Part 8, 15, and 68, and shall comply with UL1459.

B. Communications devices shall be UL listed.

C. Communications devices shall be ADA compliant and shall be designed and installed in accordance with the most current ADA Standards for Accessible Design (28 CFR Part 36).

D. Communications devices shall meet local codes and/or regulations for emergency operation as established by the authority having jurisdiction.

PART 2 - PRODUCTS

2.1 PASSENGER EMERGENCY CALL (PEC) UNIT

A. PEC units shall be installed on platforms, concourses, pedestrian underpasses or overpasses, walkways, fare vending areas, or other public areas in the vicinity of Light Rail stations in locations and quantities shown on the Contract Drawings to provide a means of emergency communications from a station patron to the train control center.

B. Passenger Emergency Call Instrument:
   1. The unit shall be an outdoor-rated (NEMA 3R or better), weatherproof, hands-free, ADA compliant emergency telephone instrument.
   2. Call Operation and Functions:
      a. Telephone shall operate on a standard telephone line or an analog PABX or key system extension.

b. The telephone shall operate from a single cable pair in an auto-dial DTMF mode. The unit shall be capable of programming, storing, and dialing a minimum of two successively dialed telephone numbers, each at least 10 digits in length.

c. The telephone shall be capable of auto-answering and operating in a monitor mode, where authorized personnel may silently connect a call from any station connected to the PABX network to any field telephone and monitor activity immediately around the telephone.

d. The telephone shall have a DTMF call disconnect function, enabling the control center operator to disconnect the call by pressing and sending a single touch tone key or a series of no more than three touch tone keys.

3. Telephone shall have only a single, 3/4 inch minimum sized button to initiate a call. The unit shall not have a 12-digit dial pad nor shall the telephone have a corded handset.

4. Sound pressure level (SPL) within three feet in front of instrument should be a minimum of 3 dB above peak ambient station sound levels and conform to the NFPA 72 requirement of minimum intelligibility of 0.70 on the Common Intelligibility Scale (CIS) scale, corresponding to a Speech Transmission Index (STI) of 0.50. Concealed microphone sensitivity and speaker volume adjustment controls shall be provided for DART maintenance personnel to adjust the instrument to acceptable levels.

5. The telephone shall have an auxiliary output that enables peripheral equipment, such as a blue light strobe, to be activated when the emergency call button is pressed. The auxiliary output shall be a solid-state relay that isolates the control voltage from the output contact.

6. Device Impedance: Off-hook impedance presented to the line shall be 600 ohms or less. On-hook line impedance shall be the ringer impedance.

7. Power Supply. Telephone line powered, requiring no battery back up or external power source.

8. Loop Current (at 48V supply). Minimum range of 24-80 mA.

10. Ringer Equivalency (REN). 1.0A or less.

12. Environmental. Minus 20 deg C to plus 60 deg C and humidity of 0 to 95 percent non-condensing.

13. Local and Remote Programming. The telephone shall be capable of local programming, through the use of a concealed, integrated, internal keypad or through the use of an externally attached programmer. The telephone shall be capable of remote programming by calling into the phone over its connected telephone line using any standard touch tone telephone set connected on the same network.

a. Programming shall be held in non-volatile memory and shall be saved in the event of disconnection from telephone line.

b. A password of at least four digits shall be required to enter the programming mode when dialing through the system to program in remote mode.

14. Remote maintenance. The telephone shall be capable of operation with an externally Windows based PC monitoring and reporting package that utilizes the existing telephone line for connection. Maintenance calls shall not interfere with or pre-empt emergency call operations. The telephone and the PC based monitoring package shall:

a. Automatically report operational status to PC (keep alive and/or health status) for new telephones on network

b. Automatically report and database any telephone fault condition

c. Provide call usage reports (with time, date, call length, and other information)

d. Provide telephone identification upon incoming call from any field telephone

e. Generate reports of maintenance data and call statistics

C. Unit Enclosure, Identification, and Indication:

1. The telephone instrument may be installed as a self-contained unit or as a unit within a stanchion, pedestal, or other enclosure so long as the environmental rating for the instrument specified in this section is maintained.

2. A readily identifiable location marker plate indicating station name, address, and telephone location (ie. north or south pedestal) shall be installed on or adjacent to the faceplate of each telephone.

3. A blue light fixture or beacon with vandal-resistant lens and a lamp and strobe, or combination of flashlamp, strobe, incandescent, fluorescent, or other light, shall be installed with each emergency telephone. Beacon shall be powered by an uninterruptible 120V AC power source from the station electrical panel.

a. Conduits containing power lines shall be separate from those containing telephone signal wire. Power cable shall be sized adequately for cable distances and voltage drops and shall conform to the requirements of Section 16120: Wires and Cables.

b. Lamp shall remain constantly on during on-hook situations and shall provide a high-intensity strobe when telephone goes off-hook.

c. Lamp shall be rated, at a minimum, for 60 Watt output.

d. Flash rate of strobe shall be a minimum of 1 Hz and a maximum of 3 Hz.

e. Lamp fixture shall be rated NEMA 3R or better.

4. The word “Emergency” shall be incorporated on the faceplate and/or enclosure of the telephone.

a. Letters shall be raised no less than 3/32 inch, accompanied by Grade 2 Braille lettering, and otherwise comply fully with requirements of the ADA.

b. Operating instructions shall be incorporated with or adjacent to the telephone.

5. The telephone instrument shall provide on demand information to authorized personnel at the Train Control Center that identifies the Station location, address, and telephone location (ie. north platform) and that assistance is required.

6. An easily identifiable and labeled visual indication shall be provided on the telephone faceplate, which is activated by authorized personnel at the Train Control Center, to acknowledge that two-way communications link has been established.

a. The visual indication shall be extinguished when the two-way communications link is terminated.
b. The label for this indication shall not imply that any emergency response has been automatically dispatched or is otherwise underway. Such a prohibited example is, “Help is on the way”. Examples of permissible phrases include, “Call Received When Lit”, “Call Connected”, or “Received”.

c. If a lamp is used as the visual indication, it shall be an LED device.

2.2 ELEVATOR EMERGENCY TELEPHONE

A. An elevator emergency telephone shall be integrated into each elevator cab installed in stations or any other public area servicing LRT patrons to provide a means of emergency communications from a station patron, located inside the elevator, to the train control center.

B. Elevator Emergency Telephone Instrument

1. The telephone instrument shall be a hands-free, ADA compliant emergency telephone.

2. Call Operation and Functions

   a. Telephone shall operate on a standard telephone line or an analog PABX or key system extension.

   b. The telephone shall operate from a single cable pair in an auto-dial DTMF mode. The unit shall be capable of programming, storing, and dialing a minimum of two separate successively dialed telephone numbers, each at least 10 digits in length.

   d. The telephone shall be capable of auto-answering and operating in a monitor mode, where authorized personnel may silently connect a call to any field telephone and monitor activity immediately around the telephone.

   e. The telephone shall have a DTMF call disconnect function, enabling the control center operator to disconnect the call by pressing and sending a single touch tone key or a series of no more than three touch tone keys.

3. The telephone shall have only a single, 3/4 inch minimum sized button to initiate a call. The unit shall not have a 12-digit dial pad nor shall it use a corded handset in the car.

4. Sound levels at areas within the elevator cab shall be uniform and conform to the NFPA 72 requirement of minimum intelligibility of 0.70 on the Common Intelligibility Scale (CIS) scale, corresponding to a Speech Transmission Index (STI) of 0.50. Sound pressure level (SPL) within three feet in front of instrument should be a minimum of 3 dB above peak ambient station sound levels. Concealed microphone sensitivity and speaker volume adjustment controls shall be provided for DART maintenance personnel to adjust the instrument to acceptable levels.

5. Device Impedance: Off-hook impedance presented to the line shall be 600 ohms or less. On-hook line impedance shall be the ringer impedance.

6. Power Supply. Telephone line powered, requiring no battery back-up or external power source.

7. Loop Current (at 48V supply). Minimum range of 24-80 mA.

8. Signaling. Loop start (FXO/FXS compatible).

9. Ringer Equivalency (REN). 1.0A or less.

11. Environmental. Minus 20 deg C to plus 60 deg C and humidity of 0 to 95 percent non-condensing.

12. Local and Remote Programming. The telephone shall be capable of local programming, through the use of a concealed, integrated, internal keypad or through the use of an attached programmer. The telephone shall be capable of remote programming by calling into the phone over its connected telephone line using any standard telephone set connected on the same network.

   a. Programming shall be held in non-volatile memory and shall be saved in the event of disconnection from telephone line.

   b. A password of at least four digits shall be required to enter the programming mode when dialing through the system to program in remote mode.

   c. Connection for external programmer (if required) shall be concealed to patrons during normal operation.
13. Remote maintenance. The telephone shall be capable of operation with an externally Windows based PC monitoring and reporting package, compatible with the maintenance system specified for the PEC unit, that utilizes the existing telephone line for connection. Maintenance calls shall not interfere with or preempt emergency call operations. The telephone and the PC based monitoring package shall:
   a. Automatically report operational status to PC (keep alive and/or health status) for new telephones on network
   b. Automatically report and database any telephone fault condition
   c. Provide call usage reports (with time, date, call length, and other information)
   d. Provide telephone identification upon incoming call from any field telephone
   e. Generate reports of maintenance data and call statistics

C. Telephone Mounting, Identification, and Indication:
   1. Telephone assembly shall be flush mounted into a recessed area in the elevator control panel, with brushed stainless faceplate finish or a finish to match the elevator panel. Alternatively, the unit may be mounted without faceplate behind an existing control panel that is integral to the elevator cab assembly, so long as the speaker and microphone cutouts match, the elevator control panel labeling satisfies ADA standards, and specified features and functions of the telephone are made available. Mounting height shall be in accordance with ADA Standards for Accessible Design, 28 CFR Part 36, Section 4.10.14.
   2. A readily identifiable location marker plate indicating station name, address, and telephone location (ie. south elevator) shall be installed on or adjacent to the faceplate of each telephone.
   3. The word “Help” shall be permanently incorporated and visible on the faceplate of the telephone or elevator control panel adjacent to the call button.
      a. Letters shall be raised no less than 3/32 inch, accompanied by Grade 2 Braille lettering, and otherwise comply fully with requirements of the ADA.
      b. Operating instructions shall be incorporated with or adjacent to the telephone and shall conform to ASME A17.1a-2002 Section 2.27.7.3.

2.4 The telephone instrument shall provide on demand information to authorized personnel at the Train Control Center that identifies the Station location, address, and elevator identification (ie. north or south elevator) and that assistance is required.
   a. The visual indication shall be extinguished when the two-way communications link is terminated.
   b. The label for this indication shall not imply that any emergency response has been automatically dispatched or is otherwise underway. Such a prohibited example is, “Help is on the way”. Examples of permissible phrases include, “Call Received When Lit”, “Call Connected”, or “Received”.
   c. If a lamp is used as the visual indication, it shall be an LED device.

2.3 STATION PROTECTORS AND ENCLOSURES
   A. Protected terminal block assemblies, as manufactured by Marconi Communications, Circa Enterprises, Krone, or an approved equal, shall be installed at each Passenger Emergency Call unit with positions sufficient to terminate cable pairs plus at least 100 percent spare terminations at each telephone location. Station protectors shall be three element gas or solid-state type, designed to provide heavy duty transient and power fault protection for this telephone line application and shall have the following operating characteristics:
      1. Balanced operation
      2. DC Breakdown at > 350V @ 2KV/sec
      3. DC Holdover Voltage of < 150V, < 200ms
      4. Surge Life of > 750 surges @ 10A, 10x1000μsec
   B. Individual terminals shall be sized to accept OSP and inside wire conductors.
   C. An enclosure shall be installed beneath or adjacent to each telephone enclosure to house the protected terminal blocks. The enclosure shall be a NEMA 3R or better gasket protected enclosure with screw-on cover or approved equal. Cover screws shall be tamper-resistant and non-corrosive. The enclosure shall be sized to house the telephone station protectors and wiring. Cable cut outs shall be sized to accept inbound and outbound cables.
D. Station protectors and enclosures are not required at elevator emergency telephone locations.

2.4 TELEPHONE CABLE

A. OSP telephone cable between the station demarcation panel and communications devices shall be no less than 6 pair, filled, and shall conform to RUS Specification 7 CFR 1755.890 (PE-89).

B. The conductors shall be solid annealed bare copper conforming to the latest requirements of ASTM B3. The conductors shall be no smaller than No. 22 AWG.

1. Conductors shall be individually insulated with a colored, solid insulating grade, high density-polyethylene or polyolefin of ICEA S-56-434.

2. The insulating material color shall be coded per U.S. telephone industry standards with color concentrates chosen for permanency and electrical balance of individual circuits. The colors of insulated conductors shall be supplied in accordance with ICEA S56-434, Section II-7 and shall comply with the requirements of EIA TIA-359.

3. The insulated conductors shall be twisted into pairs. The length of pair twists shall be designed to meet ICEA S45-434 latest edition.

4. The average twist length of any pair in the finished cable shall not exceed 6 inches.

5. The insulated pairs shall be twisted and assembled into a cable core into specified color combinations to provide pair identification as well as low susceptibility to noise pick-up and with varying lay lengths to minimize cross-talk.

C. The filling compound, a petroleum jelly base multi-component, shall be applied to the cable core in such a way as to provide as near to 100 percent fill of the available air space within the core as is commercially practicable. The filling compound shall be applied in a manner to fill voids and conductor interstices under the core to restrict the migration of moisture. The filling compound shall be compatible with the insulation and other cable components.

D. The filled core shall be completely covered with a layer of non-hygrosopic, non-wicking polymeric tape applied with overlap over the cable core to ensure high dielectric strength from cable core to shield.

E. 0.008-inch thick corrugated aluminum tape shall be applied over the core. The tape shall be coated with a 0.002-inch thick copolymer compound and shall be applied longitudinally with overlap.

F. The outer jacket shall be of virgin, black high molecular weight polyethylene copolymer except low-smoke jacketed cables that shall be as specified below. The overall jacket shall be sequentially marked at 2-foot intervals with cable type, year of mfg., footage, pair count, conductor size and manufacturer. The jacket shall be free from holes, splits, blisters or other imperfections and shall be smooth and concentric.

G. Conductor insulation shall conform to RUS Specification 7 CFR 1755.97 Bulletin 345-63 "RUS Standard for Acceptance Test and Measurements of Telephone Plant" for the following:

<table>
<thead>
<tr>
<th>Test</th>
<th>Minimum Criteria</th>
</tr>
</thead>
<tbody>

</table>

J. **Outside communications cables** (e.g. those run in conduits, trough or ductbanks) shall be foam/skin insulated conductors that meet RUS Specification 7CFR 1755.890 and shall be rodent protected using armor taping or approved equivalent.

K. **Inside wire,** defined as wire from telephone terminals to communications devices, shall be 22 AWG or 24 AWG and have a characteristic impedance of 105 ohms plus or minus 16 ohms. Cable shall be low smoke and non-toxic.

L. **Cable lengths and slack allowances** shall be sized for at least three re-terminations on any connector or terminal block.

### 2.5 SPARE PARTS AND SPECIAL TOOLS

**A. Spare Parts.** The Contractor shall provide either the quantity specified below of the total installed quantity, rounded up to the nearest integer (example: if 15 elevator telephones total are installed under this contract, and 10 percent spare quantity is specified, provide two spare elevator telephones). Spare PECs and elevator emergency telephones shall be assembled, programmed, and ready to be fully installed.

1. Elevator Emergency Telephone instruments: qty. 10%
2. Passenger Emergency Call units: qty. 10%
3. Station protected terminal blocks: qty. 10%
4. Station protected terminal block modules: qty. 10%
5. Telephone Cable: qty. 2000 ft.
7. Complete Blue Light assembly: qty. 10%

**B. Special Tools.** The Contractor shall provide either the quantity specified below or 5 percent of the total installed quantity, rounded up to the nearest integer (example: if 30 elevator telephones are installed, provide two spare elevator telephones).

1. Tools needed to access tamper resistant screws or hardware: qty. 8
2. Tools necessary for wire wrapping or terminal connection: qty. 8
3. Special tools necessary for protector terminal block module replacement: qty. 8
4. External hand programmer (if not integral to device): qty. 3

### 2.6 TRAINING

**A.** The Contractor shall perform or provide manufacturer’s approved operations, administration, and maintenance training for communications devices furnished and installed under this contract.

**B.** Training shall be held at DART facilities and shall consist of two identical sessions, each eight hours in length. Each session shall accommodate up to twelve maintenance technicians and one supervisor.

**C.** Sessions shall include hands-on training, including troubleshooting steps, covering features and functions utilized in the installation and application of these products.
PART 3 - EXECUTION

3.1 INSTALLATION

A. Field Installation:

1. The Contractor shall furnish, install, wire, and test communications devices. The devices shall be wired to a common station demarcation panel, as shown on Contract Drawings, from which each instrument can be integrated into the existing or new communications and control system.

3. Terminate telephone cable pairs within each telephone instrument, terminal block, and junction box according to color code. Terminate and label telephone location, tip, and ring for telephone cable pairs at the nearest communications interface or demarcation panel located on Contract Drawings. Each telephone instrument shall be wired independently on a unique cable pair to this demarcation panel. Parallel or daisy chain wiring on the same cable pair between any communications device is not permitted.

4. The Contractor shall coordinate with the elevator equipment supplier for details in routing communications cabling to the supplied telephone instrument and for telephone compartment dimensions.

5. Externally exposed mounting hardware, fixtures, buttons, ground connections, or enclosures shall be tamper-proof and vandal-resistant.

6. Conduit from the cableways or pullboxes to and from the protected terminal block enclosure and the telephone enclosure shall be 2 inches GRS conduit per Section 16111, “Conduits”.

7. Grounding:

   a. Passenger Emergency Call units, enclosures, and protectors shall be grounded to the station ground grid utilizing No. 6 AWG stranded, insulated ground wire and approved ground connection hardware.

   b. Communications devices located in elevators will be grounded to the elevator structure utilizing No. 6 AWG stranded, insulated ground wire and approved ground connection hardware.

   c. The telephone enclosure, junction box, and protected terminal blocks for each communications device shall be connected to station ground grid.

   d. Telephone cable jacket shields shall be grounded to the protected terminal block ground lug from which the cable signal pairs are terminated. At no time should cable shields be grounded at both ends of run.

3.2 TESTING

A. Factory Acceptance Testing: The Contractor shall perform or provide manufacturer’s certified testing results for RUS specified telephone cable satisfying the requirements of Section 2.4 of this specification and those detailed below. Include in this report any test measurement results. The Contractor shall notify the DART Communications Systems Element Manager (SEM) ten working days prior to testing so that he/she or a representative may be present during facilities telephone testing activities.

1. 1000 Hz attenuation, signal to noise ratio, and peak to average ratio.

2. Conductor to ground insulation resistance test for each conductor.

3. Conductor to conductor insulation resistance test between conductors of each cable pair.

B. Field Installation Testing: The following field installation tests shall be performed from the station local demarcation panel out to the individual communications devices using standard telephone line simulators and other equipment. The Contractor shall include in this report the results of test measurements. The Contractor shall notify the DART Communications Systems Element Manager (SEM) ten working days prior to testing so that he/she or a representative may be present during facilities telephone testing activities:

1. Cable pair continuity (DC loop resistance of each cable pair) between telephone protector terminal and station demarcation panel.

2. Audio performance of telephone from three feet directly in line with instrument speaker/microphone, including SPL and STI measurements under normal call operation.

3. Speaker volume and microphone sensitivity level adjustments to ensure no feedback.

4. Off hook ringer impedance.

5. Resistance to remote earth ground of no more than 25 ohms at each equipment, cable shield, and protector block ground connection.

6. Continuity of each protector block module installed.
7. Functional Testing:
   a. Verify off-hook primary auto-dial number connection to test unit / call simulator.
   b. Verify secondary auto-dial number connection(s) in the event of primary line non-availability.
   c. Verify full-duplex two-way communication once call is connected.
   d. Verify both auto-answer and standard ringing upon incoming call to the instrument.
   e. Verify disconnect function on calls initiated from the call simulator.
   f. Verify operation of ADA call acknowledgement visual indication.
   g. Verify remote programming capability.

8. Verify Blue Light operation at PEC locations.

C. Integrated System Field Testing Support: The following system field integration test shall be performed in coordination with the DART Systems Integration Consultant and Communications Systems Contractor after Systems installation is complete.

   1. Verify off-hook auto-dial, signaling, and connection to control center.
   2. Verify alternate number(s) auto-dial operation in the event of primary line non-availability.
   3. Verify loop current is sufficient for proper operation of telephone.
   4. Verify audio continuity from instrument to control center. Set transmission level points for specified audio levels.
   5. Verify remote password protection and programming capability.
   6. Verify operation of ADA call acknowledgement visual indication.
   7. Verify, from the OCC, the on-demand identification of the calling instrument.
   8. Verify correct extension and location display on train control center console phones.
   9. Verify full operation with remote maintenance PC system and equipment.

PART 4 - METHOD OF MEASUREMENT AND PAYMENT

4.1 GENERAL

   A. In accordance with Section 16001, "Electrical Systems - General"

END OF SECTION 16750
SECTION 16801
BASIC TECHNICAL REQUIREMENTS - COMMUNICATIONS SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section provides an overview of technical requirements, engineering guidelines, technical constraints, and general conditions to be followed by the Contractor throughout the design of the Authority Light Rail Communications System.

B. Technical requirements specific to each communications subsystem shall be found in each of the corresponding subsystem Specification Sections.

1. Section 16837 – Miscellaneous Components and Products – Communications System
2. Section 16838 – Communications Facilities – Communications System
3. Section 16839 – Communications Interface Cabinet – Communications System
4. Section 16841 – Communications Cable – Communications System
5. Section 16845 – Fiber Optic Cable Subsystem – Communications System
6. Section 16850 – Basic Electrical Materials and Methods – Communications System
7. Section 16851 – Telephone Subsystem – Communications System
8. Section 16852 – Public Address Subsystem – Communications System
9. Section 16853 – Visual Message Board Subsystem – Communications System
10. Section 16854 – Fire Alarm Subsystem – Communications System
11. Section 16855 – Intrusion Alarm Subsystem – Communications System
12. Section 16856 – Closed Circuit Television – Communications System
13. Section 16869 – Fare Collection Local Area Network – Communications System
14. Section 16876 – Grounding and Bonding – Communications System
15. Section 16877 – Communications Transmission Subsystem – Communications System
16. Section 16879 – Power Supplies and Distribution – Communications System
17. Section 16897 – Manuals and Training – Communications System
18. Section 16899 – Technical Support and Spares – Communications System

1.2 REFERENCED STANDARDS

A. American Society for Quality
1. ASQ Z1.11 – Quality Management System Standards - Requirements for Education Organization
2. ASQ Z1.11 – Quality Assurance Standards

B. Institute of Electrical and Electronic Engineers (IEEE)
1. IEEE 200 - Reference Designations for Electrical and Electronics Part and Equipment

C. Military Standard
1. MIL-STD-1472F - Human Engineering

1.3 SUBMITTALS

A. Design Review Submittals – General Requirements
1. This subsection defines the minimum set of design reviews to be conducted by the Contractor, and the minimum information and process requirements for Authority reviews.
2. Design Review Submittals shall be submitted to the Authority and shall consist of a complete design description, including detailed Drawings, Specifications, and Submittals of all subsystems and elements within the subsystem. Each calculation, test procedure, Final Design Review drawing and submittal shall be reviewed, signed and sealed by a Licensed Texas Professional Engineer. The final design document shall contain sufficient details for construction.
3. Contractor shall include in each submittal phase all materials, equipment, assembly
and installation required to carry out the functions and purposes indicated in these Specifications, and to make the system suitable for the purpose for which it is intended, whether or not such materials, equipment, assembly and installation are specifically indicated in the requirements of these Specifications.

4. The design proposed by the Contractor shall be subject to Authority approval. The Authority may disapprove the proposed design if it fails in any way to achieve the result intended by the requirements of these Specifications or is not in accordance with sound engineering principles. If the design or any portion of the design is disapproved by the Authority, the Contractor shall revise the design until it meets with Authority approval in accordance with the requirements of these Specifications.

5. No Authority approval or disapproval, or failure to approve or disapprove shall relieve the Contractor of any responsibilities under this Contract including the responsibility to provide a sound and practicable system design, suited for the intended purpose outlined in these Specifications.

6. Where requirements posed by individual subsystems, as defined in other sections of these Specifications, are different or greater than those specified in this subsection, those other requirements shall be deemed to augment the requirements specified herein.

7. Design Review requirements for each submittal – Preliminary and Final – are defined within the individual subsystem Specification Sections. Preliminary Design Review (PDR) packages shall be individual submittals for each subsystem, where the Final Design package is one complete submittal sufficient to provide all the required details for construction, overall system integration, and operation.

8. Contractor shall order the designated equipment and material only after Authority approval of the individual subsystem PDR submittal which includes design, calculations, operation, as well as the entire product data for that subsystem.

B. Preliminary Design Review Technical Requirements

1. Contractor shall submit PDR packages to satisfy the requirements outlined herein and the subject subsystem section of these Specifications. Communications PDR packages shall be required for the following subsystems:

a. Communications Facilities
b. Communications Interface Cabinets (CIC)
c. Communications Cable
d. Power Cable
e. Fiber Optics Cable Subsystem
f. Telephone Subsystem
g. Public Address (PA) Subsystem
h. Visual Message Board (VMB) Subsystem
i. Fire Alarm Subsystem
j. Intrusion Alarm Subsystem
k. Fare Collection Local Area Network (LAN)
l. Communications Transmission System (CTS)
m. Power Supplies and Distribution
n. Control Center Modifications
o. Supervisory Control and Data Acquisition (SCADA) Remote Terminal Units (RTU)
p. Miscellaneous Items
q. CCTV Subsystem

2. Each PDR package shall be organized to include the following headings and information:

a. PDR package Purpose and Scope: A brief description and introduction of the package.
b. Reference Material: List of relevant references and standards.
c. Specification compliance matrix table: Acknowledging and referencing the Contractor’s conformance to each technical requirement clause of every subsystem specification section.
d. Design Description: As a minimum shall include the subsystem description, detailed design and interface information, all performance, functionality and operational description, as well as details such as the cable and equipment identification.

e. Interface Requirements: Contractor shall identify all required interfaces with other communications and non-communications systems and subsystems. This section of the PDR shall include:

1) Interfaces between Work performed under this Contract and any other Communications contracts. For example, Supervisory Control Software, Control Center provisioning, Alarm Points and any other required interfaces.

2) Interfaces between the subsystems defined under this Contract. Examples are CTS and Fare Collection LAN, Telephone and CTS, and all the other required interfaces defined in these Specifications.

3) Identification and description of any required hardware and software modifications, or additions to existing subsystems equipment.

4) Identification of all external interfaces, including those to facilities and equipment provided by others. Interface examples include power, cable facilities, discreet signals, voice, and data.

5) Interfaces between the systems defined under this Contract. This includes Communications, Signals and Traction Electrification System (TES).

f. Equipment List: Contractor shall submit a table or list of model and part numbers for all proposed equipment and materials to be used for individual subsystems. Include the expected lead-time for each item while identifying in boldface type the equipment with greater than 30 days lead time. The table or list shall be grouped for each subsystem with functional descriptions of equipment or material included. Quantities and locations shall be included.

g. Product Data Sheet: Contractor shall submit product information in sufficient detail to determine if the component meets these Specifications.

h. Calculations: Contractor shall provide all the required signed and sealed calculations as outlined in the subject subsystem section.

i. Phasing and Cutovers: Identification and description of all major system cutover events or integration activities describing techniques, methods, duration and procedures.

j. Certifications, Registration, and Resumes: Contractor shall provide a copy of all the required certifications, registrations and resumes as outlined in the subject subsystem section.

k. Drawings: Electrical, mechanical, block and functional diagrams with corresponding parts list.

C. Final Design Review (FDR) Technical Requirements

1. Contractor shall submit one complete FDR package no later than 60 days after Authority approval of all the PDR submittals. The FDR submittal package shall not be submitted until the Authority approves all the individual PDR submittals.

2. The FDR Submittal Package shall be organized to include the following final design information:

a. Authority approved and updated versions of all previously submitted design review materials. Updated material shall represent complete design, final calculations; detailed product and component level parts list, drawings, phasing and interface details required for construction. All the new and revised sections
of the subsystem PDRs shall be marked with revision bars to reflect the changes.

b. Updated product submittals for all, materials and components for which product submittals were not previously submitted and Authority approved.

c. Complete Drawing index.

d. Complete cable identification and equipment labels.

e. Complete wiring diagrams for all equipment to be installed, modified, upgraded, or interfaced to under this Contract.

f. Top level mechanical drawings, if applicable.

g. Grounding details.

h. Power panel schedule and distribution.

D. Installation Work Plans and Detailed Documentation

1. Complete installation Work Plan and detailed documentation and drawings shall be submitted no later than 60 days prior to the scheduled installation date for each location and each subsystem.

2. Installation detailed documentation applicable to a subsystem shall not be submitted prior to Authority approval of the FDR submittal.

3. The Installation Work Plan package shall be organized to include the following headings and information:

a. Scope and description of Work

b. Prerequisites

c. Tools

d. Installation staff and their roles

e. Safety rules, regulations, procedures, and requirements

f. Permits, traffic plans, licenses, training including confined space, and certifications.

g. Planned access dates and times for each location, and the Authority resources required for each location and Operational Impact.

h. Daily Preparation and Clean-up Procedures.

i. Storage, staging facilities, security, and the overall job-site security.

j. Installation procedures shall include each subsystem hardware and software components including any software and configuration settings and changes.

k. Installation drawings:

1) Corresponding subsystem design review drawings with updates and details. Include detailed physical layout drawings with material list keyed to the layouts.

2) Cable and conduit schedules that show exactly where each cable is to be installed. Include and identify raceways, cable trays, conduit, junction boxes, pull boxes, manholes, hand-holes, and floor boxes.

3) Cable and wiring connectors and terminal assignments.

4) Wiring diagrams to include terminal blocks, power panel details, Local Distribution Frames (LDF), Main Distribution Frame (MDF), and any additional wiring required for a complete design.

5) Names and labels for all equipment including every wire, cable, connector, terminal and rack.

6) Electrical power diagrams and panel and power strip schedules.

7) Mounting, securing, and installation details for all equipment and materials.

8) For racks in which equipment will be installed,
rack face elevations with all intra-rack and inter-rack wiring and cabling to be installed.

9) Power connections, panel schedules and grounding connections.

10) Location of all safety and hazard warning signs and labels.

11) Site Survey detailed information.

E. Product Samples. As required in individual subsystem Specification Sections or where requested by Authority.

F. Testing and Inspection

1. A Test Program shall be submitted no later than 60 days after Authority approves FDR, outlining the Contractor’s overall testing strategy and schedule.

   a. The program shall include a list of all tests to be performed for all subsystems and integral equipment and materials to meet the requirements of these Specifications.

   b. The program shall include individual subsystem test plans.

   c. Contractor shall provide:

      1) Qualified personnel throughout all the required troubleshooting activities that may involve Communications System equipment provided under this Contract.

      2) All the required testing activities specified in these Specifications, specifically those defined under Communications subsystems test requirements including the System Integration tests.

   d. At a minimum, the test program shall cover the following testing activities:

      1) Factory Testing

      2) Inspection

      3) Field Equipment and Subsystem Testing

      4) End-to-End Acceptance Test

      5) System Integration Test

   e. The test program shall include a list of all the required tests per subsystem, to be performed in order to meet the requirements of these Specifications. This list shall be organized to include:

      1) Type of test

      2) Tools and Test Equipment

      3) Prerequisites

      4) Pass and fail criteria

      5) Personnel and laboratory requirements

      6) Required Cutover, Phasing

      7) Expected Impacts (Outages, Operational, Environmental, Traffic, and Revenue) and recovery Plan when required

      8) Authority resources

      9) Scheduled date and expected duration

      10) Additional comments and notes

2. Test and inspection procedures shall be submitted no later than 60 days prior to the scheduled activity. All the required test and inspection procedure submittals shall be detailed and organized to be consistent and include, but not be limited to the following headings and information:

   a. Scope and Purpose: Clearly state the scope, case, and conditions the procedure tests.

   b. Prerequisites: Describe test environment and the prerequisites, including access, availability, and equipment configuration for each group of functions.

   c. References.
d. Tools: List test equipment and tools, with calibration data for each item.

e. Personnel: List test participants and roles.

f. Procedure: Contain enumerated step-by-step procedures. This shall include regression test and Pass and Fail Criteria.

g. Drawings: Include detailed drawings depicting test setup. This shall include list of equipment, parts and material used and tested.

h. A Test Data Form that includes space to record the tools with calibration date, environmental condition during the test, i.e., rainy, cloudy, and temperature, test measurement, pass and fail criteria and space to record the pass and fail outcome and the signature of the test engineer and a test witness.

i. The Test Exception Form shall be used to record the identifier of the defect report and problem report generated as a result of faults or problems detected during the test. All the troubleshooting techniques and corrective actions shall be documented on this sheet.

G. Test and Inspection Records and Reports

1. All test and inspection records and reports shall be submitted within one week of completion of the corresponding test.

2. Test and inspection records shall be reviewed, signed and sealed by a Licensed Texas Professional Engineer to certify adherence to design requirements and standards.

3. Test and inspection report submittal shall be organized to include the following headings and information:

   a. Purpose/Introduction: Defines the submittal scope.

   b. Test/Inspection Results Summary: Including measurements, results, problem areas, workarounds, troubleshooting, and exceptions.

   c. Open Items: Identify any open items requiring resolution. Include the corrective action to resolve the open items.

   d. Conclusion: This Section shall document the Professional Engineer’s review and how the test and inspection meets the system design and performance requirements outlined in these Specifications.

   e. Completed Test and Inspection Records: Completed, signed, and dated test/inspection procedure sheets, as well as a defect/problem report for each fault/problem found during the testing.

H. As-Built Documentation

1. As-Built versions of the following documentation shall be signed and sealed by a Licensed Professional Engineer, who is registered in the state of Texas, and provided in accordance with these Specifications and as outlined herein for the communications system:

   a. Equipment inventory, with serial numbers including delivered, installed and spares.

   b. Drawings as a minimum shall include the ones submitted under FDR, installation and test procedure documents. The As-Built drawings shall be numbered and grouped in accordance with Authority standards for Communications System.

   c. Final software data and source codes.

   d. Final equipment configuration, provisioning, programming and settings.

   e. Technical Specification to reflect the final system design implemented in the field.

1.4 QUALITY ASSURANCE

A. Comply with:

1. Applicable Standards and Codes

2. IEEE 200
B. Material and Workmanship Requirements:

1. Requirements shall be provided as described in each Specification Section.

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIALS

Not Used

2.2 CONTRACTOR FURNISHED MATERIALS

Not Used

PART 3 - EXECUTION

3.1 INSTALLATION AND GENERAL DESIGN REQUIREMENTS

A. Information regarding Authority facilities and space in Authority facilities is provided in the Contract Drawings.

B. Environmental conditions to which equipment shall be designed is defined in these Specifications.

C. Operation and Maintenance

1. Operating and maintenance safety shall be the highest consideration in equipment and subsystem design, construction, and installation.

2. Human Factors for both operation and maintenance, equipment configuration and positioning shall:
   a. Support the reach and view of a person the size of the 5th percentile female, as defined in MIL-STD-1472.
   b. Fit a person the size of the 95th percentile male, as defined in MIL-STD-1472.
   c. User interface equipment and characteristics such as display devices, preferred viewing angles, lettering, control devices and their tactile characteristics, indicators, use of colors, and use of audible indicators shall be consistent with MIL-STD-1472.

3. Where applicable, equipment and design shall comply with ADA requirements.

D. Continued Operation of the Existing Light Rail System

1. The Authority Light Rail System conducts Revenue Operations between the hours of 3:00 AM and 1:00 AM, 7 days a week. The existing Communications and Central Control System is in use 24 hours per day, 7 days per week.

2. Installation, replacement, testing or modification of equipment or software during implementation of the new Communications System shall not disrupt continued operation of the Light Rail System, including operation of the Supervisory Control System (SCS).

3. During revenue or non-revenue hours, any disruption to the existing Communications and Central Control System shall be minimized.
   a. To the extent possible, no more than a single node shall be unavailable through the existing Communications and Central Control System at any point in time without the prior Authority approval.

4. Track access time is limited and shall be coordinated and approved through the Authority’s track allocation request process. Contractor shall follow Authority’s rules for access to and working in any rail operating territory.

5. Any work that could potentially interfere with the operating systems shall be coordinated and approved through the Authority’s track allocation request process. Contractor shall follow Authority’s rules for access to and working in any rail operating territory.

E. Design Review Meetings

1. Preliminary Design Review
   a. Contractor shall conduct a formal review of the PDR Submittal with the Authority.
   b. The review shall be conducted no less than 21 days, but no more than 45 days following an Authority “Approved” or “Approved As Noted – Confirm” status of all the PDR submittals.
   c. The meeting minutes shall be submitted by the Contractor to the Authority for concurrence no later
than 7 days after the PDR meeting.

2. Final Design Review
   a. Contractor shall conduct a formal FDR Submittal review with the Authority after the approval of all PDR submittals.
   b. The review shall be conducted no less than 21 days, but no more than 45 days following an Authority “Approved” or “Approved As Noted – Confirm” status of the FDR.
   c. The meeting minutes shall be submitted by the Contractor to the Authority for concurrence no later than 7 days after the FDR meeting.

F. First Article Inspections
   1. First Article Inspection (FAI) shall be performed by the Contractor for each subsystem and component that is custom-built, custom-assembled, or generally not accepted as a commercial off-the-shelf item or assembly. Examples of items for which an FAI should be performed include Communication Facilities and pre-wired Communications Interface Cabinets.
   2. The purpose of each FAI shall be to:
      a. Determine, based on inspection, measurement, and basic operation, whether the layout and mechanical aspects of the unit under inspection, e.g., Communications Facility, are consistent with Authority approved drawings, requirements of these Specifications, and other design documentation. If not, the subject unit shall be re-assembled and the FAI repeated. Where maintainability, e.g., accessibility, safety, status indicators, power indicators and control and exposure to power connector, are present in the unit, assessment of those maintainability aspects shall be included in the FAI.
      b. Determine whether an acceptable level of workmanship that is consistent with approved workmanship standards and practices, is present in the initial copy of the unit under inspection. Where wiring, wiring connections, cabling, cable management, labels, tags or grounding connections are present in the unit under inspection, the workmanship standards, practices and procedures associated with the respective element shall be included as part of the FAI.
      c. Determine whether an acceptable level of operating and maintenance safety is provided in the initial product submittal. If not, the unit shall be re-designed and re-assembled.
   3. For each subsystem and component, the FAI shall be conducted at the earliest possible time in the manufacturing stage.
   4. Contractor shall notify the Authority at least 21 days prior to each FAI so that the Authority may be present.
   5. The Authority may request a FAI on any subsystem or component at no cost to Authority. For those subsystems or components where the Authority requires a FAI:
      a. The Authority shall approve the level of workmanship deemed to be acceptable.
      b. The following, applicable to the subject subsystem or component, shall be available at the time of the FAI:
         1) Authority approved drawings and other design documentation
         2) Subsystem or Component Parts List
         3) Manufacturing and Quality Assurance Inspection Records
         4) Test Plan and Procedures
         5) Tools and staff to make measurements
         6) Tools and staff to remove covers and perform limited disassembly
3.2 TESTING AND INSPECTION

A. General

1. This subsection and the following subsections include basic testing requirements. Where requirements for these activities are present elsewhere, the requirements specified in this Section shall be augmented by those additional requirements.

2. Contractor shall:

a. Be responsible for successfully completing all tests required by these Specifications.

b. Provide all test instruments and any other materials, equipment and personnel needed to perform the tests.

c. Be fully responsible for the replacement of all equipment damaged as a result of the tests, and shall bear all associated costs.

d. Maintain comprehensive records of all tests.

e. Notify the Authority in writing, no less than 21 days prior to each test activity.

f. Provide test plans, procedures, records and reports for Authority approval.

3. The Authority reserves the right to:

a. Witness any and all tests and inspections required by these Specifications.

b. Inspect test records at any time.

c. Perform additional testing, beyond that specified herein, of any equipment or material at any time to determine conformance with these Specifications. Additional Authority testing is not to be considered as a replacement for any Contractor required testing or manufacturer producing materials for the Contract required testing.

B. Factory Testing

1. Contractor shall notify the Authority at least 21 days prior to each Factory Test so that the Authority may be present. Factory testing shall be conducted for:

a. All equipment provided for and installed under this Contract.

b. All components installed, integrated, and operated as a subsystem (to be tested as a subsystem).

2. Subsystem factory testing shall occur only after FDR submittal package approval for that subsystem.

3. Factory testing for a subsystem must be successfully completed prior to shipping any equipment for that subsystem to the Authority.

4. If the equipment for a location is assembled at the factory, factory testing for that equipment shall be conducted after all the racks and other subassemblies are integrated and rack interconnections are in place.

5. In order to show proper operation of all aspects, behavior, and characteristics, minimum requirements for equipment testing include:

a. Manufacturer’s Recommended Testing.

c. Power-up Testing.

d. Equipment burn-in of 72 hours, with concurrent operation of the equipment, for the full burn-in period.

e. After burn-in, comprehensive functional testing, including testing of all controls and indicators.

f. After burn-in, comprehensive diagnostic testing.

g. After burn-in, comprehensive performance testing.

h. After burn-in, comprehensive external interface testing, including verification of:

1) Electrical Interface

2) Functional Interface
3) Mechanical Interface

6. Minimum requirements for subsystem testing include:
   a. Comprehensive Functional Testing
   b. Comprehensive Performance Testing
   c. Comprehensive External Interface Testing, including verification of:
      1) Electrical Interface
      2) Functional Interface
      3) Mechanical Interface
      4) Rack-to-rack Interconnects

C. Installation Inspection and Test

1. Pre-Installation inspection shall include inspection for:
   a. Missing components and parts
   b. Correct serial numbers
   c. Damage to equipment
   d. All installed equipment shall undergo as a minimum, inspections for:
      1) Conformance to standards, methods, and quality
      2) Correct location, positioning, mounting, orientation, and labeling
      3) Damage to equipment
      4) Correct and secure external connections
      5) Correct and secure routing of cable and wires
      6) Correct and secure internal connections
      7) Proper grounding
      8) Verification of all configuration data and setting
      9) Correct labeling

D. Field Equipment and Subsystem Testing

1. The following equipment field tests shall be performed for all installed equipment. Additional field tests for each subsystem, listed in the subsequent subsections shall not be construed to limit or otherwise relieve the Contractor of the responsibility for performing comprehensive field testing of the following:
   a. Basic equipment operation
   b. Functional and performance testing
   c. All external interfaces such as mechanical, electrical, and functional
   d. Operation in the presence of equipment and software failures
   e. Operation in the presence of power failure and restart

2. Subsystem testing shall include:
   a. Tests for proper local operation
   b. Tests to confirm the installed equipment or subsystem meets performance requirements
   c. Validation of all data used to configure or operate the subsystem

E. End-to-End Acceptance Testing

1. To be defined within respective System Testing Section.

F. Support For Authority’s Systems Integration Testing

1. System Integration Testing (SIT) shall be conducted in accordance with Authority requirements.

2. Upon turn-up, interface, and integration of all required individual subsystems required for each line section cutover, the Contractor shall provide technical support for the Authority’s SIT. Technical support shall include providing engineer, technician, and installation staff, as well as tools, appliances, fixtures, expendable materials, supplies, and test equipment as needed to perform the SIT procedures or to develop and implement required corrective actions on the Contractor’s elements.
3. This testing shall involve the interaction of the Communications System operating with one or more other sub-systems and will be required through System Final Acceptance.

4. SIT shall include testing of all communications subsystems added to, modified, or integrated as a result of work performed under this Contract and integrated or interfaced to any other contract. Subsystem integration testing shall include:
   a. SCS indications and controls between intended field and control locations
   b. CTS node integration
   c. Proper operation and reporting between Fire Alarm Control Panel IP Communicators and IP Receiver (DACR) at the OCC from field transmitter sites and all other Fire and Intrusion subsystem indications.
   d. Proper local and remote operation of Station PA and VMB messaging and CCTV monitoring.
   e. Proper operation of all voice circuits
   f. Proper transport and operation of Signaling controls and indications
   g. Proper transport and operation of Traction Power Substation (TPSS) controls and indications
   h. Proper transport and operation of Fare Collection data and indications

5. Contractor shall verify the accuracy of the as-built documentation for each equipment location.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work described in this Section shall be full compensation for providing and installing the Communications System complete in place as specified including finalizing design, shop drawings, submittals, testing, and inspection; and for all Work as described in the Contract Drawings and in this Section and related Specification Sections; and for all operations, materials, tools, labor, equipment, and incidentals required to complete the specified Work.

4.2 PAYMENT

A. The Work described in this Section will be paid as a lump sum.
SECTION 16837
MISCELLANEOUS COMPONENTS AND PRODUCTS - COMMUNICATIONS SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section describes the detailed technical requirements for the Miscellaneous Components and Products to be designed, provided, installed, and tested under this Contract. Scope of work for the Authority Light Rail Communications System includes:

1. Contractor shall design, provide, install and test all Miscellaneous Components and Products to complement the communications subsystems as specified in these Specifications.

1.2 REFERENCED STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM)

1. ASTM B3 - Standard Specification for Soft or Annealed Copper Wire

B. International Organization for Standardization

1. ISO 9001 – Quality Management Systems - Requirements

C. National Fire Protection Association (NFPA)

1. NFPA 70 - National Electrical Code (hereinafter referred to as NEC)

2. NFPA 255 - Standard Method of Test of Surface Burning Characteristics of Building Materials

D. Telecommunication Industry Association (TIA)/Electronic Industries Alliance (EIA)

1. TIA/EIA-606 – Administration Standards for Commercial Telecommunications Infrastructure

E. Underwriters Laboratories (UL)

1. UL 497 – UL Standard for Safety Protectors for Paired-Conductor Communications Circuits

PART 1.3 SUBMITTALS

A. Submittal format and content shall comply with the
general requirements of these Specifications, as
well as the specific technical requirements further
listed in this Section.

1. Manufacturer Qualifications: Any manufacturer differing from those specified
herein shall require a prequalification and
Authority approval. Acceptability of the
manufacturer shall be based on the
manufacturer’s experience, qualifications,
certifications (i.e. ISO-9001), equipment
reliability, compliance with standards
specified herein, and full compatibility with
the Authority’s current system.

2. Preliminary Design Review (PDR) Technical Requirements. Contractor shall include the following information as part of the PDR submittal package for the Miscellaneous Components and Products:

a. Product data including description and model number, catalog cuts and technical literature.

b. Design calculation for cable tray fill capacity per Specification requirement.

c. Communications Facilities Local Distribution Frame (LDF) mounting and equipment layout (on LDF).

d. Equipment cabinet and rack details.

e. Cable, wire and equipment tagging software, material and type schedule per Article 2.2 of this Section.

3. Final Design Review (FDR) Technical Requirements. Contractor shall include the following information as part of the FDR submittal package for the Miscellaneous Components and Products:

a. Updated PDR information. All drawings, calculations and design information shall reflect a final design.

b. Final equipment layout and mounting details.
4. Installation Work Plan. Contractor shall submit the following installation document for each site no later than 60 days prior to the scheduled installation activities. The installation work plan shall include:
   a. Equipment layout and plan views.
   b. Conduit installation to LDF.
   c. Wiring diagrams to LDF including all tagging identifiers.

5. Calculations and Certifications
   a. Calculations as listed in the PDR and FDR.
   b. Certifications: Copy of the following certifications shall be included:
      1) ISO certification for all proposed manufacturers.

6. Product Samples: Product samples shall be provided and demonstrated when requested by the Authority.

8. Test Records: Not required.

9. As-Built Documentation: Contractor shall submit complete As-Built documentation and drawings for all Miscellaneous Components and Products. Reference Section 01785, “Project Record Documents”.

1.4 QUALITY ASSURANCE

A. Applicable Standards and Codes
   1. Contractor’s design and installation shall comply with all applicable Standards and Codes as listed herein.
   2. All equipment and methods shall comply with the latest version of codes and standards as applicable in Article 1.2, Referenced Standards.

B. Material and Workmanship Requirements
   1. All equipment provided under this Section shall be UL listed.
   2. All products specified herein shall be subject to the Authority’s approval based on the Contractor’s ability to demonstrate adherence to the specified requirement and approval of the manufacturer’s quality process.

3. Discontinued product models, refurbished equipment, or products scheduled for either end-of-life, end-of-sale, or end-of-service within one calendar year of the installation date shall not be allowed.

4. All grounding shall be in accordance with the NEC, and specifications required by this Contract except as modified herein. Each piece of equipment shall be grounded in accordance with the recommendations of the manufacturer.

PART 2 - PRODUCTS

2.1 CIRCUIT BREAKERS, FUSES, AND FUSE CLIPS

A. Capacity: Fuses and circuit breakers shall be suitable for protection of the equipment and cabling connected.

B. Fuse Type
   1. Fuses shall be non-renewable time lag fusion type.
   2. Protective resistance shall be used in branch circuits.

C. Fuse Clips: Positive contact pressure shall be applied to the fuses to ensure electrical continuity.

2.2 TAGGING

A. Cables and Wires
   1. Contractor shall install cable identification tags at both ends of each cable, including wires, where they terminate on terminals, punch-down blocks, and connectors. Communications cable identifiers shall comply with standard TIA/EIA-606. This includes all electrical power wires and cable for communication facilities and equipment.

   2. Contractor shall tag all cables at the entrance and the exit of each manhole, pullbox, handhole, junction box, splice-box, cable trough, or fiber-slack enclosure. Contractor shall tag all conduits as required in these Specifications.

   3. Contractor shall use water-resistant identification tags with lamination over its designation for all cables and wires. Permanently typed lettering shall be used.

   4. Contractor shall use sleeve type non-metal tags where cable diameter permits.

   5. Contractor shall use flat plastic tags for smaller cables as follows: Two holes in the
tag shall be provided for attachment with a dielectric tie.

6. Contractor shall purchase, populate, and deliver a dedicated cable-management software, including software license, to provide Class 4 administration of the communication cables per standard TIA/EIA-606. Prior to submitting, verify software compatibility with the Authority. The software shall be able to produce the following types of schedules:

a. Typed wiring interconnect schedule for all external and internal wires and cables listing wire (cable) tag identification, To and From locations, To and From termination terminals, wire (cable) size and type.

b. Typed wiring interconnect schedule for each location and each facility for the entire project.

c. Typed schedule of conduits, wires, or cables to include quantity of each.

7. Contractor shall submit typed schedule per items a, b, and c above for approval.

8. Contractor shall submit a complete list of cable and wire identification tags. The tags shall follow the sample format in the paragraph below. Each cable and wire shall have its own unique identification tag. If a wire is not terminated, then tag it “spare-1”, “spare-2”, “spare-3”.

a. Tag Scheme for External Cable:
   18P-COM-FDP / PPK-TPS-FDP–FS12-01
   1) 18P represents originating location (18th Place)
   2) COM represents originating facility type (Communication)
   3) FDP represents originating termination cabinet/panel (Fiber Distribution Panel)
   4) “/” represents “to”
   5) PPK represents ending location (Plano Parkway)
   6) TPS represents ending facility type (Traction Power Substation)
   7) FDP represents ending termination cabinet/panel
   8) FS12 represents cable type (Fiber Singlemode 12 strand)
   9) 01 represents cable number (01 through 99)

b. Tag Scheme for Internal Cable, PPK-COM-LDF / RTU-CAT5-01
   1) PPK represents Location
   2) COM represents facility type
   3) LDF represents originating cabinet/panel
   4) “/” represents “to”
   5) RTU represents ending cabinet, panel, or equipment
   6) CAT5 represents cable type
   7) 01 represents cable number (01 through 99)

c. Tag Scheme for Internal Wires and Wires of External Cables.
   1) CAT5-01-LDF-TB2-14 / RTU-TB5-11
   2) CAT5 represents cable type
   3) 01 represents cable number (01 through 99)
   4) LDF represents originating cabinet/panel
   5) TB2-14 represents originating termination block and termination terminal
   6) “/” represents “to”
   7) RTU represents ending cabinet, panel, or equipment
   8) TB5-11 represents ending termination block and termination terminal
B. Equipment

1. Label all terminal blocks, card cages, circuit cards, punchdown blocks, and jack fields. Communications equipment identifiers shall comply with TIA/EIA-606.

2. Permanent lettering scheme shall be utilized.

3. Labels shall be attached with a non-drying adhesive.

4. Contractor shall show the correct communication equipment identifier on every respective equipment drawing and schematic.

2.3 PUNCHDOWN BLOCKS

A. Type

1. Blocks shall be Krone IDC-Type 50 pair punchdown blocks. Blocks shall be configured with 2 columns of 25 pairs of 2 termination clips. Clips shall accept No. 20 AWG through No. 26 AWG insulated wire, and No. 18 AWG through No. 19 AWG bare wire.

2. Clips shall be pre-wired to an Amphenol type RJ21X connector socket, or approved equal.

3. Blocks shall be equipped with a base, standoff bracket, cover, and bridging clips.

B. Base

1. The base shall be impact resistant plastic.

2. Molded fanning strips shall be provided on each side of the split blocks.

3. Permanent numbering shall be applied to the fanning strips.

4. A standoff of 2 inches from the mounting surface shall be provided.

5. A removable cover with circuit designations permanently applied shall be provided.

6. Connector retention screws shall be provided.

2.4 PROTECTED ENTRANCE TERMINALS

A. Design

1. Protected entrance terminals (PETs) shall be used at the input for all signal circuits using metal cable and entering/exiting the facility (e.g. Communications Facilities and CIC). Connectorized PETs shall be used in all applications unless specifically stated otherwise in this Section or on the Contract Drawings.

2. PETs shall have a data throughput of 1 Gbps and clamping speeds of 2-3 nanoseconds.

3. PETs shall have a field splice line side connection stub pre-wired to 3 element (5 pin) protector sockets.

4. Blocks shall be 110 Cat 5/5e rated or approved equal.

5. PETs shall include an integral splice chamber.

6. Protected entrance terminals shall be provided in 25, 50, and 100 pair sizes and fully populated with protector modules as per the application shown on the Contract Drawings.

B. Protector Sockets: Protector sockets shall be UL standard 5 pin sockets, with 2-position (normal and detent) design. In the detent position, the protector shall be retained, the line side shall be disconnected, and the equipment side shall be protected. When fully inserted, the line and equipment side shall be protected.

2.5 MULTI-PAIR PROTECTED TERMINAL BLOCKS

A. Design

1. Multi-pair protected terminal blocks shall be utilized for applications requiring non-connectorized 25 pair or less terminal blocks, as specified on the Contract Drawings.

2. Types and pair counts for terminal blocks shall be in accordance with these Specifications and as shown on the approved Drawings.

3. Terminal blocks shall consist of pairs of brass binding posts imbedded in high impact plastic potted with a high dielectric polyurethane compound.

4. Binding posts shall be pre-wired to 2-element protector sockets. The ground of all protector sockets shall be wired to a common ground terminal.

5. Binding posts shall be equipped with 2 brass nuts and washers. Binding posts shall be sized to accept up to 2 No.14 AWG conductors.
2.6 PROTECTOR MODULES

A. Three Element (5-Pin) Protectors: Protectors shall be solid-state modules with fuses or heat coils specifically designed for lightning protection.

1. Modules shall plug into 5-pin protected entrance terminal sockets.
2. Each module shall protect both halves of a pair.
3. Protector modules shall be UL 497 listed for primary protection.
4. Modules shall have 2 ns to 3 ns response time and support 1 Gbps data transfer rates.
5. Modules shall protect for voltages over 300 V DC.

2.7 LOCAL DISTRIBUTION FRAMES

A. Communication Houses, CIC, Demarcation, and CCTV cabinets LDF per UL: Each LDF shall consist of the following equipment:

1. A wall mounted backboard 4 feet by 5 feet or as shown in Contract Drawings. Utilize 3/4 inch marine grade smooth surface plywood backboard for mounting all equipment described in paragraphs below and as shown in the Contract Drawings. The backboard shall have all finished sides primed and painted white with fire retardant paint that is compatible with wood treatment.
2. Protected entrance terminals fully equipped with protector modules for each active and inactive or unused circuit, as described herein. PET block shall be contained within a separate enclosure mounted on the LDF backboard. Enclosure shall have a fully removable cover in order to provide access to protected terminal modules.
3. A minimum of eight, or as shown on Contract Drawings; 110 Type CAT 6 50-pair connectorized punchdown blocks (as described in Article 2.3) utilizing 25 pair connectors as cross-connects.
4. A 110 Type CAT 6 patch panel for local Ethernet connections between the Ethernet switch and the VoIP phones and fire alarm. Quantity of connections shall at a minimum provide 100% spare capacity.
5. Binding post type terminal blocks shall be provided as described in Article 2.5 of this Section. Quantity of terminal blocks shall at a minimum provide 50% spare capacity.

B. Outdoor Communication Interface Cabinet (CIC) Local Distribution Frame. Each LDF for use in an Outdoor CIC or similar application shall consist of the following equipment mounted to the Lexan panel mounted on the interior side panel of the CIC:

1. One 100-pair connectorized protected entrance terminal contained within an enclosure. Enclosure shall have a fully removable cover in order to provide access to protected terminal modules.
2. A minimum of two 110 Type CAT 6 50-pair connectorized punchdown blocks (as described in Article 2.3) utilizing 25 pair connectors as cross-connects.
3. Multi-pair protected terminal blocks designed for a minimum of 36-pairs of PA speaker connections as described in Article 2.5 of this Section, and as shown on Contract Drawings.

2.8 CABLE TRAYS

A. Cable trays shall be of open ladder type, aluminum, or other suitable material commercially available and providing support spacing and strength of material characteristics equal to or greater than the aluminum.

B. The aluminum ladder type cable tray shall meet the following requirements:

1. Ladder rung spacing shall be approximately 6 inches.
2. Side stringer section shall be a minimum of 0.094 inches.
3. Top and bottom flange section shall each be a minimum of 2 inches.
4. Flange width shall be approximately 0.75 inches.
5. Height of rail shall be approximately 3.375 inches.
6. Rung thickness shall be a minimum of 0.062 inches.
7. Rung bottom width shall be approximately 2.20 inches.
8. Rung top width shall be approximately 0.75 inches.
9. Plastic tray insert barrier to separate power and signal cables.
C. Each cable tray shall be designed and fabricated with sufficient capacity to provide 50 percent of the cross-sectional area as free air space after the full number of cables and wires are installed. Corners shall have a minimum radius of 6 inches, for either horizontal or vertical turns. Sufficient overhead space must be available after installation to permit wires and cables to be inspected. Sufficient cable trays should be installed to allow for one row of racks to be added for future expansion (i.e., if one row is needed, a second cable tray row shall be added. If two rows are needed, a third cable tray row shall be added.

D. Where practical, the tray shall be constructed in straight sections joined with approved couplers. Electrical continuity of the tray shall be maintained across sections by bonding straps.

E. Using the manufacturer's standard, the tray shall be laid out using a minimum number of sections, but providing maximum continuous runs without gaps.

F. All fittings, supports, and accessories shall be provided in accordance with the manufacturer's recommendations.

G. Insofar as practical, cable trays shall be supported by cantilever type brackets in order that the cables can be laid into the tray without pulling.

H. Where the width of the tray, or the loading of cables is such that cantilever supports are impractical, other approved suspension methods may be used, but such application must be kept to a minimum.

I. At least 3 supports shall be provided for each length of tray. Supports shall be evenly spaced insofar as possible; in no case shall the spacing between adjacent supports exceed 5 feet.

J. To prevent damage to cables, no metal edges of any description shall protrude and no sharp corners shall exist in the completed layout.

K. Fiberglass support arms, where required to insulate the cable tray from the equipment racks, shall be flame retardant, reinforced polyester laminate Class "B" 266 degrees F electrical sheet, meeting NEMA GPO-2 requirements.

2.9 EQUIPMENT RACKS

A. Equipment racks shall be 19 inch wide floor mounted aluminum racks with a minimum of 40 rack units height, unless otherwise indicated on the Contract Drawings. The racks shall have EIA-310D standard 1 3/4 inch spaced single side drilled, tapped mounting holes.

B. The racks base shall have a minimum depth of 15 inches, with bolt hole spacing of 12 inches minimum, front to back.

C. Racks shall be painted Benjamin Moore No. 2125-20.

D. Racks shall be equipped with screw clamp connection for grounding.

E. Racks shall be grounded to the Chassis Grounding Bussbar (CGB).

F. Cabinet shelves (both fixed and slide-out type) shall be provided as shown in the Contract Drawings.

2.10 INDOOR COMMUNICATIONS EQUIPMENT CABINETS

A. Design

1. Cabinets shall be designed for server type equipment with the following features:
   a. Continuously welded seams
   b. Gasketed front and rear doors
   c. Steel mesh or fully ventilated front and rear doors

2. Construction. The materials and construction shall be as follows:
   a. 14 gauge or heavier steel frame.
   b. 16 gauge or heavier panels.
   c. 16 gauge or heavier struts.
   d. 16 gauge mounting rails with EIA-310D rack mount standard spaced holes for equipment mounting widths of 19 inches and 23 inches.
   e. Both front and rear doors shall be removable.
   f. Locking front and rear removable doors shall be provided. All keys shall be alike and master keys shall be provided to the Authority.
   g. Communications House cabinets shall be installed on insulating sills as shown on Contract Drawings.
   h. Cabinet shelves (both fixed and slide-out type) shall be provided as shown in the Contract Drawings.

3. Finish
   a. Cabinets shall be painted Benjamin Moore No. 2125-20 "Deep Space" or as directed by the Authority. All
cabinets shall be painted identically.

b. Contractor shall finish inside of each cabinet in flat white enamel.

B. Racks shall be grounded to the Chassis Grounding Bussbar (CGB) as shown in the Contract Drawings.

2.11 MULTI-PAIR DISCONNECT MODULE TERMINAL BLOCKS

A. Design: Multi-pair disconnect module terminal blocks shall be 110 Type CAT 6 Rated or approved equal. Terminal blocks shall provide normally closed 2-piece (line side and equipment side) insulation displacement contacts in 8 to 50 pair modules, as per the application shown on the Contract Drawings. Disconnection of the line side from the equipment side shall be by insertion of a disconnect plug.

B. Performance

1. Contacts shall accept No. 20 AWG through No. 26 AWG insulated conductors.

2. Contact resistance shall be less than $1 \times 10^{-3}$ ohms.

3. Insulation resistance shall be greater than $50 \times 10^{12}$ ohms.

4. Wire retention force shall be greater than or equal to 75 percent of wire breaking force.

2.12 RTU WIRING INTERFACE

A. Contractor shall provide 2 RTU wiring interfaces at each Communication Facility. The wiring interfaces shall be Allen Bradley 40-point feed-through digital interface modules with extra terminals for inputs, type 1492-IFM40F-2.

B. Each wiring interface module (IFM) shall include the following:

1. IFMs with adhesive label cards.

2. DIN rails and mounting panel.

3. Cable management and support hardware.

C. Each wiring interface shall be mounted on the RTU cabinet rack as shown on the Contract Drawings.

PART 3 - EXECUTION

3.1 INSTALLATION

A. General: All parts of the Specifications pertaining to miscellaneous components and products shall be installed by Contractor as specified in this paragraph, or in any other part of this Specification and in accordance with the Contract Drawings.

B. Twenty-Five Pair Connectors

1. Cable Attachment Tool: Twenty-five pair connectors that are attached to cables in the field shall be made-up utilizing a connector attachment tool Manufacturer approved.

C. Terminal Blocks

1. All connections to terminal blocks shall be made in accordance with the connection details approved as a part of FDR or installation work plan. Twisted pair jumper wire shall be utilized for cross-connections.

2. All wiring on terminal blocks shall be neatly bundled, and restrained to prevent tracing wires by pulling.

3. Tags and labels shall be utilized to identify the terminal block designation and the pair number terminated on each terminal.

4. Protected terminal blocks shall be grounded with No. 6 AWG minimum ground wire.

D. Local Distribution Frames

1. Backboard mounting in Communications Facilities.

   a. The S4S plywood backboard shall be firmly affixed to the wall in such a manner that it will adequately support the weight of all equipment and cables that are attached to it. Cable termination and management devices shall be provided and subject to Authority’s approval.

   b. Fire retardant paint shall comply with the requirements of ASTM E84 (NFPA 255) and matching Federal Standard FS-595b, Color No. 27925, (Reference NFPA 255 and NFPA 703) shall be applied to the backboard prior to installation of any equipment.
c. Floor conduit stub-ups shall be extended to 2 feet above finished floor as shown on Contract Drawing.

2. LDF and miscellaneous equipment mounting in CICs shall be as shown on Contract Drawings.

3. Wiring
   a. Each LDF shall be wired in accordance with cross-connect and wire termination plan approved as a part of FDR or installation work plan.
   b. Tags and labels shall be utilized to identify the cross-connect module designation and the pair number terminated on each quick-clip. All tag and label designations shall be transferred to the as-built drawings. Method of tagging and labeling shall be in accordance with Article 2.2 of this Section.
   c. Cables and cross-connect wiring shall be neatly bundled and restrained using Velcro ties.
   d. Distribution frame racks and protected terminal block ground wires shall be grounded to the Communications Facilities, CIC, and Crew Room Chassis Main Grounding Buss bars/Chassis Grounding Buss bars (CMGB/CGB or earth ground buss bar) with No. 6 AWG minimum ground wire as shown on Contract Drawings.

F. Internal Wiring and Cabling
   1. Internal wiring shall be installed in wiring harnesses or cable trays.
   2. Wire and cable shall be secured within ducts or open wire ways to prevent chafing movement.
   3. Strain relief shall be provided where needed.
   4. Wire or cable splices will not be permitted.
   5. All wires and cables shall be fully protected against any contact with any surface other than that designed specifically to support or protect them.
   6. Wires and cables shall be laid in place with sufficient slack at the bends so that wires and cables will clear the inside bend surface of the wire way, thereby preventing the insulation from being crushed.
   7. All wire and cable shall be free of kinks and insulation damage. Wire installation shall not be subject to accumulations of moisture or foreign matter.
   8. Wire and cable dress shall allow for sufficient slack to provide for shock and vibration induced movements, movement of sliding racks, equipment shifting, alignment, cover removal, and component replacement.
   9. Wiring and cabling dress in harness arrangements shall be tied with a high strength approved Velcro type wire-tie.
   10. All wires and cables shall be free from metal edges, bolt heads, and other interference points, and shall have electrical clearance from the covers, regardless of the insulation properties of covers or doors.

PART 4 – MEASUREMENT AND PAYMENT

4.1 GENERAL
   A. The Work specified in this Section will not be measured separately for payment.
4.2 PAYMENT

A. All costs connected herewith shall be considered incidental to the Work specified under Section 16801 “Basic Technical Requirements-Communications System.”

END OF SECTION 16837
SECTION 16838
COMMUNICATIONS FACILITIES – COMMUNICATIONS SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section describes the detailed technical requirements for the Communications Facilities to be designed, provided, installed, and tested. Communications Facilities are labeled into two types. See the Contract Drawings for more details on Communications Facilities.

B. Facilities Definition

1. Communications Facility, Type I – A stand-alone structure, situated near or remote from a passenger station, that will contain all the required communications equipment to service one or more passenger stations, as shown in the Contract Drawings and as described in this Section. Communications Facilities Type I may have two versions of equipment layouts, layouts I-A and I-B as described below:

a. Communications Facility, Type I-A: This Facility is typically remote to the Stations. It shall house the entire Communications node equipment (required for wayside Communications) except for the Public Address (PA), Visual Message Board (VMB), and Fare Collection (FC) equipment. In this configuration the PA, VMB and FC equipment shall be installed in a Communications Interface Cabinet (CIC) at each Station to serve the respective subsystems. Details and layout plans are shown in the Contract Drawings.

b. Communications Facility, Type I-B: This Facility is typically installed at each Station (or within 500 Feet of the Station). It shall house the entire Communications node equipment (required for wayside Communications) including the Public Address (PA), Visual Message Board (VMB), and Fare Collection (FC) equipment serving the respective subsystems at the station. The layout of this Facility (not the structure) is similar to the Communications Facilities TYPE II described herein. Details and layout plans are shown in the Contract Drawings. Type II includes a Communications room built onto the end of a Crew Room building.

c. Communications Facility, Type II – Type II Facility shall be a room within a combined structure to be built as an integral part of a station service building. This room will contain all the required communications equipment to service one or more passenger stations, as shown in the Contract Drawings and as described in this Section.

2. Scope of Work for the Authority Light Rail Communications Facilities includes:

a. Design, provide and install Type I Facilities as described herein and shown on Contract Drawings. Each Type I-A Facility shall be a prefabricated structure of reinforced concrete panels. Each Type I-B Facility shall be constructed on site of same structural materials as the Crew Room building. Each Facility shall be complete with electrical, fire and intrusion alarm and HVAC subsystems. Facilities shall be sized as shown on the Contract Drawings.

b. Type II Facility is a room within a combined electrical/mechanical/communications structure, typically located at aerial stations. The combined structure shall be equipped with normal and emergency power system, fire alarm system and HVAC system as shown on the Contract Drawings. Contractor shall design, provide and install all required communications equipment in accordance with this Section and the Contract Drawings.

c. Communications Facilities, Type I and II equipment shall include Fiber Slack Enclosure (FSE), Fiber Distribution Panel (FDP), Local Distribution Frame (LDF), Uninterruptible Power Supply (UPS), AC Distribution Panel, grounding, static dissipative tile (SDT) floor, and Intrusion Alarm Panel as described in detail in this Section.

d. Communications Facilities, Type I and II shall be equipped with proper fire extinguishers and fire monitoring systems as described in these Specifications specifically Section 16854, "Fire Alarm Subsystem – Communications System", and herein.

1.2 REFERENCED STANDARDS

A. American National Standards Institute (ANSI)

1. ANSI TIA-568 Commercial - Building Telecommunication Cabling Standard
2. ANSI TIA-607 Commercial - Building Grounding and Bonding Requirements for Telecommunications

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM)
   1. ASTM C150 - Standard Specification for Portland Cement
   2. ASTM B3 - Standard Specification for Soft Annealed Copper Wire

C. Institute of Electrical and Electronics Engineers (IEEE)

D. International Organization of Standardization (ISO)
      a. Recommended Practices and Procedures, Quality Assurance (QA) and Quality Control (QC) National Electrical Manufacturers Association (NEMA)

E. National Fire Protection Association (NFPA)
   1. NFPA 70 - National Electrical Code (hereinafter referred to as NEC)

F. National Electrical Manufacturers Association (NEMA)
   1. NEMA CC1 – Power Connections
   2. NEMA FB1 - Fittings, Cast metal Boxes and Conduit Bodies for Conduit and Cable Assemblies
   3. NEMA VE1 - Metallic Cable Tray Systems

G. Underwriters Laboratories, Inc. (UL)
   1. UL 467 – Grounding and Bonding
   2. UL 497 - Protectors for Paired Conductor Communication Circuits
   3. UL 969 - Marking and Labeling Systems

H. Precast / Pre-stressed Concrete Institute
   1. Manual for Quality Control for Plants and Production of Architectural Precast Concrete Products, Latest edition

1.3 SUBMITTALS

A. Submittal format and content shall comply with the general requirements of these Specifications.

1. Manufacturer Qualifications: Any manufacturer differing from those specified herein shall require a prequalification and Authority approval. A manufacturer’s acceptability shall be based on the manufacturer’s experience, qualifications, certifications (i.e. ISO-9001), equipment reliability, and compliance with standards specified herein, and full compatibility with the Authority’s current system.

2. Preliminary Design Review (PDR) Technical Requirements
   a. Contractor shall include the following information as part of the PDR submittal package for the Communications Facilities:
      1) Drawings showing the Facility dimensions, layout (plan and elevations), and external architecture.
      2) Architectural and Construction Details, including Facility drawings.
      3) Calculations signed and sealed by a Texas Licensed Professional Engineer including structural, heating/cooling, and electrical power requirements.
      4) Grounding arrangement such as ground grid and room halo.
      5) Cable Trays and battery racks.
      6) AC and DC power distribution and lighting.
      7) Fire and Intrusion Alarm Subsystems equipment locations. Including the fire extinguisher.
      8) Cable and conduit entrance/exit details.
      9) External interface details for power connections.
      10) Plan and elevation drawings for equipment cabinets, racks and cable trays.
COMMUNICATIONS FACILITIES – COMMUNICATIONS SYSTEM

11) Product specifications for lighting, cable trays, HVAC equipment.

12) Additional product data sheets, as required for subcomponents.

13) SDT data and details.

b. Contractor shall include the following information as part of the PDR submittal package for the Type II Communications Facilities:

1) Dimension drawings, plans and elevations, showing layout of equipment.

2) AC and DC power distribution, including interface details for power connections.

3) Product specifications for all provided materials.

4) Intrusion alarm panel.

5) Product specifications for lighting, HVAC, cable trays and battery racks.

6) Cable and conduit entrance/exit Details.

7) Grounding arrangement such as ground grid, room halo, Chassis Main Ground Buss (CMGB), and Telecommunication Main Ground Buss (TMGB).

8) SDT data and details.

3. Final Design Review (FDR) Technical Requirements: Contractor shall submit 60 days after PDR approval, the following information as part of the Communications Facilities FDR submittal package:

a. Updated PDR information. All drawings, calculations and design information required for the final design.

b. Final and detailed wiring drawings ready for construction and installation.

c. Final equipment list.

d. Final equipment installation details.

e. Final cable and equipment identification.

4. Installation Work Plans: Contractor shall submit the following installation document for each site no later than 60 days prior to the scheduled installation activity. The Installation Work Plan shall include:

a. Site Plans shall include:

1) Drawings showing plan and elevation details of the ductbank, including the manhole and foundation interface.

2) Site plans for the Communications Facilities.

b. Traffic Plan shall include:

1) Planned access dates and times for each location.

2) Traffic control procedures based on size of the facilities with proper city approvals.

3) Jobsite security.

4) Storage/staging facilities.

5) Safety rules, regulations and procedures.

6) Authority resources required.

7) Daily preparation and cleanup procedures.

c. Delivery and Installation Procedures and Inspection Sheets:

1) The procedures submitted shall include descriptions of the equipment used for transport and setting of the Communications Facility, and shall include specific dates for installation of the Facility.

2) Inspection Sheets shall be completed by the Contractor and submitted to the Authority within 7 days after installation of the Facility.

3) Contractor shall develop and submit a Traffic Control Plan for authority having jurisdiction approval.
5. Calculations and Certifications
   a. Contractor shall provide calculations as listed in the PDR and FDR. All calculations shall be signed and sealed by a Texas Licensed Professional Engineer.
   b. Certifications: Copy of the following certifications shall be included:
      1) ISO certification for all proposed manufacturers.
      2) Certificates and permits for all facilities.

6. Product Samples:
   a. Contractor shall provide sample color chips of the facilities finish coat for Authority approval.
   b. Contractor shall provide pictures and facilitate factory visit for a typical sample Communications Facility for Authority approval.

7. Test Plan and Procedures: In accordance with these Specifications, specifically with the format and requirements detailed in Section 16801, “Basic Technical Requirements – Communications System”, as a minimum, the Contractor shall submit, 60 days prior to the scheduled test, the following plan and procedures to satisfy the Communications Facilities testing requirements:
   a. Test Program Plan: Contractor shall include all the required information for the Communications Facilities in the Test Program Plan as outlined in Section 16801, “Basic Technical Requirements – Communications System”.
   b. Factory and Inspection Test Procedure: Contractor shall submit a complete factory test and inspection procedure to satisfy all the requirements outlined in Article 3.2 of this Section.
   c. Field Test Procedure: Contractor shall submit a complete field test procedure to satisfy all the requirements outlined in Article 3.2 of this Section.
   d. End-To-End Acceptance Test: There is no requirement for End-to-End Acceptance Test.
   e. System Integration Test: Contractor shall provide qualified staff to support this test as described in Article 3.2 of this Section. System Integration Test will be directed by the Authority’s System Integration Consultant.

8. Test Records: Contractor shall submit the test records and results for review 14 days after the completion of each test, in accordance with these Specifications.

9. As-Built Documentation: Contractor shall submit complete As-Built documentation and drawings for the Communications Facilities and the contents. Reference Section 01785, “Project Record Documents”.

1.4 QUALITY ASSURANCE

A. Applicable Standards and Codes
   1. Contractor’s design, fabrication, inspection, installation and testing shall comply with all applicable Standards and Codes as listed herein.
   2. All equipment and methods shall comply with the latest version of the Standards as applicable in Article 1.2, Reference Standards.

B. Material and Workmanship Requirements
   1. Contractor shall monitor the fabrication of the Facility to ensure that all structural requirements are adhered to.
   2. All equipment provided under this Section shall be UL listed.
   3. All grounding shall be in accordance with local standards, and these Specifications except as modified herein. Each piece of equipment shall be grounded in accordance with the manufacturer’s recommendation.
   4. Discontinued product models, refurbished equipment, products at their end-of-life, end-of-sale, or end-of-service shall not be used.
   5. All products specified herein shall be subject to the Authority approval based on the Contractor’s ability to demonstrate adherence to the requirements of these Specifications and Authority approval of the manufacturer’s quality ISO-9001 process.

C. Inspection: Contractor shall inspect the Communications Facility prior to shipment to site. Contractor shall notify the Authority at least 21 days prior to this inspection so that an Authority representative may attend.
2.1 TYPE I COMMUNICATIONS FACILITY

A. Structural (excludes Type 1B Crew Building add-on facility)

1. Communications Facility structure shall be fabricated from reinforced concrete panels.

2. Double sealed joints shall be utilized.

3. Walls and roof shall have the following design:
   a. Panels shall have 4 inches minimum thickness.
   b. Panels shall be reinforced with No. 4 rebar and No. 4 welded wire fabric.
   c. Design loading of roof shall be at least 150 pounds per square foot and proper sloping for drainage and loading.
   d. Design loading of walls shall be adequate for 150 mph wind.

4. The floor shall be designed as follows:
   a. Floor panels shall be 8 inches minimum thickness concrete.
   b. Panels shall be reinforced with No. 6 rebar and No. 4 welded wire fabric.
   c. Design loading shall be at least 200 pounds per square foot.

B. Architectural

1. Outside walls (excludes Type 1B Crew Building add-on facility)
   a. Outside walls shall have a uniform, smooth finish. In accordance with the Precast/Pre-stressed Concrete Institute QC Manual referenced in these Specifications.
   b. Walls shall be painted as required by these Specifications utilizing Paint Specification System No. 7. The finish coat color to match Federal Standard 595b, Color Number 20372, Sierra Tan, semi-gloss, or as directed by the Authority. Contractor shall provide sample color chips for Authority approval.

2. Inside Walls
   a. Walls shall be foam insulated to R18, minimum.
   b. A 1/2 inch layer of plywood coated with white fiberglass reinforced plastic shall be utilized as the interior finish.
   c. Studs that measure 2-inch by 4-inch nominal and placed on 16 inch centers shall be utilized to support the inside walls.

3. Flooring
   a. Flooring shall be formed of STD, 1/8 inch thick by 12 inches square, Armstrong Excelon SDT or Authority approved equivalent.
   b. STD adhesive and grounding strips, followed by the tile, shall be placed directly on the concrete floor in the manner and under the conditions recommended by the manufacturer. Tile shall be polished using the SDT polish recommended by the manufacturer. Tile color shall be submitted for Authority approval.
   c. Grounding strips to be grounded to the CMGB in accordance with tile manufacturer’s recommendations.

4. Roof
   a. Roof shall be insulated to R23, minimum.

5. Steps: Reinforced concrete steps shall be provided if the lowest point of the doorway entrance is greater than 1 foot above ground level.

C. Foundation

1. The foundation shall be a monolithic pour for grade beam and slab on ground in accordance with the Standard Drawings.

2. Structural reinforced concrete shall use Mix S-2 or Authority approved equal.

3. ASTM C150 cement shall be utilized.

4. The slab shall be reinforced as shown on the Standard Drawings.

5. At each corner of the slab, a No. 2 AWG bare solid tinned copper ground wire shall be welded to the reinforcing bars. The other end of this ground wire shall be welded to the nearest ground rod as required by these specifications.
Specifications and as shown on the Contract Drawings.

D. Ductbanks

1. Contractor shall provide a ductbank from the Communications/Signals manhole to the Communications Facility penetrations for underground conduits. Ductbank shall be reinforced concrete, Mix M-1 or Authority approved equal.

2. Contractor shall locate a plastic warning tape between the ductbank and the finished grade surface and 12 inches above ductbank.

3. Conduit spacing within the ductbanks shall be accomplished with manufactured plastic conduit spacers.

4. All conduits within ductbanks shall be Schedule 40 PVC. Where conduits transition to occupied spaces (e.g. the Communications Facility), galvanized rigid steel conduits shall be used.

5. Contractor shall submit for Authority approval, a structural drawing showing all rebar placement within each ductbank.

6. The depth of the manhole will vary from site to site. Contractor shall be responsible for the excavation of ductbank as required to interface with the manhole. Contractor shall also provide the interface with the manhole as shown on Contract Drawings.

E. Doors

1. Doors shall be a minimum of 36 inches wide and formed of 18-gauge steel with a 16-gauge steel frame.

2. Doors shall be finished in corrosion inhibiting epoxy, with Authority approved color to match structure exterior.

3. A reinforced lock plate shall be provided with each lock set. Lock sets and cylinders for the Communications Facilities shall match those installed in existing Facilities. Existing cylinders are manufactured by Abloy Security. Refer to Section 08710, "Door Hardware", for keying schedule requirements.

4. Door shall open outward and shall use stainless steel hinges with non-removable pins and vandal-resistant hardware.

5. Doors shall have a drip cap installed at the top of the outside door frame. Drip cap shall have a minimum width of 2 inches and extend past each edge of the door.

F. Address Signage: Communications Facility shall be provided with an address sign on the side of the exterior door for identification.

1. The sign shall have a white, reflective background with 3 inch black lettering. Contractor shall submit sample for Authority approval.

2.2 TYPE I COMMUNICATIONS FACILITY EQUIPMENT

A. Electrical

1. Electric power for the Communications Facility shall be obtained from either a Traction Power Substation (TPSS) or the local electrical utility as shown on Contract Drawings. Contractor shall provide and install the cable and conduit required for the main AC feed to the Communications Facility as shown on the Contract Drawings.

2. Contractor shall equip the Communications Facility with a 120/240 VAC single phase, 125 Amp panelboard. A transient voltage surge suppressor, meeting the requirement of NEC Article 280, shall be provided for the panelboard. A 125 Amp main circuit breaker shall be provided. Provide 30 branch breaker slots with a minimum of 16 breakers equipped. Breakers shall be labeled with the corresponding equipment or system circuit feeds.

3. Duplex receptacles shall be provided at intervals of approximately 6 feet along walls. Electrical boxes shall be in accordance with these Specifications.

4. Interior lighting shall utilize dual LED tube fixtures; 48 inches in length. Fixtures shall be standard T8 type to accept retrofit LED lamps.

a. The light level shall be maximized but in compliance with IECC Green Building Code requirements.

b. A 6-Hour spring-loaded wall timer light switch located adjacent to the door shall operate the fixtures.

5. Exterior lighting shall be LED and utilize E26 standard socket and type A19 or A21 LED bulbs. Exterior lighting shall be in compliance with IECC Green Building Code requirements. The light level at the Communication Facility entrance shall be a minimum of 2 foot-candles.

6. All power cable runs shall be in electrical metallic tubing (EMT) conduit and secured with single hole straps.
7. Two electrotin plated solid copper grounding buss bars, the Chassis Main Grounding Busbar (CMGB) and the Telecommunications Main Grounding Busbar (TMGB), shall be installed at a height of 18 inches, attached with insulated brackets, as required by these Specifications. Equipment, cables, racks, and cable trays, shall be grounded to these buss bars as required by these Specifications and the Contract Drawings.

8. UPS and batteries as required by these Specifications.

9. A separate 120 VAC power panel shall be provided for power output from the UPS. Main lugs rated at 225 Amp shall be provided. Thirty breaker slots shall be provided with a minimum of 12 breakers equipped. All active slots shall be labeled with the equipment to which the circuit feeds. AC power to individual equipment racks shall be individual home runs from the UPS breaker panel, and shall be enclosed in EMT conduit.

10. A Local Distribution Frame (LDF) shall be provided at the entrance way for the cable entrance conduits as shown on the Contract Drawings. The LDF shall conform to these Specifications.

11. Equipment cabinets shall be provided for and equipped complete with communication equipment as required in the Contract. Cabinets shall conform to these Specifications and Contract Drawings.

12. FSE shall be provided as shown on the Contract Drawings. Enclosure shall conform to these specifications.

13. A room halo ground ring shall be provided. The halo shall be made from No. 4 AWG bare stranded copper conductor, and be bonded to the CMGB as required by these Specifications.

14. A 120 VAC battery backup green Light Emitting Diode (LED) type exit light shall be provided and installed over the doorway. The LED lamp life shall be rated for 25 years. The battery shall be a Ni-cad type and shall have 90 minutes capacity.

B. Heating, Ventilation and Air Conditioning (HVAC): The communications Facility shall be equipped with a thermostatically controlled heater and air conditioner sized to maintain temperatures within the Facility in the range of 60 degrees F to 80 degrees F with ambient temperatures in the range specified by these Specifications.

1. The temperature within the equipment cabinets shall not exceed ambient air temperature within the Facility by more than 10 degrees F.

2. The outside of each air conditioner shall be protected with a hinged, heavy gauge, hot-dipped, galvanized vandal-resistant security mesh cage. The cage shall be constructed with a slot on the frame that, when in its closed position, will not pinch the air conditioner’s condensation drainage tube.
   
   a. The cage shall be constructed of an angle iron frame and be enclosed with 1-1/2 inch by 10-gauge steel expanded metal to form a 5-sided box.
   
   b. The cage shall be hinged to swing horizontally open to allow for 90 degrees maintenance access. Prive 2 locking hasps to hold the cage in the closed position. A mechanical device shall be provided for securing the cage in the 90 degrees opened position. Cage design shall allow for a single maintenance technician to gain access and perform any maintenance activity on the HVAC unit. An open HVAC cage shall not impede on the right-of-way.
   
   c. The cage shall be attached to the wall using tamper-proof screw/bolts with anchors cast into the concrete wall during manufacturing to ensure mounting integrity.
   
   d. The cage shall have an oversized width, additional 1-foot minimum, on the hinged right side to accommodate air conditioner maintenance.

3. An exhaust fan with manual and thermostatic control shall be provided. The thermostatic control of the exhaust fan shall prevent simultaneous operation of the fan and air conditioner compressor. The exhaust fan shall include rainhood and controlled louvers with 1/4-inch wire mesh screen. The fan shall have 1000 CFM capacity.

4. All penetrations through the concrete walls shall be sealed to prevent water from entering the Facility.

5. The HVAC system shall provide separate alarm contacts for both high and low temperature, which will be connected to the local RTU and programmed for monitoring. An LED indication shall be provided within the Facility to show when the alarm is active.

6. The HVAC system, upon a Fire Alarm condition as detected by the Facility’s Fire
and Intrusion Alarm Subsystem equipment, shall automatically and within 4 seconds, initiate actions to:

a. Shut off the air conditioning unit(s).

b. Close dampers.

7. The HVAC condensation drain tube shall be installed so that it protrudes out the bottom of the security cage and away from the foundation.

C. Cable Tray: Cable trays shall be provided in accordance with the Authority approved layout plans. Cable trays shall be as required in these Specifications and Contract Drawings.

D. Fire and Intrusion Alarm Subsystems: The Fire and Intrusion Alarm Subsystems, including Fire Extinguisher shall be installed and tested as required by these Specifications specifically Sections 16854, “Fire Alarm Subsystem – Communications System”, and Section 16855, Intrusion Alarm Subsystem – Communications System”.

E. Communications System Equipment: Additional communications system equipment such as CTS, RTU and or PA/VMB cabinets, including all related hardware integral with the cabinets, shall be installed in the Communications Facility as shown on Contract Drawings and as described in these Specifications.

2.3 TYPE II COMMUNICATIONS FACILITIES EQUIPMENT

A. Contractor shall design, provide and install the following equipment at each Type II Facility:

1. UPS and batteries as required by these Specifications.

2. A 120V AC power panel fed from the output of the above UPS. Panel shall have 30 breaker slots and be provided with a minimum of 12 breakers sized as shown on the Contract Drawing.

3. An electrotin plated solid copper grounding buss bar, the Telecommunications Main Grounding Busbar (TMGB), shall be installed at a height of 24 inches, attached with insulated brackets as required by these Specifications

4. Equipment, cables, racks, and cable trays shall be grounded as required by these Specifications and Contract Drawings.

5. A Local Distribution Frame (LDF) shall be provided at the entranceway for the cable entrance conduits as required by these Specifications and as shown on the Contract Drawings.

6. FSE shall be provided as shown on the Contract Drawings. Enclosures shall conform to these Specifications.

7. Fiber Distribution Panel (FDP) shall be provided as required by these Specifications and as shown on the Contract Drawings.

8. A room halo ground ring shall be provided. The halo shall be made from No. 4 AWG bare stranded copper conductor, and be bonded to the CMGB as required by these Specifications.

9. Cable trays shall be provided in accordance with the Authority approved room layout plans. Cable trays shall be as required by these Specifications and Contract Drawings.

10. Equipment cabinets shall be provided for and equipped complete with communication equipment as required by these Specifications and Contract Drawings.

11. Intrusion Alarm Control Panel shall be installed and tested as required by these Specifications, specifically Section 16855, “Intrusion Alarm Subsystem – Communications System”.

12. Fire detection equipment (as an integral part of the combined Facility fire detection system), including the fire extinguisher, shall be provided in accordance with these Specifications.

13. Telephones shall be installed and tested as required by these Specifications specifically Section 16851, “Telephone Subsystem – Communications System”.

14. Finish flooring shall be formed from 1/8 inch thick by 12-inch square static dissipative tile, Armstrong Excelon Static dissipative tile (SDT) or equivalent. SDT adhesive and grounding strips, followed by the tile, shall be placed directly on the concrete floor in the manner and conditions recommended by the manufacturer. Tile shall be polished using the SDT polish recommended by the manufacturer. Tile color shall be subject to Authority approval. Grounding strips to be grounded to the CMGB in accordance with tile manufacturer recommendations.

15. All exposed wiring shall be run in conduits as required by these Specifications.

16. A 120 VAC battery backup green LED type exit light shall be provided and installed over each doorway. The LED lamp life shall be rated for 25 years. The battery shall be a
NiCad type and shall have 90 minutes capacity.

17. Electrical service equipment include the following:
   a. HVAC equipment.
   b. Interior lighting.
   c. Fire Detection and Alarm system.
   d. CMGB and related grounding cables.

B. Communications System Equipment: Additional communications system equipment such as CTS, RTU and PA/VMB cabinets, including all related hardware integral with the cabinets, shall be installed in the Communications Facility as shown on Contract Drawings and as described in these Specifications.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Foundation and Placement of the Communications Facility:
   1. Site preparation shall be as required by these Specifications.
   2. Excavation and backfill for the Communications Facility site shall be as required by these Specifications.
   3. The foundation shall be of depth and size to support the prefabricated shelter. Concrete formwork and concrete reinforcement shall be as required by these Specifications.
   4. The Facility shall be installed level and plumb on the foundation.
   5. Contractor shall provide and install a ballast skirt surrounding the Facility. The skirt material shall be consistent with the ballast used on the Authority Light Rail System as required by these Specifications and in accordance with the Standard Drawings.
   6. A ballast path shall extend from the Communications Facility door to the nearest driveway, parking area, or improved access point. The path material shall be consistent with the ballast used on the Authority Light Rail System as required by these Specifications. The ballast shall be a minimum depth of 6 inches and at least 3 feet wide, and consistent with the other wayside structures sharing the common location.

B. Cable Entrance Conduits
   1. Contractor shall install eight 4-inch schedule 40 PVC conduits from a Communication System Manhole (CSMH) to the Facility, and stubbing up through the Facility floor foundation. As the conduits enter the Communications Facility, the Contractor shall provide a matching coupling and Galvanized Rigid Steel (GRS) conduit above the floor. Contractor shall also provide an additional conduit, for ground conductors, which will pass through the slab and extend approximately 18 inches beyond the edge of the slab. These conduits shall be installed in the pattern provided on Contract Drawings and as required by these Specifications.
   2. The cable entrance conduits shall sweep into the Facility through the foundation. The sweep radius at the entrance conduits shall be greater than the minimum radius required for the fiber optic cable as required by these Specifications.
   3. The entrance conduits shall be encased in a concrete reinforced ductbank as shown on Contract Drawings and as required by these Specifications. Contractor shall provide the interface with the CSMH as shown in Contract Drawings.
   4. Contractor shall seal around the conduits with a permanent, waterproof and fire-stopper sealing compound as required by these Specifications. After all cables have been installed, the Contractor shall fill the conduit openings with fire-stopper duct sealant in order to prevent moisture from entering the Facility.
   5. The cable entrance conduits shall be as required by these Specifications.

C. Grounding
   1. Contractor shall install, as a minimum, one ground rod outside each corner of the Facility, and the connecting ground wire, as shown on Contract Drawings.
   2. Grounding shall be as required by these Specifications and the Contract Drawings.
   3. The electrical power systems shall be grounded as required by these Specifications, and as shown in the Contract Drawings.

3.2 TESTING AND INSPECTION

A. Contractor shall perform the following inspections and tests on all Communications Facilities. The Authority shall be given at least 21 days written notification prior to each test and inspection so that the Authority may be present as desired.
1. Factory Inspection (Communications Facilities, Type I only):
   a. Contractor shall provide Factory inspection procedure for Authority approval at least 21 days prior to scheduled inspection.
   b. Contractor shall inspect the Facility at the Factory for cracks and other damage, and repair as directed by the Authority.
   c. Contractor shall inspect the Facility at the Factory for level and plumb; proper operation of doors and dampers; proper location and installation of HVAC equipment breaker panels, lighting fixtures, electrical outlets, fire and intrusion sensors and equipment; cable trays, and other equipment.
   d. Inspections shall verify:
      1) Conformance to standards, methods, and quality.
      2) Correct location, positioning, seating, mounting, orientation, and labeling.
      3) Secured cable and wire connections.
      4) Proper routing and termination of wire and cable.
      5) Proper equipment grounding.
      6) Correct and complete labeling and tagging of wire, cable, terminal, connectors and equipment.
      7) Conformance to installation requirements.
   e. Contractor shall, 14 days after the completion of an inspection, provide inspection results for Authority approval.

2. Field Inspection
   a. Prior to installation, the Contractor shall inspect, with an Authority Inspector the foundation, conduit stub-ups, and anchors to verify that they conform to Contract Drawings. Discrepancies shall be recorded on a discrepancy list and the Contractor shall immediately submit the list to the Authority and proceed to correct discrepancies.
   b. Field inspection shall include inspection of each installed Communications Facility. Process inspections are required.
   c. The inspection shall confirm that:
      1) The installation drawings and procedures define the installation adequately and in sufficient detail, such that if the procedures are followed, the resulting installation will meet Authority approved standards, practices and procedures for workmanship, maintainability, referenced installation standards, installation requirements, these Specifications, the Contract Drawings, and the installation requirements of local jurisdictions.
      2) Should the Authority decide that the installation drawings and procedures are inadequate; the Contractor shall revise any such drawings and procedures to the Authority’s satisfaction prior to performing installation Work.
      3) The installation drawings and procedures adequately provide for the safety of installation personnel. If not, the installation procedures shall be revised prior to performing installation Work.
   d. Inspection shall verify:
      1) Conformance to installation requirements.
      2) Conformance to standards, methods and quality.
      3) Proper routing and termination of wire and cable.
      4) Secured cable and wire connections.
      5) Proper grounding of all equipment.
      6) Correct and complete labeling and tagging of wire, cable, terminal, connectors and equipment.
COMMUNICATIONS FACILITIES – COMMUNICATIONS SYSTEM

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this Section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith shall be considered incidental to the Work specified under Section 16801 “Basic Technical Requirements - Communications System.”

END OF SECTION 16838
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section describes the detailed technical requirements for the Communications Interface Cabinets (CIC) to be designed, provided, installed, and tested under this Contract. See the Contract Drawings for more details on CIC. Scope of work for the Authority Light Rail Communications System includes:

1. Designing, providing and installing CIC as indicated at locations as shown on Contract Drawings.

2. Contractor shall provide the following equipment and mount it inside the CIC: Station Controller, Public Address (PA) audio, incremental amplifiers and control equipment, Data Switch, Media Converter, fiber distribution panel (FDP), local distribution frame (LDF), local input device, pull-out shelf for laptop computer, Uninterruptible Power Supply (UPS) and power distribution equipment. Contractor shall provide all wiring including between rack equipment and terminal blocks for a complete installation.

3. Contractor shall provide termination and electrical protection for all power, indication, control, audio, and communications cables that enter the CIC.

4. Contractor shall provide Heating, Ventilation and Air Conditioning (HVAC) to maintain the temperature as specified in this Specification, under the ambient conditions specified in these Specifications.

1.2 REFERENCED STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM)

1. ASTM B3 - Standard Specification for Soft or Annealed Copper Wire

B. International Organizations for Standardization (ISO)

1. ISO 9001 - Quality Management Systems - Requirements

C. National Fire Protection Association (NFPA)

1. NFPA 70 - National Electric Code (hereinafter referred to as NEC)

D. National Electrical Manufacturers Association (NEMA)

1. NEMA FB1 - Fittings, Cast Metal Boxes and Conduit Bodies for Conduit and Cable Assemblies

2. NEMA VE1 - Metal Cable Tray Systems

E. Telecommunications Industry Association (TIA)/Electronics Industry Alliance (EIA)

1. TIA-568-C Commercial - Building Telecommunications Cabling Standard

2. TIA 607-B Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises

F. Underwriters Laboratories, Inc. (UL)

1. UL 497 - Protectors for Paired Conductor Communications Circuits

2. UL 969 - Marking and Labeling Systems

1.3 SUBMITTALS

A. Submittal format and content shall comply with the general requirements of these Specifications and the specific technical requirements further listed herein.

1. Manufacturer Qualifications: Any manufacturer differing from those specified herein shall require a prequalification and Authority approval. Acceptability of the manufacturer shall be based on the manufacturer’s experience, qualifications, certifications (i.e. ISO-9001), equipment reliability, compliance with standards specified in herein, and full compatibility with Authority’s current system.

2. Preliminary Design Review (PDR) Technical Requirements

a. Contractor shall include the following information as part of the PDR subsystem package for the CIC:

   1) Drawings showing the communications interface cabinet dimensions, layout (plan and elevations).

   2) All calculations including heating/cooling and power requirements.

b. Equipment arrangement for all equipment racks, including but not limited to, side panels, LDF’s and disconnect switches (e.g. rack face elevation view).
c. Cable and conduit Entrance/Exit details including ID (tagging).

d. Grounding arrangement.

e. Intrusion switch and automatic lighting wiring.

f. Product specifications for HVAC equipment, intrusion device, LDF and switches.

g. External Interface Details for Power Connections.

3. Final Design Review (FDR) Technical Requirements: Contractor shall include the following information as part of the FDR submittal package for the CIC:

a. Updated PDR information. All drawings, calculations and design information shall reflect a final design.

b. Final and detailed wiring drawings ready for construction and installation.

c. Final equipment list.

d. Final equipment installation details.

e. Final cable and equipment ID.

4. Installation Work Plans

a. Contractor shall submit the following installation document for each site no later than 60 days prior to the scheduled installation activity in accordance with these Specifications and the technical specifications. The installation Work plan shall include the following:

1) Drawings showing plan and elevation details of the foundation and the duct bank, including the interface with the manhole.

2) Site plan information shall include site-specific layout (plan and elevation) and detailed grounding drawings for each CIC.

3) Delivery and Installation Procedures and Inspection Sheets: The procedures submitted shall include descriptions of the equipment used for transport and setting of the CIC, and shall include specific dates for installation.

b) Inspection Sheets shall be completed by the Contractor and submitted to the Authority within 1 week after installation of the CIC. The report shall include details of cable terminations and equipment wiring diagrams marked-up with as-wired conditions.

5. Calculations and Certifications

a. Calculations as listed in the FDR.

b. ISO certification for all proposed manufacturers.

6. Product Samples: Product Samples shall be provided and demonstrated when required by these specifications.

7. Test Plan and Procedures: In accordance with the format and requirements described in these Specifications, as a minimum, the Contractor shall submit the following plan and procedures to satisfy the CIC testing requirements:

a. Test program plan: Contractor shall include all the required information for the CIC in the Test Program Plan as outlined in these Specifications.

b. Factory and Inspection Test Procedure: Contractor shall submit a complete factory test and inspection procedure to satisfy all the requirements outlined in Article 3.2 of this Section.

c. Field Test Procedure: Contractor shall submit a complete field test procedure to satisfy all the requirements outlined in Article 3.2 of this Section.

d. End-To-End Acceptance Test: There is no requirement for an End-to-End Test performed on the CIC’s.

e. System Integration Test: Contractor shall provide qualified staff to support this test as described in Article 3.2 of this Section. Authority System Integration group will direct system Integration Test.

8. Test Records: Contractor shall submit the Inspection and Test Records and Results for review 14 days after the completion of each test, in accordance with format described in these Specifications.
9. As-Built Documentation: Contractor shall submit complete As-Built documentation and drawings for the CIC and the contents. Reference Section 01785, “Project Record Documents”.

1.4 QUALITY ASSURANCE

A. Applicable Standards and Codes

1. Contractor’s design, fabrication, inspection, installation and testing shall comply with all applicable Standards and Codes as listed herein.

2. All equipment and methods shall comply with the latest version of the standards.

B. Material And Workmanship Requirements

1. All equipment provided under this Section shall be UL listed.

2. All grounding shall be in accordance with these Specifications, and with the recommendations of the equipment manufacturer.

3. Discontinued product models, refurbished equipment, products at their end-of-life, end-of-sale, or end-of-service shall not be used.

4. All products specified herein shall be subject to the Authority approval based on the Contractor’s ability to demonstrate adherence to the specified requirement and approval of the manufacturer’s quality process (i.e. ISO-9001).

C. Inspection

1. Contractor shall perform a pre-installation inspection for defects and verify that the CIC shall physically and dimensionally support the CIC equipment. This inspection shall take place before the CIC leaves the factory.

2. Contractor shall notify the Authority at least 21 days prior to this inspection so that the Authority representative may attend.

3. Contractor shall inspect the CIC for defects after it is installed in the field. This inspection shall verify proper installation and sealing of the CIC, and also ensure that there are no sharp edges that could pose a hazard to the public or the Authority personnel.

4. Contractor shall check that all cables and wires are properly terminated and the terminations are correctly labeled.

PART 2 - PRODUCTS

2.1 GENERAL DESIGN REQUIREMENTS

A. Physical Characteristics:

1. The CIC shall be a custom enclosure.

2. Rated NEMA 4X.

3. Dimension: 72 inches (Wide) by 74 inches (High) by 30 inches (Deep).

4. Equipped with a BARD CT241-A04 air conditioner, or approved equal.

5. The CIC shall have 2 doors on the front side and 2 doors on the rear side.

6. Doors shall provide seal via foam-in-place gasket, and shall be hinged and equipped with a 3-point lockable handle.

7. CIC shall be fabricated from 12-gauge stainless steel.

8. LDF shall be provided within the CIC for cable termination and circuit protection in accordance with these Specification, and Contract Drawings.

9. FDP shall be provided with a minimum of 48 connections for termination of multimode fiber cables.

10. Lexan Polycarbonate panels, painted white in accordance with these Specifications, specifically Section 09970, shall be provided for mounting manual disconnect switches, LDF, and cross-connect terminal block.

11. Contractor shall install standard EIA-310D racks. Racks shall be zinc-plated steel and located so that equipment does not interfere with cable path to the LDF. Blank panels shall be provided and installed in locations where equipment is not present; as depicted in the Contract Drawings

12. Where access to rack-mounted equipment is not convenient from either the front or rear, a zinc-plated steel pullout shelf shall be provided for that equipment.

13. A zinc plated steel pull out shelf shall be provided for supporting a local VMB input device.

14. UPS support hardware shall be provided.

15. A UL approved rack-mounted power strip and light bulb holder (with light bulbs) shall be provided for each side of the CIC. The light bulbs shall be protected with a heavy-duty wire cage.
16. All cables routed within the CIC shall be organized and routed in conduit or flex tube for cable protection.

17. The inside cabinet floor shall be at least 6 inches above the concrete pad on which the cabinet is located.

18. Power line filter shall be provided for improvement in processor immunity to high frequency noise. Ferrite sleeve shall also be provided for incoming AC power cable to reduce electromagnetic field interference.

B. Painting: Internal CIC members (such as racks, channels, LDF panels) that are not stainless steel shall be painted white with corrosion inhibiting paint in accordance with Specification 09970, “Coatings for Steel”.

2.2 HVAC

A. The CIC shall be equipped with a thermostatically controlled heater, sized to maintain the CIC internal temperature above 50 degrees F with ambient temperatures as specified in these Specifications.

B. The CIC shall be equipped with an air conditioner, which shall provide cooling when the internal temperature rises above 85 degrees F. The cooling device shall be sufficient to maintain cabinet temperature below 100 degrees F, with ambient conditions as specified in these Specifications. The air conditioner condensation drain tube shall be installed so that it protrudes out the bottom of the cage and away from the CIC foundation.

C. Any vents shall include vandal resistant 12-gauge wire mesh screens and rain hoods designed to prevent horizontally driven windblown rain from entering the CIC.

D. The CIC temperature controller shall provide an adjustable high/low temperature alarm. Alarm contacts shall be hardwired to the LDF for monitoring.

2.3 CABLE ENTRANCES

A. The CIC concrete base shall be sealed with fire stop in accordance with these Specifications including around the conduits where they leave the base to stop moisture and fire.

B. The conduit/CIC joint shall be completely sealed where the conduit penetrates the CIC bottom. After all cables have been installed, conduits openings shall be filled with duct sealant in order to stop moisture and fire.

2.4 VANDAL PROTECTION AND SECURITY

A. Steel plates shall be installed as backing to the lockset or hasp.

B. Contractor shall provide locks for each CIC so as to secure the entire cabinet. The locks shall be Abloy Padlocks whose locking cylinders match those used for CIC in the existing Build-Out System. Two keys shall be provided to the Authority for each CIC prior to project closeout. Refer to Section 08710, “Door Hardware” for keying schedule requirements.

C. An exterior skirt located at the bottom of the cabinet between the cabinet floor and the concrete pad shall be provided. The skirt shall be attached with vandal resistant stainless steel fasteners, and be designed to prevent trash from blowing or being forced under the CIC.

2.5 GROUNDING

A. CIC shall be equipped with 2 copper grounding buss bars (for Chassis and Telecommunications grounding) as specified in these Specifications. Buss bars shall be located in the bottom of the cabinet and be mounted on insulators that electrically isolate the cabinet from the buss bars (see Contract Drawings).

B. The grounding buss bars shall each be bonded to a No. 4 AWG copper conductor, which shall be connected to a single point ground grid per Contract Drawings.

C. The CIC shall be equipped with a 3/8-inch high tensile strength bronze stud, which shall be connected to the Chassis grounding buss bar using a No. 6 AWG conductor per Contract Drawings.

D. Internal chassis grounding arrangement shall utilize No. 6 AWG insulated, stranded ground wire connected to the Chassis Grounding Buss Bar (CGB) per Contract Drawings.

E. Ground wire from the station AC supply panel shall be grounded to the CGB using No. 6 AWG ground wire per Contract Drawings.

F. Protected Terminal Block ground shall be connected to the CGB using No. 6 AWG ground wire per Contract Drawings.

G. All electronic equipment signal and telecommunications grounds shall be grounded, using No. 10 AWG insulated stranded copper conductors, to the Telecommunications Grounding Buss Bar (TGB) per Contract Drawings.

H. Shields from signal cables shall be grounded to the TGB in accordance and Contract Drawings.

I. Grounding not described above shall be in accordance with these Specifications.

2.6 TERMINAL BLOCKS

A. Terminal blocks and Protected Terminal Blocks (PTB’s) shall be as specified in these Specifications.
B. Terminal block and PTB types and pair counts shall be in accordance with the approved Contract Drawings.

2.7 **CIC CABINET LIGHTS AND INTRUSION ALARM**

A. Contractor shall provide an interior cabinet light on each side of the CIC enclosure. Each light shall turn on when the corresponding door is opened and turn off when it is closed.

B. Contractor shall provide a simple intrusion detection circuit that shall utilize magnetic switches and be activated when any panel door is opened. Dual dry alarm contacts shall be wired to the LDF, cross-connected and terminated at the Communications Remote Terminal Unit (RTU), and reported to the Operation Control Center (OCC) via the Communications Transmission Subsystem (CTS) and Supervisory Control System (SCS).

**PART 3 - EXECUTION**

3.1 **INSTALLATION**

A. CIC shall be installed at locations in stations as indicated on the Contract Drawings

B. CIC Mounting

1. Prior to mounting the CIC the Contractor shall verify that the CIC foundation, conduit stub-ups and anchors are correctly configured as per the approved design.

2. Contractor shall install the CIC level and plumb on the CIC manufacturer’s provided support feet. Contractor shall verify that all parts of the CIC (including open doors) are outside the dynamic envelope of the trains.

3. Plants, foliage, or other impediments shall be placed at least 8 feet away from the installed Communications Interface Cabinet.

4. Contractor shall provide a 3-foot wide concrete skirt around the CIC.

5. After all cables have been installed and terminated, the Contractor shall fill the conduit openings with an Authority approved fire stop duct sealant to prevent fire and moisture from entering the CIC.

6. Contractor shall seal the bottom of the CIC, where the conduits penetrate, with an Authority approved sealant to stop fire and moisture.

C. Cable Termination: Cables shall be dressed, tagged and terminated in accordance with these Specifications.

D. All grounding and cable wiring shall be field installed, labeled, and tested for continuity.

E. All equipment shall be installed according to Contract Drawings and manufacturer’s requirements.

F. Terminal blocks, PTB’s and cross-connects shall be mounted to internal panels and shall be arranged as shown on the Authority approved Contract Drawings. Equipment layout and mounting shall be done such that Terminal block, and PTB equipment shall not be impeded or obstructed by other equipment and shall allow technicians to make moves, adds, and changes with ease.

G. Contractor shall make all CIC equipment and LDF/terminal block connections, including all cross-connections, as shown on the Contract Drawings.

H. All connections and cross-connections shall use required wire in accordance with these Specifications, and the Authority approved Contract Drawings.

I. CIC AC power shall be conditioned by an UPS, capable of maintaining backup power to all AC-powered CIC equipment, for no less than 1 hour under full load of all connected devices.

J. Power strips with no less than 8 receptacles shall be installed in each rack within the CIC to provide UPS power to rack-mounted equipment.

K. Power strip shall be installed in accordance with Contract Drawings and oriented to provide the highest density of receptacles to the rear of rack-mounted equipment.

L. Contractor shall install a clear plastic document pouch attached to the inside door frame containing a detailed parts list inventory of all equipment contained in the CIC and as-built drawings or diagrams showing equipment interconnections, wiring, power connections, and equipment configurations.

M. Once installation is complete, Contractor shall remove any disposable installation materials including empty equipment containers, wrappers, wire fragments, or other items and thoroughly clean enclosure of dirt, dust, and all other contaminants.

3.2 **TESTING AND INSPECTION**

A. Contractor shall perform the following inspections and tests on CIC’s, where applicable. The Authority shall be given at least 21 days written notification prior to each test and inspection so that the Authority may be present as desired.

B. Contractor shall provide testing and inspection submittals 45 days prior to each scheduled work for Authority approval.

C. Contractor shall provide Authority with each test or inspection report within 14 days after each test or inspection.

1. Factory Test and Inspection:
a. Contractor shall inspect the CIC at the Factory for cracks and other damage, and repair as required.

b. Contractor shall inspect the CIC at the Factory for level and plumb, proper operation of doors and locks, proper location and installation of HVAC equipment, and other miscellaneous equipment.

c. Inspections shall verify:
   1) Conformance to standards, methods, and quality.
   2) Correct location, positioning, seating, mounting, orientation, and labeling.
   3) Secured internal cable and wire connections.
   4) Proper routing and termination of internal wire and cable.
   5) Proper grounding of all equipment.
   6) Correct and complete labeling and tagging of wire, cable, terminal, connectors and equipment.
   7) Conformance to installation requirements.
   8) Conformance to inventory data.

d. Contractor shall provide inspection results for the Authority approval.

2. Field Inspection

a. Prior to installation, the Contractor shall inspect the CIC foundation, conduit stub-ups and anchors to verify that they conform to Contract Drawings. Discrepancies shall be corrected prior to commencement.

b. Field inspection shall include inspection of the CIC including lighting fixtures, intrusion sensors, equipment racks.

c. The inspection of the CIC installation shall confirm that:
   1) The installation drawings and procedures define the installation adequately and in sufficient detail, such that if the procedures are followed, the resulting installation shall meet approved standards, practices and procedures for workmanship, maintainability requirements, referenced installation standards, installation requirements defined within these Specifications and the Contract Drawings, and the installation requirements of local jurisdictions. If not, the installation drawings and procedures shall be revised prior to subsequent installations.

2) The installation drawings and procedures adequately provide for the safety of installation personnel. If not, the installation procedures shall be revised prior to subsequent installations.

3) Inspections of subsequent communications interface cabinet installation shall ensure that drawings and procedures are met.

4) Inspection shall verify:
   a) Conformance to installation requirements.
   b) Conformance to standards, methods and quality.
   c) Proper routing and termination of wire and cable.
   d) Secured cable and wire connections.
   e) Proper grounding of all equipment.
   f) Correct and complete labeling and tagging of wire, cable, terminal, connectors and equipment

3. Field Tests and Records

a. Contractor shall perform the following field tests:
   1) Test the electrical continuity of the connections within the CIC by measuring the resistance from the line side to the equipment side for each
2) Verify operation of main circuit breaker and all feeder circuit breakers.

3) Measure resistance to ground from all ground points, including those located in equipment cabinets. Measured resistance shall not exceed 3 ohms (see “Grounding and Bonding-Communications”.

4) Verify operation of all lighting.

5) Verify operation of HVAC equipment, including heaters, air conditioner, and all thermostatic controls.

6) Verify operation and reporting of all CIC alarm indications both locally and at the Communications RTU terminal block.

7) Verify operation of all equipment controls and indicators.

8) Verify that all cables and wires are labeled properly and all color codes have been observed.

9) Contractor shall provide records of all electrical tests for Authority approval.

4. End-To-End Acceptance test: End-To-End testing shall be a part of other subsystem testing.

5. System Integration Test: Contractor shall provide qualified technical staff to support this test as directed by the Authority.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this Section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith shall be considered incidental to the Work specified under Section 16801 "Basic Technical Requirements - Communications System.”

END OF SECTION 16839
PART 1 - GENERAL

1.1 DESCRIPTION

A. To provide and install the internal and external single and multi-pair copper conductor cables required for the communications subsystems.

1.2 REFERENCED STANDARDS

A. Contractor’s design and installation shall comply with the latest editions of all applicable Standards and Codes included herein. Contractor shall be familiar with and adhere to the latest editions of these codes, regulations, specifications and standards. Work shall meet or exceed the standards and procedures specified.

1. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM)
   a. ASTM B 3 - Standard Specification for Soft or Annealed Copper Wire
   b. ASTM D 470 – Standard Test Methods for Crosslinked Insulations and Jackets for Wire and Cable
   d. ASTM D 4101 - Standard Specification for Polypropylene Injection and Extrusion Materials
   e. ASTM E 662 - Standard Test Method for Specific Optical Density of Smoke Generated by Solid Materials
   f. ASTM E 814 - Standard Test Method for Fire Tests of Through-Penetration Fire Stops

2. Insulated Cable Engineers Association (ICEA)
   a. ICEA S-84-608-2002 – Filled Telecommunications Cable, Polyolefin, Insulated, Copper Conductor

3. Military Standards (MS)
   a. MIL-C-24643 - Cable Assembly, Aircraft Electrical Service

4. National Fire Protection Association (NFPA)
   a. NFPA 70 - National Electric Code (hereinafter referred to as NEC)
   c. NFPA 262 - Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces.

5. Occupational Safety and Health Administration
   a. 29 CFR 1910 – Occupational Safety and Health Standards
   b. 29 CFR 1926 – Safety and Health Regulations for Construction
      1) 29 CFR 1926 Subpart P - Excavations

6. Telecommunications Industry Association (TIA)/Electronics Industry Alliance (EIA):
   a. TIA-758-B - Customer-owned Outside Plant Telecommunications Infrastructure Standard
   b. TIA-568-C - Commercial Building Telecommunications Cabling Standard
   c. TIA-569-C - Commercial Building Standard for Telecommunications Pathways and Spaces.
   d. TIA/EIA-606-B - Administration Standard for Telecommunications Infrastructure of Commercial Buildings
   e. TIA-607-B - Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises.

7. Underwriters Laboratories (UL)
   a. UL 444 - Communications Cables
   b. UL 1581 - Reference Standard for Electrical Wire, Cable, and Flexible Cords
c. UL 1666 - Test for Flame Propagation Height of Electrical and Optical-Fiber Cables Installed Vertically in Shafts

d. UL 1690 - Data-Processing Cable

8. United States Department of Agriculture, Rural Utilities Service (RUS)

b. 7 CFR 1755.390, RUS Specification for Filled Telephone Cables

1.3 SUBMITTALS

A. Manufacturer Information: Contractor shall submit information for each proposed manufacturer describing relevant experience in manufacturing optical cable for rapid transit and railroad applications and quality assurance program and warranty.

B. Preliminary Design Review (PDR) Technical Requirements

1. Cable Product Data: Submit cable product data, including the following:

a. Cable cut sheets or shop drawings.

b. Certificates of Compliance confirming that wire and cable provided meets or exceeds the requirements of these Specifications.

2. Cable Terminations: Submit product data and cable termination details, including the following:

a. Ring-type solder-less wire terminals.

b. Crimping tools.

c. Calibration certifications for crimping tools.

C. Final Design Review (FDR) Technical Requirements. Contractor shall include the following information as part of the Final Design Review (FDR) Technical Requirements submittal package for the Communications Cables:

1. Updated PDR information for drawings, calculations and design information shall reflect a final design.

D. Installation Work Plans and Detailed Documentation. In accordance with these specifications, the Contract Drawings, and this Section submit as part of the Installation Plan cable installation details, including the following:

1. Pulling layout including distances and tension calculations, for each section of installation.

2. Pulling equipment and tension monitoring devices.

3. Procedures and materials for terminating the cable and preparing it for connection to the termination points.

4. Cable labeling including ID scheme, ID of each cable, and location of each tag.

5. Proposed installation procedures including:

a. Hardware.

b. Attachment.

c. Routing.

d. Conduit fill.

e. Pull locations and equipment.

6. Proposed cable splicing procedures including:

a. Material.

b. Equipment.

c. Testing.

7. Chronological plan for installing cable, including estimated time for each pull and plan for protecting cable on-reel and in slack loops during installation. Where staging of cable is required (e.g., UPRR crossing warning systems), identify details.

8. Contractor shall submit 1 original plus 10 copies of the projected loads and voltage drop calculations and optical loss calculations.

9. Contractor shall provide to the Authority 1 original plus 10 copies of the cable manufacturer's instructions and procedures for potheading of each type underground cable to be provided.
10. The manufacturer shall supply 1 original plus 10 copies of instructions for splicing for each type of cable specified. The instructions shall be forwarded with the certified test results for each reel of cable. The instructions shall specify the exact nature of splicing materials to be employed, and the manner they are to be spliced.

11. Conduit and Cable Schedule.

12. Cable Entrance Sealant - Add fire stop prior to filling with foam sealant.

E. Certifications. Submit cable qualification data, including the following:

1. Listing of Railroads and Transit Authority Customers: Provide a list of names of 5 railroads and transit properties to which the manufacturer has provided cables similar to those required by these Specifications.

2. Cable Manufacturer's Quality Plan.

3. Cable Manufacturer Qualification Report.

4. Insulation Qualification Test Documentation.

F. Contractor shall, provide to the Authority sample specimens in 1200 mm (4 foot) lengths similar to that which the manufacturers propose to provide for each type cable specified herein. The sample specimens shall remain the property of the Authority.

G. Test Plan, Procedures, and Results

1. Cable Production and Factory Test Documentation: Submit cable production test documentation, including certified test results indicating clear indication of pass/fail criteria and cable performance.

2. Submit test reports verifying compliance with field-testing requirements, per Part 3 requirements, within 14 days of completion of each test.

3. Submit cable installation details, including the following:
   a. Pull Tension Calculations, and the actual pull tension during the cable installation showing the maximum pulling tension limits are not exceeded.
   b. Update Conduit and Cable Schedule.
   c. Conduit and Mandrel Report.

H. As-Built Documentation: Contractor shall submit complete As-Built documentation and drawings including cable routing, termination details, connection diagrams, cable labeling and cable schedules. Reference Section 01785, “Project Record Documents”.

1.4 QUALITY ASSURANCE

A. Applicable Standards and Codes.

B. Cable Flammability, Toxicity, and Smoke Characteristics.
   a. Low smoke, halogen-free, jacketed cables shall be utilized for all applications required by code.
   b. Communications cables specified herein shall meet the following flammability requirements:
      1) As a minimum, all communications cable shall meet UL 1581 vertical tray test and shall be type CM listed with Underwriters Laboratories. Type CMR, or CMP may be used as substitutes.
      2) Cables used in a riser environment shall meet UL 1666 flame test and shall be CMR listed with UL. Type CMP may be used as a substitute.
      3) Plenum rated cable shall be used when cable is installed in an air plenum environment. The cable shall meet NFPA 262-2002 and shall be type CMP listed with UL.

C. Material and Workmanship Requirements: Material and workmanship of all cables specified in this section shall be consistent with the following requirements:

1. Life expectancy of the cable shall be 40 years in a railroad and transit environment.

2. Cable shall be constructed for continuous operation at 90 degrees Celsius, in a wet or dry environment.

3. Conductor to conductor and conductor to ground resistance shall be equal or greater than 1 meg-ohm (1MΩ).

4. Cable shall be constructed for continuous operation at negative 40 degrees F without cracking or becoming brittle.
D. Manufacturer Pre-Qualification Requirements:
Any manufacturer differing from those specified herein shall require a prequalification and Authority approval. Manufacturer acceptability shall be based on the manufacturer’s experience, qualifications, certifications such as ISO-9001, equipment reliability, and compliance with standards specified herein, and full compatibility with the Authority’s existing system.

PART 2 - PRODUCTS

2.1 CONTRACTOR FURNISHED MATERIALS

A. Telephone, Public Address (PA), Visual Message Board (VMB), and Data Cable

1. Local inside facility distribution of low-level voice circuits shall, at a minimum, be by standard Category 6 cable.

2. Wire conductors shall be composed of soft or annealed copper, meeting insulating, sensitivity and elongation requirements of ASTM B3, latest edition.

3. The insulation shall be colored virgin propylene copolymer meeting the requirements of ASTM D4101, or equivalent, for propylene plastic. High molecular weight polyethylene is also acceptable.

4. Insulated conductors shall be in twisted pairs. Each pair shall be individually colored. The average length of pair twist shall not exceed 6 inches. To minimize noise and crosstalk, each pair of a multi-pair cable shall have a different average length of twist from any other pair in the cable.

5. Inside wire (wiring run within any building) from telephone terminals to telephone instruments shall be No. 22 AWG and meet Category 6 Specification TIA 568.C.2. Cable shall be low smoke and non-toxic.

6. All main riser cables shall be No. 22 AWG and shall meet RUS Specifications 7 CFR 1755.890. RUS Specification 7 CFR 1755.390 cables shall not be used as a substitute for 7 CFR 1755.890 cables.

7. All main and riser paired cables shall be shielded.

8. No cable shall contain less than twelve pairs unless otherwise indicated in the Contract Drawings and shall have at least 50 percent spare pairs. In addition to the requirements listed herein, all cables shall meet the requirements of NEC and NFPA 130 latest editions and shall be manufactured to telephone industry standards.

B. Low-Smoke Jacket

1. Telephone, Supervisory Control and Data Acquisition (SCADA) I/O or data cable entering from an outside environment exceeding 50 feet in length inside a facility shall be low smoke.

2. Low-smoke jacket material for cables shall be flame retardant cross-linked polyolefin, as Authority approved. The jacket thickness shall be 60 mils minimum.

3. Jacket material shall meet or exceed the following specifications:
   a. Tensile Strength (ASTM D470) 1100 psi minimum
   b. Elongation (ASTM D470) 200 percent minimum
   c. Tear Strength (ASTM D470) 7 lb/inch minimum
   d. Oxygen Index (ASTM D2863) 27 minimum
   e. Smoke Density (ASTM E662)
      1) Flaming Mode Ds 4 minute 50 minimum
      2) Flaming Mode Dm 20 minute 175 minimum
      3) Non-flaming Mode Ds 4 minute 65 minimum
      4) Non-flaming Mode Ds 20 minute 300 minimum
   f. Smoke Index (MTL-DTL-32180) 25 minimum
   g. Halogen Content (MTL-DTL-32180) 0.2 percent minimum
   h. Toxicity Index (MTL-DTL-32180) 8.0 minimum
   i. Acid Gas Equiv. (MTL-DTL-32180) 2.0 percent minimum
   j. Ozone Resistance (ASTM D470) Pass (150 ppm at 25C)

4. All outside communications cables (e.g. those run in conduits, trough or duct-banks) shall be foam/skin insulated conductors that meet RUS Specification
COMMUNICATIONS CABLE – COMMUNICATIONS SYSTEM

7CFR 1755.890 and shall be protected using armor taping or approved equivalent.

2.2 PUBLIC ADDRESS CABLE
A. Contractor shall provide and install loudspeaker wiring for connection of all speakers at all stations. Loudspeaker cables shall be twisted pairs, foil-shielded, and stranded No. 14 AWG minimum.
B. Local distribution cables for the PA System shall be placed in separate conduit or raceways from low-level voice and data circuits. Cable jacket shall have a 600-volt rating.
C. Contractor shall provide and install cable for connection of all ambient sensing microphones. Cable shall be No. 18 AWG, shielded twisted pairs.
D. All grounding conductors for public address cables shall be insulated.

2.3 DATA CABLE
A. RS-232D Data Communications Cable
   1. Serial data cables used for RS-232 applications shall meet the following characteristics:
      a. Jacket: NEC CL2P, Low Smoke
      b. Wires: Uniquely Color Coded
      c. Cable Type: Twisted pair
      d. Conductor gauge: No. 24 AWG (7 X 32 AWG) stranded, minimum.
      e. Shield: 1 overall foil shield, with a braided shield minimum.
      f. Capacitance: 12 pf/feet
      g. Resistance: 30 ohms/1000 feet
      h. Conductors: 6 to 12-1/2 pairs

2.4 RS-422 DATA COMMUNICATIONS CABLE
A. Serial data cables used for RS-422 balanced electrical transmission of data shall have a 600-volt insulation rating and meet the following characteristics:
   1. Jacket: NEC CL2P, Low Smoke
   2. Wires: Uniquely Color Coded
   3. Cable Type: Twisted Pair
   4. Conductor gauge: No. 24 AWG (7 X 32 AWG) stranded, minimum.
   5. Shield: Individually foil shielded pairs each with a drain wire. One overall foil shield, with a braided shield minimum.
   6. Capacitance: 13 pf/feet
   7. Resistance: 16 ohms/1000 feet
   8. Conductors: 2 to 12 pairs

2.5 T1 DATA COMMUNICATIONS CABLE
A. The cable for connection of DSX-1 compatible signals shall be Western Electric type ABAM or approved equivalent.
B. The cable shall also meet the following requirements:
   1. Jacket: NEC CMR, Low Smoke
   2. Wires: Conforms to PIC color code.
   3. Cable Type: Twisted Pair
   4. Conductor gauge: Solid annealed
   5. Shield: Individually shielded pairs each with a drain wire.
   6. Characteristic Impedance: 100 ohms @ 772 KHz
   7. Average mutual capacitance: 90 nf/mi.
   8. Conductors: Two pair per T1 connection.

2.6 OUTDOOR TELEPHONE, SCADA I/O AND DATA CABLE
A. Contractor shall provide, install and terminate outdoor telephone and I/O data cabling as indicated in the Contract Drawings.
B. The multi-pair No. 22 AWG, filled cable shall conform to RUS Specification 7 CFR 1755.890 except as noted herein.
C. The conductors shall be solid annealed bare copper conforming to the latest requirements of ASTM-B-3.
   1. Conductors shall be individually insulated with a colored, solid insulating grade, high density-polyethylene or polyolefin of ICEA S-56-434.
2. The insulating material color shall be coded per U.S. telephone industry standards with color concentrates chosen for permanency and electrical balance of individual circuits. The colors of insulated conductors shall be provided in accordance with ICEA S56-434, Section II-7 and shall comply with the requirements of EIA TIA-359.

3. The insulated conductors shall be twisted into pairs. The length of pair twists shall be designed to meet ICEA S45-434 latest edition.

4. The average twist length of any pair in the finished cable shall not exceed 6 inches.

5. The insulated pairs shall be twisted into specified color combinations to provide pair identification as well as low susceptibility to noise pick-up and with varying lay lengths to minimize crosstalk.

6. The insulated pairs shall be assembled into a cable core. Cable cores of 25 or less pairs shall be assembled concentrically.

D. The filling compound, a petroleum jelly base multicomponent, shall be applied to the cable core in such a way as to provide as near to 100 percent fill of the available air space within the core is commercially practicable. The filling compound shall be applied in a manner to fill all voids and conductor interstices under the core to restrict the migration of moisture. The filling compound shall be compatible with the insulation and other cable components.

E. The filled core shall be completely covered with a layer of non-hygroscopic, non-wicking polymeric tape applied with overlap over the cable core to ensure high dielectric strength from cable core to shield.

F. A 0.008-inch thick corrugated aluminum tape shall be applied over the core. The tape shall be coated with a 0.002-inch thick copolymer compound and shall be applied longitudinally with overlap.

G. The outer jacket shall be of virgin, black high molecular weight polyethylene copolymer except low-smoke jacketed cables that shall be as specified below. The overall jacket shall be sequentially marked at 2-foot intervals with cable type, year of mfg., footage, pair count, conductor size and manufacturer. The jacket shall be free from holes, splits, blisters or other imperfections and shall be smooth and concentric.

PART 3 - EXECUTION

3. INSTALLATION

A. Field Installation

1. Contractor shall inspect cables at time of delivery to the construction site to assure that no damage was done in shipping and that the specified cable was received. Contractor shall inspect every reel for physical damage such as nails driven into reels to secure shipping blocks, lagging, or reel covering missing and cable and seals missing or damaged. A copy of these inspection reports shall be submitted to the Authority. Contractor shall replace all damaged or rejected cables promptly, at no cost to the Authority.

2. Wires and cables shall be stored on solid surfaces that shall adequately support the cable reels, but which shall be well drained and not allow accumulation of liquids, oils, or chemicals.

3. The cable reels shall be aligned and protection provided so as not to allow the reel flanges to damage other reels. Adequate aisles and barricades shall provide accessibility but prevent construction equipment from damaging the cable reels.

4. Cable ends shall be resealed promptly when a length is cut from the reel. Cable reels shall be properly handled, i.e., by using a sling and spreader attached to a shaft through the reel hubs, or by cradling both flanges between lift truck forks. The reels shall not be lifted by the top reel flange or dropped from any height. Lift truck forks shall not touch cable surfaces on the reel. Reels shall always be rolled in the direction opposite the cable wind on the reel. Reels shall not be laid flat.

5. Contractor shall verify that the installation design is correct and adequate for the cables to be installed. Contractor shall assure that conduit size, conduit fill, conduit bend radii, manhole spacing, manhole size, raceways, ducts, and associated hardware are proper for the intended installation.

6. Contractor shall be responsible for verifying the required cable length for each cable run prior to installation. Civil stationings appearing on referenced drawings may be used for defining locations and estimating cable lengths. However, no existing drawings shall be used to determine final lengths and cuts. Actual lengths shall be determined by
making on-site inspections and measurements.

7. Wires and cables shall be continuous without splices between junction boxes, terminals, pull boxes, manholes and hand holes. Cables shall not be bent to a radius less than the greater of 20 times the diameter of the cable or the manufacturers’ recommended minimum bending radius, during installation or as finally installed.

8. Develop a written cable installation procedure and check-off list for approval prior to cable installation. This procedure shall be prepared based on Contractor’s review of the conduit plans, and field site survey and shall include a cable plan and installation information for each cable pull. The installation plan shall include proper procedures for feeding cable into conduit, to maintain proper bend radii, and to minimize friction.

9. Contractor shall give the Authority at least 48 hours notice prior to installing cables.

10. Install cable per the approved installation and cable plan. Contractor shall provide any installation hardware required to route, support, terminate, or protect any cable installation.

11. Crimp-on connectors or lugs shall not be used on solid conductors.

12. Provide additional conduit as required to access equipment enclosures or apparatus.

13. Contractor shall provide sufficient slack in cable conductors at all terminating points to enable 3 re-terminations of each conductor without re-servicing or re-potheating the cable.

14. In certain types of installation, the cable cannot be constrained; therefore, ample cable slack shall be provided for additional flexibility due to vibration of such equipment.

15. Tags to identify cables shall be of plastic material. Tags shall be lettered to correspond with the cable destination and number of pairs in the cable.

16. All cables shall be terminated in order according to the color code. Individual cable pairs shall be identified at each cable termination with plastic tags. All spare pairs in each cable shall be terminated and identified. Cable tags shall be placed on all cables at termination points and 1 label applied to each cable at manholes, pull-boxes, junction boxes, and similar facilities.

17. All cable entrance openings in equipment enclosures, houses, rooms and junction boxes shall be sealed with either a compression type fitting or pliable sealing compound after the cable is in place. Sealing compounds for rooms, houses, walls, or other partitions shall be fire retardant per ASTM E814. Sealing compound shall be used to seal the area around cable where the cable emerges from the end of a conduit, pipe, or duct-bank. All spare conduits shall be sealed or plugged in an approved manner.

18. Where cable transfers from trays or troughs to conduit the ends of the conduit shall be fitted with plastic end bells to prevent damage to the cable.

19. Wherever cables are terminated the outer sheath of the cable shall be carefully removed to the point of cable entrance. At the end of the cable sheath or covering, 2 layers of plastic electrical tape shall be applied.

20. OSHA’s "Confined Spaces" procedures shall be followed in all installation activities.

B. Contractor shall install wayside cables in the buried duct-bank, trough, and conduit currently in place along the right-of-way.

1. Contractor shall review civil segment Referenced Drawings, and verify that all ducts are correctly configured for Work to be performed, stub-ups are in the proper locations, and conduits are free of obstruction and/or extraneous material. During the installation, if Work areas are exposed to heavy equipment, the Contractor shall take appropriate actions to protect exposed sections, covering such areas with heavy steel plate or other suitable material. Cable/express trough shall remain with lids installed during the times when Work not performed.

2. Contractor shall utilize only installers who are qualified and experienced in handling and installing underground cable in conduit. Experienced supervision shall be provided to ensure that all required precautions are taken and that the installation is in accordance with the requirements of this Section.

3. Contractor shall install wires and cables in accordance with cable handling and pulling practice as defined by the cable manufacturer’s recommendations.
4. Contractor shall establish the maximum allowable length of cable, which may be safely pulled into each conduit after obtaining the wire and cable manufacturer’s recommendations regarding pulling limits for the cables. Consideration shall be given to the following parameters - fill, friction, clearance, configuration, jam ratio of the cables and conduit, weight correction factor, bend radii, training of the cables on entering and exiting the conduits, maximum allowable tension, sidewall load, and weight of the cables. These factors shall be calculated for each pull as required and Contractor shall not exceed the maximum allowable values of sidewall pressure, pulling strain on conductors or sheath, limits of pulling device and pulling tension. If the pulling tension for any cable exceeds the maximum allowable, that cable shall be removed and replaced with new cable. Calculations shall be signed, sealed and dated by a Texas Licensed Professional Engineer.

5. Pulling tensions shall be calculated by Contractor from both directions to determine which will be easier and result in less pulling tension on the cable. The lower tension direction shall be utilized. Calculations shall be signed, sealed and dated by a Texas Licensed Professional Engineer.

6. Proper procedures for feeding cable into the conduit shall be established by Contractor. Feed-in tubes, sheaves, cable reel jacks, and other required tools required to provide proper bending radii and minimal friction during installation shall be used. Direction or training of the cables on entering and exiting the conduit shall coincide with other parts of the installation arrangement so that the cable is not damaged or over-stressed.

7. Contractor shall use only the wire and cable manufacturer's approved pulling compound or lubricant compatible with the cable. The lubricant shall be used in ample quantity to reduce friction and applied in such a manner that the cable is lubricated throughout the entire length being pulled through the conduit.

8. Cables installed in manholes and pull boxes shall not interfere with the future use of or access to unused conduit.

9. Cables shall be mounted and dressed on cable racks. Where the provided racking is not sufficient to properly support and dress the cable, the Contractor shall supply and install additional racks, matching those already installed to complete cable installation.

10. All exposed wires and cables entering or leaving all equipment housings, junction boxes, and cable transition points shall be protected from abrasion. Chase nipples and/or split ring plastic grommets shall be provided in drilled or punched openings in equipment housings and junction boxes.

11. The installation shall be in accordance with Contractor's approved installation procedure and check-off list which shall include the following considerations:

a. Spare wires and cables shall be installed at the same time that the active wires and cables are being installed.

b. The cables shall not be pulled through manholes.

c. Cables shall not be pulled into a conduit that already contains conductors. If it becomes required to remove a cable from a conduit, all cables in that conduit shall be removed. Cable removed from conduit shall not be used elsewhere. Cable removed from conduit shall be reinstalled under the Authority's direction. The restoration of all functions supported by the removed and reinstalled cables shall be the responsibility of the Contractor and under the Authority direction.

d. Two-way communication between pulling and feed ends shall be established before and during the installation.

e. In pulling cable, an approved wire cable grip extending not less than 18 inches back from the end of the cable shall be used. The clutch on the pulling device shall be set to slip at 50 percent of the weight per 1,000 feet of the cable to be pulled. The equipment used for pulling cable shall be equipped with a dynamometer, which shall indicate the pulling force in pounds.

f. Pulling shall be done at a constant velocity between 15 and 50 feet per minute. The pull shall not be stopped once started unless absolutely required.

g. Crossovers and kinks shall be avoided at feed end.

h. Cable shall be protected after installation and prior to terminating or splicing.
COMMUNICATIONS CABLE – COMMUNICATIONS SYSTEM

i. After pulling, the tension end of the cable damaged in the pulling process shall be cut off.

j. All cables shall be identified.

k. The cable installation in manholes and pull boxes shall not interfere with the future use of or access to unused conduit.

12. Each existing conduit to be used for cable installation shall be blown or swabbed dry to ensure cleanliness, rodded and mandreled to ensure no obstructions and to minimize chafing. Each new conduit shall be mandreled in accordance with these specifications.

13. Cables shall be placed in the duct identified to the Contractor by the Contract Drawings. All cables to be placed in 1 duct shall be installed simultaneously. Extreme care shall be used in installing cables so as to avoid twisting, kinking, or in any way injuring the cable or its sheath.

14. When required, the Contractor shall pump water out of manholes, cable pits, and pull chambers before installing any cables and shall be responsible for maintaining manholes and pull chambers in a dry condition while the cables are being pulled.

15. Cable installation in conduit shall not exceed 40 percent fill per conduit, unless otherwise allowed by the Authority.

16. Cables installed in manholes shall be properly constrained and fastened to the walls of the manhole in accordance with the approved installation drawings.

C. Non-Buried Installation

1. Routing of wires and cables in the Train Control Center (TCC), signals, Traction Power Substation (TPSS) and communications facilities shall be within Contractor-provided cable trays.

2. Cable installed in trays or troughs shall be laid loosely, neatly and with a minimum of crossovers, and not pulled into place. They shall have a minimum amount of crossover and shall not be pulled tightly around bends.

3. Cabling between racks or cabinets shall be routed via the overhead cable trays, with 1 foot of slack between the cable tray and each rack to which the cable is connected. Cables shall be secured to the last strap of the cable tray before transitioning to equipment racks or cabinets.

4. Where transfers of cable from trays to conduit occur, conduit ends shall be fitted with plastic end bells to prevent damage to cable.

5. Cable identification tags shall be installed at each termination.

6. Installation in Conduit or Pipe

a. Contractor shall have all communications conduits, including the Authority provided conduits inspected, mandreled, swabbed, and cleaned prior to cable installation. Manholes shall be cleaned and the location of pulling eyes shall be determined.

b. Contractor-provided conduits shall have a clean, smooth concentric interior surface. Conduits shall be painted to match the color of the column or wall on which they attached.

c. Crossover of cables shall be avoided when cables are pulled into conduits. Care shall be taken not to have the conductors pulled tight or kinked in conduit fittings or boxes. All cables to be installed in a single conduit shall be pulled and installed simultaneously.

d. Special Protection: Contractor shall provide required special protection for cables in areas where the cables are unavoidably exposed to hazardous conditions such as vibration or sharp corners on equipment. Cables damaged due to Contractor's neglect while installing cables shall be replaced by the Contractor at no additional cost to the Contract.

e. Multi-Pair Cables: Multi-pair cables shall be continuous without splices, between termination locations. Termination locations shall be located within indoor communication interface cabinets (CIC) and wayside equipment enclosures, as shown on the Contract Drawings. No terminations of any kind shall be acceptable at other locations, except as Authority approved.

1) The shield of each section of communication cable shall be electrically
continuous between terminations on terminal blocks. Each section of communications cable shall have its shield grounded at the terminal block location at one end of the cable section only. The shield shall be grounded with the use of tin plated brass shield connectors and No. 6 AWG insulated ground wire, in a manner as recommended by the cable manufacturer. The shield connectors shall be compatible with the cable’s aluminum binder tape. The ground wire shall be connected to the terminal block housing ground grid.

2) Pairs shall be maintained intact, and shall terminate in order following the color code. Cable pairs from different pair units shall not occupy the same line terminal block.

3.2 TESTING

A. Contractor shall present to the Authority, for approval, a cable test plan showing the tests to be made and the limiting values to be used.

B. Contractor shall provide test or inspection procedures for Authority approval, 45 days prior to each scheduled test or inspection.

C. Contractor shall provide test or inspection records within 14 days after each test or inspection.

D. Factory Tests

1. Conductor insulation shall be tested per RUS Specification 7 CFR 1755 Bulletin 1753F-201 (PC-4) for the following:
   a. Minimum Tensile Strength 2400 lb./sq. inch minimum
   b. Ultimate Elongation 300 percent minimum
   c. Maximum Shrink-back 3/8 inch minimum

2. The jacket material shall be tested per RUS Specification 7 CFR 1755 Bulletin 1753F-201 (PC-4) for the following:
   a. Minimum Tensile Strength 1700 lb./sq. inch minimum
   b. Ultimate Elongation 400 percent minimum
   c. Environmental Stress Cracking 20 percent maximum
   d. Maximum Shrink-back 5 percent minimum
   e. Impact Failure 20 percent maximum

3. The provided multi-pair shall be tested per RUS Specification 7 CFR 1755 Bulletin 1753F-201 (PC-4) for the following:
   a. Mutual Capacitance: 0.083+0.004 uF/mi.
   b. Mutual Capacitance Deviation: 3 percent RMS maximum
   c. Pair-to-Pair Capacitance Unbalance: 25 pF/1000 feet max (RMS).
   d. Pair-to-Ground Unbalance (maximum): 800 pF/1000 feet max.
   e. Pair-to-Ground Unbalance (average): 175 pF/1000 feet max.
   f. Equal Level Far End Crosstalk (150 kHz): 63 db/kft minimum
   g. Near End Crosstalk (772 kHz): 47 db/kft minimum
   h. Insulation Resistance: 1000 meg-ohm per mile.
   i. Maximum Conductor Resistance (at 20C): 91 ohms/mi.
   j. Maximum Average Attenuation (772 Hz at 20C): 4.5 dB/mi.
   k. High Voltage Test (3 seconds. between conductors): 3600V DC
   l. High Voltage Test (3 seconds. between conductors and shield) 10,000V DC
   m. Cable Bend Test: No Shield Cracks

E. Field Tests

1. Insulation Resistance Tests
   a. Tests shall be performed on all cables entering or leaving houses, after the cables are terminated.
b. Disconnect external apparatus prior to performing the test.

c. Contractor shall verify conductor-to-ground resistance.

d. Contractor shall verify conductor-to-conductor resistance for each pair.

e. Record all data on an approved test form.

2. Attenuation, S/N, Peak-To-Average Tests: Utilize transmission impairment measurement sets to determine the 1000 Hz attenuation, signal to noise ratio, and peak to average ratio.

3. DC Loop Resistance Test

4. Utilize Volt OHM Meter (VOM) to measure DC loop resistance of each cable pair.

F. End-To-End Test: Tests shall be performed end-to-end on all cables where the cables enter or leave cases, communication houses or other facilities.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this Section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith shall be considered incidental to the Work specified under Section 16801 “Basic Technical Requirements - Communications System.”

END OF SECTION 16841
PART 1 - GENERAL

1.1 DESCRIPTION

A. Contractor shall design, provide and install a complete fiber optic cable subsystem as specified herein, and as shown on the Contract Documents.

1. Contractor shall provide, install, splice, terminate and test Fiber Optic cable in accordance with the Contract Documents.

2. Scope of Work for the portion of the work where the Authority provides fiber optic cable does not include Factory Tests; however, additional Authority approved tests shall be required for the Contractor to take possession of the cables.

B. Ancillary Devices

1. Additional equipment to be provided with the fiber optic cable shall include the following:
   a. Fiber Slack Enclosures (FSE)
   b. Fiber Distribution Panels (FDP)
   c. Optical patch cords
   d. Pigtails
   e. Splices
   f. Attenuators (as required)
   g. Field splice and connector kits
   h. Media converters
   i. Wire pulling lubricant

1.2 REFERENCED STANDARDS

A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM)

1. ASTM D1248 - Standard Specification for Polyethylene Plastic Extrusion Material for Wire and Cable

2. ASTM E814 - Standard Test Method for Fire Tests of Through - Penetration Fire Stops

B. Electronic Industries Alliance (EIA)/Telecommunication Industry Association (TIA)

1. TIA/EIA 455-25-C, FOTP-25 - Impact Testing of Fiber Optic Cables

2. TIA/EIA 455-3-A, FOTP-3 - Standard Test Procedure for Fiber Optic Fibers, Transducers, Sensors, Connecting and Terminating Devices and other Fiber Optic Components

3. TIA - 455-3-A, FOTP-3 - Procedure to Measure Temperature Cycling Effects on Optical Fibers, Optical Cable, and Other Passive Fiber Optic Components

4. TIA - 455-13-A, FOTP-13 - Visual and Mechanical Inspection of Fiber Optic Components Devices and Assemblies

5. TIA - 455-33-A, FOTP-33-B - Fiber Optic Cable Tensile Loading and Bending Test

6. TIA/EIA 455-37-A, FOTP-37 - Low or High Temperature Bend Test for Fiber Optic Cable

7. TIA/EIA 455-41-A, FOTP-41 - Compressive Loading Resistance of Fiber Optic Cables

8. TIA - 455-78-B, FOTP-78-B - Optical Fibers: Measurement Methods and Test Procedures - Attenuation

9. TIA/EIA 455-81-B, FOTP-81 - Compound Flow (Drip) Test for Filled Fiber Optic Cable

10. TIA - 455-82-B, FOTP-82 - Fluid Penetration Test for Fluid-Blocked Fiber Optic Cable

11. TIA/EIA 455-85-A, FOTP-85 - Fiber Optic Cable Twist Test

12. TIA/EIA 455-88, FOTP-88 - Fiber Optic Cable Bend Test

13. TIA - 455-91, FOTP-91 - Fiber Optic Cable Twist-Bend Test

14. TIA - 455-104-A, FOTP-104 - Fiber Optic Cable Cyclic Flexing Test

1.3 SUBMITTALS

A. Qualifications:
   1. Manufacturer Information:
      a. Contractor shall submit information for each proposed manufacturer describing relevant experience in manufacturing optical cable and quality assurance program and warranty.
2. Installer Information:
   a. Submittal shall demonstrate previous successful experience in installation and testing of fiber optic cable specified herein.
   b. Submittal shall include a list of 3 recently completed projects of similar type and size with contact names and telephone numbers for each.

1. Product Technical Data: Contractor shall submit complete technical data for the cable and all ancillary devices he proposes to provide. The data submitted shall demonstrate compliance with all properties specified herein:
   a. Performance data and descriptions of all products shall be submitted for the List of Proposed Products and Materials submittal.
   b. As a minimum the following shall be provided: manufacturer model number, UL listing or rating, critical dimensions and mounting arrangement, technical specifications, and replacement parts list.

2. Complete end-to-end fiber optic subsystem splice and termination diagrams.

3. Equipment enclosures, panels, and material shop drawings including description and model numbers of all fiber splice and termination distribution equipment to be installed.

1. Contractor shall include the following information as part of the Final Design Review (FDR) Technical Requirements submittal package for the fiber optic subsystem:
   a. Update the PDR information, including drawings. Information shall include location specific final designs.

D. Product samples: Contractor shall submit 2 samples (4 feet long) for each one of the proposed cables for Authority approval.

E. Authority Provided Cable Acceptance Tests: Acceptance tests shall be performed on the Authority provided outside plant singlemode cable prior to the release of the cable from the Authority. Contractor shall submit the following:

   1. Procedures shall be submitted within 120 days after NTP.
   2. Certified copies of test results in accordance with the reporting requirements of Article 3.2 shall be submitted within 14 days after test completion for Authority approval.
      b. A certification by the Contractor of acceptability of the Authority provided cable for installation. For rejected cables, the Contractor shall submit justification for the rejection of the cable based on both visual inspection and test results.

F. Cable Factory Tests: Factory tests shall be performed in accordance with TIA/EIA-455-B and Article 3.2 of this Specification. Contractor shall submit the following:

   1. Test procedures shall be submitted 30 days prior to any scheduled test.
   2. Results with reporting requirements of Article 3.2 of this Specification shall be submitted within 14 days of test completion for authority approval.
      a. Optical Time Domain Reflectometer (OTDR) (1310/1550/1625 nm singlemode and 850/1310 nm multimode).
      b. Chromatic Dispersion (singlemode only).
      c. Attenuation in dB/km.

3. Contractor shall submit a certification statement confirming compliance with all mechanical testing requirements of these specifications.

G. Cable Field Tests: Field tests shall be performed in accordance with TIA/EIA-455-B and Article 3.2 of this Section. Contractor shall submit the following:

   1. Test procedures, 60 days prior to any scheduled test.
   2. Results in with reporting requirements of Paragraph 3.2.A through 3.2.D within 14 days after test completion for Authority approval:
a. Attenuation in dB/km for all terminated fibers
b. Optical Time Domain Reflectometer (OTDR) Testing

H. Installation Plan: Contractor shall submit, at least 60 days prior to installing cable, the following information for each segment of cable to be installed:

1. Pulling layout, including distances and tension calculations, for each section of installation.
2. Pulling equipment and tension monitoring devices.
3. Chronological plan for installing cable, including estimated time for each pull and plan for protecting cable on-reel and in slack loops during installation.
4. Contractor shall submit link budget calculations showing all intended links to be used by the submitted media conversion devices as required by Article 2.3 of this Section. This link budget will be used to compare and qualify actual loss measurements to acceptable loss measurements for pass/fail evaluation.

I. Termination Procedures: Contractor shall submit, prior to installing cable, the following information:

1. Procedure for terminating cable within the FDP, including fusion splicing of pigtails.
2. Fusion splice equipment description.
3. Splice and termination testing procedure.

J. Test Records. Contractor shall provide all test records within 14 days after completion of each test for Authority approval.

1.4 QUALITY ASSURANCE

A. Contractor’s materials, design, installation, and testing shall comply with all applicable Standards included herein. Contractor shall be familiar with and adhere to the latest editions of these codes, regulations, specifications and standards. Work shall meet or exceed the standards and procedures specified.

B. In the event of conflicts between reference standards, the most stringent provisions shall apply to the Work of this Section.

C. Manufacturer Pre-Qualification Requirements

1. Cable manufacturers and Contractors shall be Authority approved. Contractor shall provide all data required for Authority evaluation and shall make the arrangements for any required demonstrations and tests. Such compliance shall promote a thoroughly tested and properly installed cable subsystem.

2. Qualifications shall be based on the following criteria:

a. Past Performance and Experience: Cable manufacturers shall demonstrate previous successful experience in supplying, testing and installation of fiber optic cable specified herein.

b. Quality Assurance Program:

1) The manufacturer of cables, in accordance with the requirements of these Technical Specifications, is required to have in place or implement, an effective quality assurance program adhering to the requirements of ISO 9001 to ensure purchase control performance.

2) The cable manufacturer shall be ISO 9001 certified and Contractor is to submit ISO 9001 Certification Number.

c. Warranty

1) The manufacturer shall warrant that the design, material, and workmanship incorporated in each item of cable shall be of the highest grade and consistent with the established, and generally accepted, standards for fiber optic cable for transit applications; and that each such item and every part and component thereof shall comply with these Specifications.

2) Contractor shall monitor the manufacturers of the cable to assure that the approved Quality Assurance Program is being closely adhered to and that the fiber optic cable is being manufactured in accordance with these Technical Specifications.
3) If the cable supplier is not the manufacturer of the fiber, the fiber manufacturer shall be identified.

D. Point of Origin: The cable and the fibers shall be American-made.

1.5 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Packing - Cable shall be shipped on non-returnable wooden reels. The diameter of the drum shall be at least 20 times the diameter of the cable. Cable shall be shipped on reels substantial to withstand reasonable handling and shall be so designed that the inner end of the cable be accessible, but protected from injury. All ends of the cable shall be sealed to prevent entrance of moisture and securely fastened to prevent them from becoming loose during transit.

B. Marking - Each reel shall contain on the outside flange, the following information:

1. Manufacturer's name.
2. Contract name and number.
3. Cable identification number.
4. Cable length.
5. Date of manufacture.
6. Copy of the factory test results.

PART 2 - PRODUCTS

2.1 FIBER OPTIC CABLE

A. General

1. The life expectancy of the cable shall be no less than 25 years for service in a railroad and transit environment.

2. The cable shall be designed for installation in underground conduit, wet or dry environments, including alternating wet and dry conditions.

3. All fiber optic cable run in conduits or duct banks shall be listed with USDA Rural Utilities Service (RUS) 7 CFR 1755.900 and meet the requirements of ICEA S-87-640-2011.

4. The number of fiber cable strands are noted on the Contract Drawings. A minimum of 50 percent spare fibers shall be provided.

B. Outside Plant (OSP) Cable

1. All OSP fiber optic cable shall be certified to meet applicable tests of TIA-455, but as a minimum shall meet the following:

a. When tested in accordance with TIA 455-3-A, FOTP-3, the change in attenuation at extreme operational temperatures (negative 40 degrees F and 185 degrees F) shall not exceed 0.15 dB/km at 1550 nm for singlemode cable and shall not exceed 0.30 dB/km at 1300 nm for multimode cable.

b. When tested in accordance with TIA-455-82-B, FOTP-82, a 1-meter length of unaged cable shall withstand a 1-meter static head or equivalent continuous pressure of water for 1 hour without leakage through the open cable end.

c. When tested in accordance with TIA/EIA 455-81-B, FOTP-81, the cable shall exhibit no flow (drip or leak) of filling and/or flooding material at 158 degrees F.

d. When tested in accordance with TIA/EIA 455-41-A, FOTP-41, the cable shall withstand a minimum compressive load of 220 N/cm (125 lbf/in) applied uniformly over the length of the sample. The 220 N/cm (125 lbf/in) load shall be applied at a rate of 2.5 mm (0.1 in) per minute. The load shall be maintained for a period of 1 minute. The load shall then be decreased to 110 N/cm (63 lbf/in). Alternatively, it is acceptable to remove the 220 N/cm (125 lbf/in) load entirely and apply the 110 N/cm (63 lbf/in) load within 5 minutes at a rate of 2.5 mm (0.1 in) per minute. The 110 N/cm (63 lbf/in) load shall be maintained for a period of 10 minutes. Attenuation measurements shall be performed before release of the 110 N/cm (63 lbf/in) load. The change in attenuation shall not exceed 0.15 dB/km at 1550 nm and 0.30 dB/km at 1300 nm for multimode cable.

e. When tested in accordance with TIA-455-104-A, FOTP-104, the cable shall withstand a minimum compressive load of 220 N/cm (125 lbf/in) applied uniformly over the length of the sample. The 220 N/cm (125 lbf/in) load shall be applied at a rate of 2.5 mm (0.1 in) per minute. The load shall be maintained for a period of 1 minute. The load shall then be decreased to 110 N/cm (63 lbf/in). Alternatively, it is acceptable to remove the 220 N/cm (125 lbf/in) load entirely and apply the 110 N/cm (63 lbf/in) load within 5 minutes at a rate of 2.5 mm (0.1 in) per minute. The 110 N/cm (63 lbf/in) load shall be maintained for a period of 10 minutes. Attenuation measurements shall be performed before release of the 110 N/cm (63 lbf/in) load. The change in attenuation shall not exceed 0.15 dB/km at 1550 nm and 0.30 dB/km at 1300 nm for multimode cable.
f. When tested in accordance with TIA/EIA 455-25-C, FOTP-25, except that the number of cycles shall be 2 at 3 locations along a 1-meter cable length and the impact energy shall be at least 4.4 Nm (in accordance with ICEA S-87-640). The change in attenuation shall not exceed 0.15 dB/km at 1550 nm and 0.30 dB/km at 1300 nm for multimode cable.

g. When tested in accordance with TIA 455-33-A, FOTP-33-B, using a maximum mandrel and sheave diameter of 560 mm, the cable shall withstand a rated tensile load of 2670N (601 lbf) and residual load of 30 percent of the rated installation load. The axial fiber strain shall be less than or equal to 60 percent of the fiber proof level after completion of 60 minute conditioning and while the cable is under the rated installation load. The axial fiber strain shall be less than or equal to 20 percent of the fiber proof level after completion of 10 minute conditioning and while the cable is under the residual load. The change in attenuation at residual load and after load removal shall not exceed 0.15 dB/km at 1550 nm and 0.30 dB/km at 1300 nm for multimode cable.

h. When tested in accordance with TIA/EIA 455-85-A, FOTP-85-A, a length of cable no greater than 2 meters shall withstand 10 cycles of mechanical twisting. The change in attenuation shall not exceed 0.15 dB/km at 1550 nm and 0.30 dB/km at 1300 nm for multimode cable.

i. When tested in accordance with TIA/EIA 455-181, FOTP-181, the cable shall withstand a simulated lightning strike with a peak value of the current pulse equal to 105 kA without loss of fiber continuity. A damped oscillatory test current shall be used with a maximum time-to-peak value of 15 μs (which corresponds to a minimum frequency of 16.7 kHz) and a maximum frequency of 30 kHz. The time to 1/2 value of the waveform envelope shall be from 40 to 70 μs.

j. When tested in accordance with TIA/EIA 455-37-A, FOTP-37, the cable shall withstand 4 full turns around a mandrel of less than or equal to 20 times the cable diameter after conditioning for 4 hours at test temperatures of negative 22 degrees F and 140 degrees. Neither the inner or outer surfaces of the jacket shall exhibit visible cracks, splits, tears, or other openings. The change in attenuation shall not exceed 0.15 dB/km at 1550 nm and 0.30 dB/km at 1300 nm for multimode cable.

2. Construction

a. Optical fibers shall be placed inside a loose buffer tube. The nominal outer diameter of the buffer tube shall be either 2.5 mm or 3.0 mm. Each buffer tube shall contain up to 12 fibers. The fibers shall not adhere to the inside of the buffer tube. The buffer tubes shall be resistant to external forces and shall meet the buffer tube cold bend and shrink-back requirements of USDA RUS 7 CFR 1755.900.

b. Each fiber shall be distinguishable by means of color-coding in accordance with TIA-598-C. The fibers shall be colored with ultraviolet (UV) curable inks.

c. Buffer tubes containing fibers shall be color-coded with distinct and recognizable colors in accordance with TIA-598-C. Buffer tube colored stripes shall be inlaid in the tube by means of co-extrusion when required. The nominal stripe width shall be 1.0 mm. In buffer tubes containing multiple fibers, the colors shall be stable across the specified storage and operating temperature range and not subject to fading or smearing onto each other or into the gel filling material. Colors shall not cause fibers to stick together.

d. Fillers may be included in the cable core to lend symmetry to the cable cross-section where needed. Fillers shall be placed so that they do not interrupt the consecutive positioning of the buffer tubes. In dual layer cables, any fillers shall be placed in the inner layer. Fillers shall be nominally 2.5 mm or 3.0 mm in outer diameter.

e. The central member shall consist of a dielectric, glass reinforced plastic (GRP) rod. The purpose of the central member is to provide tensile strength and prevent buckling. The central member shall be over coated with a thermoplastic when required to achieve dimensional sizing to accommodate buffer tubes/fillers.
FIBER OPTIC CABLE SUBSYSTEM - COMMUNICATIONS SYSTEM

f. Each buffer tube shall be filled with a non-hygroscopic, non-nutritive to fungus, electrically non-conductive, homogenous gel. The gel shall be free from dirt and foreign matter. The gel shall be readily removable with conventional nontoxic solvents. Buffer tubes shall be stranded around the dielectric central member using the reverse oscillation, or “S-Z”, stranding process. Water swellable yarn(s) shall be applied longitudinally along the central member during stranding.

g. Two polyester yarn binders shall be applied contra-helically with sufficient tension to secure each buffer tube layer to the dielectric central member without crushing the buffer tubes. The binders shall be non-hygroscopic, non-wicking, and dielectric with low shrinkage.

h. For single layer cables, a water swellable tape shall be applied longitudinally around the outside of the stranded tubes/fillers. The water swellable tape shall be non-nutritive to fungus, electrically non-conductive, and homogenous. It shall also be free from dirt and foreign matter.

i. For dual layer cables, a second (outer) layer of buffer tubes shall be stranded over the original core to form a 2 layer core. A water swellable tape shall be applied longitudinally over both the inner and outer layer. The water swellable tape shall be non-nutritive to fungus, electrically non-conductive, and homogenous. It shall also be free from dirt and foreign matter.

j. Cables shall contain 2 ripcords under the steel armor for easy armor removal. Additionally, armored cables that have an inner sheath shall also contain 1 ripcord under the inner sheath.

k. Tensile strength shall be provided by the central member, and additional dielectric yarns as required. The dielectric yarns shall be helically stranded evenly around the cable core.

l. Cables shall have an inner sheath of Medium Density Polyethylene (MDPE). The minimum nominal jacket thickness of the inner sheath shall be 1.0 mm. The inner jacket shall be applied directly over the tensile strength members (as required) and water swellable tape. A water swellable tape shall be applied longitudinally around the outside of the inner jacket. The armor shall be a corrugated steel tape, plastic-coated on both sides for corrosion resistance, and shall be applied around the outside of the water blocking tape with an overlapping seam with the corrugations in register. The outer jacket shall be applied over the corrugated steel tape armor. The outer jacket shall be a MDPE with a minimum nominal jacket thickness of 1.4 mm. The polyethylene shall contain carbon black to provide ultraviolet light protection and shall not promote the growth of fungus.

m. The MDPE jacket material shall be as defined by ASTM D1248, Type II, Class C Category 4 and Grades J4, E7 and E8. The jacket or sheath shall be free of holes, splits, and blisters. The cable jacket shall contain no metal elements and shall be of a consistent thickness.

n. The outer surface of the jacket of each shipping length of cable shall be permanently identified by printing (in a contrasting color) descriptive information on the outer surface of the jacket at intervals of 1500 mm (5 feet) or less. The information shall include identification (Authority Communications System), country of origin (made in), count of fibers, fiber type, date of manufacturing (month and year), manufacturer's part number, manufacturer's name, sequential meter or foot markings, a telecommunication handset symbol as required by NESC Section 350G, fiber count, and fiber type. The actual length of the cable shall be within plus or minus 0 to 1 percent of the length markings. The print color shall be white, with the exception that cable jackets containing 1 or more co-extruded white stripes, which shall be printed in light blue. The height of the marking shall be approximately 2.5 mm.

o. If the initial marking fails to meet the specified requirements, i.e., improper text statement, color, legibility, or print interval, the cable may be remarked using a contrasting alternate color. The numbering sequence shall differ from the previous numbering sequence, and a tag shall be
attached to both the outside end of the cable and to the reel to indicate the sequence of remarking. The preferred remarking color shall be yellow, with the secondary choice being blue.

p. Size and construction shall recognize the nature of fiber optic cables regarding installation, especially at manholes. Allowance for such fiber characteristics shall be made in cable pull budgets.

q. The fiber colors shall meet the centroid colors and tolerances as specified in TIA/EIA-598. Since TIA/EIA-598 is specified for opaque colors, local injection/detection (LID) compatible inks, which are translucent, shall make the best fit with the centroid colors. Fiber coloring shall be compatible with LID systems.

3. Singlemode Optical Fiber Characteristics. Singlemode (Dispersion Un-shifted) with Low Water Peak fiber utilized in the optical fiber cable shall meet TIA-492-CAAB, and ITU recommendation G.652.C. These fibers shall have the same specified performance and geometry values as noted below.

a. All fibers shall be usable fibers and shall meet the following requirements:

1) Fiber and cable protective coverings shall be continuous with no factory splices.

2) All optical fibers shall be sufficiently free of surface imperfections and inclusions to meet optical, mechanical and environmental requirements of this Specification.

3) The attenuation specification shall be a maximum value for each cabled fiber at 23 within plus or minus 73.4 degrees F on the original shipping reel.

b. Glass Composition: SiO$_2$, which may include small amounts of germanium (Ge), fluorine (F), or phosphorous (P) to control the index of refraction or to assist in fiber manufacture.

c. Operational Wavelength: 1310 nm, 1550 nm, and 1625 nm.

d. Cutoff Wavelength: Less than 1260 nm.

e. Maximum Optical Attenuation:

1) At 1310 nm: Less than or equal to 0.35 dB/km at 73 degrees F

2) At 1383 within plus or minus 3 nm: Less than or equal to 0.35 dB/km at 73 degrees F

3) At 1550 nm: Less than or equal to 0.2 dB/km at 73 degrees F

4) At 1625 nm: Less than or equal to 0.23 dB/km at 73 degrees F

f. Attenuation vs. Wavelength

1) $\lambda_{ref} = 1310; 1285 \leq \lambda \leq 1330; \Delta = 0.03$ dB/km

2) $\lambda_{ref} = 1550; 1525 \leq \lambda \leq 1575; \Delta = 0.02$ dB/km

g. Water Peak Attenuation: At 1383 within plus or minus 3 nm; less than or equal to 2.1 dB/km.

h. Fiber Macro-bend

1) 1 Turn at 32 within plus or minus 2mm; less than or equal to 0.10 dB at 1550 nm

2) 100 Turns at 50 within plus or minus 2mm; less than or equal to 0.05 dB at 1310 nm

3) 100 Turns at 50 within plus or minus 2mm; less than or equal to 0.05 dB at 1550 nm

4) 100 Turns at 60 within plus or minus 2mm; less than or equal to 0.10 dB at 1625 nm

5) 100 Turns at 50 within plus or minus 2mm; less than or equal to 0.05 dB at 1625 nm

i. Point Discontinuity: No point discontinuities greater than 0.05 dB at either 1310 nm or 1550 nm.
j. Total Optical Dispersion
   1) At 1285-1330 nm: Less than or equal to 3.5 ps/(nm·km)
   2) At 1550 nm: Less than or equal to 18 ps/(nm·km)
   3) At 1625 nm: Less than or equal to 22 ps/(nm·km)

k. Zero Dispersion Slope: Less than or equal to 0.089 ps/(km·nm²).

m. Maximum Polarized Mode Dispersion: less than or equal to 0.5 ps/(km)½.

n. IEEE 802.3 GbE - 1300 nm Laser Distance: Up to 5000 m.

o. Fiber Core Diameter: 8.3 µm nominal.

p. Fiber Coating Diameter: 245 µm within plus or minus 5 µm.

q. Coating-Cladding Concentricity: Less than 12 µm.

r. Colored Fiber Nominal Diameter: 253-259 µm.

s. Coating Strip Force
   1) Dry: 0.6 lbs
   2) Wet: 0.6 lbs

t. Fiber Curl Radius of Curvature: Greater than 4.0 m.

u. Fiber Cladding Diameter: 125.0 µm within plus or minus 0.7 µm.

v. Cladding Non-circularity: Less than or equal to 0.7 percent.

w. Core/Cladding Concentricity: Less than or equal to 0.5 µm.

x. Mode Field Diameter
   1) 1310 nm: 9.2 within plus or minus 0.4 µm
   2) 1550 nm: 10.4 within plus or minus 0.5 µm

y. Effective Group Index of Refraction
   1) 1310 nm: -77 dB
   2) 1550 nm: -82 dB

z. Refractive Index Difference: 0.3 within plus or minus 0.0011 percent.

4. Multimode Optical Fiber Characteristics. Multimode fibers shall meet TIA/EIA-492-AAAA-A "Detail Specification for 62.5-µm Core Diameter/125-µm Cladding Diameter Class 1a Graded-Index Multimode Optical Fibers." These fibers shall have the same specified performance and geometry values as noted below:

a. All fibers in the cable shall be usable and meet required specifications.

b. Each optical fiber shall be sufficiently free of surface imperfections and inclusions to meet the optical, mechanical, and environmental requirements of this Specification.

c. Each optical fiber shall consist of a germanium-doped silica core surrounded by a concentric glass cladding. The fiber shall be a matched clad design.

d. The attenuation specification shall be a maximum value for each cabled fiber at 23 within plus or minus 41 degrees F on the original shipping reel.

e. Geometry
   1) Core Diameter 62.5 within plus or minus 3.0 µm
   2) Core Non-Circularity less than or equal to 5 percent
   3) Cladding Diameter 125.0 within plus or minus 2.0 µm
   4) Cladding Non-Circularity less than or equal to 2.0 percent
   5) Core-to-Cladding Concentricity less than or equal to 3.0 µm
   6) Coating Diameter 245 within plus or minus 5 µm
   7) Colored Fiber Nominal Diameter 253 to 259 µm
f. Optical

1) Cabled Fiber Attenuation
   a) 850 nm less than or equal to 3.5 dB/km
   b) 1300 nm less than or equal to 1.0 dB/km

2) Point discontinuity
   a) 850 nm less than or equal to 0.2 dB
   b) 1300 nm less than or equal to 0.2 dB

3) Macro-bend Attenuation
   a) Turns - 100; Mandrel OD -75 within plus or minus 2 mm, less than 0.5 dB at 850 nm
   b) Turns - 100; Mandrel OD - 75 within plus or minus 2 mm less than 0.5 dB at 1300 nm

4) Cabled Effective Modal Bandwidth
   a) 850 nm, greater than 385 MHz•km

5) IEEE 802.3 GbE Distance
   a) 1000BASE-SX Window (850 nm), up to 500 m
   b) 1000BASE-LX Window (1300 nm), up to 1000 m

6) OFL Bandwidth
   a) 850 nm, greater than 200 MHz•km
   b) 1300 nm, greater than 500 MHz•km

7) Numerical Aperture 0.275 within plus or minus 0.015

5. Mechanical Specifications:

   a. Each optical fiber shall be proof tested by the fiber manufacturer at a minimum of 100 kpsi (0.7 GN/m2).
   b. The fiber shall be coated with a dual layer acrylate protective coating. The coating shall be in physical contact with the cladding surface.
   c. Crush Resistance: 10 kN/m (685 lb/ft) length of cable.
   d. Cable Outside Diameter: Less than 0.65 inch.
   e. Weight per 1000 linear foot:
      1) Less than 160 lbs.
   f. Minimum Bending Radius
      1) Installation, 15X Diameter
      2) Static, 12X Diameter
   g. Temperature: Operational
      1) Negative 22 degrees F to 140 degrees F
      2) Continuous operation at negative 22 degrees F without cracking or becoming brittle
   h. Storage: Negative 40 degrees F to 158 degrees F on reel.
   i. Humidity: 0 to 100 percent, inclusive
   j. Tensile Strength
      1) Installation: 2,700 N (600 lbf)
      2) Static: 890 N (200 lbf)

2.2 FIBER CONNECTORS

A. FDP connectors shall be SC type, unless otherwise directed.

B. Connectors for media converter equipment shall be SC type. Jumper cables shall be provided that match the connectors at each end of the cable.

C. Optical parameters of the connectors shall meet the requirements of TIA/EIA-568.

D. Singlemode connectors shall be Ultra Physical Contact (UPC) factory polished. Typical optical return loss for UPC polish is 50 dB.
E. Multimode connectors shall be Physical Contact (PC) factory polished. Typical optical return loss for PC polish is 30 dB.

2.3 MEDIA CONVERTER

A. LAN media converters shall convert the 10/100 BASE-T/TX ports of the ADM Ethernet module at stations to 10 BASE-FL and 100 BASE-FX to the attached devices for media transmission. Contractor shall install and test these media converters.

B. Media converters shall be installed in a rack mounted card cage in CICs, and Communications Facility equipment cabinets. At Signals Houses and Traction Power Substations (TPSS), media converters shall be mounted separately on shelves as shown on Contract Documents. The converters shall comply with the following requirements:

1. 10/100 BASE-T/TX to 10 BASE-FL Converter
   a. Interfaces: RJ-45 to SC singlemode optical
   b. Minimum power link budget 16 dB over singlemode cable at 1310 nm operating optical wavelength
   c. Protocol Compatibility: 10 Base-T, 100 Base-TX, and 10 Base-FL standards
   d. 802.3u compliant auto-negotiation
   e. Operating Distance: 100 m for 10/100 Base-T/TX, 15 km for 10 Base-FL
   f. Data Flow: Half or Full Duplex Support
   g. LEDs: Power, Link, Transmit, Receive
   h. Store and forward switching mode. Data packet forwarding and filtering at a minimum of 148,000 pps at 100 Mbps or 14,880 at 10 Mbps
   i. Automatic address learning and aging
   j. Input power requirement as shown on Contract Documents.

2. 10/100 BASE-T/TX to 100 BASE-FX Converter
   a. Interfaces: 100 Base-TX (RJ-45), 100 Base-FX (SC)

b. Protocol Compatibility: IEEE 802u 100 Base-TX and 100 Base-FX Standards

c. Operating Distance: 100 m for 100 Base-TX, 2 km for 100 Base-FX MM, 15 km for 100 Base-FX SM

d. Data Flow: Half or Full Duplex Support

e. LEDs: Power, Link, Transmit, Receive

f. Fiber Requirements: Multimode, and singlemode fiber cabling with SC connectors

3. Contractor shall submit link budget calculations showing all intended links to be used by the submitted media conversion device. In addition to all fiber, splice, component aging, and connector losses, the calculation shall yield a minimum of 6 db of margin over the specified worst-case budget of the conversion device.

2.4 FIBER SLACK ENCLOSURES

A. Enclosure
   1. Enclosures shall be NEMA-12 type with hinged cover and securing mechanism.

2. Enclosures shall be sized for 300 feet of cable slack.

B. Hardware
   1. Hooks shall be provided to hold cable slack, with coils of required bend radius.

2. Velcro ties to restrain cable shall be utilized.

2.5 FIBER DISTRIBUTION PANELS

A. Enclosure
   1. The enclosure shall house the splice shelf and connector sleeve panels for all optical connections. As a minimum, the enclosure shall be capable of providing connections for all singlemode and multimode fibers and in accordance with the Contract Documents.

2. All OSP cable jackets and central strength members shall be secured to relieve strain.

B. Distribution Panels
   1. Distribution panels shall be a complete system of components by a single manufacturer.
2. Rack mountable connector housings shall be available for cross-connecting or interconnecting purposes. The units shall provide for direct connectorization and pigtail splicing.

3. Housings shall be mountable in an EIA-310 compatible 18.3 inch rack.

4. The unit shall meet the design requirements of TIA-568.

5. Molded plastic parts shall meet the flammability requirements of UL 94 V-0.

6. The connector housings shall have a labeling scheme that complies with TIA/EIA-606. The housing shall incorporate labeling via an adhesive backed label and a retractable sliding label panel that pulls out from the bottom front of the housing.

7. Housings shall be manufactured using 16-gauge aluminum and shall be finished with a two-tone gunmetal grey and/or anodized silver for durability. Installation fasteners shall be included and shall be black in color.

8. The unit shall be capable of connectorization and jumper management. The unit shall be capable of splicing or combination connectorization/splicing with the use of an additional splice tray kit.

9. Fiber Cable Routing: The unit shall have a fiber routing guide platform located in the rear of the housing. The fiber routing guide platform shall be removable using 2 plunger style latches so that room can be made for an optional splice tray kit.

10. Jumper Routing
   a. The unit shall have a hinged top jumper management panel capable of locking in the horizontal or vertical position. When the top panel is locked in the horizontal position, it shall act as a jumper routing area in the top front of the housing and shall enclose the top of the housing.
   b. When the hinged panel of the unit is locked in the vertical position it shall serve as a horizontal jumper management panel capable of routing jumpers out of the top of the housing. Total height of the housing shall be 5U or less.

11. Fan-Out Devices
   a. Provisions for mounting fan-out devices shall be incorporated into the housing if direct terminations are required.
   b. Splice capacity shall be 12 splice trays.

12. Units shall include a clamshell-type cable clamping mechanism to provide cable strain relief. The cable clamp shall accept 1 cable from 0.37 inches to 1.12 inches in diameter. The cable clamp mechanism shall also handle multiple smaller fiber count cables when used with a multiple cable insert. The total cable capacity per clamp shall be 5 cables (0.4 inches) OD when used with the multiple cable insert. Housing cable clamp capacity shall be 2 clamps. Additional cable clamps shall be available as an accessory kit.

13. The housing shall have 4 grommet openings for cable entry in the rear of the housing. The unit shall have 2 removable panels on both the left and right rear of the housing if more than 4 cable entries are required.

14. Front and rear doors of the connector housings shall be hinged and removable for ease of cable installation.

15. Access Doors
   a. The front doors shall be made from tinted polycarbonate.
   b. Front and rear doors shall utilize a single slide latch to provide ready access and closing. An opening shall be provided in the front and rear doors so that an optional key lock kit may be used. The opening shall be filled with a removable plastic insert so that dust may not enter if the optional lock kit is not used. There shall be a removable retaining bracket to prevent the door from being unintentionally slid off the hinges.

16. The housing shall accommodate the future installation of SC, ST, FC, D4, or MTRJ, type connector modules. Each module shall provide twelve connector sleeves.

17. Where armored cable is utilized, the armor shall be grounded to the main chassis ground bus at 1 termination location. Contractor shall not ground the armor at both ends of the cable, regardless of the length.

C. Splice Shelf

1. The splice shelf shall accept slide in/out splice trays for a maximum number of
connectors and for the fiber types to be installed.

2. Each splice tray shall restrain and protect fusion splices. Mechanical splices shall not be utilized.

D. Connector Sleeves

1. Connector sleeves shall be the SC type. The connector sleeve shall meet TIA-568-B.1-3 requirements when connecting mated pairs.

2. The FDP shall be fully populated with connector panels, each consisting of 12 connector sleeves.

3. Dust Caps shall be provided for all sleeves.

4. Loss across connection shall not exceed the following, with optical attenuators removed:
   a. Singlemode: 0.5 dB
   b. Multimode: 0.5 dB

5. The FDP sleeves shall be capable of accepting optical attenuators as required for maintaining the Optical Loss budget.

E. Slack Retention

1. Slack in pigtails and patch cords shall be neatly coiled and retained such that the minimum-bending radius shall not be exceeded.

2. Slack shall be sufficient for accessing splice shelves and connectors.

2.6 OPTICAL FIBER PATCH CORDS AND PIGTAILS

A. Patch cords and pigtails shall be cable assemblies consisting of flexible optical fiber cable with SC compatible connectors. Patch cords shall be complete factory fabricated assemblies from manufacturer's standard product lines. Fiber optic jumper cables shall meet the following requirements:

1. Patch Cord Assemblies
   a. The cable construction shall allow a small bend radius for installation in space-constrained areas. The cable shall contain a dielectric strength member and a protective outer jacket.
   b. The Patch Cord shall comply with the requirements of TIA-568-B.1-3.

2. Connectors
   a. Two duplex connectors shall be provided on patch cords.
   b. One duplex connector shall be provided on pigtails, with the other end prepared for splicing.

3. Fiber Cable
   a. Patch cords and pigtails shall utilize a 2-fiber zip-cord type jacketed cable, in lengths required to meet minimum bend radius while connected and routed through cable management hardware but no less than 6 feet in length. The cable jacket color shall be orange for multimode and yellow for singlemode cable. The fiber core size shall also be identified on the outer jacket.
   b. The optical fiber shall meet the same characteristic requirements of the distribution panel terminated cable to which it mates.
   c. Tensile strength of the jacketed cable shall be greater than or equal to 20 lbs.

2.7 INNERDUCT

A. Constructed of flame retardant PVC, FCP, or HDPE material and shall meet the following flammability requirements:

1. Outside Plant (OSP) innerduct, (General-purpose optical fiber cable raceway) shall meet the UL 2024 (raceways) Vertical Flame Test (General Use) for being resistant to the spread of fire.

2. Inside Plant (ISP) innerduct, inside building horizontal, and inside building riser innerduct shall meet the UL 2024 (raceways) Test for Flame Propagation (Riser) for having fire-resistant characteristics capable of preventing the spread of fire from floor to floor.

3. ISP Innerduct installed in any air plenum environment shall meet the UL 2024 (raceways) Test for Flame Propagation and Smoke-Density Values for having adequate fire-resistant and low smoke-producing characteristics.

B. Inside building horizontal and riser innerducts shall be flexible and corrugated type.

C. Compatible with the fiber optic cable installed within.
D. Inner diameter shall be 1-1/4 inch minimum.

E. Couplers, if used, shall not reduce the inside diameter of the innerduct.

F. All unused innerduct shall be pre-installed with lubricated pull tape or line.

2.8 WIRE PULLING LUBRICANT

A. Wire Pulling Lubricant shall have the following characteristics:

1. Polymer-based

2. Average Coefficient of Friction: Less than or equal to 0.055

3. Temperature Range: Negative 28 degrees F to 180 degrees F

4. Compatible with all cable types

PART 3 - EXECUTION

3.1 INSTALLATION

A. All optical cable installation shall be accomplished in accordance with the approved plan:

1. OSP fiber optic cable shall be installed in innerduct. No more than 1 OSP fiber optic cable shall be installed in a single innerduct without Authority approval. The innerduct shall be installed without coils or twists.

2. Pull locations shall be selected to protect the cable on the reel and in slack loops. Contractor shall be responsible for protecting cable after working hours where cable installation is not completed during a single shift. Cables damaged due to Contractor's negligence while installing cable shall be replaced by the Contractor at no additional cost to the Authority.

3. Pull lengths shall be designed to allow a 20 percent margin in cable tensile strength. The Contractor shall not exceed the lesser of 80 percent of the cable’s maximum tensile rating or 600 lbs during installation. No residual tension shall remain on the cable after installation except that due to the cable's weight in the vertical rise. Wire pulling lubricant shall be used to reduce tension on the cable during the installation process.

4. Fiber optic cables shall not be pulled into a conduit that already contains conductors, unless otherwise allowed by the Authority or shown on the Contract Drawings.

5. In case, due to the actual site condition and/or conflicts with existing or proposed utilities, it becomes required to pull fiber optic cable in existing conduit system, that already have cables in them, 21 days prior to installation, contractor shall submit a request for approval. Provide working drawings and shop drawings showing plan and scheduling for performance of the Work.

6. If a winch or pulling machine is used during installation, a dynamometer shall be used to monitor the tension on the cable. The dynamometer shall be certified as calibrated and shall hold the peak value of the cable pull. The peak value shall be recorded and forwarded to the Authority as part of the installation test data submittals.

7. Contractor shall exercise caution during construction to protect existing cable, express trough/manholes and any other utilities and elements that are located in areas of work. If necessary, the Contractor is responsible for relocation of existing utilities as per project requirements and/or replacement of damaged utilities/elements as caused by performance of this work.

8. The maximum vertical rise shall be defined as the distance over which the cable is self-supporting. Cable strain relief shall be used at the top of each vertical rise and no less than every time that 80 percent of vertical rise rating of the cable is exceeded.

9. Contractor shall not exceed the cable’s minimum bend radius for cable under tension or long-term installation/storage.

10. Continuity of cable shall be maintained between termination or splice locations shown on the Contract Drawings. Additional splices shall not be allowed without the prior written Authority approval.

11. Contractor shall notify the Authority in writing at least 48 hours in advance of installation of each section of optical cable.

12. All cable entrance openings in equipment enclosures, houses, rooms and junction boxes shall be sealed with either a compression type fitting or pliable sealing compound after the cable is in place. Sealing compounds for rooms, houses, walls, or other partitions shall be fire retardant per ASTM E814. Sealing compound shall be used to seal the area around cable where the cable emerges from the end of a conduit, pipe, or duct bank. All spare conduits shall be sealed or plugged in an approved manner.

13. Protect and maintain existing utility service in accordance with Section 02760,
“Maintenance, Support, and Restoration of Existing Utility Facilities”.

B. Termination

1. Slack in FSE's shall be carefully coiled in order to avoid violating the short and long-term minimum bend radius. Contractor shall supply a minimum slack of 150 feet of fiber optic cable at each end of the cable span inside the FSE.

2. Only hook and loop fasteners shall be used for strain relief and support of patch cords. Zip ties shall be used to mount pig tails in the splice tray.

3. The outer jacket of the cable shall be attached to the FDP with a manufacturer's clam shell cable clamp.

4. All fiber optic splices shall be fusion splices. Fusion splices shall be performed by qualified personnel only.

5. Mechanical optical splices are not permitted. This includes all mechanical fiber assemblies, crimp-on connectors, and connectors that do not require epoxy or field polishing.

6. At all wayside and communications facilities, all fibers shall be terminated. Terminations shall utilize fiber optic pigtails with factory installed connectors and shall be fusion spliced to the main fiber optic cable.

7. Contractor shall notify the Authority in writing at least 1 week in advance of terminating each section of optical cable.

8. Where armored cable is utilized, the armor shall be grounded to the ground bus at 1 termination location at 1 end of each cable span only.

9. All routing of fibers within fiber distribution panels (FDPs) and enclosures shall be neatly organized and retained such that the minimum bending radius shall not be exceeded. A slack or service loop shall be made inside the panel to be sufficient to re-prepare and re-splice the fibers if they are ever severed at the entry to the splice tray without removing the cable clamp to the FDP and un-jacketing additional cable.

10. Fusion splicing equipment shall be equipped with local injection and detection (LID) or core alignment system to optimize splices and to minimize return trips to repair unacceptable splices. The fusion machine estimated loss across each spliced fiber shall be less than or equal to 0.04 dB.

11. A heat shrinkable splice protection sleeve with a bracing strength member shall protect each fusion splice. Each splice tray shall restrain and protect fusion splices.

12. All splices shall be sequentially organized in a fiber splice tray. All fiber shall be clean and neatly wrapped in the tray and shall not be tangled, knotted, or curved in a non-flowing manner.

13. Contractor shall label all pigtail splices stored in the FDP splice tray as well as the FDP front panels. Labels shall indicate the cable terminated fiber numbers, and unique equipment assignments.

3.2 CABLE PLANT TESTING

A. Factory Cable Tests

1. Cable shall be tested on-reel prior to shipment.

2. End to end loss shall be recorded for each fiber at 1310 nm, 1550 nm and 1625 nm.

3. End to end loss shall be recorded for each multi-mode fiber at 850 nm and 1300 nm.

4. OTDR with hardcopy record shall be provided for each singlemode fiber, at 1310 nm, 1550 nm and 1625 nm.

5. OTDR with hardcopy record shall be provided for each multimode fiber, at 850 nm and 1300 nm.

6. Polarized Modal Dispersion (PMD) for each singlemode fiber shall be measured using a PMD analyzer and polarized light source.

7. Chromatic optical dispersion shall be tested for each singlemode fiber.

8. Certified copies of tests results shall be submitted to the Authority as described in these Specifications 14 days after completion of each test.

9. Original manufacturer’s factory test results, certifications, and statements confirming compliance with all of the requirements of Article 2.1 of these Specifications may be submitted for Authority approval in lieu of performing these factory tests.

B. Cable Plant Field Tests

1. Tests shall be performed after installation is complete.

2. Notice shall be provided to the Authority 7 days in advance prior to the start of testing.
3. Optical attenuation from FDP to FDP shall be measured and recorded in compliance with TIA 526-7 for singlemode fibers and TIA-526-14-A for multimode fibers.

4. Every fiber optic cabling link installed by the Contractor shall be tested in accordance with the field test specifications defined by the TIA standard TIA-568-B.1-3 (or by the required network application standards) whichever is more stringent. See Paragraph 3.2.D of this Specification.

5. TIA-568-B.1-3, shall be used to define the passive cabling network, to include cable, connectors, and splices (if present), between 2 optical fiber patch panels (connecting hardware). This TIA document shall be used to describe all applicable link segments. Tests shall include the representative connector performance at the connecting hardware associated with the mating of patch cords but not the performance of the connector at the interface with the test equipment.

6. All of the cabling links installed shall be tested and shall pass the requirements of the standards mentioned in Paragraphs 3.2.A and 3.2.B above and as further detailed in Paragraphs 3.2.C and 3.2.D. Any failing link shall be diagnosed and corrected prior to the system acceptance. The corrective action shall be followed with a new test to prove that the corrected link meets the performance requirements. The final and passing result of the tests for all links shall be provided in the test results documentation in accordance with Paragraph 3.2.D below.

7. Every fiber optic cabling link installed by the Contractor shall be tested in accordance with the field test specifications defined by TIA standard TIA-455-133-A and TIA 455-78-B (or by the required network application standards), whichever is more stringent. See Paragraph 3.2.C of this Specification.

8. Optical Time Domain Reflectometer (OTDR) equipment used shall be Telcordia GR-196-CORE and SR-4731 compliant.

9. Trained technicians who have successfully attended a required training program and have obtained a certificate, as proof thereof shall be used to execute the tests. These certificates may have been issued by any of the following organizations or an equivalent organization:

a. The manufacturer of the fiber optic cable and/or the fiber optic connectors.

b. The manufacturer of the test equipment used for the field certification.

c. Training organizations authorized by BiCSi (Building Industry Consulting Services International with headquarters in Tampa, Florida) or by the ACP (Association of Cabling Professionals™) Cabling Business Institute located in Dallas, Texas.

d. Technician resume with appropriate experience and references may be submitted in lieu of training programs for Authority review and approval.

10. Field attenuation test instruments for multimode fiber cabling shall meet the requirements of TIA-526-14A. Field attenuation test instruments for singlemode fiber cabling shall meet the requirements of TIA-526-7.

11. The test instrument calibration date shall be within the calibration period recommended by the vendor in order to achieve the vendor-specified measurement accuracy.

12. The fiber optic launch cables and adapters shall be of high quality and the cables shall not show excessive wear resulting from repetitive coiling and storing of the test instrument interface adapters.

13. An Authority representative shall be invited to perform field-testing. The representative shall be notified of the start date of the testing phase 5 business days before testing.

14. The Authority representative shall select up to 5 percent of the links installed. The representative (or authorized delegate) shall test these selected links and the results are to be stored in accordance with the prescriptions in Paragraph 3.2.D. The results obtained shall be compared to the data provided by the Contractor. If the sample results differ in terms of the pass/fail determination, the Contractor under observation of the Authority representative shall repeat testing of the affected link.

C. Cable Plant Performance Test Parameters

1. In compliance with TIA-568-B, the single performance parameter for field-testing of fiber optic links shall be link attenuation (insertion loss).

2. The maximum acceptable link attenuation for each span of cable shall be calculated
by the following formulas specified in TIA-568-B:

a. Link Attenuation = Cable Attenuation + Connector Attenuation + Splice Attenuation

b. Cable Attenuation (dB) = Attenuation Coefficient (dB/km) \times \text{Length (km)}

c. Connector Attenuation (dB) = \text{number of connector pairs} \times \text{connector loss (dB)}

d. Splice Attenuation (dB) = \text{number of splices (S)} \times \text{splice loss (dB)}

3. The values for the Attenuation Coefficient are listed below:

a. Singlemode (outside plant), 1310nm: 0.5 dB/km

b. Singlemode (outside plant), 1550nm: 0.5 dB/km

c. Multimode, 850 nm: 3.5 dB/km

d. Multimode, 1300 nm: 1.5 dB/km

4. The following values listed below are to be used in the Link Attenuation formula:

a. Attenuation Coefficient (dB/km) Singlemode, 1310 nm = 0.4 dB/km

b. Attenuation Coefficient (dB/km) Singlemode, 1550 nm = 0.3 dB/km

c. Attenuation Coefficient (dB/km) Multimode, 850 nm = 3.5 dB/km

d. Attenuation Coefficient (dB/km) Multimode, 1300 nm = 1.5 dB/km

e. Splice loss (dB) Singlemode = 0.1 dB

f. Splice loss (dB) Multimode = 0.05 dB

g. Connector loss (dB) Singlemode = 0.5 dB

h. Connector loss (dB) Multimode = 0.5 dB

i. “Number of splices (S)” and Number of connector pairs are based on physical characteristics of the span of fiber being tested

j. “Length (km)” is based on the OTDR measurement of the fiber

5. Link attenuation shall not include any active devices or passive devices other than cable, connectors, and splices, i.e. link attenuation shall not include such devices as optical bypass switches, couplers, repeaters, or optical amplifiers.

6. The value calculated by the above maximum acceptable Link Attenuation formula for each fiber span is to be used as one of the determining factors regarding the pass/fail acceptance of each fiber based on the measured attenuation for each fiber using the One Reference Jumper Method specified by TIA-526-7, Method A.1, TIA-526-14-A, Method A, or the equivalent method. The user shall follow the procedures established by these standards or application notes to accurately conduct performance testing.

7. All multimode fiber cables shall be attenuation (power meter) tested in one direction at both 850 nm and 1300 nm wavelengths to account for attenuation deltas associated with wavelength in accordance with TIA-526-14-A.

8. All singlemode fiber cables shall be attenuation (power meter) tested in one direction at both 1310 nm and 1550 nm operating wavelengths in accordance with TIA-526-7, Method A.1. One Reference Jumper or the equivalent method.

9. OTDR Testing

a. All singlemode fiber cables shall be bi-directionally OTDR tested at 1310 nm and 1550 nm operating wavelengths for anomalies and to ensure uniformity of cable attenuation and connector insertion loss. All multimode fiber cables shall be bi-directionally OTDR tested at 850 nm and 1300 nm operating wavelengths for anomalies and to ensure uniformity of cable attenuation and connector insertion loss.

b. OTDR tests shall be performed utilizing a launch cable such that the FDP termination or first test link shall be clearly shown.

c. Optical Return Loss (ORL) for each link shall be measured.

d. Fiber Length shall be measured.

e. OTDR range, resolution, pulsewidth, and index of refraction
settings should be appropriate for the fibers being tested. Contractor must scrutinize and correct the traces (in the field) for testing-related issues, including but not limited to; ghost reflectance, noisy traces, excessive dead-zones, low launch levels, bad launches, and bad connections.

f. Test Results

1) Reflective events shall not exceed negative 40 dB.

2) Attenuation of mated connections (connector pairs) shall not exceed 0.5 dB for multimode fiber, and 0.5 dB for singlemode fiber.

3) Non-reflective events (splices) shall not exceed 0.05 dB for multimode fiber and 0.1 for singlemode fiber.

4) Point discontinuities shall not exceed 0.1 dB in continuous fiber.

5) ORL shall be less than negative 30 dB.

g. OTDR Test results shall include OTDR link and channel plots, OTDR settings, user heading information, and complete event tables at the required wavelength(s) for each optical fiber as by the OTDR. The event table shall indicate distances and measurements of all connections and splices performed.

D. Cable Plant Test Result Documentation

1. The test result information for each fiber and link shall be recorded in the memory of the field tester upon completion of the test.

2. The test result records saved by the test instrument shall be transferred into a Windows™-based database utility that allows for the maintenance, inspection and archiving of these test records. A guarantee shall be made that these results are transferred to the PC unaltered, i.e., “as saved in the tester” at the end of each test. The popular ‘csv’ format (comma separated value format) does not provide adequate protection and shall not be acceptable.

3. The database records of all fiber shall be stored and delivered on CD-ROM or DVD. This CD-ROM or DVD shall include the software tools required to view, inspect, and print any selection of test reports.

4. General Information to be provided in the electronic database containing the test result information for each link:

a. The identification of the testing site, including address, building, rack, panel, and fiber information.

b. The overall pass/fail evaluation of the link-under-test.

c. The name of the standard selected to execute the stored test results.

d. The cable type and the specified value of the index of refraction (IOR) used for the fiber.

e. The date and time the test results were saved in the memory of the tester.

f. The initials or name of the technician who performed the testing.

g. The brand name, model and serial number and calibration data of the tester.

h. The revision of the tester software and the revision of the test standards database in the tester.

5. The detailed test results data to be provided in the electronic database for each tested optical fiber shall contain the following information:

a. The identification of the link/fiber in accordance with the naming convention defined in the overall system documentation.

b. The attenuation measured for each fiber at each wavelength (using TIA-526-14-A or TIA-526-7), the reference value used, and the attenuation test limit calculated for the corresponding wavelength.

c. The OTDR trace plots and associated settings and headers shall be reported for each optical fiber for which the test limit was calculated based on the formulas in Paragraph 3.2.C.

6. A paper copy of the OTDR and attenuation test results shall be provided that lists all the links and fibers that have been fully
FIBER OPTIC CABLE SUBSYSTEM - COMMUNICATIONS SYSTEM

tested with the following supporting information.

a. The identification of the link in accordance with the naming convention defined in the overall system documentation.

b. The identification of the testing site, including address, building, rack, panel, and fiber information.

c. The initials or name of the technician who performed the testing.

d. The date and time the test results were saved in the memory of the tester.

e. OTDR trace plots (dB vs. km) indicating all events with their associated range, resolution, pulsewidth, index of refraction, number of averages, and wavelength settings.

f. OTDR numerical event table per trace plot showing loss and reflectance measurements for all events. The overall pass/fail of the OTDR event measurements shall be based on the measured values versus the criteria in Paragraph 3.2.C.9.f.

g. The attenuation measured for each fiber at each wavelength (using method TIA-526-14-A or TIA 526-7), the reference value used, and the attenuation test limit calculated for the corresponding wavelength.

h. The overall pass/fail evaluation of the measured attenuation results shall be based on the maximum acceptable link attenuation value as defined in Paragraphs 3.2.C.3 and 3.2.C.4.

E. Authority Provided Cable Tests

1. Optical Time Domain Reflectometer (OTDR) testing for each strand of fiber in the cable.

   a. Unidirectional bare fiber OTDR test at 1550 nm only unless an anomaly is detected. If an anomaly is detected on a fiber during the unidirectional reel test, testing shall be performed in both directions and at both 1310 nm and 1550 nm wavelengths. Indicate in the trace information section if testing is performed in the inner or outer end of the reel.

b. Attenuation in dB/km as measured by placement of the A and B cursors inside the launch end reflection spike respectively on the traces.

3.3 MEDIA CONVERSION LINK TESTS

A. Contractor shall measure and record output power at the optical port of each media converter’s transmitter output and at the fiber cable connector serving each media converter’s receiver input.

1. Received power through the fiber link cable shall be no less than 6 dB above the converter’s worst-case minimum sensitivity specification.

2. Transmitted power shall be no less than the manufacturer’s worst case transmitted output power specification.

B. Contractor shall perform and report on Ethernet link testing between media conversion devices from twisted pair interface to twisted pair interface. The field tests shall include all applicable test requirements of RFC 2544, as a minimum shall include the following tests to verify compliance with the manufacturer’s specifications:

1. Throughput testing to find the highest rate at which the media converter can forward frames.

2. Frame Loss tests to show how the media converter responds to streams with different gaps separating the frames.

3. Back-to-back tests to show how the media converter responds to different quantities of frames, with the frames separated at the minimum gap allowed by IEEE 802.3 protocol specifications.

4. Latency testing to show how much processing overhead the media converter requires for forwarding frames.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this Section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith shall be considered incidental to the Work specified under Section 16801 “Basic Technical Requirements - Communications System”.

END OF SECTION 16845
PART 1 - GENERAL

1.1 DESCRIPTION

A. Contractor shall be responsible for completing an expansion of the existing communications system that performs as intended, is easy to operate and maintain, and includes inherent protection against certain deleterious ambient conditions that are anticipated in a railroad environment. Contractor shall bear total responsibility for system elements that are designed, provided, installed, tested, and commissioned under this Contract.

B. Contractor shall deliver complete operable systems that comply with performance and availability requirements in these Specifications notwithstanding any errors or omissions in these Specifications or Drawings, which might otherwise render such delivery uncertain or impossible.

C. In providing equipment and systems, the Contractor shall accept responsibility for development, design, fabrication, equipment selection and configuration, material, parts and details, wiring and cabling, software, documentation, testing, and all other related hardware and services.

D. Contractor shall bear total responsibility for the correction of any damage, malfunction, or degradation in equipment performance if the difficulty is caused by Contractor's system design, interfacing equipment, software, connection details, site work, or such other factors under Contractor's control.

E. Specification requirements and Contract Drawings are intended as the baseline (elementary) requirements for the Work under this Contract.

1. Specification requirements and Contract Drawings are not to be construed as a complete outline of or a limitation on the Work. The Specifications and Drawings include specific mention of all materials, equipment, installation details and other things required to be included in the design or to be provided or accomplished by the Contractor.

2. Where plans and these Specifications describe portions of the Work in general terms and where details are incomplete or silent, it is understood that only the best general practice is to prevail and that only new materials and first-quality workmanship are to be used.

3. Omissions of Work details that are customarily performed or are standard practices shall not relieve the Contractor from the obligation to perform such Work and to provide a fully functioning system which satisfies the operational and performance requirements in the Contract Documents and these Specifications.

F. Systems and equipment that do not meet performance requirements of these Specifications, and Authority approved submittals shall be corrected at the Contractor's expense until conformance with the governing requirements is achieved.

1.2 REFERENCED STANDARDS

A. Federal Communications Commission (FCC)

B. IPC Guidelines (IPC)

1. IPC-CM-770E – Guidelines for Printed Board Component Mounting
2. IPC-2221B – Generic Standard on Printed Board Design

C. Joint Electronic Device Engineering Council (JEDEC)

D. Military Standard

1. MIL-M-14F – Plastic Materials, Molding and Plastic-Parts Molded; Thermosetting
2. MIL-STD-275 – Printed Wiring for Electronic Equipment
3. MIL-STD-461E - Requirements For The Control Of Electromagnetic Field

E. National Fire Protection Association (NFPA)

1. NFPA 70 - National Electrical Code (hereinafter referred to as NEC)

F. National Electrical Manufacturers Association (NEMA)

1. NEMA Standards Publication 250, Enclosures for Electrical Equipment

G. Society of Automotive Engineers (SAE)

1. SAE Recommended Practice ARP 1393

H. Urban Mass Transit Association (UMTA)

1. UMTA-MA-06-0153-85-6 - Conductive Interference in Rapid Transit Signal Systems- Vol. II: Suggested Test Procedures
1.3 SUBMITTALS

A. Workmanship standards, practice, and procedures for assembly and installation shall be submitted at least 30 days prior to the earlier of:

1. The planned date for any assembly work.
2. The planned submittal date for installation drawings or procedures.
3. Shall include standards, practices and procedures applicable to:
   a. Wiring, cabling, cable management, connectors and termination of wire and cable.
   b. Color-coding standards.
   c. Grounding
   d. Labeling, including labels for:
      1) Equipment and material identification
      2) Operating and maintenance instructions and data
      3) Safety / Hazard warnings

B. At least 30 days prior to communications equipment installation, submit the following for each basic electrical and electronic assembly which is custom designed and fabricated:

1. Assembly bill of materials
2. All printed circuit board layouts
3. Enclosure and connector designs
4. Pertinent design details required for the complete assembly fabrication and its interfaces
5. Product information for all wiring and printed circuit components and standard assemblies shall be submitted to the Authority in an organized, sorted, and indexed listing. Contractor list shall include supplementary information or specific references to aid the Authority in replacement procurement.
6. Product information for special tools needed for assembly, maintenance, and testing.

C. Submitals for basic mechanical components and devices:

1. At least 30 days prior to communications equipment installation, submit product information and specification sheets for all mechanical components, devices and associated appurtenances.
2. Identify external controls, indicators, test points, ports, terminals, and connectors. Identify product salient characteristics to the Authority for procurement of replacement components.
3. At least 30 days prior to communications equipment installation, submit the following information about each device, module, or similar item:
   a. General assembly outline drawings
   b. Internal circuitry schematic diagrams

D. Identification and numbering scheme, and use and format of labels, tags, sleeves, and equivalent, for all types of equipment and material identification shall be submitted at least 30 days prior to the planned date for any installation detailed documentation submittal.

E. Prior to issuing purchase specifications for any apparatus, submit an Electromagnetic Compatibility (EMC) and Electromagnetic Interface (EMI) Control Plan that outlines a strategy of ensuring compliance with the requirements of Paragraph 2.1.C of this Section.

PART 2 - PRODUCTS

2.1 GENERAL

A. Equipment Maintainability. The design and construction of all systems provided shall be such to be routinely maintainable by Authority personnel, on site or at the Authority maintenance facilities. Replaceable and repairable assemblies and modules shall be provided to facilitate troubleshooting.

1. Equipment Assemblies
   a. Cable-connected or pullout modules shall be designed for direct access and quick replacement and shall weigh less than 15 pounds.
b. Assemblies weighing 15 pounds or more shall be provided with rollout slides, hinges, or other devices to permit moving assemblies to test or maintenance positions without manual lifting.

c. Packages, which weigh more than 15 pounds, shall be provided with lifting devices.

d. Assemblies requiring removal for shop maintenance shall weigh less than 40 pounds.

e. Assemblies requiring removal for preventive maintenance or replacement shall have quick disconnect plug connectors and flexible cabled leads.

f. Assemblies and subassemblies shall be designed to be handled in normal work positions without damaging or displacing any component parts, and shall require no mechanical readjustment before installation.

g. All assemblies, subassemblies, and circuit or hardware components shall have permanently affixed labels giving manufacturer and part number. Color-coding to designate value and ratings of components shall be used only where it has been accepted as an industry standard.

h. All equipment shall be mounted in racks, cabinets or consoles, and shall be fabricated, finished, and arranged to present a uniform and coordinated appearance.

2. Equipment Accessibility. All components, modules, and subassemblies shall be accessible for testing, removal, or replacement without removal of other parts. Where this is not possible, other parts shall be of a pullout or plug-connected type.

a. All components requiring adjustment or replacement shall be visible and identifiable.

b. Access openings shall be covered where required to protect internal parts, safeguard personnel, or restrict access for adjustments not normally performed in the field. Covers shall be labeled to indicate their purpose, or the hazard involved. Hardware or fasteners used to secure covers shall be captive.

c. Structural braces, supports or enclosure sheets shall not hamper access to components or subassemblies. Overhanging edges or exposed corners that could hamper access or cause injury to personnel shall not be allowed.

d. All components, modules or subassemblies that may require maintenance access, shall be located with sufficient room for effective use of required tools and test equipment for required maintenance. Any installed security enclosures, frames, or cages shall allow the same access and shall be accessible for servicing by a single technician.

3. Test Points. Test points shall be provided to support troubleshooting and maintenance for checking essential voltages, wave forms, pulse codes, register content, software/firmware, or for injecting test signals or codes. All hardware related test points shall be permanently labeled with alphanumeric identifiers for reference.

a. Selected test points or ports essential for regular in-service checks shall be accessible on a test sub-panel. Test points, for in-service or off-line tests of plug-in modules or assemblies, shall be readily accessible on the module or assembly in the operating position.

b. Test points shall be capable of accepting probes and connectors used with standard test equipment required for specified tests, except where special test equipment and connectors are provided by the Contractor. In lieu of test points, the Contractor may supply test sets that can plug into a subassembly to identify faults.

4. Recurring maintenance adjustments shall be minimized by the use of wide-tolerance circuits, stable components, and automatic re-calibration or adaptation. Components that are manually adjustable shall be used only if there is no other choice.

a. When frequent observations or adjustments are required, built-in indicators, meters, or other readouts shall be provided. GO/NO-GO type indicators shall be
b. Adjustable devices shall have locking screws or shall be self-locking to prevent inadvertent operation or drift.

c. Wherever practicable, points requiring preventive maintenance adjustment together shall be located within 12 inches of each other so maintenance can be performed by one person. Interacting adjustments shall be avoided if possible.

d. The replacement of a module or subassembly with a spare unit shall not require adjustment to the associated external input or output circuits or modules. If adjustments are required, such adjustments shall be provided on, and limited to, the device being replaced or repaired.

5. Safety and Hazard Warnings. Safety and hazard warnings shall be placed on equipment which, when installed, can pose a danger to maintenance personnel factors to which its equipment may be sensitive that are not listed below. Contractor shall insure that no equipment damage occurs during manufacture, storage, and shipment as a result of climatic conditions which differ from those below:

a. Temperature and Solar Load:

1) Minimum ambient air temperature external to equipment is 4 degrees F

2) Maximum ambient air temperature external to equipment is 115 degrees F

3) Maximum solar radiation: 275/BTU/hr*ft²

4) Maximum daily temperature range is 50 degrees F

5) Average days under 32 degrees F is 38

b. Precipitation:

1) Maximum rainfall rate is 7 inches an hour and this rate may occur simultaneously with wind.

2) Maximum snowfall is 12 inches in 24 hours

3) Measurable quantities of ice infrequently occur

4) Average relative humidity

a) Morning: 82 percent

b) Afternoon: 56 percent

c) Maximum average: 87 percent

c. Wind:

1) Average speed: 11 mph

2) Maximum sustained for 1 minute: 73 mph

3) Maximum gusting: 100 mph

d. Air Contamination. The equipment shall operate as specified in the atmosphere commonly found in rail vehicle environments and the

B. Environmental Protection Design

1. Equipment and material covered by this Contract will be designed for indoor and outdoor locations along the Authority System right-of-way (ROW), at elevations of approximately sea level to 100 feet above sea level, in a suburban environment. The areas adjacent to Authority ROW are urban or suburban zones, some of which are occupied by industrial or commercial developments. Authority rail lines run parallel with major freeways along several lengthy sections, run through the downtown mall area and run through a tunnel on the North Central line.

2. The following particular climatic conditions shall be used as design guidelines and shall be considered as operational requirements. Actual localized temperatures and conditions within spaces and enclosures may be more severe than the ambient climatic conditions and the Contractor shall be responsible for evaluating these during the design effort. Additionally, the Contractor shall be responsible for advising the Authority if there are any special environmental
3. Enclosures
   a. Outdoor Locations:
      1) Equipment and enclosures installed in outdoor locations shall be designed to operate properly in the extremes of local weather conditions, including heavy winds, rain, hail, outside air temperatures, and relative humidity up to 100 percent.
      2) Where equipment is installed in outdoor enclosures and subject to temperature extremes caused by exposure to direct sunlight plus heat from internal electrical losses, the enclosures shall be equipped with sun shields and convection vents so that maximum internal temperature rise above ambient air does not exceed 25 degrees F. Equipment intended to be installed in outdoor enclosures shall be designed and tested for continuous service at 140 degrees F.

   b. Indoor Wayside Locations:
      1) Equipment and enclosures installed in indoor wayside locations shall be designed to operate continuously, properly, and safely in a temperature range of 32 degrees F to 120 degrees F, at relative humidity ranging up to 95 percent.

   c. Cooling Devices:
      1) Cooling devices shall be provided by the Contractor. Such devices shall be internal to the associated enclosures, and shall be included in the determination of conformance to reliability and maintainability requirements.
      2) Unless otherwise specified, cooling devices shall be sized to maintain temperatures within enclosures between 60 degrees F to 80 degrees F while outside ambient temperatures are in the range specified previously in Paragraph 2.1.B.2.
      3) More specific requirements for climate-controlled facilities may be found in these Specifications.

   d. Heater Devices
      1) Heater devices shall be provided by the Contractor.
      2) Such devices shall be internal to the associated enclosures, rooms or houses, and shall be included in the determination of conformance to reliability and maintainability requirements.
3) Heating devices shall also meet the requirements of these Specifications.

e. All equipment shall be designed to operate in an environment subject to the following vibration limits:

f. Wayside equipment

1) Equipment located adjacent to track on direct fixation or tie-and-ballast sections, and mounted anywhere within the Authority ROW except as indicated herein below, shall be designed to operate in an environment subject to the following vibration levels: all frequencies less than 12 Hz, 0.02 inches peak-to-peak amplitude; all frequencies from 12 Hz to 1000 Hz, 0.14 g peak or 0.1 g rms.

2) Equipment located adjacent to and within 20 feet of special track work on direct fixation or tie-and-ballast construction shall be designed to operate in an environment subject to the following vibration levels: all frequencies less than 12 Hz, 0.2 inches peak-to-peak amplitude; all frequencies from 12 Hz to 1000 Hz, 1.4 g peak or 1.0 g rms.

g. Equipment located in communications equipment spaces at Operation Control Center (OCC), Communication Interface Cabinet’s (CIC’s), Communications Facilities, Signal Houses, or Yards:

1) For all frequencies less than 12 Hz: 0.02 inches peak-to-peak amplitude; and

2) For all frequencies from 12 Hz to 100 Hz: 0.14 g peak or 0.1 g rms.

C. EMI Design. Contractor shall ensure that the electrical, electronic, and communications systems design can perform in the Authority transit system EMI environments with vehicles and other equipment without being functionally affected by them; and without affecting the system operation, safety, or other car borne or wayside installations because of conducted, induced, or radiated emissions.

1. Methods and Equipment. Contractor shall employ design techniques, construction methods, and whatever equipment is required to prevent interference caused by external and internal sources from affecting the proper operation of the equipment and systems specified herein. To contain EMI emissions wherever possible, the suppression of transients shall be at the source of the transient. The following design requirements shall be included in the Contractor’s design:

a. In addition to coordinating frequencies, the Contractor shall provide required balancing, filtering, shielding, modulating techniques, and isolation to maintain signal to noise ratio (S/N) above limits required to operate all equipment installed under this contract. Shielding, isolating, balancing, and grounding shall be used, as required, to reduce the undesirable effect of interference.

b. Electrostatic and magnetic shielding methods shall be employed to minimize the effect of stray signals and transient voltages on interconnecting cables.

c. Interconnecting power and signal cables shall be physically separated.

d. Equipment and facilities shall be located and arranged to minimize voltage induction into circuits due to the Light Rail Transit (LRT) vehicle’s propulsion system, auxiliary power, and overhead catenary system current transients.

e. Suppressors shall be incorporated across inductive devices to minimize switching transients.

f. All relay coils and contactor coils shall have freewheeling diode or metal-oxide varistor transient suppression. Other means of suppression or the absence of suppression for performance reasons shall be Authority approved prior to use.

g. The number of suppression device types shall be kept to a minimum.

h. Equipment design and enclosures shall shield equipment from any effects resulting from the operation...
of an Authority handheld transceiver when said transceiver is within 18 inches of the enclosure.

i. Equipment design and enclosures shall shield equipment from any effects resulting from the operation of cellular telephones, including when said telephones are operated in the vicinity of the equipment and on the passenger platforms.

2. EMI Sources. Known EMI sources along the Authority ROW include but are not limited to the following major sources of interference that could affect operation of the System:

a. Medium and low voltage power circuits, including the Authority’s Traction Power AC source sub-transmission distribution system, operating at 60 Hz and carrying harmonics typical for the configuration and the loads served.

b. Direct-current traction power system:

1) Substation thyristor rectifier apparatus

2) Direct current power distribution to trains, via overhead power catenary circuits

3) On-board propulsion equipment, including solid-state chopper and motor circuits

4) Direct current arcing, catenary to pantograph

5) Temporary faults on the AC or DC power circuits

c. Local ground mat voltage rise or drop at any communications equipment room site, caused by patterns of DC traction power currents in running rail and earth return paths, or by temporary AC or DC circuit fault conditions.

d. Authority Train Control System, which comprises a variety of discrete digital and digitally coded signal sources and receivers at the Operations Control Center (OCC) Building, in Signal Houses, in wayside cables, in running rails, and in rail vehicles. Coded signal sources are in the DC to 20 KHz range.

e. The design shall provide surge arresters and other circuit protection devices required to protect equipment from lightning currents and voltages.

f. Authority, governmental, public, and private radio systems

g. Authority T-1 carrier terminals and copper cable circuits

h. Authority video multiplex terminals and coax cable circuits

i. Commercial 800 MHz cellular transmission facilities

3. To help avoid undesirable effects upon communications and control equipment or other installations along the ROW as caused by on-board LRT vehicle subsystems, electromagnetic emission limits have been specified and will not be exceeded. Meeting the emission limit requirements does not guarantee elimination of interference; it is the first level of defining the interface between the vehicles and their intended environment. Contractor shall work jointly with the vehicle supplier, wayside signal system supplier, and others designated by the Authority to ensure compatibility. Vehicle Emissions will be limited to the following:

a. Radiated Emissions Limits. Radiated emissions, as measured by the procedures in UMTA-MA-06-0153-85-11 will conform to the following limits:

1) From 0.01 MHz to 30 MHz, the maximum permissible interference limit will not exceed 20 dB above the limit of Figure 22 (RE05) MIL-STD-461E.

2) From 30 MHz to 88 MHz, the maximum permissible interference limit shall be 58 dB above 1 microvolt/meter/MHz bandwidth.

3) From 88 MHz to 1000 MHz, the maximum permissible interference limit will be 68 dB above 1 microvolt/meter/MHz bandwidth.
b. The limits in Paragraph 2.1.C.3.a will not be exceeded when measured at a distance of 100 feet from the track centerline (Reference: SAE Recommended Practice ARP 1393, 5/3/76).

c. Conductive Emissions Limits. Conductive emissions, as measured by the procedures from, UMTA-MA-06-0153-85-6, Method RT/CE02A, will have a current limit as follows:

1) From 0 Hz to 80 Hz: 10A max.
2) From 80 Hz to 90 Hz: 10 amperes decreasing log-linearly to 1 ampere max.
3) From 90 Hz to 120 Hz: 1A max.
4) From 120 Hz to 600 Hz: 10A max.
5) 600 Hz to 1500 Hz: 1A max.
6) 1500 Hz to 4 KHz: 0.02A max.
7) 4 KHz to 20 KHz: 0.03A max.
8) The limits above shall be met individually by each equipment apparatus as well as during the simultaneous operation of all equipment.

d. Inductive emissions, as measured by the procedures from "Inductive Interference in Rapid Transit Systems, Volume II: Suggested Test Procedures," UMTA-MA-06-0153-85-8, will be limited to a maximum of 20 millivolts, rms, rail-to-rail, at all frequencies between zero Hz to 1 KHz and a maximum of 10 millivolts from 1 KHz to 20 KHz. This condition shall be met by each individual equipment as well as the simultaneous operation of all equipment.

e. Conducted Disturbances. Contractor shall formulate a set of criteria governing both generation and tolerance of electrical disturbances on conductors between assemblies. The criteria shall distinguish the basic types of circuits present in the system and shall define a suitable comprehensive classification of disturbances, which may be present in each type of circuit. The criteria shall ensure that each connected assembly will be able to tolerate the disturbances introduced simultaneously by all of the other assemblies to which it could be connected. These criteria shall be a part of the EMC control plan.

f. Contractor shall formulate a set of criteria governing generation and tolerance of magnetically coupled disturbances on or between assemblies. The criteria shall identify the basic types of circuits present on the vehicle and shall define a suitable comprehensive classification of disturbances, which could be present in each type of circuit. The criteria shall ensure that each connected assembly will be able to tolerate the disturbances introduced simultaneously by all of the other assemblies to which it is magnetically coupled. These criteria shall be a part of the EMC control plan and shall be submitted for approval prior to issuing purchase specifications for any apparatus.

4. Emissions. Contractor shall design and implement the system such that its equipment:

a. Does not electrically interfere with the proper operation of the LRT vehicles or wayside equipment

b. Complies with 47 CFR Part 15

5. Overvoltage Protection

a. Overvoltage protection shall be provided for all outdoor Public Address (PA)/ Visual Message Board (VMB) equipment, and for new CIC’s.

D. Prohibited Materials and Methods

1. Extra-flexible, metallic or non-metallic, non-labeled conduit

2. Plastic conduit for interior electrical use, except that Polyvinyl Chloride (PVC) conduit may be used for power circuits below basement concrete floors and for ground wires in any location. The transition from PVC to steel shall be made below the floor.
3. Steel Conduit shall not be used outside unless in concrete. Use Galvanized Rigid Steel (GRS) conduit outside and wet locations above grade.

4. Aluminum wiring shall not be used.

5. Non-insulated stranded wiring shall not be used for grounding.

6. Use of Incompatible Materials:
   a. Aluminum fittings and boxes shall not be used with steel conduit.
   b. All materials in a raceway system shall be compatible.
   c. Dissimilar Metals. All dissimilar metals shall be properly insulated to prevent galvanic action.
   d. When bronze and aluminum components come into contact with dissimilar metals, surfaces shall be kept from direct contact by painting the dissimilar metal with a heavy coat of a proper primer or asphalt paint.
   e. When aluminum components come into contact with cement or lime mortar, exposed aluminum surfaces shall be painted with heavy bodied bituminous paint, water-white methacrylate lacquer, or zinc chromate.
   f. Fasteners. All exposed fasteners shall be stainless steel.

7. Multi-use Suspension Systems: Piggyback suspension systems for conduits and fixtures are prohibited. All suspensions shall be hung independently from structure, or, in limited cases, from trapeze suspension systems.

8. Use of wire ties to support conduit.

9. Use of splices to join communications or electrical wiring within ductbanks and raceways.

2.2 BASIC ELECTRICAL AND ELECTRONIC COMPONENTS

A. General. This section specifies the characteristics of basic electrical and electronic assemblies, which are custom designed and fabricated by the Contractor. Contractor shall not retain rights of royalty for future fabrication of these assemblies.

B. Communications Power Cable. Power cables, rated 600 volts and below, used in communications circuits shall be provided in accordance with these Specifications.

C. Electronic Components. For all Contractor custom designed electrical and electronic assemblies, all electrical and electronic components provided shall be:
   1. New and free of manufacturing defects
   2. Free of damage due to aging, storage, handling, or exposure
   3. Clearly and permanently labeled with rating, value, and type identification; coding is acceptable on components that are too small to label
   4. Derated according to conservative practice in the industry, or as proposed in relevant standards or guides, or according to the manufacturer's advice
   5. Commercially available as spare or replacement parts

D. Wiring and Printed Circuit Components
   1. Wiring Connections. Not more than 2 wires shall be connected to a single terminal
   2. Printed Circuit Cards
      a. Cards shall be constructed of epoxy glass material, NEMA Type FR-4, Grade G-10
      b. Cards shall be of sufficient thickness to permit easy insertion and removal without buckling or breaking.
      c. Cards shall be mechanically keyed to prevent incorrect interchange.
      d. Cards shall be equipped with a card puller.
      e. Large computer-type cards shall be equipped with a lever or cam-type locking device.
      f. Circuits shall be formed by etching.
      g. Conductor material shall be copper.
      h. Width and thickness of conductors shall be in accordance with IPC 2221B.
      i. Complete printed circuit card assemblies shall be conformal
coated in accordance with IPC-CM-770E.

j. Card contacts shall have gold plating of at least 0.00005-inch thickness.

k. Component mounting and lead solder connections shall be in accordance with IPC-CM-770E.

l. Component side shall be silk screened on the component side to identify all printed circuit parts. Silk-screened labels shall not be covered by installed printed circuit parts.

3. Printed Circuit Card Connectors. Printed circuit card connectors shall have the following features:

a. Unless otherwise Authority approved, contacts shall have gold plating of at least 0.00005-inch thickness.

b. Contacts shall be bifurcated.

c. Insulation resistance shall be 5,000 megohms minimum.

d. Insulation material shall be glass-filled diallyl phthalate per MIL-M-14F.

4. Printed Circuit Design. Printed card circuitry shall be designed in such a manner so that terminals assigned to a given power supply, common, or ground will be the same on all cards in each subsystem. Where practical, the remaining card circuitry shall be arranged in such a manner so that the terminals assigned to a given function will be the same on all cards in each subsystem.

a. Cards containing circuits, which affect safety, shall be designed such that removal of the card shall not create an unsafe condition, or cause a failure of another component.

b. Printed circuit cards shall be replaceable under operating (power on) conditions without adverse effect or damage to components either on the card or connected electrically to the card.

5. Printed Circuit Modifications. All modifications to manufactured printed circuit card assemblies shall be subject to Authority approval and shall be in accordance with all applicable IPC Standards and Guidelines.

6. Printed Circuit Identification. Each type of printed circuit card assembly shall be permanently and legibly marked with a unique number identifying that type of card assembly. Each card containing vital circuitry shall be permanently and legibly marked with a unique serial number and revision level.

7. Printed Circuit Card Cages. Printed circuit cards shall be installed vertically in card cage slots that are permanently mounted and enclosed inside a chassis or module.

E. Electronic Components

1. Resistors. Resistors provided as discrete components in electronic modules shall have a maximum tolerance within plus or minus 5 percent, or a narrower tolerance when prescribed by circuit design. Such resistors shall be rated at twice the maximum power that they will be subjected to in operation.

2. Capacitors. Capacitors provided as discrete components in electronic modules shall have a maximum tolerance of plus or minus 10 percent, or a narrower tolerance when prescribed by circuit design. Capacitors shall be rated for at least 1.5 times the maximum peak voltage that they will be subjected to in operation.

3. Inductors. Inductors provided in electronic modules shall have encapsulated windings and leads, and shall be rated to withstand at least twice the overall and internal winding peak voltages that they will be subjected to in operation.

4. Transformers. Power-level transformers provided in electronic modules shall have a minimum inter-winding breakdown voltage of 1,000 Vdc. Such transformers shall not emit audible noise in excess of 40 dB, referenced to 0.0002 dynes/cm² at a distance of 2 feet, while operating at rated voltage and load and performing their intended function.

5. Semiconductor Devices. All discrete semiconductor devices shall carry a Joint Electronic Device Engineering Council (JEDEC) number, or shall be available as standard products from more than one manufacturer. All semiconductor devices shall conform to the published specifications for such JEDEC number. All such semiconductor devices shall be the silicon type, unless the specific functions of certain circuits require another standard type.
a. Zener Diodes. Zener diodes provided for voltage regulation or reference levels shall be rated such that the diodes shall not be damaged if the entire load is removed abruptly, and shall have a zener voltage tolerance within plus or minus 5 percent.

b. Transient Protection. Zener diodes provided for transient protection shall be rated such that the diodes shall not be damaged in performing their functions within all actual conditions encountered in the operating system.

6. Integrated Circuit Packages. All digital integrated circuits shall be of the Transistor-Transistor Logic (TTL), Metal Oxide Semiconductor (MOS), or Complimentary Metal Oxide Semiconductor (CMOS) logic families. They shall be packaged in DIP or equivalent industry standard units, and identified with clear and permanent labels.

2.3 IDENTIFICATION

A. Labeling Components, Subassemblies, and Assemblies. All components, subassemblies, and assemblies shall require labels so that they shall be readily identified. Part reference designations shall be assigned in accordance with ANSI Standard Y32.16 and shall be marked on the product unless otherwise Authority approved. Reference designations for parts unique to an indicated location shall be preceded by the location control number.

B. Controls and Adjustments. Controls and adjustments shall be clearly identified as to function and shall be marked or indexed so that the control position or direction of rotation can be readily identified. Fixed guide marks on controls or adjustments shall be provided if the controls or adjustments require presetting for a standard maintenance operation.

C. Indexing. Mechanical assemblies subject to maintenance disassembly shall be indexed to ensure proper relative positioning of parts after reassembly.

D. Access Labeling. Labeling at accesses shall be provided and shall include, but not be limited to essential maintenance information, including but not limited to names of items inside; reference to schematic wiring diagrams and servicing procedures; and warning of hazardous or critical operations.

E. Equipment Cabinets. Each equipment cabinet shall have a unique I.D. located top center front and rear on exterior of cabinet frame, stenciled with black epoxy enamel. Lettering shall be in block letters 1/2 inch.

1. Each I.D. stenciled text shall consist of 2 lines; the first line to show cabinet number, and the second line to show specific name of the cabinet, as indicated. Cabinet name and number shall correspond with the cabinet terminology indicated on the Contract Drawings.

F. Junction and Pull Boxes. Each junction and pull box shall have a unique number stenciled on the cover with black epoxy enamel. Lettering height shall be 1 inch. Numbers shall identify the service of circuits within the box and the location of the box by civil stationing. Pull boxes shall be stenciled to show unique identification and civil stationing.

G. Relays. Relays shall be provided with nametags or engraved plastic "lamicord" engraving. Tags shall be of stamped or engraved metal plates. Information on tags or engraving shall include type, rating, part number, date and place of manufacture.

PART 3 - EXECUTION

3.1 INSTALLATION REQUIREMENTS

A. Install electrical materials, equipment, appurtenances, and accessories in locations as indicated, rigid and secure, plumb and level, and in alignment with related and adjoining Work to provide a complete and operable system. Do not weld electrical materials for attachment or support.

B. Provide anchor bolts and anchorage items as required, and field check to ensure proper alignment and location. Provide templates, layout drawings, and supervision at the job site to ensure correct placing of anchorage items in concrete. Check embedded items for correctness of location and detail before concrete is placed.

C. Install supporting members, fastenings, framing, hangers, bracing, brackets, straps, bolts, and angles as required to set and connect the work rigidly.

D. Control erection tolerance requirements so as to not impair the strength, safety, serviceability, or appearance of the installations. Determine exact locations of conduit. Route conduit parallel to building lines unless otherwise indicated.

E. The trade size, type, and general routing and location of conduits, raceways, and boxes shall be as indicated or specified.

F. Install exposed conduit so as to avoid conflicts with other Work. Install horizontal raceways close to the ceiling or ceiling beams, and above water or other piping wherever possible.
G. Install individual conductors and multiple-conductor sheathed cables in conduits, raceways, cable trays, ducts, and trenches as indicated to complete the wiring systems.

H. Install switches, receptacles, special purpose outlets, and cover plates complete in a neat manner in accordance with the NEC and local electrical codes. Plug unused openings in boxes, cabinets, and equipment.

I. Use of explosive fasteners is prohibited.

J. All electrical equipment, panels, telephone, and fire alarm panels shall be sealed against dust, whenever dusty conditions are present inside the rooms or outside, during the construction period.

3.2 CONDUIT AND FITTINGS

A. Provide as indicated and required in accordance with these Specifications.

3.3 EQUIPMENT, APPURTEANCES, AND INSTALLATION ACCESSORIES

A. Provide conduit hangers and inserts, pull cords, outlet boxes, junction and pull boxes, metal and plastic cable tray systems, and under floor duct work as indicated and required in accordance with these Specifications.

3.4 ELECTRICAL WIRING

A. Wiring Requirements

1. Provide wiring as indicated and required in accordance with the requirements of these Specifications.

2. Furnish wires and cables to the site in unbroken standard coils or reels to which shall be attached a tag bearing the manufacturer’s name, trade name of the wire, and the UL label for 600 V wire and cable.

3. Provide wiring complete as indicated. Provide ample slack wire for motor loops, service connections, and extensions. In outlet or junction boxes provided for installation of equipment by others, tape ends of wires and install blank covers.

4. Measure insulation resistance of the wiring system before connection to terminal blocks, motors, switchboards, motor control centers, transformers, panel boards, and control cabinets.

5. Do not bend cables during installation, either permanently or temporarily, to radii less than 10 times the outer diameters, except where conditions make the specified radius impracticable and shorter radii are permitted by the National Electrical Code and NEMA WC 7, Appendix N.

6. Secure and neatly bundle cables inside panel boards, control cabinets, switchboards, motor control centers, and pull boxes with nylon straps.

7. Identify wiring as specified in these Specifications.

B. Cable Supports: Install cable supports for vertical feeders in accordance with the National Electrical Code.

C. Splices and Terminations

1. Make wire and cable splices only in outlet, junction or pull boxes, or in equipment cabinets. Splices in conduit, trough, or raceway will not be permitted. Make splices by means of compression type connectors on stranded cables, and cover with tape to an insulation level equal to that of the cable.

2. For stranded copper wire, compression-type, insulated terminals in accordance with the wire and cable manufacturers’ recommendations shall be used. The terminals shall be installed only with tools and techniques recommended by the terminal manufacturer.

3. Solid wire shall be terminated by wire eyes. The use of compression-type terminals for solid wires is prohibited.

4. Wires and cables shall be terminated at terminal blocks. Compression-type insulated terminal connections to terminal blocks shall use a single washer on top of the terminal. Wire eyes require 2 washers for 1 eye, 3 washers for 2 eyes. Connections shall be completed with double nuts torqued to the rated value of the nut.

5. Use positive type connector installation tools as recommended by the manufacturer.

6. Mechanical hand tools, with dies for each conductor size as recommended by the manufacturer, may be used on conductor sizes through No. 6 AWG.

7. For conductor sizes larger than No. 6 AWG, use hydraulic tools with hexagonal or circumferential installing dies for each conductor size, as recommended by the manufacturer.

8. For inspection purposes, clearly mark die numbers on the installed connectors.
9. Before installation, apply anticorrosion electrical joint compound to conductors and terminal bolting pads.

10. Wire and cable shall be continuous from power source to equipment. Where splices are required, they shall be made only in approved fittings or junction boxes and shall be subject to Authority approval. Follow manufacturer's instructions in splicing wire and cable.

11. Fixture Wire: Make splices in lighting circuits with insulated crimp-type connectors.

12. Use approved manufacturer tools to strip off cable or wire insulation.

3.5 WIRING DEVICES

A. Locate switches 4 feet above finished floor and general-purpose duplex convenience receptacles 15 inches minimum above finished floor, except as otherwise indicated.

B. Attach receptacles rigidly to outlet boxes by means of 2 stainless steel screws.

C. For exterior and damp locations, surface or embedded, mount receptacles in watertight cast metal outlet boxes with threaded hubs or bosses and equipped with gasketed spring cover.

3.6 COMMUNICATIONS WIRING AND TERMINATION

A. All communications cable entering a facility from an outside environment shall be prevented from transmitting induced transient voltages harmful to the attached equipment through the use of gas discharge or Zener type protection blocks integral to Local or Main Distribution Frames (MDF). Cable shields and armor jackets shall be directly connected to signal ground at the Communications Facility. For cables running between Communications Facilities, the ground shall be applied at the facility closest to the OCC. In no case shall the cable shield be grounded at both ends. Protector blocks shall meet the requirements of these Specifications.

B. All voice frequency (VF) communications cabling connecting from end devices to Communication Transmission Subsystem (CTS) equipment shall terminate to the applicable terminal blocks in the facility's Local Distribution Frame (LDF) or MDF unless otherwise shown on the Contract Drawings. CTS VF channel equipment shall terminate to the LDF or MDF on 25 pair telephone style connectors. Connection from the equipment to the CTS shall be accomplished by installing cross-connecting wires from the associated equipment block to the CTS transmission equipment block. Cross Connects shall be twisted pair solid No. 22 AWG wire. LDF and MDF terminal blocks shall meet the requirements of these Specifications.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this Section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith shall be considered incidental to the Work specified under Section 16801 “Basic Technical Requirements - Communications System.”

END OF SECTION 16850
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section describes the detailed technical requirements for the Telephone Subsystem to be designed, provided, installed, and tested under this contract. Scope of Work includes:

1. Local installation, wiring, turn-up, programming and testing of all new telephone instruments, enclosures and housings, and associated interconnect and station protection equipment from designated telephone locations to a field Communication Transmission Subsystem (CTS) interface, required for subsystem expansion to support communications to line sections defined under this contract.

2. The following types of telephone instruments and devices shall be furnished installed and, tested as a part of the Telephone Subsystem:
   a. Wayside telephones – environmentally hardened telephone instruments placed in typically non-public areas along the right-of-way such as on bridges, aerial track structures, or tunnel passages. Analog wayside telephones shall require a Gateway conversion to be compatible with the DART VoIP telephone system.
   b. Administrative telephones – wall or desk mounted telephone instruments located in wayside Communications Facilities, Signal Houses, Traction Power Substations (TPSS), station service buildings, elevator maintenance rooms, crew rooms, Operation Control Center (OCC), and other Authority facilities for internal administrative use. Administrative telephones shall be natively compatible with the DART VoIP telephone system.
   c. Passenger Emergency Call (PEC) units – telephone instruments located on station platforms, concourses, pedestrian walkways, areas of refuge and other public areas for patrons to communicate with local public service agencies (“911” services) during emergency situations or with the DART customer service department in non-emergency situations. PEC phones shall operate on a single CO or cellular phone line and have 2 buttons for calling 911 or DART Customer Service.
   d. Elevator Emergency telephones – telephone instruments integrated into each elevator cab panel for patrons to communicate with the Train Control Center (TCC) during an emergency situation. Elevator phones are hands free and only have one button for initiating a call. Elevator telephones shall be natively compatible with the DART VoIP telephone system.

B. Voice over Internet Protocol (VoIP) Telephone System:

1. The VoIP Telephone system shall utilize Ethernet networking over the CTS system. VoIP Telephone sets shall utilize Power over Ethernet (PoE).
   a. All components of the Telephone system shall be designed to be powered by either a battery backup, Uninterruptible AC Power Supply (UPS), or UPS and generator system during normal operation and for a minimum of 8 hours of temporary backup AC power in case of a failure of normal AC. Refer to facility power requirements and to Contract Drawings.
   b. Phones shall be fully compatible with DART’s existing VoIP Private Branch Exchange (PBX). Coordinate with DART for approved phone models. Non-approved models require samples and Authority pre-testing for system compatibility prior to approval.
   c. Gateway conversion equipment shall be fully compatible with DART’s existing Gateway equipment. Coordinate with DART for approved Gateway models. Non-approved models require samples and Authority pre-testing for system compatibility prior to approval.
   d. Contractor shall coordinate and receive approval from DART for compatible phone models.
   e. All desk-top components shall be installed in the transportation and administration facilities or as indicated in the contract drawings.
   f. DART will provide IP addresses and phone numbers for each phone to be installed.
7. DART IT will provide SIP server and DNS programming for connecting phones to Primary, or Secondary Virtual PBX.

8. DART Communications will provide phone monitoring via LAN Management Software.

9. Major components of the VoIP System shall include, but not be limited to, the following equipment:
   a. VoIP compatible external ringing device for TPSS facilities
   b. Noise cancellation headsets (wireless) meeting the noise cancellation characteristics identified in this specification and shall work with the new VoIP phones for all substations.

C. Existing System Description and Configuration

1. The existing telephone subsystem provides emergency and maintenance voice switched services to weatherproof, ruggedized telephone instruments installed at station platforms, pedestrian underpasses, aerial structures along the guideway, at tunnel cross passages, as well as standard telephone instruments at station elevators and fire alarm transmission equipment. Telephones are intended for use both internally by the Authority personnel and by Light Rail Transit System (LRT) patrons.
   a. The Authority utilizes AT&T's OPT-E-MAN Switched Ethernet service and NEC Univerge-3C virtual PBX servers. VoIP service for the existing analog phone systems are enabled via Gateway conversions.
   b. Existing wayside telephone instruments are served by one analog circuit and have a 12-digit dial pad. When the phone is off-hook, an extension is auto-dialed to the DART IT callpilot application which directs the calls to either Train Control or allows dialing of an authorized DART extension. Wayside telephones circuits utilize a Gateway conversion to be compatible with the DART VoIP telephone system.
   c. The existing administrative telephone subsystem provides administrative voice services to standard desk or wall mount telephones located in communications and signal houses, TPSS, crew rooms, and other locations over DART VoIP PBX extensions. Administrative analog telephones circuits utilize a Gateway conversion to be compatible with the DART VoIP telephone system.
   d. Existing Passenger Emergency Call (PEC) units are located on station platforms, concourses, pedestrian walkways, areas of refuge and other public areas for patrons to communicate with local public service agencies (“911” services) during emergency situations or with the DART customer service department in non-emergency situations. PEC phones operate on a single CO phone or cellular line and have 2 buttons for calling 911 or DART Customer Service.
   e. Existing Elevator Emergency telephones instruments are integrated into each elevator cab panel for patrons to communicate with the Train Control Center (TCC) during emergency situations. Elevator phones are hands free and only have one button for initiating a call. Analog elevator telephones circuits utilize a Gateway conversion for compatibility with DART’s VoIP telephone system.

1.2 REFERENCED STANDARDS

A. Americans with Disabilities Act (ADA)
   1. 28 CFR Part 36 – Nondiscrimination on the Basis of Disability by Public Accommodations and In Commercial Buildings (ADA Standards for Accessible Design)

B. American Society of Mechanical Engineering (ASME)
   1. ASME A17.1a-2002 - Safety Code for Elevators and Escalators

C. Federal Communications Commission (FCC)
   1. 47 CFR Part 68 – Connection of Terminal Equipment to the Telephone Network

D. American National Standards Institute (ANSI)

E. Building Industry Consulting Services International (BICSI)
F. International Organization for Standardization
   1. ISO 9001 – Quality Management Systems - Requirements

G. National Fire Protection Association (NFPA)
   1. NFPA 70 - National Electric Code (hereinafter referred to as NEC)
   2. NFPA 72 - National Fire Alarm Code
   3. NFPA 130 - Standard for Fixed Guideway Transit and Passenger Rail Systems

H. Telecommunications Industries Association (TIA)

I. Underwriters Laboratories (UL)
   1. UL1459 - UL Standard for Safety Telephone Equipment
   2. UL 60950 – UL Standard for Safety, Safety on Information Technology Equipment
   3. UL 50, Type 3R – Enclosures for Electrical Equipment

1.3 SUBMITTALS

A. Submittal format and content shall comply with the general requirements of these Specifications and the specific technical requirements further listed herein.

B. Contractor shall submit for Authority approval the manufacturer and each product differing from those specified in these Specifications. Acceptability of the manufacturer shall be based on the manufacturer’s experience, equipment reliability, compliance with standards specified in this Section, and complete compatibility with the Authority’s current system.

C. Preliminary Design Review (PDR) Technical Requirements shall include the following information as part of the PDR submittal package for the Telephone Subsystem:

   1. Telephone subsystem block diagram, local and overall system description.
   2. Contractor shall submit complete material specification data sheets (MSDS), product samples, specification data sheets and product data including description and model number, shop drawings, catalog cuts, technical literature, software descriptions, and samples, as Authority requested for all equipment provided under this Contract including:
      a. All telephone instruments and accessories
      b. Equipment Enclosures and/or pedestals
      c. Protected Terminal Block (PTB) Assemblies and Protector Modules
      d. Installation Drawings
      e. Location Marker Detail
      f. Enclosure Identification Details including painting and lettering
      g. Operating Instructions and Details
      h. Mounting and installation details and schematics for telephones instruments, pedestals, and enclosures
      i. Complete end-to-end wiring diagrams for each instrument to be installed, including cross connect terminations details
      j. Complete list, in tabular format, of all telephones and jacks installed in the Contract. Each line item shall identify telephone number, IP address, type, e.g., wayside, PEC, elevator, and administrative telephone, and its location.

D. Contractor shall include the following information as part of the Final Design Review (FDR) Technical Requirements submittal package for the Telephone Subsystem:

   1. Update the PDR information including drawings, calculations and design information shall reflect a final design
   2. Electrical Drawings and Calculations
   3. Blue-light light power and control circuit end-to-end wiring details
   4. Telephone cable end-to-end wiring and termination details from each device through the station demarcation termination cabinet, and to the designated CTS equipment
   5. Protector terminal and all equipment grounds to station ground grid end-to-end wiring details
   6. Power cable voltage loss and telephone cable loop voltage loss calculations to confirm proper device operation at designed cable lengths
   7. Installation Work Plans
E. Contractor shall submit the following installation document for each site no later than 30 days prior to the scheduled installation activity. The installation plan shall include:

1. Drawings showing locations of each instrument and details of mounting including conduit details.
2. Installation Procedures including cutover and upgrade details.
3. Configuration and Provisioning Information
4. Network management system detail
5. Calculations or Certifications: UL certifications for all telephone instruments
6. As directed by the Authority, the Contractor shall provide product sample telephones for Authority approval.
7. In accordance with the format and requirements described in these Specifications the Contractor shall submit the following test plans and procedures to satisfy the Telephone Subsystem testing requirements:
   a. Test program plan: Contractor shall include all the required information for the Communications Facilities in the Test Program Plan as outlined in these Specifications.
   b. Contractor shall submit a complete Factory Test and Inspection Test Procedure to satisfy all the requirements outlined in Article 3.2 of this Section.
   c. Contractor shall submit a complete Field Test Procedure to satisfy all the requirements outlined in Article 3.2 of this Section.
   d. Contractor shall coordinate with the Authority for End-To-End system testing. This Contract shall be ultimately responsible for the following End-to-End testing activities for each new telephone instrument installed under this Contract.
   e. Contractor shall provide qualified staff to support the Authority’s System Integration Test (SIT) as described in Article 3.2 of this Section.
   f. Contractor shall submit Test Records and Results for review 1 week after the completion of each test in accordance with the format described in these Specifications.
8. As-Built Documentation
   a. Drawings
   b. Rail Operations Controller (ROC) operating instructions for call connection, disconnect, and use of programmable features for all telephone types.
   c. Operation and Maintenance (O&M) Manuals
9. Final Configuration and Provisioning Information: Contractor shall submit, within 30 days of installation, detailed information for each installed telephone instrument to allow system integration by the Authority.

1.4 QUALITY ASSURANCE
A. Applicable Standards and Codes. Contractor’s design and installation shall comply with all applicable Standards and Codes as listed herein. All equipment and designs shall comply with the latest version of standards as applicable in Article 1.2, Reference Standards.
B. Material and Workmanship Requirements
   1. All telephone instruments shall be registered under 47 CFR, Part 68, and shall comply with UL1459 (UL 60950).
   2. All equipment provided under this Section shall be UL listed.
   3. All telephone instruments shall be ADA compliant and shall be designed and installed in accordance with 28 CFR Part 36.
   4. All telephone instruments shall meet local codes and/or regulations for emergency operation as established by the authority having jurisdiction.
   5. All grounding shall be in accordance with local standards and these Specifications except as modified herein. Each piece of equipment shall be grounded in accordance with the recommendations of the manufacturer.
   6. Discontinued product models, refurbished equipment, or products scheduled for end-of-life, end-of-sale, or end-of-service within 1 calendar year of the installation date shall not be used.
   7. All products specified herein shall be subject to Authority approval based on the
Contractor’s ability to demonstrate adherence to these Specifications and approval of the manufacturer’s quality process.

8. All new telephone instruments provided and installed under this contract shall be compatible with the DART VoIP PABX extensions delivered over the CTS or by standard Central Office (CO) lines furnished by local Telecommunications Service Providers.

9. All provided telephone equipment shall be new and unused.

C. Manufacturer Pre-Qualification Requirements

1. Manufacturers shall be ISO 9001 certified.

2. Programmable telephone units shall be compatible with a PC based management and maintenance monitoring and reporting package in accordance with Article 2.6 of this Section.

3. All manufacturers supplying product for this Contract shall be pre-qualified by the Authority based on the following criteria:
   a. Past performance and statistical reliability of products in a LRT or similar transit application.
   b. Demonstration Tests or Samples
   c. Certification of Design, Warranty, and Experience

D. Safety

1. Personnel installing any telephone equipment shall be required to follow the Authority safety rules and procedures while performing any field Work.

2. Follow any and all manufacturer recommended safety precautions and considerations during equipment or accessory installation.

PART 2 - PRODUCTS

2.1 GENERAL DESIGN REQUIREMENTS

A. Subsystem

1. PEC units shall be individually fed by unique telephone lines from the demarcation termination cabinet and shall not be parallel wired, daisy chained or “party” lined on the same cable pair.

2. Wayside telephones shall not be parallel wired, daisy chained or “party” lined.

3. The same dial extension lines shall be shared by all telephones within a single signal house.

4. The same dial extension lines shall be shared by the telephones and headset systems within a single TPSS.

B. Telephone Identification. Each wayside and elevator telephone instrument shall be programmed to provide unique on demand information to authorized personnel at the TCC that identifies the telephone location and telephone type to indicate that assistance is required.

1. Contractor shall coordinate with the Authority to determine and program individual telephone identification information to be displayed on PBX station LCD display telephones in the TCC.

2. At a minimum, this identification shall be unique for each telephone and include the type of telephone instrument calling and its location.

C. Telephone instruments installed at station locations such as PEC, elevator, crew room telephones, service building and other administrative telephones shall be wired to station demarcation termination cabinet.

1. Typical station telephone instruments and demarcation termination cabinet details are shown in the Contract Drawings.

2. Demarcation Termination Cabinet terminal wiring assignments shall be in accordance with the Contract Drawings.

D. Contractor shall be responsible for completing each cable path by wiring from the telephone instrument, through the Demarcation Termination Cabinet, to a designated CTS or external Service Provider interface, described below.

E. All lines, except for PEC lines, shall be wired and connected to the CTS. VoIP phones shall be connected via CTS Ethernet switch. Analog phones shall be connected via VoIP gateway and then to the CTS Ethernet switch.

F. Gateway’s (convert analog phones to VoIP) are only to be utilized if required per approved design plans. Coordination with the Authority including product submittals and approvals shall be required for gateway equipment products and configurations to ensure reliability, full-functionality, and compatibility with the DART VoIP system.
G. Contractor shall wire and connect PEC lines from the demarcation termination cabinet to a service provider pedestal for cross connection to CO lines.

2.2 PASSENGER EMERGENCY CALL (PEC)

A. PEC units shall be installed on platforms, concourses, pedestrian underpasses or overpasses, walkways, fare vending areas, areas of refuge or other public areas in the vicinity of LRT stations in locations and quantities shown on the Contract Drawings.

B. PEC Instrument

1. The unit shall be an outdoor-rated (NEMA 3R or better), weatherproof, hands-free, stainless-steel faceplate, ADA compliant communications device.

2. The device shall operate from a single standard Central Office (CO) or cellular telephone line.

3. The unit shall have 1 button, red in color, labeled “EMERGENCY” that when activated, auto-dials a programmed and stored telephone number.
   a. The emergency call function shall be capable of storing a minimum of 2 successively dialed telephone numbers, each at least 10 digits in length.
   b. If the first programmed number does not answer or is busy, the unit shall automatically call the second programmed number after a user selectable number of rings (default should be programmed for 5 rings). The unit shall continue alternating calls between these 2 numbers until the call is answered or a user selectable amount of time has passed.
   c. Contractor shall coordinate with the Authority for telephone numbers to program into the memory locations.
   d. Activation of the emergency call function shall seize the line and preempt (disconnect) a non-emergency call in progress.
   4. The unit shall have 1 button, black in color, labeled “INFORMATION” accompanied by a standard 12 digit DTMF keypad, that when activated, auto-dials a programmed and stored telephone number and, after call connection, allows the ability to enter DTMF digits for navigation through interactive voice response (IVR) prompts.
      a. The information call function shall be capable of storing a minimum of 2 successively dialed telephone numbers, each at least 10 digits in length.
      b. Contractor shall coordinate with the Authority for telephone numbers to program into the memory locations.
      c. The call initiated in this manner shall disconnect either by pressing the “INFORMATION” button during an in-progress call or by automatically ending once the called party has hung up.

5. For emergency calls, there shall be no time-out disconnect, based on length of call, programmed for any PEC. Calls shall remain connected until disconnected by the distant end public safety operator.

6. The telephone shall be capable of and programmed for auto-answering and operation in a monitor mode, where authorized personnel may silently connect a call from any PBX station or external phone location to any field PEC and monitor activity immediately around the PEC.

7. Sound pressure level (SPL) within 3 feet in front of instrument should be a minimum of 3 dB above peak ambient station sound levels and conform to the NFPA 72 requirement of minimum intelligibility of 0.70 on the Common Intelligibility Scale (CIS) scale, corresponding to a Speech Transmission Index (STI) of 0.50. Concealed microphone sensitivity and speaker volume adjustment controls shall be provided for the Authority maintenance personnel to adjust the instrument to acceptable levels.

8. The telephone shall have an auxiliary output that enables peripheral equipment, such as a blue light, to be activated when only the emergency call button is pressed. The auxiliary outputs shall not activate when the information call button is activated. The auxiliary output shall be a solid-state relay that isolates the control voltage from the output contact.

9. Device Impedance. Off-hook impedance of 600 ohms or less.

10. Power Supply. Telephone line powered, requiring no battery back up or external power source.

11. Loop Current (at 48V supply): Minimum range of 24 to 80 mA.
12. Signaling. Capable of operating on standard CO phone lines or analog PBX extensions.

13. Ringer Equivalency (REN): 1.0A or less.

15. Environmental: Negative 4 degrees F to 140 degrees F and humidity of 0 percent to 95 percent non-condensing.

16. PEC units at areas of refuge shall be cellular based. Coordinate with DART for activation of the cellular account for the PEC.

C. Local and Remote Programming. The telephone shall be capable of local programming, through the use of a concealed, integrated, internal keypad or through the use of an externally attached programmer. The telephone shall be capable of remote programming by calling into the telephone over its connected telephone line using any standard touch-tone telephone set connected on the same network.

1. All programming shall be held in non-volatile memory and shall be saved in the event of disconnection from telephone line.

2. A password of at least 4 digits shall be required to enter the programming mode when dialing through the system to program in remote mode. Contractor shall program an identical but non-default password for each PEC and provide this password to the Authority.

D. Unit Enclosure, Identification, and Indication

1. The telephone instrument shall be installed in compliance with ADA guidelines as a self-contained unit within a freestanding, steel tower mount, manufactured by the same company as the telephone.

2. The tower shall be 100 inches tall, plus the height of the blue light assembly.

3. The word “ASSISTANCE” shall be emblazoned on all 4 sides of the tower in 3.25 inches highly reflective white lettering.

4. The color of the tower shall be Safety Blue.

5. The tower shall be mounted in locations indicated on Contract drawings with base plates and epoxy anchor bolts adequate to support the weight of the unit under wind loads described in the Contract Specifications. Base plates shall have an opening of no less than 3” diameter for all power and communications cabling required for operation.

6. The tower shall have at least 1 wiring access point or hand hole near the bottom of the unit, with a removable flush cover secured with tamper-resistant screws.

7. A blue light assembly shall be installed with each PEC telephone.

8. The telephone faceplate shall be illuminated by a 7-watt or less LED or compact fluorescent light for nighttime use.

9. The word “EMERGENCY” shall be incorporated on castings near the red button used to activate the emergency call function and the word “INFORMATION” shall be incorporated on castings near the black button and dial pad on the faceplate of the telephone.

a. Letters shall be raised no less than 3/32-inches, accompanied by Grade 2 Braille lettering, and otherwise comply fully with all requirements of the ADA.

b. Operating instructions shall be incorporated with or adjacent to the telephone.

10. An easily identifiable and labeled LED or other visual indication shall be provided on the telephone faceplate, which is activated by authorized personnel, to acknowledge to the hearing impaired that 2-way communications link has been established.

a. The visual indication shall be extinguished when the 2-way communications link is terminated.

b. The label for this indication shall not imply that any emergency response has been automatically dispatched or is otherwise underway. Such a prohibited example is, “Help is on the way”. Examples of permissible phrases include, “Call Received When Lit”, “Call Connected”, or “Light on Indicates Call Received”.

E. Power

1. PEC units at most locations shall be powered from adjacent station power source.
2. PEC units at places of refuge shall be solar powered with battery backup. Solar panels and battery shall be sized appropriately for the Dallas area and the orientation mounted so as to provide for continuous service. Panels and batteries shall be mounted so as to avoid vandalism.

2.3 WAYSIDE TELEPHONE INSTRUMENTS

A. Wayside telephone instruments shall be installed along LRT right-of-way in quantities and locations as shown on the Contract Drawings.

B. Telephone Instrument

1. The telephone instrument shall be a heavy duty, Dual Tone Multi-Frequency (DTMF) type telephone with standard 12-digit keypad.

2. Line Impedance. Off-hook line impedance shall be 600 ohms.

3. Talk Battery. The talk battery voltage shall be 24V to 48V (nominal) line.

4. Power Supply. Telephone line powered, requiring no battery back up or external power source.

5. Signaling. Signaling to the dial-up line switching equipment shall be via a DTMF push-button keypad. Loop start signaling (FXO/FXS) shall be utilized.

6. Hardware. The handset shall attach to the telephone base by a 19-inch, or greater, non-modular armored cord. The hookswitch shall be non-moveable, magnetic type. The weatherproof keypad shall provide the user with DTMF signaling capability to access specific Authority extensions.

7. Environmental. The wayside telephone instrument shall operate over the temperature range of negative 4 degrees F to 140 degrees F and humidity of 0 percent to 95 percent non-condensing.

C. Wayside Telephone Enclosure and Facilities

1. The phone housing shall be vandal resistant, weatherproof (NEMA 3R or better) and shall withstand corrosive environments. The enclosure shall have a spring closing door with a hasp and pin arrangement to securely latch the door. The enclosure shall be finished with brushed enamel paint, inside and out, in Pantone 116C “Authority Yellow Encoded Stock” color. All wayside telephones shall be permanently labeled with the Authority emblem.

2. An instruction and location marker plate shall be installed on the front cover of each enclosure.

3. The instruction marker shall include a list of all applicable dial extensions for various Authority divisions such as Transit Police and the OCC. Contractor shall coordinate with the Authority for a complete list of required extensions.

4. A blue light assembly shall be installed with each wayside telephone in accordance with Paragraph 2.8.B of this Section.

D. Junction Box: A junction box shall be installed beneath each wayside telephone enclosure. The enclosure shall be a NEMA-3R (or better) gasket protected enclosure with screw-on cover or Authority approved equal. Cover screws shall be tamper-resistant. The junction box enclosure shall be sized to house the wayside telephone terminal blocks.

2.4 ADMINISTRATIVE TELEPHONE INSTRUMENTS

A. Contractor shall provide and install single line, desk or wall-mounted, VoIP Authority compatible telephone instruments, lines, and outlets at communications facilities, TPSS, Signal Houses, crew rooms, aerial station facilities, and other locations as shown in the Contract Drawings.

B. General VoIP telephones

1. Telephones shall be compatible with the Authority’s existing VoIP PBX server and pre-approved by the Authority. Coordinate with the Authority for pre-approved models and requirements.

C. Wall-Mount Telephones

1. Wall-Mount Telephones shall be provided in Communications Facilities, station service facility vestibule areas, TPSS, crew rooms, elevator maintenance rooms,
2. The telephones shall contain a noise-canceling microphone. A wireless headset may be utilized to meet this requirement if approved by the Authority. The noise cancellation microphone and circuitry shall attenuate all background and ambient noise by more than 20 db referenced to the speaker’s voice level.

3. At substations, the telephone shall be installed with a loud ringing bell compatible with the VoIP phones. The loud ringer shall be a single gong type with volume control.

4. Telephones shall have a highly durable retractile handset cord with a minimum length of 25 feet. If a headset is provided this cord length requirement may be reduced with Authority approval.

D. Desk Top Telephones
1. Desktop type telephones shall be provided in crew rooms.

E. Electrical Parameters. Telephone sets provided shall meet or exceed the following specifications:
1. Power: Power over Ethernet (PoE). No external power required

F. Instrument Mounting
1. Location of telephone instruments and local distribution frame terminal block enclosures within rooms shall be as Authority approved.
2. Contractor shall install raceway from the stubbed up communication conduits to the local distribution frame (LDF) enclosure, and Electrical Metallic Tubing (EMT) conduit from the local distribution frame, CIC, or terminal block to each telephone instrument location. EMT conduit routing shall avoid other equipment and heat sources and shall be Authority approved. Pull strings shall be installed within the EMT.
3. Telephone jacks shall be installed at the Authority approved locations utilizing mounting screws. Adhesive mounts shall not be used.
4. Station wire shall be pulled through the EMT after installation of the EMT is complete. Contractor shall use adequate care to avoid damaging the station wire during installation.

2.5 ELEVATOR EMERGENCY TELEPHONE

A. An elevator emergency telephone shall be integrated into each elevator cab installed in stations or any other public area servicing LRT patrons to provide a means of emergency communications from a station patron, located inside the elevator, to the train control center.

B. Elevator Emergency Telephone Instrument
1. The elevator telephone instrument shall be a hands-free, ADA compliant emergency telephone.
2. Elevator telephones shall be compatible with the Authority’s existing VoIP PBX server and pre-approved by the Authority. Coordinate with the Authority for pre-approved models and requirements.
3. Call Operation and Functions
a. The telephone shall be capable of programming, storing, and dialing a minimum of two separate successively dialed telephone numbers, each at least 10 digits in length.
b. The telephone shall be capable of auto-answering and operating in a monitor mode, where authorized personnel may silently connect a call to any field telephone and monitor activity immediately around the telephone.
c. The telephone shall have a DTMF call disconnect function, enabling the control center operator to disconnect the call by pressing and sending a single touch tone key or a series of no more than three touch tone keys.
4. The telephone shall have only a single, 3/4 inch minimum sized button to initiate a call. The unit shall not have a 12-digit dial pad nor shall it use a corded handset in the car.
5. Sound levels at areas within the elevator cab shall be uniform and conform to the NFPA 72 requirement of minimum intelligibility of 0.70 on the Common Intelligibility Scale (CIS) scale, corresponding to a Speech Transmission Index (STI) of 0.50. Sound pressure level (SPL) within three feet in front of instrument should be a minimum of 3 dB above peak ambient station sound levels. Concealed microphone sensitivity and speaker volume adjustment controls shall be provided for DART maintenance.
personnel to adjust the instrument to acceptable levels.

7. Environmental. Minus 20 deg C to plus 60 deg C and humidity of 0 to 95 percent non-condensing.

C. Telephone Mounting, Identification, and Indication:

1. Telephone assembly shall be flush mounted into a recessed area in the elevator control panel, with brushed stainless faceplate finish or a finish to match the elevator panel. Alternatively, the unit may be mounted without faceplate behind an existing control panel that is integral to the elevator cab assembly, so long as the speaker and microphone cutout match, the elevator control panel labeling satisfies ADA standards, and specified features and functions of the telephone are made available. Mounting height shall be in accordance with ADA Standards for Accessible Design, 28 CFR Part 36, Section 4.10.14.

2. A readily identifiable location marker plate indicating station name, address, and telephone location (i.e. south elevator) shall be installed on or adjacent to the faceplate of each telephone.

3. The word “Help” shall be permanently incorporated and visible on the faceplate of the telephone or elevator control panel adjacent to the call button.

   a. Letters shall be raised no less than 3/32 inch, accompanied by Grade 2 Braille lettering, and otherwise comply fully with requirements of the ADA.
   
   b. Operating instructions shall be incorporated with or adjacent to the telephone and shall conform to ASME A17.1a-2002 Section 2.27.7.3.

4. The telephone instrument shall provide on demand information to authorized personnel at the Train Control Center that identifies the Station location, address, and elevator identification (i.e. north or south elevator) and that assistance is required.

5. An easily identifiable and labeled visual indication shall be provided on the same panel as the “Help” call button, which is activated by authorized personnel at the Train Control Center, to acknowledge that two-way communications link has been established.

   a. The visual indication shall be extinguished when the two-way communications link is terminated.
   
   b. The label for this indication shall not imply that any emergency response has been automatically dispatched or is otherwise underway. Such a prohibited example is, “Help is on the way”. Examples of permissible phrases include, “Call Received When Lit”, “Call Connected”, or “Received”.
   
   c. If a lamp is used as the visual indication, it shall be an LED device.

2.6 STATION PROTECTORS AND ENCLOSURES

A. Protected terminal block (PTB) assemblies (also referred to as ‘terminal blocks’), as manufactured by Marconi Communications, Circa Enterprises, Krone, or an Authority approved equal, shall be installed at each telephone instrument with positions sufficient to terminate all cable pairs plus at least 100 percent spare terminations at each telephone location. Station protectors shall be 3 element gas or solid-state type, designed to provide heavy duty transient and power fault protection for this telephone line application and shall meet the following minimum operating characteristics:

   1. Balanced operation
   
   2. DC Breakdown at greater than 350V at 2KV/sec
   
   3. DC Holdover Voltage of less than 150V, less than 200ms
   
   4. Surge Life of greater than 750 surges at 10A, 10x1000µsec

B. Individual terminals shall be sized to accept Outside Plant (OSP) and inside wire conductors.

C. An enclosure shall be installed beneath or adjacent to each telephone enclosure to house the PTBs. The enclosure shall be a NEMA 3R (or better) gasket protected enclosure with screw-on cover or Authority approved equal. Cover screws shall be tamper-resistant and non-corrosive. The enclosure shall be sized to house the telephone station protectors and all wiring. All cable cut outs shall be sized to accept all inbound and outbound cables.
2.7 PROGRAMMABLE TELEPHONE MANAGEMENT AND MAINTENANCE PACKAGE COMPATIBILITY FOR ANALOG TELEPHONES

A. Programmable telephone instruments shall be capable of operation with a single Windows based PC monitoring and reporting package, located at OCC.

B. The monitoring and reporting package shall connect to all instruments over the same telephone line used to connect normal emergency or information calls.

C. Maintenance or management calls to or from a telephone shall not interfere with or interrupt in progress emergency or information calls. If a management call is in progress and an emergency or information button is pushed, the emergency or information call shall disconnect the management call.

D. The telephone and the PC based monitoring package shall provide the following type of functions:

1. Detect and report telephone memory corruption, phone line interruption, microprocessor faults
2. Automatically poll for and report operational status (keep alive and/or health status) of network telephones
3. Automatically report and database any telephone fault condition
4. Provide call reports (with time, date, call length, telephone identification)
5. Generate reports of polling history, maintenance data, and call statistics

E. Contractor shall provide any hardware or software (including manufacturer options) required to provide this functionality to analog telephone instruments provided under this contract in accordance with manufacturers minimum requirements and recommended instructions.

2.8 BLUE LIGHT ASSEMBLY

A. PEC Telephone Blue Light:

1. A blue light fixture with vandal-resistant lens and a lamp and strobe, or combination of flashlamp or strobe shall be installed where specified.
2. Blue light shall be powered by 120V AC as shown in the Contract Drawings.
3. Conduits containing power lines shall be separate from those containing telephone signal wire along any run of ductbank, trough, conduit, or other system element. Signal and power cables shall be separated as much as possible within the stanchion containing the telephone instrument and light fixture. Power cable shall be sized adequately for cable distances and voltage drops and shall conform to the requirements of these specifications.
4. Lamp shall remain constantly on during on-hook situations and shall provide a high intensity strobe when an emergency telephone function goes off-hook.
5. Flash rate of strobe shall be a minimum of 60 and a maximum of 85 flashes per minute (FPM).
6. For telephone instruments with dual emergency and information purposes, the strobe shall only fire when the emergency button has been activated.
7. Strobe shall continue to flash until the call has been completed, when it shall automatically stop flashing and resume normal blue light operation.
8. Lamp shall be compact fluorescent, 13 watt or less, 800 lumens minimum, rated for 10,000 hours minimum. LED lamps of at least equivalent brightness are acceptable, but shall be rated for 50,000 hours minimum.
9. Lamp fixture shall be rated NEMA 3R or better.

B. Wayside Telephone Blue Light:

1. A blue light fixture with vandal-resistant lens and a lamp shall be installed where specified.
2. Blue light shall be powered by 120V AC as shown in the Contract Drawings.
3. Conduits containing power lines shall be separate from those containing telephone signal wire along any run of ductbank, trough, conduit, or other system element. Signal and power cables shall be separated as much as possible within the stanchion containing the telephone instrument and light fixture. Power cable shall be sized adequately for cable distances and voltage drops and shall conform to the requirements of these specifications.
4. Lamp shall remain constantly on at all times.
5. Lamp shall be compact fluorescent, 13 watt or less, 800 lumens minimum, rated for 10,000 hours minimum. LED lamps of at least equivalent brightness are acceptable, but shall be rated for 50,000 hours minimum.

6. Lamp fixture shall be rated NEMA 4X.

PART 3 - EXECUTION

3.1 INSTALLATION

A. General

1. All new administrative, elevator, wayside telephone, and fire alarm device circuit shall be routed to and serviced by the Authority provided VoIP system.

2. Contractor is responsible for programming all PEC telephones in accordance with the Contract Specifications and Drawings.

3. PEC telephone lines shall be cross connected to Telecommunications Service Provider CO lines through the station demarcation termination cabinet to a Service Provider interface panel described later in this Section.

4. Contractor is responsible for programming PEC units to dial over the CO or cellular lines leased by the Authority.

5. The Contractor shall be responsible for the physical interface from the CTS system to each new or affected telephone.

6. Telephone instrument wiring and interconnection details shall be in accordance with these Specifications and Contract Drawings.

7. For elevator phones, the Contractor shall coordinate with the elevator equipment supplier for details in routing telecommunications cabling to the supplied telephone instrument and for telephone compartment dimensions.

8. Under no circumstances shall any emergency function auto-dialed telephone call be routed to voicemail or any other auto attendant answering system. These calls must be programmed to ring primary or secondary locations continuously until answered.

B. Factory Installation

1. Each wayside telephone instrument shall be factory assembled and wired.

2. Each assembly shall be tagged with its intended location.

3. PTBs shall be tagged with cable and color code designations.

C. Field Installation

1. Contractor shall provide, install, wire, and test telephone instruments. The devices shall be wired to a station demarcation termination cabinet, or as shown on Contract Drawings, then wired to designated CTS equipment in the Communications Facilities.

2. Telephone instruments shall be installed in locations, quantities, and configurations as shown on Contract Drawings.

3. Mounting height for all communication devices shall be in accordance with 28 CFR Part 26, Section 4.31.

4. Terminate all telephone cable pairs within each telephone instrument, terminal block, and junction box according to color code. Parallel or daisy chain wiring on the same cable pair, or piggy backing more than 1 pair on the same terminal posts between any telephone instruments shall not be permitted.

5. Telecommunications Service Provider Leased Line Interface to PEC Units

a. PEC units shall be connected to standard Central Office lines, leased by the Authority from SBC, Verizon, or some other local Service Provider, and connected at a Service Provider interface panel (pedestal) to be located adjacent to the demarcation termination cabinet.

b. The Service Provider interface panel shall be furnished by the Authority.

c. Contractor is responsible for installing the Service Provider interface panel in accordance with Contract Drawings and wiring from it to the demarcation termination cabinet to complete PEC circuit connectivity.

d. Contractor shall coordinate all work associated with this task through the Authority and local Service Provider.

6. All externally exposed mounting hardware, fixtures, buttons, ground connections, or
enclosures shall be tamper-proof and vandal-resistant.

7. Conduit from the cableways or pull boxes to and from the PTB enclosure and the telephone enclosure shall be 2-inch GRS conduit per these Specifications.

8. Grounding
   a. All equipment requiring grounding shall be grounded in accordance with manufacturer’s installation instructions and any local or NEC standards.
   b. Wayside telephones, enclosures, and protectors located on bridge or aerial structures shall be grounded to the structure utilizing No. 6 AWG stranded, insulated ground wire and Authority approved ground connection hardware.
   c. The telephone enclosure, junction box, and PTBs for each telephone instrument shall be connected to nearest ground grid.
   d. Telephone cable jacket shields shall be grounded to the PTB ground lug as shown in the Contract drawings.

3.2 TESTING AND INSPECTION

A. General: All testing and reporting shall be performed in accordance with Section 16801, “Basic Technical Requirements.”

B. Contractor shall perform the following inspections and tests on the Telephone Subsystem where applicable. Contractor shall provide written notice to the Authority not less than 10 days prior to each test and inspection so that the Authority may be present as desired.

   1. Factory Test and Inspection: Contractor shall perform or provide manufacturer’s certified testing results for all telephone instruments and interconnection equipment provided under this Contract. Include in this report any test measurement results:
      a. Verify power up
      b. Verify button and/or keypad operation
      c. Perform local programming
      d. Verify speaker and microphone operation
      e. Verify DTMF signaling
      f. Verify ringer operation

C. Field Test and Inspection

   1. The following field installation tests shall be performed from the communications facility CTS interface (i.e. LDF disconnect block) out to the individual telephone instruments using standard telephone line simulators and other equipment. Contractor shall include in this report the results of all test measurements. Contractor shall notify the Authority 21 days prior to testing so that a representative may be present during all telephone testing activities listed below:
      a. Cable pair continuity (DC loop resistance of each cable pair) between telephone instrument station protector terminal and Communications Facilities Local Distribution Frame.
      b. Speaker volume and microphone sensitivity level adjustments to ensure adequate functioning levels with no feedback.
      c. Off hook ringer impedance.
      d. Resistance to remote earth ground of no more than 25 ohms at each equipment, cable shield, and protector block ground connection.
      e. Continuity of each protector block module installed.

2. Functional Testing
   a. Verify successful operation of a test call through the primary connection to a local test unit / call simulator.
   b. Verify full-duplex 2-way communication once call is connected.
   c. Verify both standard ringing and call connection features upon incoming test call to the instrument.
   d. Verify disconnect function on calls initiated from the call simulator.

3. Verify continuous Blue Light voltage levels and operation at installed locations.

D. Contractor shall coordinate with the Authority for End-To-End system test. This Contract shall be ultimately responsible for the following End-to-End
TELEPHONE SUBSYSTEM - COMMUNICATIONS SYSTEM

testing activities for each new telephone instrument installed under this Contract:

1. VLAN provisioning to the CTS network.

2. Coordination with the Authority for VoIP PBX programming and phone functionality as required for a fully functioning system.

3. Connectivity from the phone to the CTS network VoIP VLAN

4. Verify off-hook dial tone, dialing, signaling, loop closure, and call connection of instruments during test calls placed to and from the control center, DART customer service department, or local jurisdiction having authority.

   a. Test calls shall be placed using the manual keypad or programmed auto-dial call buttons, depending on the type of telephone.

   b. The actual programmed auto-dial number(s) shall be used to test telephones with this capability.

   c. Coordinate proper procedures and advanced notice with the local jurisdiction having authority for all 911 test calls.

5. Verify all secondary number(s) programmed for auto-dial operation are functional in the event of primary line non-availability.

6. Verify full-duplex 2-way communication once call is connected.

7. Functionally verify audio performance of instrument during test call. Set transmission level points for specified audio levels.

8. Verify standard ringing or splash-tone upon incoming call to the instrument.

9. Verify silent monitoring function upon incoming call to the instrument.

10. Verify Blue Light strobe activation during PEC emergency and wayside test calls.

11. For the PEC information call function, verify auto-dial connection to, successful transmission of DTMF keypad tones, and proper IVR responses during a test call to the DART Customer Service Department.

12. Verify proper operation of all disconnect functions initiated by the control center and that calls cannot be disconnected by pressing the Emergency call button on the telephone.

13. Verify remote password protection and programming capability.

15. Verify, from the OCC, the on-demand identification of the calling instrument, including correct circuit identification and telephone location for all new telephones on TCC console phone displays upon an incoming call.

16. Verify polling connection, reporting, and full operation with Management and Maintenance application PC system and equipment.

E. Systems Integration Testing (SIT) shall be performed for each new telephone instrument installed in coordination with the Authority’s Systems Integration Consultant after all instrument and subsystem installation and provisioning is complete. Contractor shall provide qualified technical staff to support the Authority’s testing tasks.

   1. Contractor shall provide sufficient resources to correct system integration defects, found during this testing period, within 10 days after notification.

   2. Contractor shall demonstrate to the Authority that all defects found under the System Integration Testing were corrected and no new defects exist.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this Section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith shall be considered incidental to the Work specified under Section 16801 “Basic Technical Requirements - Communications System.”

END OF SECTION 16851
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section describes the detailed technical requirements for the Public Address (PA) Subsystem. Work scope includes:

1. Contractor shall design, provide, install and test a PA subsystem in accordance with these specifications and in compliance with the American Disability Act (ADA).

2. The PA subsystem shall allow communications with patrons at Stations via the PA/VMB station controller equipment. The PA/VMB Controller will be provided and installed by the Contractor. The PA/VMB station controller will be communicating with OCC through CTS/Ethernet protocol. The PA subsystem shall allow adhoc and canned messages to be stored and initiated locally and from Operation Control Center (OCC).

B. Existing System Description and Configuration: The existing public address system provides voice messages to Authority patrons at the passenger stations in the North East and North Central lines of the Authority’s LRT system. Voice messages are initiated by the Authority personnel from the Train Control Center (TCC) or locally from PA/VMB input devices with local messages taking precedence over TCC messages. Voice messages can be issued in conjunction with VMB messages or separately.

C. New Work

1. Contractor shall extend the existing PA subsystem to the new stations of the Authority Extensions as shown in the Contract Drawings.

2. Contractor shall install PA equipment in the Station Communication Interface Cabinet (CIC) and/or Communications Facilities as shown in the Contract Drawings and described in these Specifications.

3. The PA subsystem shall allow adhoc and canned messages to be initiated from both the Local PA input device, and the PA/VMB Consoles located at OCC.

4. Contractor shall install all PA, (including Microphone, and cables) as shown in the Contract Drawings and described in these Specifications. Contractor shall wire from the speakers and ambient sensing microphones through the demarcation cabinet to the CIC or Communication Facilities as shown in the Contract Drawings.

5. Contractor shall perform sound studies to properly identify location and orientation of the speakers to satisfy the requirements and performance outlined herein.

6. Contractor shall provide a local PA input device for every Station. The input device shall be in accordance with these specifications and the Contract Drawings.

7. Contractor shall test a complete local PA subsystem as described in this Specification.

8. Contractor shall provide “Next Train” announcement at the stations. Contractor shall coordinate all work between the Signals and Communications work to ensure a seamless implementation of the “Next Train” announcement at the terminal stations.

D. Contractor shall perform all the required work and provisioning at OCC to provide remote access and control of the Station PA subsystem.

1.2 REFERENCED STANDARDS

A. American Disability Act (ADA)

1. 28 CFR Part 36 - Nondiscrimination on the Basis of Disability by Public Accommodations and In Commercial Buildings (ADA Standards for Accessible Design)

B. Underwriters Laboratories (UL)

C. International Electrotechnical Commission (IEC)

1. IEC 60268-16 - Objective Rating of Speech Intelligibility by Speech Transmission Index

1.3 SUBMITTALS

A. Submittal format and content shall comply with the general requirements of these Specifications and the specific technical requirements listed in this Section.

1. Manufacturer Qualifications: Any manufacturer differing from those specified herein shall require a prequalification and Authority approval. Manufacturer acceptability shall be based on the manufacturer’s experience, qualifications, certifications such as ISO-9001, equipment reliability, compliance with standards specified herein, and full...
2. Contractor shall include the following information as part of the Preliminary Design Review (PDR) Technical Requirements for the PA subsystem submittal package:

a. Contractor shall submit an audio coverage analysis verifying the sound coverage, and sound levels of the Contractor’s design. Contractor shall use a standard software package such as “EASE” to perform this analysis. The software package used shall be the manufacturer’s latest version as of Notice to Proceed (NTP).

b. Public Address Block Diagram.

c. Proposed speaker locations at the stations.

d. Material Specification Data Sheets and Product Samples. Contractor shall submit complete product data including description, model number, shop drawings, catalog cuts, technical literature, software descriptions, and samples as requested by the Authority, for all equipment provided under this Contract. Including the followings:

   1) Speakers- Data sheet, samples and all required information on at least 3 speakers with housing, as well as proposed installation detail on each speaker for Authority approval. The Color of the Speaker Housing, grill and backbox shall be Benjamin Moore 1600 with Satin finish.

   e. Proposed instruction as well as the label material to be used for the Local PA announcement instructions (to be installed by the microphone, as describe in this Section).

   f. Identification and specification of all external interfaces to other systems, subsystems provided under this Contract, and to any other Contracts.

   g. Descriptions of modifications required (if any) to the existing equipment to interface with new equipment.

   h. Complete wiring diagrams for all field equipment provided and installed under this contract.

   i. Complete terminal cabling and interconnection diagrams.

   j. Proposed rack layouts and elevations for new field nodes, including assembly drawings, installation drawings, and part lists.

3. Contractor shall include the following information as part of the Final Design Review (FDR) Technical Requirements submittal Package for the PA subsystem:

a. Updated PDR information for drawings, calculations and design information shall reflect a final design.

b. Shelf layout and inventory within equipment chassis.

c. Final wiring details.

d. Final speaker mounting details.

4. Contractor shall submit the following Installation Work Plans and Detailed Documentation for each site no later than 60 days prior to scheduled installation activities. The installation plan shall include:

a. Block and signal level diagram.

b. Wiring diagrams of rack equipment, and to demarcation cabinet and Supervisory Control And Data Acquisition (SCADA) interface. Include power and communications wiring.

c. Equipment layout in plan and elevation views

d. Conduit installation specific to PA.

e. System Configuration and switch setting Data. Contractor shall submit as part of the Installation Work Plan all configuration settings of equipment to be installed.

5. Calculations and Certifications

a. Calculation as listed in the PDR and FDR.

b. Certifications: Copy of the following certifications shall be included:
1) ISO certification for all proposed manufacturers.

6. Product Samples
   a. At least 3 different complete speaker units with housings shall be provided for the Authority to choose and approve. The Color of the housing, backbox, and the grill shall be Benjamin Moore 1600 with Satin Finish, or as directed by the Authority.
   b. Label with instruction printed for operating the local PA microphone shall be submitted for the Authority's approval.

7. Contractor shall submit the following PA Test Plan and Procedures:
   a. Test Program Plan: Contractor shall include all the required information for the PA Subsystem in the Test Program Plan as outlined in these Specifications.
   b. Factory and Inspection Test Procedure: Contractor shall submit a complete factory test and inspection procedure to satisfy all the requirements outlined in Article 3.2 of this Section.
   c. Field Test Procedure: Contractor shall submit a complete field test procedure to satisfy all the requirements outlined in Article 3.2 of this Section. This includes a station sound coverage test to satisfy the requirements of these Specifications.
   d. End-To-End Acceptance Test: Contractor shall submit a complete Local End-To-End Public Address Test procedure to satisfy all the required functionality and requirements outlined in Article 3.2 of this Section.
   e. System Integration Test: Contractor shall provide qualified staff to support the PA subsystem integration test as described in Article 3.2 of this Section. System Integration Testing (SIT) will be directed by the Authority.

8. Contractor shall submit all the Test Records for review 14 days after the completion of each test in accordance with these Specifications.

9. As-Built Documentation
   a. Drawings.
   b. Operation and Maintenance Manuals.
   c. Specifications.
   d. Final configuration settings.
   e. Any software source code.

1.4 QUALITY ASSURANCE

A. Applicable Standards and Codes. Contractor’s design and installation shall comply with all applicable Standards and Codes as listed herein. All PA equipment shall comply with the latest version of the following standards as applicable:
   1. Equipment and installation shall conform to all applicable National Electrical Code, and local regulations.
   2. All equipment shall be UL listed.
   3. Station PA design shall be in compliance with local noise ordinances.
   4. IEC 60268-16

B. Material and Workmanship Requirements
   1. All equipment provided under this Section shall be UL listed.
   2. All grounding shall be in accordance with local standards, and Specifications required by this contract except as modified herein. Each piece of equipment shall be grounded in accordance with the recommendations of the manufacturer.
   3. Discontinued product models, refurbished equipment, or products scheduled for end-of-life, end-of-sale, or end-of-service within 1 calendar year of the installation date shall not be allowed.
   4. All products specified herein shall be subject to Authority approval that will be based on the Contractor’s ability to demonstrate adherence to the specified requirement and approval of the manufacturer’s quality process.

C. Manufacturer Pre-Qualification Requirements: All equipment provided and installed under this Contract shall be new and compatible with existing equipment installed at the OCC in order to perform the intended use set forth by the Authority.
PART 2 - PRODUCTS

2.1 GENERAL DESIGN REQUIREMENTS

A. PA system shall receive and process messages from the OCC Communications Controller. Audio shall be directed to the correct PA speakers by way of the local Station PA/VMB Controller at the station CIC or a Communications Facilities via Ethernet. The PA equipment shall also provide for local generation of audio messages to PA speakers. Contractor shall demonstrate that the proposed PA subsystem equipment listed herein are the same, compatible or better than the existing one, to allow a seamless end-to-end PA subsystem implementation from operational central control to the station.

1. PA Coverage
   a. PA subsystem shall provide intelligible output coverage with nominal Sound Pressure Levels at a level 6 dB to 12 dB over normal train, equipment, and public (ambient) noise during peak travel times.
   b. On station platforms, the coverage shall be a uniform level (within plus or minus 3 dB) at 5 feet above floor level. The coverage area meeting this uniformity requirement shall not be less than 90 percent of the platform area.
   c. On mezzanines, the coverage shall be a uniform level (within plus or minus 3 dB) at 5 feet above floor level. Exact coverage areas are delineated in the Contract Drawings. Audio messages shall be directed simultaneously at platform and mezzanine levels of aerial stations.

2. PA Intelligibility Standards
   a. PA subsystem shall provide a Speech Transmission Index (STI) of 0.8 measured from the input of the station PA equipment to the speaker output covering the station platforms and mezzanine.

3. PA Functions
   a. OCC Public Address Messages. PA messages received from the OCC shall be addressable to a single station.
   b. Local PA messages. Local ad-hoc PA messages shall be generated from a microphone at the station’s CIC, Communications or other Facilities. Local PA messages shall be broadcast to all zones within the station.
   c. “Next Train” announcement. The PA/VMB subsystems shall be capable of automatically generating the “Next Train” announcement at the terminal stations. The Next Train logic signal will be created and made available as dry contacts by Signals System at the station CIC or Communications Facility.
   d. PA /VMB message priorities. The priority of the messages will be as described below.

1) Highest Priority - PA / VMB initiated from a Station Fire Alarm Control Panel (FACP).
2) Second Priority – PA / VMB initiated from a local input device at the station.
3) Third Priority – PA / VMB announcement initiated from the OCC.
4) Fourth Priority – Prerecorded messages.
5) Lowest Priority – “Next Train” message announcement at the terminal stations.
   e. PA Summary Alarm – The following PA subsystem alarms shall be combined into a single PA Summary Alarm using a normally closed contact for reporting to the OCC via the local Remote Terminal Unit:

f. PA Acoustic Feedback. Contractor’s design shall prevent acoustic feedback from local PA announcements.
g. PA Power Amplifier Redundancy. The failure of any one PA power amplifier shall not result in the loss of PA coverage in any station area.

h. PA Sound Level. The sound level shall be automatically adjusted upward through the use of a sensing microphone or microphones located centrally at the station to compensate for increases in ambient sound levels.

1) Compensation shall not exceed 15 dB above ambient sound levels.

2) Maximum sound level shall not exceed 105 dBA.

i. PA Zoning. Platforms shall have coverage for 4 zones. Two zones are required, a Northbound Zone, and a Southbound Zone. Third zone shall be for Mezzanine, and the forth is reserved for future applications such as the station parking lot.

1) PA Chime shall initiate from the PA/VMB Controller.

B. Public Address Equipment General Requirements

1. Unless superseded by specific equipment requirements below, the PA electronic equipment shall have the following general specifications:

a. Solid state design

b. Latest manufacturer’s model

c. Balanced outputs

d. Rack-mountable

e. Frequency response: 30 to 20 kHz within plus or minus 1 dB

f. THD: Less than 1 percent over the frequency range at full rated output.

g. Hum and Noise: Less than 80 dB at rated output.

1. Audio Processor performance criteria include:

a. Audio:

1) Phantom Voltage: 24V DC

2) Input Gain Range: plus 20 dB to negative 12 dB

3) Digital Sampling: 24 bit, 48 kHz

4) Input Impedance: 20 kohms balance, 10 kohms unbalanced

5) Dynamic Range: greater than 100 dB (A-weighted, 20 Hz to 20 kHz)

6) Frequency Response: within plus or minus 0.5 dB, 20 Hz to 20 kHz

7) Common Mode Rejection: 50 dB at 60 Hz

8) Crosstalk: greater than 80 dB at 10 kHz

9) Total Harmonic Distortion: less than 0.05 percent

10) Maximum Input Level: plus 32 dBu line, or plus 7dBu mic

11) Output Impedance: 100 ohms balanced, 50 ohms unbalanced

12) Control Port:

a) Power Supply: plus 5V DC and plus10V DC at 1A

b) Outputs: logic low and logic high

c) Inputs: logic low and logic high, 0 to 10V analog

2.3 AUDIO POWER AMPLIFIERS

A. The audio processor shall be compatible or better than the current audio processor a Crown IQ-USM 810. The audio processor shall provide mixing, filtering, busy and processor faults, and sound level controls.

Audio power amplifiers shall be Power Amplifier Crown CTs Series 600 amplifiers or Authority approved equal to allow a seamless end-to-end PA subsystem implementation from operational central control to the station. Contractor shall provide amplifiers in the size and quantity to provide a power capacity 50 percent greater than...
the power output required at nominal sound pressure levels.

1. The amplifier performance criteria include:
   a. Frequency Response: 20 Hz to 10 kHz
   b. Signal to Noise Ratio: less than 105 dB A-weighted
   c. Total Harmonic Distortion: less than 0.1 percent at full rated power
   d. Inter-modulation Distortion: less than 0.1 percent, 60 Hz and 7 kHz at full power
   e. Crosstalk: greater than 80 dB, 20 Hz to 1 kHz
   f. Voltage Gain: 70V operation, 1.4V sensitivity
   g. Common Mode Rejection: 50 dB, 20 Hz to 1 kHz
   h. AC Line Voltage: 120V AC
   i. Front Panel Indicators: Bridge Mode, Ready, Signal, Clip, Thermal, Fault, Data, Power
   j. Protection: thermal, fault, filters, over- and under voltage, circuit breaker, inrush limiting

2.4 DIGITAL SIGNAL PROCESSOR (DSP) - FAULT MONITOR

A. Fault monitor shall be compatible or better than the current DSP Crown IQ P.I.P.-USP2 DSP and Load Supervision module. The module shall provide continuous supervision of the amplifier and loudspeaker lines. The fault monitor failure outputs shall be wired and integrated into the PA Summary Alarm as described in Paragraph 2.1A.3.e of this Specification.

B. Fault monitor Performance Criteria shall include:
   1. Amplifier output monitor.
   2. Ethernet plug.
   3. 24-bit conversation and 32 bit DSP processing.
   4. 64 assignable filters with multiple filter types.
   5. Two-second available delay.
   6. Input compressor and output limiters.

2.5 SPEECH PROCESSOR

A. A speech processor shall be required to enhance speech intelligibility in loud noise-floor environments. Speech processors shall be installed at stations where ambient noise levels (with no trains idled at the station) exceed 70 dB over any operating time.

B. Speech processor shall be compatible or better than the current equipment a Communications Company SP-1.

1. Speech processor performance criteria shall include:
   a. Type: adjustable peak clipping of a lower sideband sing at suppressed carrier frequency
   b. Frequency Responses:
      1) Select On: 6 dB/octave pre-emphasis up to peak from 1500 Hz to 3100 Hz, 18 dB rolloff above 3400 kHz
      2) Select Off: Flat Response
   c. Output: 0 to 10V into 600 ohms
   d. Input: line and microphone
   e. Frequency Shift: 7 Hz shift for control of acoustic feedback
   f. Remote Select: contact closure to ground, or floating control to 24 V DC
   g. Front Panel Controls:
      1) Line level
      2) Microphone level
      3) Clipping level
      4) Output level
      5) Local/Remote switch
PUBLIC ADDRESS SUBSYSTEM - COMMUNICATIONS SYSTEM

6) 7 Hz switch
7) Power on/off

h. Rear Panel Controls:
1) Microphone pad
2) Line In/out ground switch

i. Displays:
1) Clipping bar graph: negative 3 dB to 24 dB
2) Output bar graph: negative 9 dB to +18 dB

2. Speech processor shall be considered as part of the PA subsystem in meeting the intelligibility requirements.

2.6 SPEAKERS
A. The speakers shall conform to the following:
1. Sensitivity 2.83 V at 1 m.: 90 dB (anechoic), 93 dB (half space).
2. Rated impedance: 8 ohms
3. Rated power: 50 watts (average)
4. Wattage tap selections: 30, 15, 7.5, 3.75 watts
5. Frequency response: 80 Hz to 22 kHz

2.7 PA CABLES
A. PA cables shall conform to the requirements of these Specifications and the Contract Drawings.

2.8 SENSING MICROPHONES
A. Sensing microphones shall be compatible or better than the current microphone Crown PZM11LLWR.
1. Microphone performance criteria include:
   a. Frequency Response: 80 Hz to 10 kHz
   b. Polar Pattern: hemispherical
   c. Impedance: 75 ohms
   d. Sensitivity: 1.4V/ Pa

2.9 STATION PA/VMB CONTROLLER
A. Station PA/VMB Controllers are common equipment to the PA and the VMB subsystem described in these Specifications. PA equipment including public address audio line selection/pre-amplification shall interface to a single Station PA/VMB Controller at the Station CIC or Communications Facility as shown in the Contract Drawings.

B. Station PA/VMB Controller will be provided and installed by the contractor and shall be fully compatible with the existing system located at the OCC. The controller shall be equipped with all required modules to satisfy all requirements for PA/VMB communications from the local PA/VMB input device. The PA/VMB Controller shall perform the following PA functions:
1. Provide multiple audio outputs to support PA zoning as described in this Section.
2. Accept multiple local audio input sources. Provide priority selection of audio sources.
3. Provide 10/100 BASE T Ethernet interface to support network communications and connection to SONET backbone.
4. Provide fiber optic network interface card where Ethernet link exceeds 100 meters.
5. Store multiple PA and VMB messages locally and remotely for automatic selection.
6. Report equipment fault via contact closures as a summary alarm connected to the local RTU and transmitted to OCC for alarm indication.
7. Provide 4 PA zones per station.
8. Provide an interface for local input device.

2.10 LOCAL PA INPUT DEVICE
A. Local PA announcements shall be initiated from a hardwired push-to-talk microphone located in the CIC, Communications Facility or an aerial station FACP, and as shown in the Contract Drawings.

B. Operational instruction for local announcement shall be provided at the microphone or as directed by the Authority.

C. Color of the microphone for local announcement shall be red.
PART 3 - EXECUTION

3.1 INSTALLATION

A. General: Contractor shall meet the requirements of this subsection in meeting the installation requirements.

B. Factory Installation: Contractor shall mount and wire PA equipment in a rack prior to shipment to the site for final installation.

C. Field Installation

1. PA speakers shall be installed and wired by the Contractor. Cables from the speakers shall be wired to the Demarcation Cabinet as shown in the Contract Drawings.

2. PA amplifiers and other equipment shall be installed as shown in the Contract Drawings. All PA cable entering the location of the station’s PA/VMB Station Controller shall be wired through protected terminal blocks at that location. Power shall be derived from the Uninterruptible Power Supply (UPS) as shown in the Contract Drawings.

3. The Local PA Input Device shall be installed as shown in the Contract Drawings.

4. Contractor shall ensure the housings, backboxes, and the grills of all speaker assemblies shall be painted Benjamin Moore 1600 with Satin Finish in accordance with Section 09970 “Coatings for Steel”, or as directed by the Authority.

3.2 TESTING

A. General: Contractor shall meet the requirements of this subsection in meeting the testing requirements. The testing of the working PA subsystem shall be the responsibility of the Contractor and other contracts organized as:

1. Contractor shall prepare test plans, test and inspection procedures and checklists, conducting the test and/or inspection until acceptable results are achieved, and preparing and submitting test and/or inspection reports.

B. Factory Testing and Installation Inspection

1. Contractor shall perform factory tests of the racked and wired PA equipment. Minimum testing requirements shall be:

   a. Power on test. Measure input current under no load.

   b. Power under load. Measure input current under expected average and peak load.

   c. Functional test of system faults.

   d. Microphone and line level input to output test under load.

   e. Frequency response test under load.

2. Installation Inspection: Contractor shall perform an Installation Inspection on installed PA equipment. Inspection shall be done using the Installation Drawings and an Installation Inspection Checklist. All non-conforming checklist items shall be noted.

C. Field Test

1. Contractor shall perform field tests consisting of the following:

   a. Functional tests of equipment for line and microphone inputs at nominal Sound Pressure Level.

   b. Functional test of detecting and reporting PA equipment indications.

   c. Functional test of priority select between Local and OCC messages.

   d. Functional test of the “Next Train” message announcement and visual indication at each Terminal station.

   e. Functional test of feedback for locally generated PA messages.

   f. Functional test of pre-recorded message operation.

   g. Correct phasing of all speakers.

   h. Functional and sound level test of the chime.

   i. Functional testing of ambient sound level sensing and PA sound level compensation mechanism.

   j. Audio coverage test: Under canopies, at 5 feet above the platform level, test frequencies at 250 Hz, 1 kHz, 3 kHz, Sound Pressure Level (dBA scale). Confirm coverage requirements. Measurements made every 5 feet
along platform edge and extending 5 feet beyond the canopy limits.

k. Audio coverage test: On mezzanines, at 5 feet above the mezzanine level, test frequencies at 250 Hz, 1 kHz, 3 kHz, Sound Pressure Level (dBA scale). Confirm coverage requirements. Measurements made every 100 square feet as shown in the Contract Drawings.

l. Contractor shall perform an intelligibility test using the STI method as described in IEC 60628-16 and at specific locations as identified above.

D. System End-To-End Acceptance Test

1. Contractor shall provide a local End-To-End test procedure to test a complete local PA Subsystem at every station to show the proper functionality at the field.

2. Contractor shall perform End-To-End testing of the field PA/VMB equipment to the servers at OCC.

E. Systems Integration Test: Contractor shall provide technical support to the Authority in performing System Integration Tests. This test shall include a complete PA/VMB test including the field and OCC elements.

F. Contractor shall submit test reports, including items specific to technical requirements, above. In addition, the Contractor shall record in tabular form all test configuration settings of the PA equipment. The Test records and results shall be submitted 14 days after each test.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Work specified in this Section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith shall be considered incidental to the Work specified under Section 16801 “Basic Technical Requirements - Communications System.”

END OF SECTION 16852
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section describes the detailed technical requirements for the Visual Message Board (VMB) Subsystem to be designed, provided, installed, and tested under this Contract. Work scope includes:

1. Contractor shall design, provide, install and test a VMB subsystem to complement the Station Public Address (PA) subsystem and comply with American Disability Act (ADA) requirements. The PA/VMB equipment at the stations shall be coordinated and be compatible with the PA/VMB equipment at the OCC.

2. The Public Address/Visual Message Board (PA/VMB) subsystems shall allow communications with patrons at Stations via the PA/VMB station controller equipment. The PA/VMB station controller (provided by DART for installation by the Contractor) shall communicate with the OCC via SONET/Ethernet protocol. The PA/VMB subsystem shall allow live and canned messages to be initiated from both the Local PA/VMB input device, and the PA/VMB Console(s) located at Operation Control Center (OCC).

B. Existing System Description and Configuration:
The existing VMB subsystem provides text messages to the Authority patrons at the existing stations in the North East and North Central Light Rail Transit (LRT) system. Text messages are initiated by the Authority personnel from the Train Control Center (TCC) or locally from a PA/VMB Message Panel with local messages taking precedence over TCC messages. Text messages can be issued in conjunction with public address messages or separately. The existing visual message signs are manufactured by Daktronics, Inc (Galaxy, X-1001-16x96-4.2-Tri-color), Daktronics, Inc. (Galaxy AF-6200-16x96-RG-DF) and Luminator (510999-002 and 510999-001).

C. New Work.

1. Contractor shall provide a VMB subsystem to the new stations in accordance with Technical Specifications and the Contract Drawings.

2. Contractor shall install VMB equipment in the Station Communication Interface Cabinets (CIC) and/or Communications Facilities as shown in the Contract Drawings and described in these Specifications.

3. Contractor shall install station VMB wiring as shown in the Contract Drawings. Contractor shall wire from the Sign through the demarcation cabinet to the CIC or Communications Facilities as shown in the Contract Drawings.

4. Stanchions for supporting the VMBs shall be designed, provided and installed by the Contractor. Contractor shall mount the VMBs on these stanchions and complete the final connections for power and communications.

5. Contractor shall provide “Next Train” message announcement (simultaneous audio and text message) at Terminal stations. Contractor shall coordinate all work between the Signals and Communications work to ensure a seamless implementation of the “Next Train” announcement (PA and VMB) at each terminal station.

6. Contractor shall perform tests as described in these Specifications.

7. Contractor shall test a complete local VMB subsystem as described in this Specification including all the work and provisioning required at OCC to provide remote access and control from the OCC, and System Integration test. Contractor shall provide coordination and qualified technical staff to support design and implementation of a seamless and complete PA and VMB subsystem.

8. Contractor shall take the lead, with support from the Authority in troubleshooting of the PA VMB system, when the station equipment does not function or communicate properly with the remote equipment at OCC.

9. Provide and install a KVM (keyboard, video, mouse) style input device with each PA/VMB Controller for local control and configuration.

1.2 REFERENCED STANDARDS

A. Americans with Disabilities Act (ADA)

1. 28 CFR Part 36 – Nondiscrimination on the Basis of Disability by Public Accommodations and In Commercial Buildings (ADA Standards for Accessible Design)
B. International Organization for Standardization
   1. ISO 9001 – Quality Management Systems - Requirements

C. National Fire Protection Association (NFPA)
   1. NFPA 70 - National Electric Code (hereinafter referred to as NEC)

D. Underwriters Laboratories (UL)
   1. UL 48 - Standard for Safety Electric Signs

1.3 SUBMITTALS

A. Submittal format and content shall comply with the general requirements of these Specifications and the specific technical requirements further listed in this Section.

1. Manufacturer Qualifications:

   a. Any manufacturer differing from those specified herein shall require a prequalification and Authority approval.

   b. Manufacturer acceptability shall be based on the manufacturer's experience, qualifications, and certifications, i.e., ISO-9001, equipment reliability, and compliance with standards specified herein, and full compatibility with the Authority's existing system.

2. Preliminary Design Review (PDR) Technical Requirements

   a. Contractor shall include the following information as part of the PDR submittal package for the VMB subsystem:

      1) Visual Message Board Subsystem Block Diagram
      2) Electrical diagrams, calculations and power requirements.
      3) Demonstration of sign display characteristics including graphics and compatibility with the existing VMB controller software (Venus 1500 v1.83 from Daktronics).

   4) Contractor shall provide data sheet, samples and all required information on the signs to include the housing and installation details for Authority approval.

   5) System compliance documentation for ADA requirements.

   6) Material Specification Data Sheets and Product Samples. Contractor shall submit complete product data including description and model number, shop drawings, catalog cuts, technical literature, software descriptions, and samples (as requested by the Authority), for all equipment provided under this Contract.

   7) Identification and specification of all external interfaces to other systems, subsystems provided under this Contract, and to any other Contracts.

   8) Descriptions of modifications required (if any) to the existing equipment to interface with new equipment.

   9) Complete Wiring diagrams, terminal cabling, and interconnecting diagrams for all field equipment provided and installed under this Contract.

   10) Proposed rack layouts and elevations for new field systems, including assembly drawings, installation drawings, and part lists.

   11) Proposed VMB stanchion layout and elevation.

3. Final Design Review (FDR) Technical Requirements: Contractor shall include the following information as part of the
FDR submittal package for the VMB subsystem:

a. Updated PDR information. All drawings, calculations and design information shall reflect a final design.

b. Shelf layout and inventory within equipment chassis

c. Final wiring details, including alarm points

d. Final VMB mounting details including stanchion structural design details.

4. Installation Work Drawings and Detailed Documentation: Contractor shall submit the following installation document for each site no later than 60 days prior to the scheduled installation activities. The Installation Work Drawings shall include:

a. Drawings and Diagrams. Contractor shall submit installation drawings and diagrams for each station installation. Specific drawings and diagrams shall include:

1) Block diagram

2) Wiring diagrams of rack equipment showing Supervisory Control And Data Acquisition (SCADA) interface, including power and signal wiring.

3) Equipment layout in drawings and side views

4) Conduit installation specific to VMBs

b. System Configuration and switch setting data. Contractor shall submit as part of the Installation Work Drawings all configuration settings of equipment to be installed.

c. Procedures. Contractor shall submit installation procedures as part of the Installation Work Drawings for each station.

5. Calculations and Certifications

a. Calculation as listed in the PDR and FDR.

b. Certifications: Copy of the following certifications shall be included:

1) ISO certification for all proposed manufacturers.

6. Product Samples: Product samples shall be provided and demonstrated when requested by the Authority. This may include the proposed visual message signs.

7. Test Procedures, and Results

a. Test Procedures shall be submitted in accordance these Specifications, and specifically Section 16801, Basic Technical Requirements – Communications System”, and as outlined herein:

1) Test program drawings: Contractor shall include all the required information for the VMB subsystem in the Test Program drawings as outlined in these Specifications.

2) Factory and Inspection Test Procedure: Contractor shall submit a complete factory test and inspection procedure to satisfy all the requirements outlined in Article 3.2 of this Specification.

3) Field Test Procedure: Contractor shall submit a complete field test procedure to satisfy all the requirements outlined in Article 3.2 of this Specification.

4) End-To-End Acceptance Test: Contractor shall submit a complete Local End-to-End Public Address and Visual Message Board Test procedure to satisfy all the required functionality and requirements outlined in Article 3.2 of this Specification.

b. System Integration Test (SIT): Contractor shall provide qualified staff to support the VMB SIT as described in Article 3.2 of this Specification. SIT will be directed
8. Test Records: Contractor shall submit the Test Records for review 14 days after the completion of each test, in accordance with these Specifications.

9. As-Built Documentation
   a. Drawings, conduit and cable schedule
   b. Operation and Maintenance Manuals
   c. Specifications
   d. Final configuration settings

1.4 QUALITY ASSURANCE

A. Applicable Standards and Codes: Contractor’s material, design installation and testing shall comply with all applicable Standards and Codes as listed herein. All VMB equipment shall comply with the latest version of the standards as applicable in Article 1.2 of these Specifications.

B. Material and Workmanship Requirements.
   1. VMB shall meet ADA requirements for message display at stations. Contractor shall submit documentation showing compliance with ADA requirements.
   2. All equipment provided under this Section shall be UL listed.
   3. All grounding shall be in accordance with local standards, and specifications required by this Contract except as modified herein. Each piece of equipment shall be grounded in accordance with the recommendations of the manufacturer.
   4. Discontinued product models, refurbished equipment, or products scheduled for end-of-life, end-of-sale, or end-of-service within 1 calendar year of the installation date shall not be used.
   5. All specified material shall be subject to the Authority approval based on the Contractor’s ability to demonstrate adherence to the specified requirement and approval of the manufacturer’s quality process.
   C. Manufacturer Pre-Qualification Requirements: All new equipment provided and installed under this contract shall be compatible with the existing VMB System equipment installed in the field and central locations in order to perform the intended use set forth by the Authority.

PART 2 - PRODUCTS

2.1 GENERAL DESIGN REQUIREMENTS

A. VMB system shall receive and process messages from OCC. Messages shall be directed to the correct VMB display by way of the local PA/VMB Station Controller at the station CIC or Communications Facilities. The VMB equipment shall provide for local generation of messages to be displayed and broadcast at the station’s VMB equipment.
   1. VMB Coverage. The VMBs shall be placed on the platform so that patrons can see the displayed message from all positions along the platform edge. VMBs on mezzanines in aerial stations shall be located as shown in the Contract Drawings.
   2. VMB Zones. VMBs shall be individually addressable and capable of sending messages to minimum of 4 zones.
      a. Two Zones for station platforms. One zone is for the north bound platform side, and the second is for the south bound platform side. In the case of a station side platform, each is a zone. In the case of a station center platform, each side of the platform is a zone.
      b. Third VMB zone shall be the mezzanine area.
      c. The fourth Zone shall be for other applications such as parking lot or underpass.
      d. Messages directed to any of the platform zones shall be displayed on mezzanine VMBs.

2.2 STATION PA/VMB CONTROLLER

A. The Station PA/VMB Controller is common equipment to both PA and VMB subsystems, described in detail in these Specifications.

B. The station PA/VMB Controller will be provided by the Authority for installation by the Contractor. The controller will be equipped with all required modules and software applications to satisfy all requirements for PA/VMB communications from local VMB input device for the existing signs (Daktronics, Galaxy Model No. X-1001-16X96-4.2-Tri-Color). The PA/VMB Controller will perform the following functions:
1. Provide multiple audio and data outputs to support PA and VMB zoning.

2. Accept multiple local audio input sources. Provide priority selection of audio sources.

3. Provide 10/100 BASE T Ethernet interface to support network communications and connection to the CTS network.

4. Provide fiber optic network interface card where Ethernet link exceeds 100 meters.

5. Store multiple local PA and VMB messages for automatic selection.

6. Report equipment fault via contact closures connected to the local RTU.

7. Provide an interface for local input device.

8. Modification to controller interfaces may be required for connection to new VMB signs. Contractor is responsible for required modifications.

2.3 VISUAL MESSAGE BOARD

A. The VMB is used to display visual messages at the stations. The VMB shall be the Daktronics, Inc Galaxy Model No. AF-6400-48x240-6-RGB-DF or Authority approved equivalent and be compatible with the existing sign control software. Visual messages shall be initiated from the OCC, and from a Local PA/ VMB Input Device.

1. OCC Visual Messages: Visual messages received from the OCC shall be addressed to one or both platform zones in a station. Messages shall appear only in the zone addressed.

2. Local Visual Messages: Local VMB messages shall take priority over OCC initiated messages and shall appear in all zones within the station.

3. Location: Contractor shall provide VMB signs at Station at locations and in quantities shown on Contract Drawings.

4. VMB Display: The VMB shall be capable of displaying text or graphic images on a large bright screen of high intensity red and green light emitting diodes (LED). The display shall have the following characteristics and be compatible with the current system:

   a. Variable character heights: Minimum of 2 lines of text, minimum 21 character per line when the character height is 4 inch

   b. Automatic Intensity Control

   c. Minimum of 16M colors. Viewing angle shall be plus or minus 70 degrees from center axis

   d. Multiple Fonts

   e. Multiple display effects; flash, scroll, roll, graphics.

   f. Graphic Capability

       1) Address individual pixels to form an image.

       2) Utilize bitmapped (bmp) files to create graphic frames on the display face

5. VMB Addressing: Each VMB shall be individually addressable from OCC for sending information, configuring memory, and for investigating the contents of memory. VMBS shall be addressable as groups, such as, station, extension, or platform zone.

6. VMB Intensity: The VMB shall automatically lower its intensity in concert with ambient light conditions. The peak intensity settings during daylight hours and night hours shall be subject to the Authority approval.

7. VMB Strobe: Each VMB shall include a strobe light capable of signaling deaf patrons when a visual message is being broadcast.

8. VMBS shall be equipped with sunshades.

9. VMB LED Characteristics shall conform to the following:

   a. VMB Display Characteristics: The overall luminous intensity shall be a minimum of 5000 nits

   b. LED Size: 6.6 mm maximum.

   c. Pixel: Each pixel shall include 1 surface mounted LED controlled to enable a minimum of 16M colors
10. VMB Physical and Electrical Characteristics shall conform to the following:

a. Below Ground Enclosure: NEMA 4X (NEMA 4X rating shall be preserved even after installation, including all mounting hardware and cable conduits)

b. Above Ground Enclosure: NEMA 3R (NEMA 3R rating shall be preserved even after installation, including all mounting hardware and cable conduits.

c. Enclosure Size: 18 inches high by 70 inches wide by 14 inches Deep (without sunshade) maximum

d. Display Window: Shatterproof, vandal resistant, ultra-violet resistant, condensation prevention.

e. Metal Components: Corrosion resistant

f. Maintenance Access: Access doors on each side of double sided sign

g. Input Power: 120V AC UPS circuit

11. VMB strobe shall conform to the following:

a. Mounted on VMB

b. Strobe Rate: 1 per second

c. Vandal resistant and weatherproof

2.6 VMB CABLES

A. VMB cables shall conform to the requirements of Section 16841, “Communications Cable – Communications System”, and these Specifications.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Contractor shall meet the requirements of this subsection in meeting the installation requirements.

B. Field Installation

1. OCC Installation: The required wiring, provisioning and cross-connects at the OCC Equipment Room will be performed by the Contractor. Coordinate with the Authority for access and as-built conditions.

2. VMB Installation

a. VMB stanchions and foundations shall be installed as designed by the Contractor and approved by the Authority.

b. Color of VMB housing shall match stanchion color, Benjamin Moore 1600, and be subject to the Authority approval.

B. Color of sunshade shall match the housing color. Outside color of sunshade can be a lighter shade to reduce direct heat gain. Color shall be subject to the Authority approval.

3. VMB communication equipment shall be installed as shown in the Contract Drawings. All communication cable to/from the CIC or Communications Facilities shall be wired through protected terminal blocks and proper grounding.

4. Power shall be derived from UPS as shown in the Contract Drawings.

5. A pullout tray shall be provided at the PA/VMB cabinet to support a laptop PC or other maintenance equipment, for troubleshooting and testing purposes. Power and communication jacks shall be allocated for the laptop. This will allow include summation of the PA/VMB Controller trouble, loss of communications with VMB, and the VMB trouble signals.

2.4 LOCAL VMB INPUT DEVICE

A. Local adhoc VMB messages shall be able to be initiated from a local pull out drawer style keyboard, mouse, and a LCD display panel, installed in the rack at the Station CIC or Communications Facilities. See Contract drawings for more details.

B. A pullout tray shall be provided at cabinet to support additional user / maintenance devices.

2.5 VMB SUMMARY ALARM

A. The VMB summary alarm shall be available to OCC via dry contacts provided to the Communications Central Contractor at the interface panel (to be transmitted to OCC via the RTU). The summary alarm shall be designed and provided as 1 single dry contact alarm to
adjacent and convenient connection from laptop to the pullout tray side.

3.2 TESTING

A. Contractor shall perform the following inspections and tests on the VMBs. The Authority shall be given at least 21 days written notification prior to each test and inspection so that the Authority may be present as desired.

1. Factory Test and Inspection:
   a. Contractor shall inspect the VMB at the Factory for conformance to Specification manufacturing standard requirements.
   b. Contractor shall perform factory tests of the racked and wired VMB equipment. Minimum testing requirements shall be:
      1) Power on test. Measure input current under no load.
      2) Power under load. Measure input current under expected average and peak load.
      3) Functional test of system faults.
      4) Conformance to light output and viewing angle requirements.
      5) Contractor shall submit test reports, including items specific to technical requirements, above. In addition, the Contractor shall record in tabular form all test configuration settings of the VMB equipment.

2. Installation Inspection
   a. Contractor shall perform an Installation Inspection on installed VMB equipment. Inspection shall be done using the Installation Drawings and an Installation Inspection Checklist. All non-conforming checklist items shall be noted.
   b. Contractor shall submit Installation Inspection reports, including items specific to technical requirements, above.

3. Field Equipment Tests
   a. Contractor shall perform the following field equipment functional tests:
      1) Functional test of all message features.
      2) Functional test of strobe feature.
      3) Equipment failure supervision interface.
      4) Display of locally generated messages and OCC initiated messages.
      5) Demonstration of graphics capability.
      6) Functional test of single and multiple zone operation.
      7) Strobe operation and timing
   b. Contractor shall submit the reports within 14 days after completion of each Field Test. Contractor shall also submit Installation Inspection reports, including items specific to technical requirements, above.

4. System End-to-End Acceptance Test
   a. Contractor shall provide a local end-to-end test procedure to test a complete Visual Message signs at every station to show the proper functionality and performance at the field.
   b. Contractor shall provide a local end-to-end test procedure to test complete “Next Train” functionality at each Terminal station. This includes the audio and visual announcement; priority of the announcement, and the testing of the Signals System Next Train Logic. This will ensure the interface and implementation of this function in the field are in accordance with the requirements outlined in these specifications.
   c. Contractor shall perform End-To-End testing of the field PA/VMB equipment to the OCC server.
d. Contractor shall submit the end-to-end test reports within 14 days after completion of each test.

5. Systems Integration Test

a. Contractor shall provide technical support to the Authority's System Integration Consultant in performing SITs. This test shall include a complete PA and VMB subsystems functional test including the field and OCC elements.

b. Contractor shall submit the test records for any work done under SIT within 14 days after completion of each test.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this Section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith shall be considered incidental to the Work specified under Section 16801 “Basic Technical Requirements - Communications System.”

END OF SECTION 16853
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section describes the detailed technical requirements for the Fire Alarm Subsystem to be designed, provided, installed, and tested under this Contract. Scope of Work includes:

1. Providing, installing and testing all fire alarm and associated equipment in Communication Facilities and any other facilities referencing this section and as shown in the Contract Drawings.

2. Providing a fire suppression system in facilities (communications, signal houses, traction power substations) where required by code. The fire suppression system shall be in accordance with the latest applicable codes, including:
   a. Requirements of local Jurisdictional Authority
   b. NFPA
   c. UL Listings

B. The new Fire Alarm Subsystem work shall include a Fire Alarm Control Panel with IP communications and an IP compatible DACR. Requires redundant new DACR units at the OCC, new DACR software and GUI. This functionally eliminates the use of a DACT and 2 analog phone lines per reporting facility that were previously provided as part of DART legacy fire alarm system. The Fire Alarm Subsystem is subject to approval by the City of Dallas.

C. Fire alarm control panels, sensors, annunciators and associated equipment shall be common to all new facilities including communications rooms, stations, signal houses, substations, and other Authority facilities referencing this Specification Section.

1.2 REFERENCED STANDARDS

A. American Society for Quality (ASQ):
   1. ASQ Z1.11 - Quality Assurance Standard

B. Institute of Electrical and Electronics Engineers (IEEE):
   2. IEEE C62.41.2 - Recommended Practice on Characterization of Surges in Low-Voltage (1000 V and less) AC Power Circuits

C. International Organization for Standardizations
   1. ISO 9000 - Quality Management Systems - Fundamentals and Vocabulary
   2. ISO 9001 - Quality Management Systems - Requirements

D. National Fire Protection Association (NFPA):
   1. NFPA 70 - National Electric Code (hereinafter referred to as NEC)
   2. NFPA 72 - National Fire Alarm Code

E. Underwriters Laboratories, Inc. (UL):
   1. UL 268 - Standard for Safety Smoke Detectors for Fire Protective Signaling Systems

1.3 SUBMITTALS

A. Submittal format and content shall comply with the general requirements of these Specifications and the specific technical requirements further listed in this Section.

1. Manufacturer Qualifications:
   a. Fire Safety Professional Engineer: Qualifications, with verification of experience and license number, of a Licensed Fire Safety Professional Engineer in the State of Texas, with at least 4 years of current experience in the design of fire protection and detection systems shall be provided to the Authority for approval prior to commencement of design.
   b. Equipment Installer
      1) Documentation demonstrating that the fire alarm system installers have been regularly engaged in the installation of fire detection and suppression and alarm systems meeting NFPA standards for a minimum of 3 years immediately preceding commencement of this contract shall be provided as part of the Installation Work Plan.
      2) Documentation shall include proof of satisfactory performance on at least 3 projects similar to that
required by these specifications, including the names and telephone numbers of using agency points of contact for each of these projects.

3) Documentation shall indicate the type of each system installed and include a written certificate that each system has performed satisfactorily in the manner specified for a period of not less than 12 months following completion.

4) Listing of the installer under "Protective Signaling Services - Local, Auxiliary, Remote Station Proprietary (UUJS)" or under "Protective Signaling Services - Central Station (UUFFX)" of the UL Fire Protection Equipment Directory will be accepted as equivalent proof of compliance with the foregoing experience requirements.

a. Contractor shall include the following information as part of the PDR submittal package for the Fire Alarm Subsystem:

1) Battery calculations shall be provided for supervisory and alarm power requirements.

2) Ampere-hour requirements for each Fire Alarm Panel and all sensor components and the battery recharging periods shall be included.

3) Battery calculations shall substantiate both NFPA 72 and specification requirements.

4) A complete list of Fire Alarm Subsystem equipment (including manufacturer's descriptive and technical literature and catalog cut sheets) including the IP communicator, sensor equipment, alarm annunciation devices and Fire Alarm panel.

5) Drawings showing the plan and elevation for typical configurations of Communications Facility, Communications Rooms, and Signal House.

6) Certified copies of current approvals or listings issued by UL, FM or other nationally recognized testing laboratory, showing Fire Alarm Subsystem equipment compliance with specified NFPA standards.

b. Contractor shall include the following as part of the PDR for the fire suppression system:

1) Completed layouts drawings to include isometric details of agent storage containers, mounting details, proposed pipe runs and sizes, and symbol legend.

2) Electrical layout drawings shall show the location of all devices and include point-to-point conduit runs and a description of the method(s) used for detector mounting.

3) Qualifications of fire suppression system installers.

4) Qualifications of fire suppression system training instructors.

3. Final Design Review (FDR) Technical Requirements. Contractor shall include the following information as part of the FDR submittal package for the Fire Alarm Subsystem:

a. Updated PDR information. All drawings, calculations and design information shall reflect a final design.

b. Detail drawings for Communications Facilities containing Fire Alarm systems.

c. Drawings shall be signed by the Texas Licensed Fire Safety Professional Engineer (as required on a per-system basis) and
approved, signed, and sealed by the authority having jurisdiction.

d. Drawings shall consist of the following:

1) Schematics.
2) Wiring diagrams.
3) Complete subsystem interconnection diagrams.
4) Fire Alarm Panel layout.
5) Other details required to verify that the system conforms to industry standards and requirements.

e. Spare Parts Data:

1) Spare parts data for each different item of material and equipment specified, shall be provided. Data shall include a complete list of spare parts and supplies with the current unit prices and source of supply, along with a list of any parts which the manufacturer recommends be replaced periodically.

4. Installation Work Plans. Contractor shall submit the following installation document for each site no later than 60 days prior to the scheduled installation activities. The Installation Work plan shall include:

a. Drawings and Diagrams to include:

1) Equipment layout in Drawings and elevation views. This includes details of adding the new IP based DACR units into the existing OCC display.
2) System block diagram.
3) Wiring diagrams showing detail connection of all system components including power and control wiring.
4) Conduit installation details.

5. Calculations or Certifications

a. Calculations as listed in the PDR and FDR.

b. Certifications: Copy of the following certifications shall be included:

1) ISO certification for all proposed manufacturers.

6. Product Samples: Product samples shall be provided and demonstrated when requested by the Authority.

7. Test Plan and Procedures: In accordance with the format and requirements described in these Specifications, as a minimum, the Contractor shall submit the following drawings and procedures to satisfy the Fire Alarm Subsystem testing requirements:

a. Test program plan: Contractor shall include all the required information for the Fire Alarm Subsystem in the Test Program Plan as outlined in these Specifications.

b. Factory and Inspection Test Procedure: Contractor shall submit a complete factory test and inspection procedure to satisfy all the requirements outlined in Article 3.2 of this Section.

c. Field Test Procedure: Contractor shall submit a complete field test procedure to satisfy all the requirements outlined in Article 3.2 of this Section.

d. System Acceptance Test: Contractor shall submit a complete system acceptance test procedure to satisfy all the requirements outlined in Article 3.2 of this Section.

e. System Integration Test (SiT): Contractor shall provide qualified technical staff to support this test as described in Article 3.2 of this Section. SiT will be directed by the Authority.

8. Test Records: Contractor shall submit the Test Records and Results for review 14 days after the completion of each test, in accordance with the format described in these Specifications.

9. As-Built Documentation: Contractor shall submit complete As-Built documentation and drawings for the Fire Alarm Subsystem.
1.4 QUALITY ASSURANCE

A. Manufacturer Pre-Qualification Requirements

1. The Authority shall approve the manufacturer Pre-Qualification Requirements.

2. Contractor shall provide all data required by the Authority for its evaluation.

3. Contractor shall make the arrangements for any required demonstrations and tests as required to ensure specification compliance or properly installed Fire Alarm Subsystem equipment.

4. Material and equipment shall be the standard products of a manufacturer regularly engaged in the manufacture of digital alarm communicator systems and shall be items that have been in satisfactory use for at least 2 years prior to bid opening.

5. Equipment shall be supported by a service organization that can provide service within 24 hours.

6. Qualifications shall be based on the following criteria:
   a. Past Performance and Experience
   b. Fire alarm equipment manufacturers shall demonstrate previous successful experience in supplying, testing and installation of fire alarm systems and components specified herein.

C. Provide a list containing of 3 recently completed projects of similar type and size with contact names and telephone numbers for each.

D. Manufacturer Quality Assurance/Quality Control Program

1. Manufacturers of fire alarm subsystem, in accordance with the requirements of these specifications, is required to have in place or implement, an effective Quality Assurance/Quality Control program adhering to the requirements of ISO 9001 to ensure purchase control performance.

2. Manufacturers shall be ISO 9001 registered and contractor is to submit ISO 9001 Certification Number.

3. Contractor shall monitor the manufacturers to assure that the approved Quality Assurance/Quality Control Program is being closely adhered to and that the equipment is being manufactured in accordance with these Specifications.

E. Warranty: Manufacturer shall warrant that the design, material, and workmanship incorporated in each equipment item shall be of the highest grade and consistent with the established, and generally accepted, standards for transit applications; and that each such item and every part and component thereof shall comply with these Specifications.

PART 2 - PRODUCTS

2.1 GENERAL DESIGN REQUIREMENTS

A. Fire Alarm Subsystem shall be a complete, supervised system consisting of fire alarm control panel with digital transmitter connected to communications facility fire alarm panels and communicate with existing new Authority digital receiver system at the Train Control Center (TCC).

B. Fire alarm control panel shall also control the fire suppression system, including interlock with HVAC and ventilation of the facility.

C. Fire Alarm Subsystem equipment shall be compatible with, and capable of interfacing to the new reporting system to be implemented by the Contractor at the OCC.

D. System shall be activated into the alarm mode when a fire alarm condition is detected. The system shall remain in the alarm mode until the alarm is acknowledged and reset by the operator.

E. New Work shall also include providing cabling and communications interface to signal house, station and TPSS fire alarm system.

F. Contractor shall verify that existing reporting systems are maintained with the equipment added to the fire alarm cabinet in the OCC. Contractor shall take the lead, with support from DART, in troubleshooting of the Fire Alarm subsystem when the station equipment do not function or communicate properly with the remote equipment at OCC.

2.2 CONTRACTOR FURNISHED MATERIALS

A. Work consists of providing heat and smoke detector sensors, connected to the fire alarm panel and interfacing this equipment to the new Fire Alarm Reporting Subsystem.

B. Detectors Zoning Arrangement: Detectors shall be arranged in 2 zones within the Communications Facility.

C. Detector Wiring: Fully supervised Class-A circuits shall be utilized for:
1. Power to all sensors from the control panel power supply.

2. Activation of alarm indication from sensor to control panel.

D. The following alarm conditions shall be wired to the local Remote Terminal Unit (RTU) and FACP IP communicators at each location to be monitored:

1. Fire Alarm: One or more zones at a specific location has active fire signal.

2. Fire System Trouble: A fault has been sensed within the fire detection system includes low battery or failed detector.

3. Fire Supervisory Alarm: An alarm condition using a normally-closed contact (failed-safe) derived from:
   a. Activation of any fire supervisory circuit, and
   b. Activation of a Knox box intrusion alarm.

4. Two spare indications for future use.

E. An active alarm, trouble, or supervisory condition in any structure that reports to the system shall automatically initiate the following functions:

1. System shall:
   a. Receive the alarm indication from the FACP.
   b. Transmit the abnormal condition information via IP connection to the OCC fire alarm reporting unit.

2. Alarm Annunciation Circuits

   1. Audio and visual alarm annunciators shall be arranged on separate Class-A circuits, supervised by the control panel.
   
   2. Indication of alarms from control panel to RTU and FACP shall utilize supervised circuits and as shown in the Contract Drawings.

F. Supervisory Functions: Communications between the fire alarm reporting unit and each remote fire alarm control panel shall be monitored and failures alarmed and reported.

2.3 FIRE ALARM CONTROL PANEL SPECIFICATIONS

A. Primary Functions

1. Monitor heat and smoke detectors for activation and failure.

2. Control activation of audio and visual alarm indicators.

3. Supervise wiring, perform self-tests (including a battery life test) and provide indication of any abnormal system events.

4. Provide Fire Alarm, Fire System Trouble, Fire Supervisory Alarm, Knox Box Alarm and Spare indication outputs to the RTU and the fire alarm reporting system.

5. Provide 2 normally open contacts, close upon detection of fire alarm, for shutting down of facility air conditioning unit and closing air dampers.

6. Provide a normally-closed contact to close upon sensing any supervisory and trouble alarm conditions.

7. Provide remote testing and monitoring of serial port.

I. Control Unit

1. The control unit shall utilize the multiple zone detection design methodology to determine the fire/no fire condition.

2. Control unit logic shall be self-checking to ensure that the required fire/no fire decision is made.

3. Control unit shall supervise all input and output modules to verify system integrity.

4. Control unit shall monitor AC power and the status of the standby battery.

J. Input/Output Modules

1. Input Circuits.
FIRE ALARM SUBSYSTEM - COMMUNICATIONS SYSTEM

2. Manual pull stations and sensors shall be supervised for activation and power.
3. Independent modules shall be used for separate zones.

K. Output Circuits
1. Output circuits shall supervise from 19 VDC to 24 VDC output to audio and visual devices.
2. Independent modules shall be used for audio and visual devices.

L. Relay Modules
1. Relays shall be assigned as follows:
   a. Fire Alarm.
   b. Fire System Trouble.
   c. Fire Supervisory Alarm.
   d. Knox Box Alarm
   e. Interlocks to shutdown air conditioning unit and close air dampers.
   f. Two spares.
   g. Two contacts on each of the alarm and trouble relays shall be provided.
   h. Relay contacts shall be Form-C.

M. Supplemental Relay Modules
1. Four independent single-pole, double-throw, non-supervised relays shall be provided per module.
2. Relays shall be individually assigned.
3. Relays shall be activated on any alarm level or trouble condition.
4. One manual disable switch shall be associated with each relay.
5. Relay contacts shall be Form-C.

O. Power
1. Primary power shall be 120 VAC, 57 Hz to 63 Hz, from the Main AC Power Distribution panel.
2. Battery backup for 48 hours shall be provided, housed within the control panel enclosure, via the use of dedicated sealed lead-calcium batteries.
3. In the event of loss of 120 VAC power, the control panel shall automatically switch to battery operation. The switchover shall be accomplished with no interruption of protective service, and without adversely affecting the battery-powered capabilities.
4. Upon restoration of 120 VAC power, transfer back to the normal AC power supply shall be automatic and the battery shall be recharged.
5. Battery charger shall be capable of restoring the batteries from full discharge to full charge within 48 hours.
6. Converter/battery charger shall be installed within the panel enclosure.
7. Power supply transient voltage surge suppression shall be provided.
8. Power supply shall power the panel and all sensors and output devices.

2.4 DIGITAL ALARM COMMUNICATOR TRANSMITTER
A. The traditional DACT functionality shall be provided using IP-based communications via the Ethernet network to the DART OCC. The fire alarm control panel and fire alarm reporting unit shall be UL listed and NFPA approved for this application.
2.5 FIRE ALARM REPORTING UNIT

A. Fire Alarm Reporting unit shall include redundant servers, graphical display and KVM. Required equipment shall be integrated into the existing OCC DACR display cabinet as indicated on the drawings.

B. Reporting Unit shall include all software necessary for monitoring, indicating, and reporting alarms and status messages.

C. Contractor shall configure the system for all alarm and status reporting for the new facilities equipped under this contract. Graphical layout shall be Authority approved.

2.6 ALARM BELL

A. Alarm bells shall be fabricated from a high quality die casting with a baked red enamel finish.

B. Power consumption shall be 0.030 ampere at 24 VDC.

C. Typical output shall be 84 dBA at 24 VDC.

D. Typical output shall not be less than 15 dBA above ambient noise level.

E. Alarm bells shall mount to a standard 4 inch square outlet box.

2.7 ALARM HORN

A. Alarm horns shall be fabricated from a high quality die casting with a baked red finish.

B. Power consumption shall be 0.035 ampere at 24 VDC.

C. Typical output shall be 97 dBA at 24 VDC.

D. Alarm horns shall mount on a standard 4 inch square outlet box.

2.8 ALARM STROBE LIGHT

A. Each alarm strobe light shall be a high intensity flashing light, utilizing a Xenon flash tube sealed in silicone and housed in a polycarbonate (Lexan™) lens.

B. Translucent lens shall be attached to a fire alarm gloss red back plate.

C. Power consumption shall be 0.033 ampere at 24 VDC.

D. Strobe shall flash at a rate and duty cycle compliant with ADA requirements current at time of procurement.

E. Lens shall have "Fire" imprinted on 2 sides.

2.9 STROBE HORN

A. Strobe horn shall be a high intensity flashing, ADA Compliant, light with 97 dBA horn output.

B. Typical output shall be equal or greater than 15 dB above ambient noise level.

C. Strobe horn shall be housed in a fire alarm, gloss red, die cast enclosure.

D. Light source shall be sealed in silicone and protected by a polycarbonate (Lexan™) lens.

E. Strobe lens shall be white translucent with the word "FIRE" imprinted upon it in red.

F. Power shall be 0.068 ampere at 24 VDC.

2.10 FIXED-TEMPERATURE HEAT DETECTOR

A. Thermal detectors shall activate at 135 degrees F nominal temperature setting with exception of TPSS facilities which shall activate at 194 degrees F.

B. Detectors shall be hermetically sealed.

C. Detectors shall be shock and corrosion resistant.

D. Detectors shall automatically reset upon returning to normal temperature.

2.11 IONIZATION SMOKE DETECTOR

A. Ionization type smoke detectors shall have relay contact outputs rated for 24 VDC, 1.0A minimum.

B. Sensitivity shall be adjustable.

C. A red alarm indication LED shall be provided on the enclosure.

D. Power shall be 18.8 VDC to 27.7 VDC with current draw as follows:

1. Normal: 40 microampere at 24 VDC
2. Alarm: 85 milliamperc at 24 VDC
3. The detector shall mount on a 4-inch octagonal outlet box utilizing tamper-resistant screws.
4. Operating temperature shall be 32 to 120 degrees F.

2.12 MANUAL FIRE ALARM PULL STATION

A. Manual fire alarm pull station shall be installed within Communications Facilities, at locations as specified herein and as shown on Contract Drawings.
FIRE ALARM SUBSYSTEM - COMMUNICATIONS SYSTEM

B. Manual stations shall be double action type, providing for 2 separate and distinct actions to activate an alarm.

C. Enclosure shall be constructed of high impact polycarbonate (LexanTM) or metal, red enclosure with raised white lettering and a smooth high gloss finish.

D. A common key shall be provided to reset the station.

2.13 FIRE EXTINGUISHER

A. Fire extinguisher shall use Carbon Dioxide (CO₂), intended for Class B and Class C fire hazards.

B. Fire extinguishers shall be portable, wall-mount type with UL rating 10B and 10C.

C. Fire extinguisher containers shall be heavy-duty, seamless, aluminum alloy cylinders, painted red, with instructions label permanently affixed.

D. Discharge mechanism shall have a locking pin to prevent accidental discharge.

E. Fire extinguisher shall have a flexible hose and horn for aiming at the fire.

F. Fire extinguisher shall meet or exceed the following specifications:
   1. CO₂ capacity: 15 pounds.
   2. Weight: 40 pounds maximum.
   3. Range: 3 feet to 8 feet
   4. Discharge time: 12 seconds.

G. Fire extinguisher shall be currently inspected, certified, and tagged and shall be properly maintained in accordance with manufacturer's recommended guidance and local Fire Department regulations, until such time when the Authority grants Final Acceptance.

2.14 FIRE SUPPRESSION SYSTEM

A. Contractor shall design, provide, install and test a complete Fire Suppression System for systems facilities, when required and/or as identified in the Contract Documents.

B. Fire Suppression and Alarming System shall be designed as an integrated, comprehensive system. The systems shall be signed and sealed by a Fire Protection Engineer licensed in State of Texas.

C. Proposed system and products shall meet the following:
   1. EPA SNAP approved products;
   2. Shall be effective at suppressing fire; while it is suitable for energized equipment, and it would not damage critical electronics and vital mechanical devices.
   3. Proposed product shall be similar to products listed below or equivalent:
      a. INERGEN, manufactured by Ansul
      b. FM-200, manufactured by Great Lakes Chemical Company

D. System shall automatically be initiated upon a "Fire Alarm" signal. Detectors shall be Cross-Zoned detection requiring 2 detectors to be in alarm before release. This will ensure a false alarm would not initiate the release of the fire suppression agent. A pre-release warning shall be provided. A fire alarm shall close/seal the room ventilation and also shut down the HVAC system.

E. Manufacturer of the suppression system hardware and detection components shall be ISO 9000 registered. The name of the manufacturer shall appear on all major components. All devices, components and equipment shall be the products of the same manufacturer. All devices, components and equipment shall be new, standard products of the manufacturer’s latest design and suitable to perform the functions intended. All devices and equipment shall be UL listed and/or FM approved.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Equipment shall be installed as shown in the Contract Drawings, and in accordance with the manufacturer’s recommendations.

B. Interconnections, services, and adjustments required for a complete and operational system shall be provided.

C. Equipment primary power shall be extended from the main 120 VAC breaker panel.

D. Backup battery power shall be integral to each system panel.

E. Fire Alarm Reporting Unit: New fire alarm reporting unit shall be integrated into the new IP DACR servers and GUI software at the OCC. Contractor shall verify functionality of the FACP’s IP communications prior to and after implementation of the new equipment.
F. Wiring

1. System wiring shall be installed in electric metallic tubing.

2. Conductors for the alarm system shall be installed in conduits, junction boxes, or outlet boxes separate from lighting and power systems conduit.

3. Conduit shall be 1/2-inch minimum. No more than one conductor shall be installed under any screw terminal.

4. Circuit conductors entering or leaving any mounting box, outlet box enclosure or cabinet shall be connected to screw terminals with each terminal marked in accordance with the wiring diagram.

5. Connections and splices shall be made using screw terminal blocks. Wire nut type connectors shall not be used.

6. Wiring within control equipment shall be readily accessible without removing component parts.

G. Over-voltage and Surge Protection

1. Cables and conductors, which serve as communications links, shall have surge protection circuits installed at each end.

2. Fuses shall not be used for surge protection.

H. Delivery and Storage: Equipment delivered and placed in storage shall be protected from the weather, humidity and temperature variation, dirt and dust, and any other contaminants.

I. Keys for Lockable Fire Enclosures

1. A master set of keys for locking FACP enclosures shall be consolidated and delivered to the Authority prior to project closeout.

2. Keys for similar equipment enclosures, where practical, shall be keyed identically so that 1 key operates the same enclosure at multiple locations.

3. Master set shall include keys to open any of the enclosures installed under this contract.

4. One set of keys shall also be left in each enclosure at each location.

3.2 TESTING AND INSPECTION

A. Contractor shall perform the following inspection and test on the Fire Alarm Subsystem at each equipment installed location. The Authority shall be given at least 10 days written notice prior to each scheduled test so that the Authority may be present.

1. Factory Testing and Inspection: No factory test and inspection of fire alarm subsystem equipment is required.

2. Field Inspection. Field inspection of fire alarm equipment, including remote reporting, at each facility shall verify the following:

   a. Conformance to standards, methods, quality, specification requirement and approved drawings.

   b. Proper routing and termination of wire and cable.

   c. Secured cable and wire connections.

   d. Proper grounding of all equipment.

   e. Correct and complete labeling and tagging of wire, cable, terminal, connectors and equipment.

3. Field Test

   a. Tests shall be performed in the presence of the Authority and under the supervision of the fire alarm system manufacturer's qualified representative.

   b. Contractor shall perform the following field tests:

      1) Contractor shall provide all instruments and personnel required for the tests.

      2) Upon installation completion, the Contractor shall subject the system to a complete functional and operational performance test. As a minimum, the tests shall include:

         a) Test all inputs, outputs, and functions of the Fire Alarm Control Panel and the remote reporting capability to the fire alarm reporting unit at the OCC.
b) Verify correct DACR functionality for existing units, after the work is complete.

c) Verify operation of the heat detectors.

d) Verify sensitivity of smoke detectors.

e) Measure audible alarms output level from specific locations.

3) When all corrections have been made, the system shall be re-tested to assure that it is functional.

4. System Acceptance Test

a. Testing shall be in accordance with NFPA 72. The recommended tests in NFPA 72 shall be considered mandatory and shall verify that any design or installation deficiencies have been corrected.

b. Contractor shall coordinate with the Authority for development of Acceptance Testing procedures, and to fulfill the requirements of the local Fire Marshall, for compliance to local Fire Department regulations. An inspector from the local jurisdictional fire department shall also witness tests in order to provide a certificate of approval for the system upon test completion.

c. Tests shall include the following:

1) Tests shall indicate that there are no grounded, shorted, or open circuits.

2) Tests of each IP communicator to each IP DACR, including transmission of alarm signals at each location.

3) Tests of normal and emergency power supplies, including batteries.

4) Tests shall include verification of complete system operation at extreme end of the required emergency power duration, and verification of recharging time.

5) Each Fire suppression systems functions shall individually and locally be tested, in accordance with an approved test procedure. All functions, including system and equipment interlocks, shall be tested to prove they are ready for final acceptance of the complete Fire System including end-to-end and remote monitoring of the Fire System.

5. Systems Integration Test: Contractor shall provide qualified technical staff to support this test as directed by Authority’s System Integration Consultant.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this Section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith shall be considered incidental to the Work specified under Section 16801 “Basic Technical Requirements - Communications System”

END OF SECTION 16854
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section describes the detailed technical requirements for the Intrusion Alarm Subsystem to be designed, provided, installed, and tested under this Contract. Scope of Work includes:

1. Providing, installing and testing all new intrusion alarm equipment in new Communications Facilities, and Communications Interface Cabinets (CIC), as specified and as shown on Contract Drawings.

2. The Intrusion Alarm Subsystem shall detect and monitor alarm conditions and shall provide the required sensor equipment, local alarm annunciations and the corresponding Supervisory Control And Data Acquisition (SCADA) remote outputs.

3. The intrusion alarm equipment shall be compatible with, and capable of interfacing to the Authority’s existing SCADA system.

4. New Work shall also include providing cabling and interfacing Traction Power Substations (TPSS) intrusion alarm systems, Ticket Vending Machines (TVM), and Signal Houses intrusion alarm systems as shown in the Contract Drawings.

B. Existing System Description and Configuration: The existing Intrusion Alarm Subsystem utilizes Intrusion Alarm Control Panels, Liquid Crystal Display (LCD) keypads, and doorframe-mounted magnetic switches at Communication Houses, with magnetic door switches installed at CIC’s, Proximity switches at each door, with toggle switches and indicator lamps.

1.2 REFERENCED STANDARDS

A. American Society of Quality (ASQ)

1. ASQ Z1.11 - Quality Assurance Standards - Guidelines for the Application of ANSI/ISO/ASQC Q9001 or Q9002 to Education and Training Institutions- ANSI/ASQC Z1.11

B. The Institute of Electrical and Electronics Engineers (IEEE)

1. IEEE C62.41 - IEEE Recommended Practice on Surge Voltages in Low-Voltage AC Power Circuits

1.3 SUBMITTALS

A. Submittal format and content shall comply with the general requirements of these Specification and the specific technical requirements further listed herein.

1. Manufacturer Qualifications: Any new equipment differing from those specified in the technical specifications shall require a prequalification and approval of the proposed manufacturer. Acceptability of the manufacturer shall be based on the manufacturer’s experience, equipment reliability, compliance with standards specified in this section, and complete compatibility with the Authority’s existing system.

2. Preliminary Design Review (PDR) Technical Requirements: Contractor shall include the following information as part of the PDR submittal package for the Intrusion Alarm subsystem:

a. Battery calculations shall be provided for supervisory and alarm power requirements.

b. Ampere-hour requirements for each Intrusion Alarm Control Panel and all sensor components, and the battery recharging periods shall be included.

c. Battery calculations shall substantiate specification requirements.

d. A complete list of Intrusion Alarm Subsystem equipment (including manufacturer’s descriptive and technical literature and catalog cut sheets) including sensor equipment, alarm annunciation devices and Intrusion Alarm Control panel.

e. Preliminary wiring diagrams for all field Intrusion Alarm equipment provided and installed under this contract.

f. Drawings showing the plan and elevation for typical Communications House configurations, Communications Rooms, CIC’s, Signal Houses and TPSS’s.
3. Final Design Review (FDR) Technical Requirements: Contractor shall include the following information as part of the FDR submittal package for the Intrusion Alarm Subsystem:

   a. Updated PDR information. All drawings, calculations and design information shall reflect a final design.

   b. Battery calculations shall be provided for supervisory and alarm power requirements.

   c. Ampere-hour requirements for each Intrusion Alarm Control Panel and all sensor components, and the battery recharging periods shall be included.

   d. Battery calculations shall substantiate specification requirements.

   e. A complete list of Intrusion Alarm Subsystem equipment (including manufacturer’s descriptive and technical literature and catalog cut sheets) including sensor equipment, alarm annunciation devices and Intrusion Alarm Control panel.

   f. Detail drawings for Communications Facilities containing Intrusion Alarm systems. The drawings shall consist of the following:

      1) Schematics
      2) Wiring diagrams
      3) Complete subsystem inter-connection diagrams Intrusion Alarm Control Panel layout

   g. Other details, as required to verify that the system conforms to industry standards and requirements

4. Installation Work Plans: Contractor shall submit the following installation document for each site no later than 60 days prior to the scheduled installation activities. The Installation Work plan shall include:

   a. Drawings and Diagrams to include:

      1) Equipment layout in plan and elevation views.

   2) System block diagram.

   3) Wiring diagrams showing detail connection of all system components including power and control wiring.

   4) Conduit installation details.

5. Calculations or Certifications

   a. Calculations as listed in the PDR and FDR.

   b. Certifications: Copy of the following certifications shall be included:

      1) ISO certification for all proposed manufacturer

6. Product Samples: Product samples shall be provided and demonstrated when requested by the Authority.

7. Test Plan and Procedures

   a. Test procedures shall be submitted for all the required tests as described in Article 3.2 of this Section. As a minimum:

      1) Test program shall include all the required tests for this subsystem

      2) Factory Test Procedure

      3) Field Test Procedure

      4) Integration Test Procedure

   b. Test Records: Contractor shall submit the Test Records and Results for review 7 days after the completion of each test, in accordance with these Specifications.

8. As-Built Documentation: Contractor shall submit complete As-Built documentation and drawings for the Intrusion Alarm Subsystem.

1.4 QUALITY ASSURANCE

A. Contractor’s design and installation shall comply with all applicable Standards and Codes as listed herein.

B. Material and Workmanship Requirements

   1. All equipment provided under this Section shall be UL listed.
2. All grounding shall be in accordance with local standards, and specifications required by this contract except as modified herein. Each piece of equipment shall be grounded in accordance with the recommendations of the manufacturer.

3. Discontinued product models, refurbished equipment, or products scheduled for end-of-life, end-of-sale, or end-of-service within 1 calendar year of the installation date shall not be used.

4. All products specified herein shall be subject to the Authority approval based on the Contractor’s ability to demonstrate adherence to the specified requirement and approval of the manufacturer’s quality process.

C. Manufacturer Pre-Qualification Requirements: All new equipment provided and installed under this contract shall be compatible with existing Intrusion Alarm Subsystem equipment installed in field and central locations in order to perform the intended use set forth by the Authority.

PART 2 - PRODUCTS

2.1 GENERAL DESIGN REQUIREMENTS

A. System Description

1. The system equipment shall consist of magnetic door switches, proximity sensors (Signals), audible annunciation devices and intrusion alarm control panels, to be interfaced to the existing SCADA system.

2. The system shall be activated into the alarm mode when an abnormal condition occurs in any of the intrusion alarm sensors, after a pre-determined time delay.

3. The system shall remain in the alarm mode until the alarm is acknowledged and reset by the operator.

4. The following points shall be transmitted via the local Remote Terminal Unit (RTU) (provided by Others) system, for each location:
   a. Communications House intrusion alarm.
   b. Communications Room intrusion alarm.
   c. CIC intrusion alarms.
   d. TVM intrusion alarms.
   e. Station equipment room intrusion alarm, as required.

B. Detectors Arrangement: Detectors shall be installed on Communication House and Room doors, CIC doors, Signal and Instrument houses’ doors (proximity sensors), and Station equipment room doors.

C. Detectors Wiring: Fully supervised Class-A circuits shall be utilized for activation of alarm indication from sensor (switches) to control panel.

D. Alarm Functions: The following alarm function shall be wired to the local RTU at each location to be monitored:

1. Alarm: One or more indicators at a specific location have active intrusion alarm signals.

2. An active alarm in any structure that reports to the system shall automatically initiate the following functions:
   a. The Intrusion Alarm Control Panel shall receive the alarm indication input from the Communications House and Room door magnetic switch, and provide an alarm indication to the Train Control Center (TCC) via the local RTU and shall initiate a local alarm bell.
   b. The Intrusion Alarm Control Panel shall receive the alarm indication input from the CIC doors’ magnetic switches, and provide an alarm indication (“Cabinet Open”) to the TCC via the local RTU.

E. Electrical Power

1. Intrusion Alarm equipment shall receive primary power from the Main AC Power Distribution panel.

2. Transfer from normal to emergency power or restoration from emergency to normal power shall be fully automatic and shall not prevent transmission nor cause false transmission of an alarm.

3. The Intrusion Alarm Control Panel shall be installed with an individual battery backup system, for 48 hours of battery-power operation.

F. Alarm Annunciation Circuits

1. Audio alarm annunciation devices shall be arranged on separate Class-A circuits, supervised by the control panel.
2. Indication of alarm from control panel to RTU shall utilize supervised (normally closed) circuits.

2.2 INTRUSION ALARM CONTROL UNIT

A. Functions: The intrusion alarm control unit shall perform the following functions:

1. Monitor normally closed contacts of magnetic switch assembly.
2. Control local audio alarm annunciation activation.
3. Allow deactivation when valid 4 to 4-digit security code is entered via the control keypad within 30 seconds of opening the door.
4. Allow reactivation when valid security code is entered.
5. Provide intrusion alarm indication to RTU via dry contact closure.
6. Provide for selecting the local security code. A key shall be required to set the code.

B. Operation

1. There shall be a 30 second nominal entry/exit time period.
2. A low-level alert tone shall be activated when the magnetic switch is activated.
3. If the alarm is deactivated by correct entry of a 4-digit security code within 30 second entry period, low-level alert tone shall be deactivated; otherwise an alarm condition shall be detected.
4. Alarm detection shall cause an output to the RTU and activation of local high-level audio alarms.
5. The alarm shall be armed by correct entry of the 4-digit code. There shall then be a 30 second period for exiting without activating an alarm.
6. If an incorrect or incomplete code is entered, it shall be cleared after 3 seconds. The operator could then re-enter the code.

C. Enclosure

1. The intrusion alarm control unit shall be housed in a NEMA-12 enclosure with locking cover.

2. Front panel Light Emitting Diode (LED) indications shall be provided for power on and battery status.

2.3 INTRUSION ALARM KEYPAD

A. Characteristics

1. The keypad shall be integrated with the alarm control unit or shall be a separate wall-mounted unit.
2. Keys shall be labeled 0 through 9, *, and #.
3. The keypad shall be resistant to entry of dirt and moisture.
4. The keypad shall provide tactile feedback of operation; membrane keypads shall not be acceptable.
5. The keypad shall be powered from the alarm control panel.
6. The keypad shall have LED indications of status: ready, armed, alert.

2.4 INTRUSION ALARM MAGNETIC SWITCH

A. Specifications

1. The magnetic switch shall consist of flush mounted magnet and switch assemblies, each housed in thermoplastic.
2. The switch assembly shall activate when the magnet is more than 1/4-inch removed.
3. The switch contacts shall activate within 10 ms and shall be rated for 24V DC at 500 ma.
4. Normally open and normally closed contacts shall be provided.
5. The magnetic switch provided shall be capable of a minimum of 100,000 operations over a minimum period of 10 years without failure.

2.5 ALARM BELL

A. Specifications

1. Alarm bells shall be fabricated from a high quality die casting with a baked red enamel finish.
2. Power consumption shall be 0.030 ampere at 24 VDC.
3. Typical output shall be 84 dBA at 24 VDC.
4. Typical output shall not be less than 15 dBA above ambient noise level.

5. Alarm bells shall mount to a standard 4 inch square outlet box.

PART 3 - EXECUTION

3.1 INSTALLATION

A. General

1. Equipment shall be installed as shown in the Contract Drawings, and in accordance with the manufacturers’ recommendations.

2. Required interconnections, services, and adjustments for a complete and operational system shall be provided.

3. Electrical work shall be in accordance with NEC.

B. Power: Equipment primary power shall be extended from the Main AC Power Distribution panel.

C. Wiring

1. System wiring shall be installed in electric metallic tubing. The conductors for the alarm system shall be installed in conduits, junction boxes, or outlet boxes separate from lighting and power systems conduit.

2. Conduit shall be 1/2-inch minimum in accordance with NEC. No more than 1 conductor shall be installed under any screw terminal.

3. Circuit conductors entering or leaving any mounting box, outlet box enclosure or cabinet shall be connected to screw terminals with each terminal marked in accordance with the wiring diagram.

4. Connections and splices shall be made using screw terminal blocks. Wire nut type connectors shall not be used in the system.

5. Wiring within control equipment shall be readily accessible without removing component parts.

D. Over-voltage and Surge Protection

1. Cables and conductors, which serve as communications links, shall have surge protection circuits installed at each end.

2. Fuses shall not be used for surge protection.

E. Delivery and Storage: Equipment delivered and placed in storage shall be protected from the weather, humidity and temperature variation, dirt and dust, and any other contaminants.

F. Keys for Alarm Panels

1. A master set of keys for locking Intrusion Alarm Control Panels shall be consolidated and delivered to the Authority prior to project closeout.

2. Keys for similar equipment enclosures, where practical, shall be keyed identically so that 1 key operates the same enclosure at multiple locations.

3. The master set shall include keys to open any of the enclosures installed under this Contract.

4. One set of keys shall also be left in each enclosure at each location.

3.2 TESTING AND INSPECTION

A. Contractor shall perform the following inspection and test on the Intrusion Alarm Subsystem at each equipment installed location. The Authority shall be given at least 10 days written notice prior to each scheduled test so that the Authority may be present as desired.

1. Factory Testing and Inspection:

   a. Factory testing and inspection of intrusion alarm subsystem for Communications Houses shall include the following:

      1) Each Intrusion alarm control panel shall be powered-up and tested after the factory wiring is complete.

      2) Verify magnetic switch and alarm operation.

      3) Verify intrusion alarm keypad operation.

   b. Factory testing and inspection of intrusion alarm subsystem for communication room will not be required since equipment shall be field installed.

2. Field Inspection

   a. Field Inspection of intrusion alarm equipment at each communications house/room and CIC shall verify the following:
1) Conformance to standards, methods, quality, specification requirement and approved drawings.

2) Proper routing and termination of wire and cable.

3) Secured cable and wire connections.

4) Proper grounding of all equipment.

5) Correct and complete labeling and tagging of wire, cable, terminal, connectors and equipment.

3. Field Testing

   a. The tests shall be performed in the presence of the Authority under the supervision of the intrusion alarm system manufacturer’s qualified representative.

   b. Contractor shall perform the following:

      1) Provide all instruments and personnel required for the tests.

      2) Upon completion of the installation, the Contractor shall subject the system to a complete functional and operational performance test. As a minimum, the tests shall include:

         a) Verify operation of the keypad panel.

         b) Verify operation of the magnetic switches.

         c) Measure audible alarms output level from specified locations.

         d) Test all inputs, outputs, and functions of the Intrusion Alarm Control Panel.

      3) When all corrections have been made, the system shall be re-tested to assure that it is functional.

4. System Acceptance Test

   a. The tests shall include the following:

      1) Tests to indicate there are no grounded, shorted, or open circuits.

      2) Tests of each input to the Intrusion Alarm Control Panel, including transmission of alarm signals across local RTU at each location.

      3) Tests of normal and emergency power supplies, including batteries.

5. End-To-End and Systems Integration Test

   a. Contractor shall provide qualified technical staff and perform End-To-End testing (for SCADA and alarming at TCC).

   b. Contractor shall take the lead, with support from the Authority in troubleshooting of the Intrusion subsystem when the station equipment do not function or indicate properly at OCC.

   c. Contractor shall provide qualified technical staff and resources to support the Authority’s System Integration Testing.

PART 4 – MEASUREMENT AND PAYMENT

4.1 GENERAL

   A. The Work specified in this Section will not be measured separately for payment.

4.2 PAYMENT

   A. All costs connected herewith shall be considered incidental to the Work specified under Section 16801 “Basic Technical Requirements - Communications System.”

END OF SECTION 16855
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section describes the detailed technical requirements for the Closed Circuit Television (CCTV) Subsystem to be designed, provided, installed, and tested under this Contract. Scope of Work for the Project includes:

1. Providing, installing and testing all new CCTV equipment in new Passenger Stations, as specified and as shown on Contract Drawings.

B. Providing, installing and testing modifications to DART’s existing CCTV monitoring, control and network storage system located at the OCC and NWROF facilities, including all licenses necessary for the new CCTV equipment. New CCTV equipment shall utilize the new Project network and the existing DART SONET network for communications to the OCC and NWROF. The system expansion shall incorporate IP fixed Network Video Recorders (NVRs), Physical Security Integration Management (PSIM) software client, network switches, codecs, and any other hardware or software required to transmit/receive video over an IP network for a complete and functional system.

1. All modifications to the existing network shall be included in the scope herein.

C. Existing System Description and Configuration: The existing CCTV Subsystem utilizes IP cameras, Network Video Servers (NVR’s), Archive Servers, viewing workstations, and associated software. DART currently uses the Cisco Video Surveillance Operations Manager (VSOM) system 7.0 as the Primary security application. Contractor shall verify the version being utilized at the time of required work. All equipment shall be integrated with this system.

D. Contractor shall fully integrate all of the new cameras and video streams into the existing PSIM system and will require geospatially placing icons onto new and existing system maps. The icons shall allow access to the camera’s controls and video streams. The functionality shall match that of the existing integrated cameras. All camera device monitoring shall be activated and tested; this shall include but not be limited to; status, loss of video, faults, failures, alarms, and all tampering related events/alarms.

1. The existing CCTV Subsystem utilizes IP cameras, Network Video Servers (NVR’s), Archive Servers, viewing workstations, and associated software. DART uses Cisco Physical Security Operations Manager as the Primary security application. All equipment shall be compatible with this system and integrated into the existing system.

E. Contractor shall configure all CCTV cameras for be set up to single stream images with or H.264 compression. This stream shall have at least HD resolution (1920 x 1080) at 30 fps for NVR recording. The camera shall also be capable of providing a second stream with at least D1 resolution (720 x 480 NTSC) or 4CIF at 30 fps, provided that frame rate of the primary stream is reduced to 15 fps. Before CCTV camera set-up, the Contractor shall verify all camera settings with the Engineer or an AUTHORITY representative.

F. CCTV system is currently in use by DART personnel and is considered a critical system for DART Operations and security. All coordination for system improvements must be coordinated in advance as to not impact operations. This may require the Contractor to perform, installation, testing, upgrades or system outages at off-peak times.

G. For the purpose of Configuration Management, the Contractor must inform the AUTHORITY of the length of time the contractor will be making any system modifications. The dates and length of downtime of the system must be submitted in writing on the Contractor’s letterhead to the Communications Department and the AUTHORITY project manager, and must be approved by those groups. Contractor shall verify all camera settings being utilized at the time of required work. All equipment shall be integrated with this system.

H. Contractor shall provide all configuration/setup/programming of new and existing video system components identified in this specification section for a complete working system. Device configuration settings shall be submitted to the Engineer and the AUTHORITY for approval prior to installation.

I. Contractor shall perform visual adjustments of each camera on installation to account for lighting conditions, desired field-of-view, distance to primary targets, and environmental conditions. Contractor shall also perform a final camera tuning and field of view adjustment to all cameras installed under this project 30 days after the video system has been installed; cameras have been positioned, and have been recorded.
1.2 REFERENCE STANDARDS

A. Contractor’s design and installation shall comply with the latest editions of all applicable Standards and Codes included herein. Work shall meet or exceed the standards and procedures specified.

1. American Public Transportation Association (APTA)
   a. The CCTV system shall conform to the Technical Recommended Practices for the Selection of Cameras, Digital Recording Systems, Digital High Speed Networks and Train Lines for Use in New Transit Related CCTV Systems, as per the latest version of the referenced APTA publication.
      1) APTA IT-RP-001-08

2. American Society of Quality (ASQ):
   a. ASQ Z1.11 - Quality Assurance Standards - Guidelines for the Application of ANSI/ISO/ASQC Q9001 or Q9002 to Education and Training Institutions-ANSI/ASQC Z1.11

3. The Institute of Electrical and Electronics Engineers (IEEE)
   a. IEEE C62.41 - IEEE Recommended Practice on Surge Voltages in Low-Voltage AC Power Circuits

4. National Fire Protection Association (NFPA)
   a. NFPA 70 - National Electrical Code (hereinafter referred to as NEC)

1.3 SUBMITTALS

A. Submittal format and content shall comply with the general requirements of these Specification and the specific technical requirements further listed herein.

1. Manufacturer Qualifications:
   a. Any new equipment differing from those specified in the technical specifications shall require a prequalification and approval of the proposed manufacturer. Acceptability of the manufacturer shall be based on the manufacturer’s experience, equipment reliability, compliance with standards specified in this section, and complete compatibility with the Authority’s existing system.
   b. Prior to approval of the CCTV system hardware and software components, the Contractor shall submit the proposed equipment vendors qualifications and a written statement from the vendors acknowledging that the hardware and software to be supplied shall meet all functionality as required within this specification.

   a. Contractor shall include the following information as part of the PDR submittal package for the CCTV subsystem:
      1) Battery calculations shall be provided for CCTV power requirements.
      2) Complete list of CCTV Subsystem equipment (including manufacturer’s descriptive and technical literature and catalog cut sheets) including Cameras, enclosures, storage devices, Ethernet switches, software licenses
      3) Preliminary wiring diagrams for all field CCTV equipment provided and installed under this contract.
      4) Drawings showing the plan and elevation for each station equipped or retrofitted.
      5) Preliminary drawings showing the modifications necessary at OCC and NWROF.
      6) Submit the following to the Engineer for approval: Network diagram of complete system, illustrating proposed configuration and interconnections. The Network diagram shall
include detailed network architecture of all related IP devices, IP schema, device bandwidth, configuration and routing requirements.

a. Contractor shall include the following information as part of the FDR submittal package for the CCTV Subsystem:

b. Updated PDR information. All drawings, calculations and design information shall reflect a final design.

c. Battery calculations shall be provided for CCTV equipment.

d. Complete list of CCTV Subsystem equipment (including manufacturer's descriptive and technical literature and catalog cut sheets) including Cameras, enclosures, storage devices, Ethernet switches, software licenses.

e. Detail drawings for Stations containing CCTV systems. The drawings shall consist of the following:

1) Wiring diagrams for stations and control centers

2) Complete subsystem interconnection diagrams

3) CCTV coverage plans, indicating lens to be used for each camera, expected field of view (discounting obstructions) and proposed focal point.

f. Other details, as required to verify that the system conforms to industry standards and requirements

g. FDR should include site specific plans showing details of the following:

1) Camera enclosure location and mounting details.

2) Cable and conduit details.

3) Light intensity ranges throughout the surveillance areas (determined by actual field tests).

4) Camera field-of-view. This shall include indication of any obstruction or potential obstructions due to trees or foliage.

5) Submit schematic and wiring diagrams complete with terminal numbers.

6) Submit NVR storage recording calculations, in days and hours, based on motion sensing configuration. Define camera image motion zones and activity levels.

7) Submit procedures for programming and troubleshooting.

8) Submit full interconnect diagram for overall system, including interface connections to existing equipment.

9) Submit configuration plan for camera/NVR access levels

4. Installation Work Plans: Contractor shall submit the following installation document for each site no later than 60 days prior to the scheduled installation activities. The Installation Work plan shall include:

a. Drawings and Diagrams to include:

1) Equipment layout in plan and elevation views, including all conduit and cable

2) System block diagram.

3) Wiring diagrams showing detail connection of all system components including Ethernet, power and control wiring.

4) Conduit installation details.
5. Calculations or Certifications
   a. Calculations as listed in the PDR and FDR.
   b. Certifications: Copy of the following certifications shall be included:
      1) ISO certification for all proposed manufacturers.

6. Product Samples: Product samples shall be provided and demonstrated when requested by the Authority.

7. Test Plan and Procedures:
   a. Test procedures shall be submitted for all the required tests as described in paragraph 3.2 of this Section. As a minimum:
      1) Test program shall include all the required tests for this subsystem
      2) Factory Test Procedure
      3) Field Test Procedure
      4) Integration Test Procedure
   b. Test Records: Contractor shall submit the Test Records and Results for review 7 days after the completion of each test, in accordance with these Specifications.

8. As-Built Documentation: Contractor shall submit complete As-Built documentation and drawings for the Intrusion Alarm Subsystem

1.4 QUALITY ASSURANCE

A. Contractor's design and installation shall comply with all applicable Standards and Codes as listed herein.

B. Material and Workmanship Requirements
   1. All equipment provided under this Section shall be UL listed.
   2. All grounding shall be in accordance with local standards, and specifications required by this contract except as modified herein. Each piece of equipment shall be grounded in accordance with the recommendations of the manufacturer.

3. Discontinued product models, refurbished equipment, or products scheduled for end-of-life, end-of-sale, or end-of-service within 1 calendar year of the installation date shall not be used.

4. All products specified herein shall be subject to the Authority approval based on the Contractor's ability to demonstrate adherence to the specified requirement and approval of the manufacturer's quality process.

C. Manufacturer Pre-Qualification Requirements: All new equipment provided and installed under this contract shall be compatible with existing CCTV Subsystem equipment installed in central locations in order to perform the intended use set forth by the Authority.

PART 2 - PRODUCTS

2.1 GENERAL DESIGN REQUIREMENTS

A. System Description
   1. System equipment shall consist of IP cameras, cabling, Power over Ethernet (PoE) switches, storage devices, and video management software.
   2. The system shall provide for video surveillance of substantially all of the station platform and parking areas with fixed cameras.
      a. 90 percent coverage of station platform entrances, platform areas and walkways shall be provided.
      b. 100 percent coverage of Passenger Emergency Call Units and Ticket Vending Machines shall be provided.
   3. The intent of this system is to provide optimized video images of sufficient quality to facilitate the identification of individuals and objects to facilitate crime prevention, revenue protection, anti-terrorism, and promote general situational awareness in and around station areas.
   4. System installation, including physical security of equipment and configuration of all system components shall allow DART Police or other authorized Authority personnel to maintain chain-of-custody integrity of any recorded video evidence such that the video may be admissible in a court of law for prosecutorial purposes.
   5. Any CCTV camera, NVR, and video encoder installed under this contract must
be an open device and the manufacturer must provide an SDK to other device and software manufacturers to allow the integration of the device.

6. All CCTV cameras, NVRs, and video encoders installed under this contract shall be integrated and fully functional with the DART PSIM software and the integration shall be approved by PSIM vendor. If the Contractor wishes to use a CCTV camera that meets the specifications and is not currently integrated into the PSIM software, then they must have the camera integrated and the integration approved by PSIM at no additional cost to the contract and without any contract time extension.

B. Camera Arrangement

1. Cameras shall be installed on station platforms and within parking areas. Station canopies and lighting poles shall be used to support cameras to the greatest extent possible.

2. Cabling distances from the station communications room to the cameras shall be limited to 300 feet for copper cable in all instances. Where the distance to a camera exceeds this 300 foot limit, a cabinet with Ethernet switch shall be provided to aggregate the IP video and transmit it to the station communications room via local fiber cable.

C. Electrical Power: CCTV equipment shall receive primary power from the communications Uninterruptible Power Supply (UPS).

2.2 CCTV CAMERAS

A. Existing Cameras.

1. CIVS-IPC-6000P, with CIVS-IPCA-VCM31-8 housing

2. CIVS-IPC-3535

3. CIVS-IPC-7070

B. New Cameras: New cameras shall meet the minimum specifications of the existing cameras and also be compatible with the existing camera system. Additionally the following are minimum requirements for new cameras:

1. Minimum scene illumination (for 30 IRE video) shall be:
   a. Color (Day): 0.65 lux at F1.0
   b. B&W (Night): 0.12 lux at F1.0, 0 lux preferred with illuminator active for new cameras

2. Fixed IP Camera shall output multiple video streams using different codecs simultaneously.

3. Fixed IP Camera shall be capable of streaming both H.264 and MJPEG, minimum.

4. Fixed IP Camera shall be ONVIF conformant.

5. Fixed IP Camera shall support on-camera analytics and shall come standard with intelligent motion detection which allows the camera to alarm on motion and to ignore unimportant sources of motion such as moving trees or waves.

6. Camera equipment and layout shall allow image clarity sufficient to be capable of identifying persons in areas defined as having CCTV Coverage.

7. Fixed IP Camera shall stream 30 FPS at 1920 x1080 with H.264 encoding.

8. Electrical:
   a. RJ-45 connector for 100Base-TX Ethernet
   b. Input voltage: PoE (IEEE 802.3af) Class 0, 12.95 watts at camera; maximum

9. Camera shall be fully operational to the Operating Temperature listed elsewhere in this specification on IEEE 802.3af PoE.

10. Imaging System
   a. Iris: Automatic iris control
   b. Imaging Sensor: 1/4 inch minimum
   c. Image Resolution: 1080p (1920 x 1080, 30 fps), minimum

1) Varifocal Lens: 3.3 mm to 8.3 mm, minimum F1.6, maximum

11. Provide LED status indicators on each camera to report power, hardware and communications failures.

12. Provide a minimum of 1 alarm in and 1 alarm out port capable of initiating specific actions when an alarm is detected.
13. Cameras shall have backlight compensation to overcome severe backlighting situations. The image brightness shall be set to automatically compensate for adverse lighting conditions.

14. Signal to noise ratio shall be greater than 48 dB.

15. Minimum Illumination (No Image Enhancement, AGC On):
   a. Color: 0.5 lux for 50 IRE
   b. Black & White: 0.06 lux for 50 IRE

16. Fixed IP Camera Angle Adjustment:
   a. Panning Range: 350 degrees
   b. Tilting Range: 20 degrees to 80 degrees, minimum

17. Fixed IP Camera assembly shall meet or exceed the following environmental requirements:
   a. Operating Temperature: Negative 13 degrees F to 122 degrees F (using PoE)
   b. Environmental Rating: IP66

18. Networking Requirements:
   a. Fixed IP Camera shall include Unicast and Multicast streaming.
   b. Fixed IP Camera shall support the following protocols: TCP/IP, UDP/IP, IPv4, IPv6, HTTP, HTTPS, (Unicast, Multicast IGMP) UPnP, DNS, DHCP, RTP, and NTP

19. Camera Lenses
   a. Lenses shall be integral to each camera.

20. Camera Enclosures: Contractor shall provide an enclosure and mounting hardware as necessary to install each camera to the supporting structure.

21. General Construction
   a. Impact resistant housing, IK10, minimum
   b. Smoked, vandal-resistant polycarbonate dome

   c. Vandal resistant CCTV Camera assembly. Contractor shall provide an enclosure and mounting hardware as necessary to the supporting structure.

22. Coordinate approved camera types with the Authority to determine if camera enclosures require painting. Typical camera housings shall be painted to match the color of the Authority’s facilities.

23. Enclosures shall meet NEMA 3R standards or better.

24. Camera Mounting Kit
   a. A camera mounting kit for each specific enclosure and mounting surface or support shall be provided. The kit shall be designed to support the load of the camera and enclosure along with the wind load. All parts shall be protected from corrosion.
   b. For pole mount cameras, the camera mounting kit shall be provided for placing a standard wall-mount unit on camera-equipped poles.
   c. Camera mounting kits and assemblies mounted on poles shall be painted to match the approved pole color. Camera mounting kits and assemblies mounted on columns or other structures shall be painted to match architecture color schemes and are subject to Authority approval.

2.3 NETWORK VIDEO SERVER

A. Characteristics

1. All cameras implemented as part of this contract shall utilize the existing DART Video Management System, New Network Video Servers NVS shall be provided at the Camp Wisdom and UNT Stations. Any additional licenses to place these servers and associated cameras on the DART system shall be provided.

2. Video storage shall be provided at each location for 30 days storage at full frame rate and resolution for all connected cameras. Video storage shall be certified by Cisco, the CCTV system manufacturer, as compatible and appropriate for video storage.
3. If the Contractor wishes to use a CCTV camera that meets the specifications and is not currently integrated into the NVR or DART PSIM, than they must have the camera integrated at no additional cost to the contract and without any contract time extension.

2.4 LOCAL AREA NETWORK EQUIPMENT

A. CCTV Field Ethernet Switches shall meet or exceed the following criteria:

1. Shall be rack or din rail mounted
2. Shall support Jumbo Frames up to 9,018 byte frame size.
4. Shall be 1 rack unit in height.
5. Rack Mount Ethernet Switch ports shall include the following.
   a. Minimum (24) auto-sensing and auto-negotiating 10/100/1000 ports
   b. 1 RS-232C DB-9 console port
   c. 4 open 10/100/1000 SFP Ports (for use with 1000LX GBIC transceivers)
6. Ethernet Switch shall meet the following performance requirements:
   a. Latency: <6 µs
   b. Throughput: up to 38 million pps
   c. MAC address table size: 12,000 entries
   d. 32 Gbps switching fabric
7. Ethernet Switch shall meet the following environmental requirements:
   a. Operating temperature: 32 degrees F to 113 degrees F
   b. Operating relative humidity: 10 percent to 85 percent non-condensing
8. Ethernet Switch shall meet the following electrical requirements:
   a. Voltage: 100-240VAC
   b. Frequency: 50-60Hz
9. Ethernet Switch shall meet the following safety requirements:
   a. UL Listed (UL60950), cUL, CE, Emissions meet FCC Part 15, Class A.
10. Ethernet Switch shall meet the following device management standards:
    a. RFC 1591 DNS (client)
    b. HTML and telnet management
11. Ethernet Switch shall meet the following network management standards:
    a. RFC 2819 Four groups of RMON: 1 (statistics), 2 (history), 3 (alarm) and 9 (events)
    b. SNMPv1/v2c/v3
12. Ethernet Switch shall use the following IP Multicast Standards:
    a. IGMPv1, IGMPv2, IGMPv3
13. Ethernet Switch shall be in compliance with the following security features:
    a. IEEE 802.1X Port Based Network Access Control
    b. RFC 1492 TACACS+
    c. Secure Sockets Layer (SSL)
    d. SSHv1/SSHv2 Secure Shell
14. Ethernet Switch shall meet the following protocols and industry standards:
    a. IEEE 802.1D MAC Bridges
    b. IEEE 802.1p Priority
    c. IEEE 802.1Q VLANs
    d. IEEE 802.1s Multiple Spanning Trees
    e. IEEE 802.1w Rapid Reconfiguration of Spanning Tree
    f. IEEE 802.3x Flow Control
    g. RFC 854 TELNET
    h. RFC 951 BOOTP
    i. RFC 2030 Simple Network Time Protocol (SNTP) v4
j. RFC 2131 DHCP

B. Environmentally hardened Ethernet switches shall be utilized to aggregate IP streams from cameras and to provide for optical uplinks so as not to exceed 300 foot distance typical for copper cable Ethernet circuits.

1. All hardened Rack Mount PoE Ethernet Switches shall meet or exceed the following criteria:

a. Shall mount in a 19 inch equipment rack.

b. Shall support Power over Ethernet (POE) on all copper ports.

c. Rack Mount Ethernet Switch ports shall include the following.

1) Minimum (24) auto-sensing 10/100 POE ports

2) 1 RS-232C DB-9 console port

3) 2 open 10/100/1000 SFP Ports (for use with 1000LX GBIC transceivers)

d. POE Switch shall meet the following performance requirements:

1) Latency: 6 µs

2) Throughput: up to 11.9 million pps

3) MAC address table size: 4,000 entries

e. POE Switch shall meet the following environmental requirements:

1) Operating temperature: -40 degrees F to 185 degrees F (-40 degrees C to 85 degrees C)

2) Operating relative humidity: 5 percent to 95 percent non-condensing

f. POE Switch shall meet the following electrical requirements:

1) Voltage: 48 VDC

g. POE Switch shall meet the following safety requirements:

1) UL Listed (UL60950), UL, CE, Emissions meet FCC Part 15, Class A.

2) IEC 61850 EMC and Operating Conditions Class C for Power Substations

3) IEEE 1613 Class 2 Environmental Standard for Electric Power Substations

4) NEBS L3 and ETSI compliant

5) NEMA TS-2 and TEES for traffic control equipment Standards and Protocols

h. POE Switch shall meet the following device management standards:

1) RFC 1591 DNS (client)

2) HTML and telnet management

i. POE Switch shall meet the following network management standards:

1) RFC 2819 Four groups of RMON: 1 (statistics), 2 (history), 3 (alarm) and 9 (events)

2) SNMPv1/v2/v3

j. Poe Switch shall use the following IP Multicast Standards:

1) IGMPv1, IGMPv2, IGMPv3

k. POE Switch shall be in compliance with the following security features:

1) IEEE 802.1X Port Based Network Access Control

2) RFC 1492 TACACS+

3) Secure Sockets Layer (SSL)

4) SSHv1/SSHv2 Secure Shell
I. POE Switch shall meet the following protocols and industry standards:

1) IEEE 802.1D MAC Bridges
2) IEEE 802.1p Priority
3) IEEE 802.1Q VLANs
4) IEEE 802.1w Rapid Reconfiguration of Spanning Tree
5) IEEE 802.3af Power over Ethernet
6) IEEE 802.3x Flow Control
7) RFC 854 TELNET
8) RFC 951 BOOTP
9) RFC 2030 Simple Network Time Protocol (SNTP) v4
10) RFC 2131 DHCP

C. Ethernet switches shall be compatible with the DART network as defined in Section 16877 including the existing DART SONET system. All Ethernet switches shall be managed.

2.5 OUTDOOR EQUIPMENT CABINETS

A. CCTV Remote Field Cabinet Specifications

1. Outdoor equipment cabinets shall be provided as necessary to house Ethernet switches for aggregation and fiber uplink, as described above. Cabinets shall be sized to accommodate the Ethernet switches, fiber distribution panels and cabling.

2. Cabinets shall be NEMA-4X. Cabinets shall mount to the station platform, canopy, light pole or a concrete pedestal (provided by the contractor) as appropriate to the installed location and per architect and Authority acceptance.

3. Cabinets shall be fabricated from 12-gauge stainless steel.

4. All cables within the cabinet shall be organized and routed in conduit of flex tube for cable protection.

5. Cable entrances shall be sealed with duct sealant that provides moisture and fire barrier.

6. Steel plates shall be provided as backing to the lockset or hasp. Contractor shall provide locks for each cabinet, keyed as directed by DART.

7. Grounding

a. Cabinet shall be equipped with a copper grounding bus bar. The bus bar shall be located in the bottom of the cabinet and shall be mounted on insulators that isolate the bus bar from the cabinet.

b. Bus bar shall be bonded to a No. 4 AWG insulated stranded copper conductor that shall be connected to the station ground grid or a ground rod for cabinets not located within the station area.

c. Cabinet enclosure shall be equipped with a 3/8 inch high tensile strength bronze stud which shall be connected to the bus bar via a No. 6 AWG conductor.

d. All electronic equipment chassis grounds shall be grounded using No. 10 AWG insulated stranded copper conductors, connected to the ground bus.

2.6 INDOOR EQUIPMENT CABINETS

A. CCTV Cabinet Specifications: Where indoor cabinets are used at passenger stations, CCTV equipment shall be mounted with other communications equipment in cabinets as per Section 16837.

2.7 WIRE AND CABLE

A. Specifications

1. Cameras shall utilize Category 6e Shielded twisted pair cable as per Section 16841.

2. Fiber optic uplinks shall utilize multimode fiber optic cable as per Section 16845. Fiber distribution panels shall be provided as per contract Drawings and Section 16845.

PART 3 - EXECUTION

3.1 INSTALLATION

A. General

1. Equipment shall be installed as shown in the Contract Drawings, and in accordance
with the manufacturers’ recommendations.

2. Required interconnections, services, and adjustments for a complete and operational system shall be provided.

3. Electrical work shall be in accordance with NEC.

B. Power: Equipment primary power shall be extended from the UPS AC Power Distribution panel.

C. Wiring

1. System wiring outside of the communications room shall be installed in conduit. The conductors for the CCTV system shall be installed in conduits, junction boxes, or outlet boxes separate from lighting and power systems conduit.

2. Conduit shall be 1/2-inch minimum in accordance with NEC.

3. Wiring within equipment shall be readily accessible without removing component parts.

D. Over-voltage and Surge Protection

1. Cables and conductors, which serve as communications links, shall have surge protection circuits installed at the equipment room or cabinet end.

2. Fuses shall not be used for surge protection.

E. Delivery and Storage: Equipment delivered and placed in storage shall be protected from the weather, humidity and temperature variation, dirt and dust, and any other contaminants.

3.2 TESTING AND INSPECTION

A. Contractor shall perform the following inspection and test on the CCTV Subsystem at each equipment installed location. The Authority shall be given at least 10 days written notice prior to each scheduled test so that the Authority may be present as desired.

1. Field Inspection: Field Inspection of CCTV equipment at each station shall verify the following:

   a. Conformance to standards, methods, quality, specification requirement and approved drawings.

   b. Proper routing and termination of wire and cable.

   c. Secured cable and wire connections.

   d. Proper grounding of all equipment.

   e. Correct and complete labeling and tagging of wire, cable, terminal, connectors and equipment.

   f. Correct mounting position and orientation of each camera.

2. Field Testing

   a. Tests shall be performed in the presence of the Authority under the supervision of the CCTV system manufacturer’s qualified representative.

   b. Contractor shall perform the following:

      1) Provide all instruments and personnel required for the tests.

      2) CAT5e and CAT6 cable shall be tested after termination to ensure that the cable was not damaged during pulling and that it was properly terminated. The Engineer reserves the right to attend or send a representative to any cable testing that is performed.

      3) An Ethernet bandwidth test shall also be performed on each CAT5e and CAT6 cable with commercial off the shelf handheld Ethernet bandwidth testers that perform RFC 2544 compliant tests at 1 Gigabit. The Ethernet bandwidth tester shall also be capable of saving test reports to internal or removable storage for printing a PDF of each report. Each cable report shall be submitted. The test setup shall use 1 tester on each end of the cable and shall test bi-directionally. Upon
completion of the installation, the Contractor shall subject the system to a complete functional and operational performance test. As a minimum, the tests shall include:

a) Verify operation of each camera, including video.

b) Verify field of view for each camera provides expected coverage.

c) Verify and adjust focus of each camera, based on observation of video at the DART control center.

d) Verify that video from each camera is recorded. Verify that resolution and frame rate are correct.

e) Verify that alarms tag video correctly.

3. End-To-End and Systems Integration Test: Contractor shall provide qualified technical staff to support the End-To-End test for CCTV, performed by others.

PART 4 – MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Work specified in this Section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith shall be considered incidental to the Work specified under Section 16801 “Basic Technical Requirements - Communications System.”

END OF SECTION 16856
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section describes the detailed technical requirements for adding a new line section to the DART OCC.

1. All work shall be accomplished by personnel approved by the manufacturer of the existing DART system.

2. Work includes provision of all hardware and software (including licenses and modifications) to provide a fully functioning, stable system with all of the functionality that currently exists.

3. Work includes modification to the existing overview display and workstation graphics to depict the new line section and facilities. A preliminary concept of the display modifications is shown on the drawings.

4. All functionality that exists on the existing system shall be provided for the new line section. This shall include:
   a. Controller Log-in to territory
   b. Interlocking monitoring and control
   c. Substation monitoring and control
   d. Passenger station equipment monitoring and control
   e. Train tracking
   f. Dark territory train counts for existing line sections adjacent to the new line section
   g. Interface with PA/VMB functionality for automated train arrival announcements
   h. Interface with CCTV server for streaming video, camera controls and monitoring
   i. Interface with VBS for vehicle reporting
   j. Alarm and status management
   k. Alarm and status reporting

1.2 REFERENCED STANDARDS

A. Contractor’s design and installation shall comply with the latest editions of all applicable Standards and Codes included herein. Work shall meet or exceed the standards and procedures specified

1. American Society of Quality (ASQ)
   a. ASQ Z1.11 - Quality Assurance Standards - Guidelines for the Application of ANSI/ISO/ASQC Q9001 or Q9002 to Education and Training Institutions - ANSI/ASQC Z1.11

2. The Institute of Electrical and Electronics Engineers (IEEE)
   a. IEEE C62.41 - IEEE Recommended Practice on Surge Voltages in Low-Voltage AC Power Circuits

3. National Fire Protection Association (NFPA)
   a. NFPA 70 - National Electrical Code (hereinafter referred to as NEC)

1.3 SUBMITTALS

A. Submittal format and content shall comply with the general requirements of these Specification and the specific technical requirements further listed herein.

1. Personnel Qualifications: All personnel that will work on hardware or software are subject to AUTHORITY approval. Provide resumes of all proposed personnel.

2. Manufacturer Qualifications: Any new equipment or software differing from those specified in the technical specifications shall require a prequalification and approval of the proposed manufacturer. Acceptability of the manufacturer shall be based on the manufacturer’s experience, equipment reliability, compliance with standards specified in this section, and complete compatibility with the Authority’s existing system.

3. Preliminary Design Review (PDR) Technical Requirements. Contractor shall include the following information as part of the PDR submittal package:
a. Battery calculations shall be provided for modified CCS power requirements.

b. A complete list of CCS modified or new Subsystem equipment (including manufacturer's descriptive and technical literature and catalog cut sheets) including Cameras, enclosures, storage devices, Ethernet switches, software licenses.

c. Preliminary wiring diagrams for all field CCS equipment provided and installed under this contract.

d. Drawings showing the plan and elevation for each station equipped or retrofitted.

e. Preliminary drawings showing the modifications necessary at OCC and NWROF.

f. A software requirements specification and preliminary software design description for the modifications shall be provided. This shall give a description of the software modules, databases, XML, and other elements that will require change. It will also identify and necessary re-structuring or changes to database dimensions.

4. Final Design Review (FDR) Technical Requirements. Contractor shall include the following information as part of the FDR submittal package for the CCS Subsystem:

a. Updated PDR information. All drawings, calculations and design information shall reflect a final design.

b. Battery calculations.

c. A complete list of CCS Subsystem modified or new equipment (including manufacturer's descriptive and technical literature and catalog cut sheets) including Cameras, enclosures, storage devices, Ethernet switches, software licenses.

d. Detail drawings for CCS systems. The drawings shall consist of the following:

1) Wiring diagrams

2) Complete subsystem inter-connection diagrams

e. Other details, as required to verify that the system conforms to industry standards and requirements

f. An updated software requirements specification and final software design description for the modifications shall be provided. This shall give a description of the software modules, databases, XML, and other elements that will require change. It will also identify and necessary re-structuring or changes to database dimensions.

5. Installation Work Plans. Contractor shall submit the following installation document for each site no later than 60 days prior to the scheduled installation activities. The Installation Work plan shall include:

a. Drawings and Diagrams to include:

1) Equipment layout in plan and elevation views, including all conduit and cable

2) System block diagram.

3) Wiring diagrams showing detail connection of all system components including Ethernet, power and control wiring.

4) Conduit installation details.

6. Calculations or Certifications

a. Calculations as listed in the PDR and FDR.

b. Certifications: Copy of the following certifications shall be included:

1) ISO certification for all proposed manufacturers.

7. Product Samples: Product samples shall be provided and demonstrated when requested by the Authority.
8. Software Implementation and Cutover Plan
   a. Implementation and cutover of the software to support the new line section without disruption to the Authority’s operations is imperative. All software must be fully tested off-line before it is implemented on the DART system. This is to include regression testing to verify that there is no loss of functionality. This is to also include stress testing of the software to validate that stability of the software has not been compromised by the addition of the new line section.
   b. Contractor shall submit a complete plan for implementing and cutting over the software. This plan shall include necessary hold and validation points to verify suitability prior to placing any upgrades into service. The plan shall also include a description of the software testing and validation procedures that shall be used.
   c. Contractor shall provide a release plan that will indicate which changes will be provided in each release and the general format of the release notes to be provided with each release. Release notes shall include a section describing how the release will be installed as well as a procedure for backing out the release if necessary.

9. Test Plan and Procedures
   a. Test procedures shall be submitted for all the required tests as described in paragraph 3.2 of this Section. As a minimum:
      1) Test program shall include all the required tests for this subsystem
      2) Factory Test Procedure
      3) Field Test Procedure
      4) Integration Test Procedure
   b. Test Records: Contractor shall submit the Test Records and Results for review 7 days after the completion of each test, in accordance with these Specifications.

10. As-Built Documentation: Contractor shall submit complete As-Built documentation and drawings for the Control Center hardware and software.

1.4 QUALITY ASSURANCE
   A. Contractor’s design and installation shall comply with all applicable Standards and Codes as listed herein.
   B. Material and Workmanship Requirements
      1. All equipment provided under this Section shall be UL listed.
      2. All grounding shall be in accordance with local standards, and specifications required by this contract except as modified herein. Each piece of equipment shall be grounded in accordance with the recommendations of the manufacturer.
      3. Discontinued product models, refurbished equipment, or products scheduled for end-of-life, end-of-sale, or end-of-service within one calendar year of the installation date shall not be used.
      4. All products specified herein shall be subject to the Authority approval based on the Contractor’s ability to demonstrate adherence to the specified requirement and approval of the manufacturer’s quality process.
   C. Manufacturer Pre-Qualification Requirements: All new equipment provided and installed under this contract shall be compatible with existing CCS Subsystem equipment installed in central locations in order to perform the intended use set forth by the Authority.
   D. Personnel Requirements All software work shall be performed under the supervision of personnel certified to work on the existing GE software. Personnel are subject to AUTHORITY approval.

PART 2 - PRODUCTS

2.1 GENERAL DESIGN REQUIREMENTS
   A. System Description: The existing system provides for complete monitoring and control of all DART lines. Complete documentation regarding system functionality can be made available to the Contractor upon request from the Authority.
   B. Integration of New Line Sections
      1. All new Project controls and indications shall be fully integrated into the existing system and shall function in a manner
similar to existing controls and indications of the same type. Any new software licenses or upgrades necessary to support this integration shall be provided.

2. The drawings show a typical layout for modifying displays to accommodate the new line section in a geographically representative manner. All displays shall be subject to Authority approval.

3. All reporting capabilities of the system shall be provided for the new line section, with reports containing data for both existing and new locations, in appropriate context. This shall include ad-hoc queries.

4. Alarm and status display shall show new line section information in the correct context and order, similar to existing lines.

PART 3 - EXECUTION

3.1 INSTALLATION

A. General

1. Any new equipment required shall be installed as shown in the Contract Drawings, and in accordance with the manufacturers' recommendations.

2. Required interconnections, services, and adjustments for a complete and operational system shall be provided.

3. Electrical work shall be in accordance with NEC.

B. Power: Equipment primary power shall be extended from the UPS AC Power Distribution panel.

C. Wiring

1. System wiring outside of the communications room shall be installed in conduit. The conductors for the CCS system shall be installed in conduits, junction boxes, or outlet boxes separate from lighting and power systems conduit.

2. Conduit shall be 1/2-inch minimum in accordance with NEC.

3. Wiring within equipment shall be readily accessible without removing component parts.

D. Over-voltage and Surge Protection

1. Cables and conductors, which serve as communications links, shall have surge protection circuits installed at the equipment room or cabinet end.

2. Fuses shall not be used for surge protection.

E. Delivery and Storage: Equipment delivered and placed in storage shall be protected from the weather, humidity and temperature variation, dirt and dust, and any other contaminants.

F. Software Modifications

1. Software modifications shall be executed in accordance with the approved implementation and cutover plan. It is anticipated that all software revisions will be developed and tested in an offline environment that resembles the installed environment at DART. The live DART system shall not be used for development.

2. Contractor shall work with the Authority and specifically the Authority's OCC personnel to schedule any software releases. All software releases shall be installed during non-revenue hours. Contractor shall provide on-site personnel to support the release. These personnel shall remain at DART during the morning rush hour or until the Authority indicates that they are satisfied with the installation.

3.2 TESTING AND INSPECTION

A. Contractor shall perform the following inspection and test on the CCS Subsystem at each equipment installed location. The Authority shall be given at least 10 days written notice prior to each scheduled test so that the Authority may be present as desired.

1. Factory Testing: Factory testing of CCS software shall be required, to verify complete functionality of the system for new line section and to validate that no unintended problems were introduced to existing functionality.

2. Field Testing

a. The tests shall be performed in the presence of the Authority under the supervision of the CCS system manufacturer's qualified representative.
b. Contractor shall perform the following:

1) Provide all instruments and personnel required for the tests.

2) Upon completion of the installation, the Contractor shall subject the system to a complete functional and operational performance test. As a minimum, the tests shall include:

- Logging in and assuming control of the new line section
- Setting routes (all methods)
- Displaying correct track circuit occupancies and signal aspects
- Capability to exercise all substation controls
- Correct display of all substation indications
- Correct display of all passenger station status indications
- Correct display of counts of trains in existing adjacent dark territories
- Correct generation of train arrival announcements
- Correct operation of status and alarm windows
- Correct generation of reports
- Correct generation of query results
- Correct graphical display and nomenclature

3. End-To-End and Systems Integration Test:

a. Contractor shall provide qualified technical staff to perform the End-To-End test for CCS. The Authority will use the system for a period up to thirty days and report any anomalies to the Contractor. The Contractor shall correct anomalies and re-validate the system.

PART 4 – MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this Section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith shall be considered incidental to the Work specified under Section 16801 “Basic Technical Requirements - Communications System.”
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section describes the detailed technical requirements for providing Supervisory Control and Data Acquisition (SCADA) Remote Terminal Units (RTU’s) to provide for controls and indications of wayside devices from the DART OCC.

1. All work shall be accomplished by personnel approved by the manufacturer of the existing DART system.

2. Work includes provision of all hardware and software (including licenses and modifications) to provide a fully functioning, stable system with all of the functionality that currently exists.

3. RTU’s shall be provided for monitoring and control of Traction Power Substations, Signal Houses, and Communications Facilities and their systems.

1.2 REFERENCED STANDARDS

A. Contractor’s design and installation shall comply with the latest editions of all applicable Standards and Codes included herein. Work shall meet or exceed the standards and procedures specified.

1. American National Standards Institute (ANSI)

2. American Railway Engineering and Maintenance of Way Association (AREMA)

3. American Society of Quality (ASQ)

5. The Institute of Electrical and Electronics Engineers (IEEE)

6. National Fire Protection Association (NFPA)

7. National Electrical Manufacturer’s Association (NEMA)

8. National Electrical Code (NEC)

10. Underwriters Laboratories, Inc. (UL)

1.3 SUBMITTALS

A. Submittal format and content shall comply with the general requirements of these Specification and the specific technical requirements further listed herein.

B. Any new equipment differing from those specified in the technical specifications shall require a prequalification and approval of the proposed manufacturer. Acceptability of the manufacturer shall be based on the manufacturer’s experience, equipment reliability, compliance with standards specified in this section, and complete compatibility with the Authority’s existing system.

C. Preliminary Design Review (PDR) Technical Requirements. Contractor shall include the following information as part of the PDR submittal package for the Intrusion Alarm subsystem:

1. Battery or UPS calculations shall be provided for RTU power requirements.

2. A complete list of RTU Subsystem equipment (including manufacturer’s descriptive and technical literature and catalog cut sheets) including enclosures, storage devices, Ethernet switches, software licenses.

3. Preliminary wiring diagrams for all field RTU equipment provided and installed under this contract.

4. Drawings showing the plan and elevation for each station equipped or retrofitted.

5. Preliminary drawings showing the modifications necessary at OCC and NWROF.

6. A SCADA points list for each location including at a minimum the type (input/output) and the output relay contact states (normally open or normally closed).

1. Contractor shall include the following information as part of the FDR submittal package for the RTU Subsystem:

   a. Updated PDR information. All drawings, calculations and design information shall reflect a final design.

   b. Battery calculations shall be provided for RTU equipment.
c. A complete list of RTU Subsystem equipment (including manufacturer's descriptive and technical literature and catalog cut sheets) including enclosures, storage devices, Ethernet switches, software licenses.

2. Detail drawings for RTU systems. The drawings shall consist of the following:
   a. Wiring diagrams.
   b. Complete subsystem inter-connection diagrams.

3. Other details, as required to verify that the system conforms to industry standards and requirements.

E. Installation Work Plans. Contractor shall submit the following installation document for each site no later than 60 days prior to the scheduled installation activities. The Installation Work plan shall include:

1. Drawings and Diagrams to include:
   a. Equipment layout in plan and elevation views, including all conduit and cable.
   b. System block diagram.
   c. Wiring diagrams showing detail connection of all system components including Ethernet, power and control wiring.
   d. Conduit installation details.

F. Calculations or Certifications

1. Calculations as listed in the PDR and FDR.

2. Certifications: Copy of the following certifications shall be included:
   a. ISO certification for all proposed manufacturers.

G. Product Samples: Product samples shall be provided and demonstrated when requested by the Authority.

H. Test Plan and Procedures

1. Test procedures shall be submitted for all the required tests as described in Article 3.2 of this Section. As a minimum:
   a. Test program shall include all the required tests for SCADA subsystem

b. Factory Test Procedure

c. Field Test Procedure

d. Integration Test Procedure

2. Test Records: Contractor shall submit the Test Records and Results for review 7 days after the completion of each test, in accordance with these Specifications.

I. As-Built Documentation: Contractor shall submit complete As-Built documentation and drawings for the SCADA Subsystem.

1.4 QUALITY ASSURANCE

A. Applicable Standards and Codes: Contractor's design and installation shall comply with all applicable Standards and Codes as listed herein.

B. Material and Workmanship Requirements

1. All equipment provided under this Section shall be UL listed.

2. All grounding shall be in accordance with local standards, and specifications required by this contract except as modified herein. Each piece of equipment shall be grounded in accordance with the recommendations of the manufacturer.

3. Discontinued product models, refurbished equipment, or products scheduled for end-of-life, end-of-sale, or end-of-service within one calendar year of the installation date shall not be used.

4. All products specified herein shall be subject to the Authority approval based on the Contractor's ability to demonstrate adherence to the specified requirement and approval of the manufacturer's quality process.

C. Manufacturer Pre-Qualification Requirements: All new equipment provided and installed under this contract shall be compatible with existing RTU Subsystem equipment installed in central locations in order to perform the intended use set forth by the Authority.

PART 2 - PRODUCTS

2.1 GENERAL DESIGN REQUIREMENTS

A. System Description

1. SCADA RTU Equipment – DART's SCADA system is currently fully operational. The new RTU's for this contract shall be fully integrated into the existing system. The Contractor is
advised to become fully familiar with the existing hardware, software and operations of the SCADA system used by DART and design the new system to be fully compatible with it. To achieve this, the Contractor should visit DART’s facilities and study relevant technical information before designing the new RTU’s.

2. The SCADA RTU Equipment shall be capable of communications with DART’s Central Control System (CCS) and have the functionality as indicated in Section 16866. Communications between the RTU and the office shall be based on the DF1 protocol as implemented for existing DART facilities.

   a. If RTU functionality is implemented via interface with a traction power or signal PLC, the work shall include protocol conversion to use the DF1 protocol.

3. The SCADA RTU Equipment shall be compatible with the existing Allen-Bradley product DART approved equal. Typical SCADA RTU components are shown on the Contract Drawings. SCADA panels include:

   a. PLC Chassis with power supply, CPU, and input/output modules.
   b. SCADA power supply.
   c. Terminal blocks.
   d. Any interposing relays necessary.

4. PLC programming shall utilize the modules and structure typical for existing PLC’s utilized on the DART SCADA system.

2.2 SCADA POINTS

A. The required SCADA Points are indicated in these Specifications, on the Contract Drawings and as shown in the typical SCADA points list in this Section’s appendix. The SCADA points shall support similar monitoring and control capabilities as are in place for existing DART locations.

PART 3 - EXECUTION

3.1 INSTALLATION

A. General

   1. Equipment shall be installed as shown in the Contract Drawings, and in accordance with the manufacturers’ recommendations.

   2. Required interconnections, services, and adjustments for a complete and operational system shall be provided.

   3. Electrical work shall be in accordance with NFPA 70.

B. Power:

   1. Equipment primary power shall be extended from the UPS AC Power Distribution panel or a battery backup.

   2. When the AC supply is interrupted, the UPS or battery backup system shall supply the RTU with the required power for a minimum of 8 hours.

C. Wiring

   1. System wiring outside of the communications room shall be installed in conduit. The conductors for the RTU system shall be installed in conduits, junction boxes, or outlet boxes separate from lighting and power systems conduit.

   2. Conduit shall be 1/2-inch minimum in accordance with NFPA 70.

   3. Wiring within equipment shall be readily accessible without removing component parts.

D. Over-voltage and Surge Protection

   1. Cables and conductors, which serve as communications links, shall have surge protection circuits installed at the equipment room or cabinet end.

   2. Fuses shall not be used for surge protection.

E. Delivery and Storage: Equipment delivered and placed in storage shall be protected from the weather, humidity and temperature variation, dirt and dust, and any other contaminants.

3.2 TESTING AND INSPECTION

A. General: All testing and reporting shall be performed in accordance with Section 16801, “Basic Technical Requirements - Communications System.”

B. Contractor shall perform the following inspections and tests on the RTU Subsystem where applicable. Contractor shall provide written notice to the Authority not less than 10 days prior to each test and inspection so that the Authority may be present as desired.
1. Factory Test and Inspection:
   a. Factory testing and inspection of RTU system shall be required.
   b. Inspections shall verify proper wiring and workmanship of SCADA panels.
   c. Testing shall verify proper programming of the PLC’s, including alignment of the SCADA points list.

2. Field Inspection: Field Inspection of RTU equipment at each station shall verify the following:
   a. Conformance to standards, methods, quality, specification requirement and approved drawings.
   b. Proper routing and termination of wire and cable.
   c. Secured cable and wire connections.
   d. Proper grounding of all equipment.
   e. Correct and complete labeling and tagging of wire, cable, terminal, connectors and equipment.
   f. Correct mounting position and orientation of each camera.

3. Field Testing
   a. The tests shall be performed in the presence of the Authority under the supervision of the RTU system manufacturer’s qualified representative.
   b. Contractor shall perform the following:
      1) Provide all instruments and personnel required for the tests.
      2) Locally verify all input output points using a laptop configured to allow for toggling of points and indication monitoring.
      3) Upon completion of the installation, the Contractor shall subject the system to a complete functional and operational performance test. As a minimum, the tests shall include:
         a) End-To-End Test: Contractor shall provide qualified technical staff for the End-To-End test for SCADA, to the OCC, including proper indications, controls and status monitoring.
         b) Systems Integration Test: Contractor shall provide qualified technical staff to support the Authority’s System Integration Test for SCADA, to the OCC, including proper indications, controls and status monitoring.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL
   A. The Work specified in this Section will not be measured separately for payment.

4.2 PAYMENT
   A. All costs connected herewith shall be considered incidental to the Work specified under Section 16801 “Basic Technical Requirements - Communications System.”

PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section describes the detailed technical requirements for the Fare Collection Local Area Network (LAN) to be designed, provided, installed and tested under this Contract. Work scope includes:

1. Technical and administrative requirements for interfaces between Communications and Central Control System (CCS) and the Fare Collection discipline, and the detailed technical requirements for the Fare Collection LAN to be designed, provided, installed, and tested.

B. Existing System Description and Configuration

1. Multiple Ticket Vending Machines (TVM) at each station are connected into a LAN to consolidate data at the Communications Interface Cabinet (CIC) or Communications Room via a 10/100 Mbps multi-port switch and forward the information to Ethernet ports on the Communication Transmission Subsystem (CTS) equipment.

2. Ethernet ports at all CTS equipment are provisioned at 100 Mbps for a separate Fare Collection Virtual Local Area Network (VLAN) to segregate this traffic from all others on the network.

3. The Fare Collection VLAN will have existing connectivity to the Authority LAN and subsequently to a Fare Collection Data Storage Computer (DSC) located at Authority Headquarters via the CTS. This connectivity shall allow data to be exchanged between individual Station TVMs and the Data Storage Computers.

C. Responsibilities

1. DART will provide the Fare Collection Equipment, completely programmed.

2. Contractor shall install the equipment at the designated locations at the stations.

3. Contractor shall connect power and the data network equipment, as described in this section.

4. Contractor shall support DART in testing the end-to-end communications capabilities.

1.2 REFERENCED STANDARDS

A. Institute of Electrical and Electronics Engineers (IEEE)

1. IEEE 802 – Local and Metropolitan Area Network Standards

B. International Organization for Standard (ISO)

1. ISO 9001 – Quality Management Standards

C. National Fire Protection Association (NFPA)

1. NFPA 70 – National Electric Code

D. Underwriters Laboratories, Inc. (UL)

1. UL 444 – Communications Cables

2. UL 1863 – Communications-Circuit Accessories

1.3 SUBMITTALS

A. Submittal format and content shall comply with the requirements of these Specifications and the specific technical requirements further listed in this Section.

1. Preliminary Design Review (PDR) Technical Requirements

a. Complete product data including description and model number, shop drawings, catalog cuts and technical literature for the following equipment and material:

1) Data switch

2) SC Duplex Single Mode Fiber Optic Jumper Cables

3) Media conversion equipment

4) Category 5e Ethernet Patch Cables

b. Fare Collection LAN block diagram and overall system description.

c. Interface description between the Fare Collection LAN and other Communications subsystems and contracts required to complete the transfer of Fare Collection data from TVMs to DSC.
d. Proposed revision of Data switch operating software with descriptive documentation, including, but not limited to:

1) Release Notes
2) Product Bulletins
3) Applicable Field Notices

e. Equipment operating instructions or details.
f. Mounting and installation details, rack layouts.
g. Complete End-to-End wiring diagrams.
h. Outside Plant (OSP) cable routing, pair, and fiber strand usage diagrams.
i. Intra and Inter rack wiring.
j. Patches.
k. Power and grounding

2. Final Design Review (FDR) Technical Requirements. Contractor shall include the following information as part of the FDR submittal package for the Fare Collection LAN:

a. Updated PDR information. All drawings, calculations and design information shall reflect a final design.
b. Fiber optic link loss budgets for all fiber optic spans between CICs and Communications facilities, sufficient to show that all proposed spans meet published link loss budgets.

c. Field Test Procedure: Contractor shall submit a complete field test procedure to satisfy all the requirements outlined in paragraph 3.2 of this Section.

d. End-to-End Acceptance Test: There is no requirement for an End-to-End Test performed on the Fare Collection LAN.

e. System Integration Test: Contractor shall provide qualified staff to support the Fare Collection LAN integration test as described in paragraph 3.2 of this Section. The Authority will direct the System Integration Test.

3. Installation Work Plans. Contractor shall submit the following installation document for each site no later than 60 days prior to the schedule installation activities. The Installation Work plan shall include:

a. Drawings showing plan and elevation details of equipment including conduit interface and all mounting hardware.
b. Cable and wire requirements.
c. Grounding details.

4. Calculations or Certifications: Fiber span loss calculations (as required in the Design Review Sections) to validate switch distances.

5. Test Plan and Procedures. Test Plan and Procedures shall be submitted in accordance with these Specifications and as outlined herein:

a. Test Program Plan: Contractor shall include all the required information for the Fare Collection LAN in the Test Program Plan as outlined in these Specifications.
b. Factory Test and Inspection Procedure: Contractor shall submit a complete factory test and inspection procedure to satisfy all the requirements outlined in paragraph 3.2 of this Section.
c. Field Test Procedure: Contractor shall submit a complete field test procedure to satisfy all the requirements outlined in paragraph 3.2 of this Section.

d. End-to-End Acceptance Test: There is no requirement for an End-to-End Test performed on the Fare Collection LAN.

e. System Integration Test: Contractor shall provide qualified staff to support the Fare Collection LAN integration test as described in paragraph 3.2 of this Section. The Authority will direct the System Integration Test.

6. Test Records: Contractor shall submit the Test Records for review 14 days after the completion of each test in accordance with these Specifications.

7. As-Built Documentation

a. Submit as-built drawings and complete equipment data with operating instructions.
b. Accompanying each interface drawings package, submit a written interface specification that details the functional, electrical and mechanical interface properties.
c. Submit default or as-built Configuration and Provisioning Information for each programmable piece of equipment to allow system integration by follow-on contractors and consultants, including:
FARE COLLECTION LOCAL AREA NETWORK - COMMUNICATIONS SYSTEM

1) Programming passwords.
2) Programmable feature settings.
3) Board level switch/strap settings.
4) Node addressing information.
d. Submit card layout or slot configurations (component equipment inventory).
e. Submit any other configuration or provisioning which deviates from manufacturer's default state.

1.4 QUALITY ASSURANCE

A. Applicable Standards and Codes: Contractor’s design, fabrication, inspection, installation and testing shall comply with all applicable Standards and Codes as listed herein. All equipment and methods shall comply with the latest version of standards as applicable in paragraph 1.2 of this Section.

B. Material and Workmanship Requirements

1. All equipment provided under this Section shall be UL listed.
2. All products specified herein shall be subject to Authority approval based on the Contractor’s ability to demonstrate adherence to these Specifications and Authority approval of the manufacturer’s quality process.
3. All products shall be compatible with existing LAN and CTS elements in order to perform the intended use set forth by the Authority.
4. Discontinued or end-of-life product models, refurbished equipment, or products scheduled for end-of-life, end-of-sale, or end-of-service within one calendar year of the installation date shall not be used.

PART 2 - PRODUCTS

2.1 FARE COLLECTION LAN DATA SWITCH AND OTHER MATERIALS

A. The Fare Collection LAN shall utilize TCP/IP as the transport and network layer service protocol. Physical Ethernet interface settings shall be set to 100 Mbps, Full Duplex.

B. Fare Collection LAN data transmission equipment, media conversion, and interconnection equipment at each station or Communications Facility shall include:

1. Data switch and LAN equipment shall be commercial off-the-shelf equipment (COTS).
2. The Data Switch shall support the following protocols and operating characteristics:
   a. IEEE 802.3 (10BaseT)
   b. IEEE 802.3u (100BaseTX, FX)
   c. IEEE 802.3x (flow control)
   d. IEEE 802.1q (VLAN)
   e. IEEE 802.1w (Rapid Spanning Tree)
   f. SNMP v1, v2c
   g. Input power: 120 VAC 60Hz nom.
   h. Power consumption < 25 W
   i. Network management via both Telnet (VT100) and Command Line Interface (CLI)
3. At each Station CIC or Communications Facility serving ticket vending machines the Contractor shall provide sufficient full duplex 100Base-FX MM fiber ports to terminate all TVM’s. This shall be accomplished using one or more multi-port, multifunction Data Switches.
4. Data Switches shall not exceed the allocated rack space requirements shown in the Contract Drawings for each location. The Data Switch shall be either rack mounted or mounted to a Contractor provided shelf in the space indicated on the Contract Drawings. If a shelf is used for mounting the data switch, it shall be mounted on sliding rails and all cords and cables will be mounted with service loops and slack to support extending the shelf without interference.
5. Data Switch shall perform media conversion between all of its Ethernet port types. All fiber ports shall be full duplex (i.e. two fibers per port – one transmit, one receive) Each Data Switch shall provide as a minimum the following Ethernet data port quantities and types:
<table>
<thead>
<tr>
<th>QTY</th>
<th>TYPE</th>
<th>Connector</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>10/100Base TX</td>
<td>RJ45</td>
</tr>
<tr>
<td>2</td>
<td>100Base-FX SM</td>
<td>SC</td>
</tr>
<tr>
<td>4</td>
<td>100 Base-FX MM</td>
<td>SC</td>
</tr>
</tbody>
</table>

6. Data Switch shall be capable of local management and shall be remotely manageable by a telnet connection and a single SNMP based manager application.

7. Media conversion for Fare Collection equipment as described in these Specifications and as shown on Contract Drawings.

8. Fiber distribution panels and accessories as described in these Specifications and as shown on Contract Drawings.

9. At stations with a CIC, fiber optic cable from the CIC to a designated Communications Facility.

10. Cable and termination equipment to support transmission of TVM intrusion alarms through a station demarcation panel to the nearest Communications Facility, as described in these Specifications and as shown on Contract Drawings.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Equipment shall be installed as shown in the Contract Drawings, and in accordance with the manufacturer’s recommendations.

B. Contractor shall install data transmission equipment, media conversion, and interconnection equipment at each station CIC, and Communication Facility as applicable.

C. Contractor shall coordinate all Work described in this Section with the Authority.

D. Contractor shall coordinate details of all interface requirements with the Authority.

E. Contractor shall program the Data Switch VLAN configuration as necessary to isolate TVM data ports from PA/VMB and other data sources that may also connect to the switch.

F. Cable and Wiring

   1. Contractor shall provide TVM intrusion alarm cable from each TVM routing through underground conduits to intermediate interconnection equipment to an RTU located in the nearest communications facility, to monitor and alarm any intrusion event over the SCS.

2. Contractor shall coordinate all civil work and installation of all facilities and equipment cables with the Authority.

G. TVM quantities and locations shall be in accordance with Contract Drawings.

3.2 TESTING AND INSPECTION

A. Contractor shall perform the following inspection and test on the Fare Collection LAN at each installed location. The Authority shall be given at least 10 days written notice prior to each scheduled test so that the Authority may be present as desired.

1. Factory Test and Inspection

   a. Factory Testing shall be conducted on individual equipment or assembled subsystems after all mounting, installation, wiring and other activities to support turn-up are complete.

   b. Diagnostic testing shall be performed for all equipment and all communications ports.

   c. Functional testing and validation of equipment settings shall be performed on all equipment.

   d. Any commercial off-the-shelf equipment that shares a common interface shall be assembled, integrated, and factory tested for compatibility.

2. Field Inspection

   a. Field inspection of the Fare Collection LAN shall verify the following:

      1) Equipment not damaged in transit.

      2) Equipment, port, and cable labeling are correct.

      3) Power supply integration and mounting.

      4) Cable routing.

      5) Unobstructed air flow to vented equipment.
3. **Field Test**
   
a. The tests shall be performed in the presence of the Authority.
   
1) **Functional testing from each TVM to the CTS Interface.** If required, utilize a data test set at the demarcation point to validate connection and data transfer from each TVM.

2) **Failover testing,** if applicable.

3) **Verify power connections,** test and record for proper voltage level.

4. **End-to-End Acceptance Test:** Not Required.

5. **System Integration Test.** Contractor shall provide sufficient technical staff to support the following testing activities during the Authority’s system integration test:
   
a. **Full path Ethernet connectivity testing between TVMs and Fare Collection DSC.**

b. **Functional testing between Fare Collection DSC and each networked TVM.**

c. **TVM intrusion alarm operation and reporting.**

**PART 4 - MEASUREMENT AND PAYMENT**

4.1 **GENERAL**

A. The Work specified in this Section will not be measured separately for payment.

4.2 **PAYMENT**

A. All costs connected herewith shall be considered incidental to the Work specified under Section 16801 “Basic Technical Requirements - Communications System.”

END OF SECTION 16869
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section describes the detailed technical requirements for the Grounding and Bonding for communications systems to be designed, provided, installed, and tested under this Contract. See the Contract Drawings for more details on Grounding and Bonding for communications systems. Work scope includes:

1. Designing, providing, installing and testing Grounding and Bonding for all communications systems at Communications Facilities, Communication Interface Cabinets (CIC’s), Traction Power Substation (TPSS) and Signal Houses in accordance with these Specifications and Contract Drawings.

1.2 REFERENCE STANDARDS

A. ASTM International (Formerly known as American Society for testing and Materials) (ASTM)

1. ASTM B187/ B 187 M - Standard Specification for Copper, Bus Bar, Rod, and Shapes and General Purpose Rod, Bar and Shapes

2. ASTM B8 – Standard Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft

4. ASTM D5 - Standard Test Method for Penetration of Bituminous Materials

B. Institute of Electrical & Electronics Engineers (IEEE)

C. Lightning Protection Institute (LPI)

1. LPI 175 – Standard of Practice

D. National Fire Protection Association (NFPA)

1. NFPA – 70 National Electrical Code

E. National Electrical Safety Code (NESC)

F. Telecommunications Industries Association (TIA)/ Electronic Industries Alliance (EIA)

1. TIA/EIA-607 - Commercial Building Grounding and Bonding Requirements for Telecommunications-Replaced by J-STD-607

G. Underwriters Laboratories (UL)

1. UL 467 - Safety Grounding and Bonding Equipment

1.3 SUBMITTALS

A. Submittal format and content shall comply with the general requirements of these Specifications and the specific technical requirements further listed herein.

B. Preliminary Design Review (PDR) Technical Requirements

1. Contractor shall include the following information as part of the PDR for the Grounding and Bonding of communications systems:

   a. Manufacturer’s catalog data for all proposed materials with installation recommendations.

   b. Drawings showing grounding arrangement for communications facility and CIC, including locations of ground rods, cables and connectors.

   c. Drawings showing details of ground connections, terminations and access points, including details of all daisy chain connections of panels and its end connection to the Chassis Main Grounding Busbars (CMGB).

   d. Drawing showing mounting details of all ground buses (CMGB, TMGB, CGB and TGB).

   e. Grounding calculations to demonstrate the installation meets the Specification requirement of the 3 ohms.

C. Final Design Review (FDR) Technical Requirements

1. Contractor shall include the following information as part of the FDR submittal
package for the Grounding and Bonding of communications systems:

a. Updated PDR information. All drawings, calculations and design information shall reflect a final design.

b. Final installation details.

D. Installation Work Plans

1. The Contractor shall submit the following installation document for each site no later than 60 days prior to the scheduled installation activity in accordance with these Specifications. The installation Work plan shall include the following:

a. Locations of ground rods, connectors, cables, and details of connections, terminations and access points.

b. Manufacturer’s installation recommendations.

E. Certifications

1. Certified test reports verifying that ground resistance of each ground grid when installed and each ground bus when connected to the ground grid does not exceed specified values.

F. Product Samples

1. Product samples shall be provided and demonstrated when requested by the Authority.

G. Test Plan and Procedures

1. Submit, no later than 75 days prior to the scheduled date of the corresponding test, procedures and equipment for testing resistances and electrical continuity for each location.

H. Test Records

1. Contractor shall submit the Test Records and Results for review one week after the completion of each test, in accordance with these Specifications.

I. As-Built Documentation

1. Contractor shall submit complete As-Built documentation and drawings for the Grounding and Bonding of all communications systems completed in this Contract.

1.4 QUALITY ASSURANCE

A. Contractor’s design, fabrication, inspection, installation and testing shall comply with all applicable Standards and Codes as listed herein. All equipment and methods shall comply with the latest version of the standards as applicable in paragraph 1.2 in this Section.

B. Material and Workmanship Requirements.

1. All equipment and material provided under this Section shall be UL listed.

2. All grounding shall be in accordance with local standards, and specifications required by this Contract except as modified herein. Each piece of equipment shall be grounded in accordance with the recommendations of the manufacturer.

3. Discontinued product models, refurbished equipment, products at their end-of-life, end-of-sale, or end-of-service shall not be used.

C. All products specified herein shall be subject to the Authority approval based on the Contractor’s ability to demonstrate adherence to the specified requirement and approval of the manufacturer’s quality process.

PART 2 - PRODUCTS

2.1 GENERAL DESIGN REQUIREMENTS

A. Subsystem

1. Facilities Lightning Protection

a. A lightning protection system shall be provided for all outdoor communications equipment and wayside facilities including Communications Facilities, outdoor Public Address/Visual Message Board (PA/VMB) equipment, Wayside Telephones, Passenger Emergency Call (PECs) and CICs. The lightning protection system shall be in accordance with the requirements of ANSI/NFPA 780, Lightning Protection Code. The lightning protection system shall consist of multiple rooftop/facility/equipment air (lightning) terminals, down conductors, equalizing conductors, and ground terminals. This hardware shall surround the Communications Facility for the purposes of intercepting, diverting, and dissipating direct lightning strikes.

b. The spacing and interconnection of the lightning protection system with the communications system grounds shall be in accordance with ANSI/NFPA 780. Communications grounds shall...
be bonded to the lightning protection system grounding within 12 feet of the base of the building. Communications conductors shall not be routed closer than 6 feet from any lightning protection system conductors. The Contractor shall submit an assessment for Lightning Protection System and bonding requirements as part of the Electromagnetic Interference (EMI) and Electromagnetic Compatibility (EMC) Control and Test Plan to the Contracting Officer.

c. Lightning protection systems and installers shall be certified to the Lightning Protection Institute's LPI-175 and LPI-176 standards.

2.2 GROUND RODS

A. Ground rods shall be copper-clad steel, of the non-rusting type as manufactured by Copperweld Corporation, or approved equal. The rod shall be at least ten feet in length and at least 0.75-inch in diameter.

B. Ground rod clamps shall be made of a cast bronze clamp body with non-ferrous setscrews as manufactured by Copperweld Corporation or an approved equal.

2.3 EXOTHERMIC WELDS

A. Welding material shall consist of copper exothermic mixture employing tin-metal in an amount to effectively constitute 4.5 percent to 5.5 percent of the resulting weld metal. The resulting weld metal shall be of high electrical conductivity and shall have a minimum tensile strength of 39,000 pounds per square inch (psi).

B. Coating Materials for Thermite Welded Connections; Use black, rubber based compound coating materials, which are soft, permanently pliable, moldable, and unbacked, not less than 1/8 inch thick, with properties as follows:

1. Solids: 100 percent
2. Density: 12.0 pounds per gallon minimum
3. Penetration: 90-130 ASTM D5
4. Water Absorption: 0.10 percent maximum ASTM D570
5. Dielectric Strength: 500 volts/ml ASTM D149
6. Volume Resistivity: 2,000 megohms-inches ASTM D257 5,000 megohms-cm ASTM D257
7. Service Temperature: -40 degrees F to +160 degrees F

8. Chemical Resistance: Melting point, none; flammability, slow burning (ASTM C653); resists alcohol, water, aqueous hydrochloride and sodium hydroxide; dissolved by carbon tetrachloride, naphtha gasoline, mineral, spirits, ketones, and benzene.

C. Highly cohesive and adheres strongly to metals and adhesive concrete and to itself.

2.4 GROUND GRID CONDUCTORS

A. No. 2 AWG bare solid tinned copper conductor, or as shown on Contract Drawings.

2.5 GROUND ELECTRODE CONDUCTORS

A. Insulated stranded copper conductor, as shown on Contract Drawings, in accordance with these Specifications, for single-conductor cable, 600 volts.

B. Size unless otherwise shown:

1. For use in connecting ground grid to CMGB and Telecommunications Main Grounding Busbars (TMGB) at Communications Facilities: insulated No. 2 AWG or as shown on drawings.

2. For use in connecting ground grid to Chassis Grounding Busbars (CGB) and Telecommunications Grounding Busbars (TGB) at CICs: insulated No. 4 AWG or as shown on drawings.

3. For other grounding electrode conductors: In accordance with NEC Table 250-94.

C. Equipment Grounding Conductors

1. Size in accordance with NEC article 250-95, unless otherwise shown on Contract Drawings.

2. Equipment grounding insulated conductor: Single conductor stranded copper as specified in these Specifications.

D. Static Dissipative Tile

1. Static Dissipative Tile (SDT) shall be used in Communications Facilities to prevent equipment damage due to static discharge. Ground SDT ground strips to the CMGB in accordance with the manufacturer's instructions using a minimum of No.12 AWG copper wire.

2.6 CHASSIS AND TELECOMMUNICATIONS GROUNDING BUSBARS

A. CMGB and Telecommunications Main Grounding Busbars (TMGB), located in Communications Facilities shall be as follows:
1. Predrilled electrotin plated copper busbar provided with standard NEMA bolt hole sizing and spacing for the type of connectors to be used.

2. Sized in accordance with the immediate requirements of the application and with consideration for future growth (provide approximately 50 percent spare holes).

3. Minimum dimensions shall be 1/4 inch thick x 4 inches wide and variable in length.

B. CGB and TGB, located in CICs and in the bottom of Communication Transmission Subsystem (CTS) cabinets in various locations, shall be as follows:

1. Predrilled electrotin plated copper busbar provided with standard NEMA bolt hole sizing and spacing for the type of connectors to be used.

2. Sized in accordance with the immediate requirements of the application and with consideration for future growth (provide approximately 50 percent spare holes).

3. Minimum dimensions shall be 1/4 inch thick x 2 inches wide and variable in length, or as shown on Contract Drawings.

2.7 TERMINAL LUGS

A. For No. 4/0 AWG and smaller conductors, use copper compression terminal lugs.

B. For No. 250 MCM and larger, use long barrel, copper, double-compression terminal lugs.

2.8 GROUND CONNECTOR

A. O-Z Gedney, Type KG or approved equal.

B. Two-piece, designed for connecting grounding conductor to bus bar.

C. Copper alloy body and silicon bronze bolt, nut and washer with interlocking clamp.

D. Exothermic weld: Size and type per manufacturer’s recommendations.

2.9 JUMPERS

A. Jumpers shall be insulated copper braided or leaf-type flexible jumper, size as required.

2.10 BUSBAR INSULATORS

A. Fibrous glass reinforced polyester insulator with 1/2 inch diameter by 2 inches length, threaded holes at both ends for CMGB, TMGB, CGB, and TGB installation.

2.11 COAL TAR EPOXY

A. Polyamide cured coal tar epoxy, Dupont Corlar 823 CTE, Koppers Company No. 300M, PPG Industries 97-640 or 97-641 or approved equal, applied to a dry film thickness of 8 mils. per coat.

2.12 EPOXY RESIN ENCAPSULATION

A. Two-component epoxy resin type with plastic snap mold, as manufactured by Duriron Company, 3-M Company or approved equal.

2.13 COMMUNICATIONS FACILITY ROOM HALO GROUND RING

A. The halo shall be No. 4 AWG bare stranded copper conductor. It shall encircle the perimeter of the interior walls of the Communications Facility at a uniform height of 3 inches to 12 inches from the ceiling. The halo shall be bonded to the CMGB also using a No. 4 AWG bare stranded copper conductor and approved ground connector.

2.14 COMMUNICATIONS CIRCUIT PROTECTION

A. Copper cables shall enter all Communications Facilities, CIC’s and Wayside Telephones at a Local Distribution Frame (LDF). All signal cables shall terminate on Protected Terminal Blocks (PTBs) located within the LDF, which shall conform to these specifications. Cable sheath shall be neatly trained and soldered to a No. 8 AWG insulated ground conductor and grounded at the TMGB or TGB.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Grounding Connections

1. Weld buried ground connections exothermically, in accordance with manufacturer’s recommendations. Clean and coat with coal tar epoxy applied with a 32 mils dry film thickness using multiple coats. Allow drying between coats and before backfilling. Encapsulate with epoxy resin all buried ground connections of grounding electrode conductors running to ground buses.

2. Use terminal lug to connect grounding conductor to equipment enclosure. Secure connector or terminal lug to the conductor so as to engage all strands equally by using tools and pressure recommended by the manufacturer.

3. Exothermically weld connections for ground rods in manholes and handholes, or as shown.

4. Splices in grounding conductors are not permitted.
B. Ground Grid

1. Install ground grid consisting of bare solid tinned copper conductors and ground rods buried in earth in the pattern and at the locations shown on Contract Drawings. Install ground rods vertically if possible. If this is impossible, rods may be at an angle or (as a last resort) buried horizontally 30 inches (minimum) below grade.

2. Bury top of ground rod 30 inches minimum below grade or as shown on Contract Drawings.

3. Provide 24-inches minimum horizontal separation between ground rods and concrete structures.

4. Interconnect ground rods using bare solid tinned copper conductors as shown on Contract Drawings.

5. For Communications Facilities and CICs, unless otherwise shown, provide two pigtails of grounding electrode conductor of sufficient length above finished floor for connection to the TMGB and CMGB or TGB and CGB. The two pigtails shall be exothermically welded or bonded in an approved manner to the grounding grid at a single point.

C. Grounding Bars

1. Install separate CMGBs and TMGBs, CGBs and TGBs in Communications Facilities, CIC’s and other locations as shown on Contract Drawings.

2. Mount Communications Facility TMGB’s and CMGB’s on insulators 2 feet above finished floor using cap screws and expandable threaded anchors, unless shown otherwise on Contract Drawings.

3. Install CIC and CTS cabinet TGBs and CGBs in the bottom of the cabinet, on insulated spacers which electrically isolate them from the cabinet.

4. Provide insulator support at each end of grounding busbars and at intervals not exceeding three feet.

5. Bond the grounding electrode conductors to the grounding busbar using an approved ground connector in accordance with this Section.

D. Grounding of Separately Derived AC Power System

1. Bond the safety ground conductor (green wire) to the CMGB using a minimum of No. 4 AWG insulated stranded copper wire, as shown on Contract Drawings. For additional guidance refer to the NEC.

E. Grounding for Personnel Safety

1. In Communications Facilities, CICs, bond equipment enclosures and racks, ductwork, conduit, metal cable trays, the LDF ground bolt, PTB grounds, and the room halo ground ring to the local CMGB or CGB using a minimum of No. 6 AWG insulated stranded copper conductor or as specified on Contract Drawings.

2. Wayside metal equipment including, but not limited to, cabinets, poles, pullboxes, equipment enclosures, and junction boxes: bond and ground each item using No. 6 AWG (minimum) copper conductor to one or more ground rods to provide 3 ohms or less resistance to ground. Wayside metal equipment on a bridge structure should be attached to the structure using a minimum of No. 6 AWG (minimum) copper conductor.

F. Electronic Equipment Signal Grounding

1. Where electronic equipment is provided with separate ‘Signal’ or ‘Telecommunications’ ground connections, a separate isolated TGB shall be provided in the equipment rack or enclosure. These connections shall be grounded to the TGB using a minimum of No. 10 AWG insulated stranded copper conductor.

2. Within the Communications Facility or other electronic equipment room, a separate TMGB shall be provided. All individual equipment rack or enclosure TGBs shall be grounded to the TMGB using a minimum of No. 8 AWG insulated stranded copper conductor.

3. The TMGB shall be grounded to the same point on the ground grid (or to the structural steel) as the CMGB using the same AWG grounding electrode conductor. Both grounding electrode conductors shall be insulated.

G. Cable Shield Grounding

1. One end of all cable shields shall be grounded to the TMGB or TGB. Use the following guidelines to determine which end of the cable to ground:

   a. When a cable goes between Communications Facilities, ground the shield at the southern most facility.

   b. When a cable goes between a Communications Facility and any other facility (TPSS, Signal House, and CIC), ground the shield at the Communications Facility.
c. When a cable goes between the CIC and station equipment, ground the shield at the CIC.

H. Fiber Optic Cable Jacket Grounding

1. Armored jackets on all fiber optic cables shall be grounded to the CBG or CMGB using a minimum of No. 8 AWG insulated stranded copper conductor.

3.2 TESTING AND INSPECTION

A. The Contractor shall perform the following inspections and tests on Grounding and Bonding. The Authority shall be given at least 10 days written notification prior to each test and inspection so that the Authority may be present as desired.

1. Factory Test and Inspection: Not Required.

2. Field Test and Inspection. The Contractor shall make the following Field Inspections and Tests:

a. Inspect ground grid installation, installation depth, conductor sizes, connections to ground rods and foundation rebars prior to backfill, for conformance to Specification requirement.

b. Inspect installation of all main ground busbars for proper mounting.

c. Test ground resistance of each ground grid after installation and each ground bus when connected to ground grid, using approved test procedure.

d. Resistance to ground for Communications Facilities and CIC’s is not to exceed three ohms.

e. To meet resistance requirements, install additional ground rods. If resistance requirements can still not be met, install a sacrificial anode to be Authority approved.

f. Test metal conduit and raceways, equipment enclosures, metal cable troughs, fences, metal structures, and light poles for ground resistance not to exceed three ohms.

B. End-To-End acceptance Test:

1. Not required.

C. System Integration Test:

1. Not required.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this Section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith shall be considered incidental to the Work specified under Section 16801 “Basic Technical Requirements - Communications System.”
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section describes the detailed technical requirements for the Communications Transmission Subsystem (CTS) to be designed, provided, installed, and tested under this Contract. Work scope includes:

1. Local installation, turn-up, and testing of all new CTS nodes and associated CTS interconnect equipment required for network expansion to support communications to line sections defined under this Contract.

2. Design, install and test of the fiber optic backbone cable, as well as installing and patching fiber distribution panels in accordance with Contract Drawings.

B. The existing CTS provides communications links between the field terminal equipment at Communication Interface Cabinets (CIC), Communication Facilities, Substations, Signal Houses, and office terminal equipment at Operation Control Center (OCC) Equipment Room. The CTS currently transmits voice, signaling, and data circuits between field locations and the OCC, and include:

1. CISCO ONS15454 Synchronous Optical Network (SONET) Add-Drop Multiplexers (ADM), Telco Model DCB-24 channel banks, DSX-1 jack fields, wiring distribution terminals, fiber slack enclosures and fiber distribution panels at the OCC, Headquarters building, and Communications Facilities on the existing Authority System.

2. Other supporting hardware, as shown on the Contract Drawings and described in these Specifications.

3. The existing CTS system architecture utilizes a single-mode fiber optic backbone with CISCO ONS15454 OC-48 ADM nodes. The ONS15454 platform provides T-1 drops, and integrated Ethernet services at each communications node. Voice and dial-up data services for Traction Power Substation (TPSS), Signal Houses, Communications Facilities, and designated Station facilities are groomed onto the CTS channel bank equipment and digital cross-connect systems (DCS).

4. The SONET ring network topology structure consists of two separate backbone Unidirectional Path Switched Rings (UPSR) described below, both terminated into a node at the OCC. The two nodes at the OCC are connected via OC-48. Each ring is implemented in a collapsed, staggered configuration as shown in the Contract and Reference Drawings. A single backbone fiber optic cable is used between each communication facility, with ADM connections between every other node on separate strands of the same fiber.

   a. Ring No. 1 includes NC1, NC2, NC3, NC4, NC5, NW1, NW2, NW3, NW4, I1 and I2 line section nodes.

   b. Ring No. 2 includes the CBD, OC1, OC2, SE1, SE2, G1, G2, G3 and R1 line section nodes.

C. New CTS Work shall include expanding the current physical topology by implementing new 1 Gb/s Ethernet switches at each new communications room or facility and also at each of the two nearest existing Communications Houses with SONET OC-48 nodes. CTS Ethernet traffic for the new systems shall be routed to the existing CTS SONET network to completely interface all new facilities and systems to the existing CTS. Specific Work to be performed includes:

1. Provide, install and locally configure new 1 Gb/s Ethernet switches.

2. Wire from the local CTS interfaces, through patch panels, intermediate distribution frames and interconnect equipment to each field instrument, appliance, or other equipment as shown on Contract Drawings.

3. Provide and install interface equipment to TPSS and Signal Houses required to transport data and voice from these locations onto the CTS.

4. Locally test all CTS interfaces and connections installed under this Contract.

5. Network provisioning of existing Network Management System (NMS) and SONET Ring 2 system to accommodate the new Ethernet traffic and required new Virtual Local Area Networks (VLANs).

1.2 REFERENCED STANDARDS

A. Contractor’s design and installation shall comply with the latest editions of all applicable Standards and Codes included herein. Work shall meet or exceed the standards and procedures specified.

B. Alliance for Telecommunications Industry Solutions (ATIS)
1. IEEE 802.1D – IEEE Standards for Local and Metropolitan Area Networks: Media Access Control (MAC) Bridges
2. IEEE 802.1Q-2011 – IEEE Standard for Local and Metropolitan Area Networks – Media Access Control (MAC) Bridges and Virtual Bridged Local Area Networks
3. IEEE 802.1Qaz - IEEE Standard for Local and Metropolitan Area Networks – Media Access Control (MAC) Bridges and Virtual Bridged Local Area Networks: Amendment 18: Enhanced Transmission Selection for Bandwidth Sharing Between Traffic Classes
4. IEEE 802.1Qbb IEEE Standard for Local and Metropolitan Area Networks – Media Access Control (MAC) Bridges and Virtual Bridged Local Area Networks: Amendment 17: Priority-based Flow Control
5. IEEE 802.3AD – IE Standards for Information Technology – Local and Metropolitan Area Networks – Part 3: Carrier Sense Multiple Access with Collision Detection (CSMA/CD) Access Methods and Physical Layer Specifications – Aggregation of Multiple Link Segments

1.3 SUBMITTALS

A. Submittal format and content shall comply with the general requirements of these Specifications and the specific technical requirements further listed herein.

1. Manufacturer Qualifications: Any manufacturer differing from those specified herein shall require Authority prequalification and approval. Acceptability of the manufacturer shall be based on the manufacturer’s experience, qualifications, certifications (i.e. ISO-9001), equipment reliability, and compliance with standards specified herein, and full compatibility with the Authority’s existing system.

2. Preliminary Design Review (PDR) Technical Requirements Contractor shall include the following information as part of the PDR submittal package for CTS subsystem:

a. Network Block Diagrams
   1) Physical node diagrams.
   2) Logical network topology.

b. Material Specification Data Sheets and Product Samples. Contractor shall submit complete product data including description and model number, shop drawings, catalog cuts, technical literature, software descriptions, and samples (as requested by the Authority), for all equipment provided under this Contract.

c. Identification and specification of all external interfaces to existing network components, other subsystems provided under this Contract, and to any other contracts.

d. Descriptions of modifications required to existing CTS equipment in order to interface new subtended rings or to add local voice or data services.

e. Complete wiring diagrams for all field CTS equipment, including intermediate patch panels, protection, and interconnect equipment provided and installed under this contract.

f. Complete terminal cabling and interconnection diagrams for all Outside Plant (OSP) fiber optic cable (backbone and distribution) provided and installed under this contract.

g. Proposed rack layouts and elevations for new or modified field nodes, including assembly drawings, installation drawings, component level inventories and parts lists.

h. Preliminary fiber optic link loss budgets for all fiber optic spans (backbone and distribution) installed under this Contract. Calculations shall show total anticipated optical loss in dB for each span compared to the published link or span loss budget for that particular piece of optical transmission gear.
3. Final Design Review (FDR) Technical Requirements: Contractor shall include the following information as part of the FDR submittal package for the CTS.

   a. Updated PDR information. All drawings, calculations and design information shall reflect a final design.

   b. Shelf layout and inventory within equipment chassis.

   c. Final fiber optic link loss budgets for all fiber optic spans installed under this contract, sufficient to show that all proposed spans meet published link loss budgets.

4. Installation Work Plans and Detailed Documentation: Contractor shall submit the following installation document for each site no later than 60 days prior to the schedule installation activities. The Installation Work plan shall include:

   a. Drawings and Diagrams

      1) Cable pair and fiber strand usage diagrams

      2) Local Distribution Frame (LDF) wiring and termination assignments

      3) Interconnect and wiring diagrams to include ADM, media converters, Supervisory Control and Data Acquisition (SCADA) points, power supply, fuse panels, and other required equipment.

   b. Installation Procedures

      1) New ADM equipment

      2) New channel bank and media converters

      3) New Fiber Distribution Panel (FDP) components and equipment

      4) Procedures for installing new equipment into existing nodes to interface with new subtended rings.

5. Calculations and Certifications:

   a. Calculation as listed in the PDR and FDR.

   b. Certifications: Copy of the following certifications shall be included:

      1) ISO certification for all proposed manufacturers.

      2) CCNA certification and Cisco ONS15454 Installation Training for any technician performing installation, test, or turn-up work on any CTS equipment.

6. Product Samples: Product samples shall be provided and demonstrated when requested by the Authority.

7. Test Plan and Procedures. Contractor shall submit the following plan and procedures for the CTS:

   a. Test program plan: Contractor shall include all the required information for the CTS in the Test Program Plan as required by these Specifications.

   b. Factory Test Procedure: Contractor shall submit a complete factory test and inspection procedure to satisfy all the requirements in Section 3.2 of this Specification.

   c. Field Test Procedure: Contractor shall submit a complete field test procedure to satisfy all the requirements in Section 3.2 of this Specification.

   d. System Integration Test: Contractor shall provide qualified staff to support this test as required in Section 3.2 of this Specification. System Integration Test will be directed by the Authority.

8. Test Records: Contractor shall submit the Test Records for review 1 week after the completion of each test, in accordance with these Specifications.

9. As-Built Documentation

   a. Drawings

   b. Final Configuration and Provisioning Information: Contractor shall submit, within 30 days of installation, detailed information, if modified from default settings, for each programmable piece of equipment to allow System Integration by follow-on contractors.
1.4 QUALITY ASSURANCE

A. Applicable Standards and Codes: Contractor’s design and installation shall comply with all applicable Standards and Codes as listed herein. All CTS equipment shall comply with the latest version of standards as applicable in Section 1.2 of this Specification.

B. Material and Workmanship Requirements

1. All equipment provided under this Section shall be UL listed.

2. All grounding shall be in accordance with local standards, and specifications required by this Contract. Each piece of equipment shall be grounded in accordance with the recommendations of the manufacturer.

3. Discontinued product models, refurbished equipment, or products scheduled for either end-of-life, end-of-sale, or end-of-service within 1 calendar year of the installation date shall not be used.

4. All products specified herein shall be subject to the Authority approval based on the Contractor’s ability to demonstrate adherence to the specified requirement and approval of the manufacturer’s quality process (i.e. ISO-9001).

C. Manufacturer Pre-Qualification Requirements: All new equipment provided and installed under this Contract shall be compatible with existing CTS equipment installed in field and central locations in order to perform the intended use set forth by the Authority.

PART 2 - PRODUCTS

2.1 GENERAL DESIGN REQUIREMENTS

A. CTS Ethernet equipment reliability shall be assured by installing one fully equipped, provisioned and tested “cold-standby” switch for every switch required.

B. Power sources to 1 Gb/s and 100 Mb/s CTS Ethernet equipment shall be isolated and redundant, in accordance with these Specifications and Contract Drawings.

C. Unless otherwise directed by the Authority, manufacturer’s latest hardware revisions shall be provided and installed for all specified equipment.

D. Contractor shall be responsible for all cabling between CTS and any Communications Facility equipment, including, but not limited to Ethernet cabling, SCADA alarm cabling, power cabling.

E. Install all factory provided covers and protectors onto backplane assembly.

F. Install all required CTS equipment in racks as shown on Communications Facility elevation drawings.

G. Standard Warranty and Ownership: Contractor shall ensure all remaining standard manufacturer’s warranty (hardware and software) and any other service or support entitlements for CTS equipment (for example – technical support, return material authorization, software maintenance releases) is transferred, at no cost, expressly into the Authority’s name after Contractor’s Warranty period expires.

2.2 CTS 1 Gb/s Ethernet Switches

A. Gigabit Ethernet switches shall be provided at Communication Facilities. Each location shall be equipped with 2 Gigabit Ethernet switches, a normal and a standby. The standby switch shall be identical to the normal and shall be activated by manually moving all connections from the normal to the standby.

1. Each Ethernet switch shall be hardened for temperature and humidity

2. Each Ethernet switch shall be equipped with 2 Gigabit singlemode sets of Tx/Rx optical ports.

3. Each Ethernet switch shall be equipped with 24 10/100 Mb RJ45 Ethernet ports.

4. Each Ethernet switch shall be equipped with 36 100 Mb multimode sets of Tx/Rx optical ports.

5. Unless otherwise directed, manufacturer’s latest hardware and software revisions shall be provided and installed for all specified equipment.

6. Network Ethernet Switches shall be Layer 3-capable, where applicable.

7. Contractor shall be responsible for all cabling between any communications facility equipment and end devices, including, but not limited to Ethernet cabling, SCADA alarm cabling, power cabling.

8. Install all factory provided covers and protectors onto backplane assembly.

9. All switches shall support Resilient Ethernet Protocol (REP) and other network-level-resilience protocols, where applicable for loop-free operation and mechanisms for fast convergence.
10. All switches shall be configured for device-level-resilience, where applicable for dual power supplies, stackwise, HAS, etc.

11. All switches will be managed and will require configuration for the following protocols.
   a. IEEE 802.1D
   b. IEEE 802.1Q-2011
   c. IEEE 802.1Qaz
   d. IEEE 802.1Qbb
   e. IEEE 802.3AD

12. All Ethernet switches shall be rack mountable and purchased with all hardware necessary to mount in 19 inch rack or cabinet.

13. All media converters shall be Small Form-factor Pluggable (SFP) type converters installed directly into switches.

14. All media converters used in the network shall be Gigabit SFP.

2.3 CTS 100 Mb/s Ethernet Switches

A. 100 Mb/s Ethernet switches shall be required for aggregation of local Ethernet traffic at substations and signal houses.
   1. Each 100 Mb/s Ethernet switch shall be hardened for temperature and humidity
   2. Each 100 Mb/s Ethernet switch shall be equipped with 12 10/100 Mb RJ45 ports
   3. Each 100 Mb/s Ethernet switch shall be equipped with 2 100 Mb singlemode sets of Tx/Rx optical ports
   4. Contractor shall be responsible for all cabling between CTS switch equipment and end devices, including, but not limited to Ethernet cabling, SCADA alarm cabling, power cabling.
   5. 100 Mb/s Ethernet switches will be managed and will require configuration for the following protocols.
      a. IEEE 802.1D
      b. IEEE 802.1Q-2011
      c. IEEE 802.1Qaz
      d. IEEE 802.1Qbb
      e. IEEE 802.3AD

6. 100 Mb/s Ethernet switches shall be wall mountable and purchased with all hardware necessary to mount in a wall mounted cabinet.

7. All switches shall be configured for device-level-resilience, where applicable for dual power supplies, stackwise, HAS, etc.

PART 3 - EXECUTION

3.1 INSTALLATION

A. General
   1. Any technician performing installation, test, or turn-up work on any CTS equipment shall be a Cisco Certified Network Associate (CCNA) and shall have attended the Cisco ONS15454 Installation, Test, and Turn-up Training Course (or approved Operations, Administration, and Maintenance training course). Certificates of completed training and certifications shall be provided to the Authority prior to receiving authorization to perform any Work.
   2. All equipment accessories shipped with the product and not used for installation such as installation hardware, covers, removable doors or enclosures, security keys, cables, cable connectors, fiber boots, adaptors, labels, filters, spare parts, and documentation shall be provided to the Authority.

B. Factory Installation
   1. Mount all equipment within cabinets and racks on 19 inch rails with EIA-310D Standard hole spacing.
   2. Pre-wire all circuits in accordance with these Specifications.
   3. Utilize connectorized cables for external connections.
   4. Label all connections.
      a. Transfer labels to As-Builts.
      b. Label all circuit cards.
   5. Dress all cross-connections with dielectric cable ties. Trim ties with flush-cut pliers and locate to eliminate any hazard to personnel from sharp edges.
C. Field Installation

1. Equipment may be installed in cabinets and racks prior to shipment to the Authority.

2. Cabinets shall be installed and securely bolted to the floor.

3. Cabling shall be secured to racks and cable trays using approved cable management equipment to avoid any pinching or microbends. Fiber optic cables shall be secured only with Velcro type cable ties.

4. Fiber boots shall be installed on fiber jumper connectors at connection points requiring a 90 degrees or greater bend within 6 inches of the connector.

5. Install all cables and secure to trays and cabinets with dielectric ties. Trim ties with flush-cut pliers and locate to eliminate any hazard to personnel from sharp edges.

6. All cables shall be routed in cable tray between racks.

3.2 TESTING

A. All testing shall be performed in accordance with the general requirements within these Specifications.

B. Contractor shall perform the following inspections and tests on the CTS. The Authority shall be given at least 10 days written notification prior to each test and inspection so that the Authority may be present as desired.

1. Factory Testing. Factory Testing shall be conducted on individual equipment or assembled subsystems after all mounting, installation, wiring and other activities to support turn-up are complete.

   a. Factory test configuration shall be provided, including equipment layouts, connections, and interfaces to be tested.

   b. Optical light levels for all optical ADM cards (working and protect), fiber optic media converters, or other fiber optic transmitters.

   c. If an LED lamp test function is available, perform this test and verify proper operation of all lamps on chassis, cards, or any other component of equipment.

   d. Port-to-port continuity and wiring polarity testing between DSX and fiber distribution panels and all wired or patched equipment ports.

2. Field Inspection

   a. Correct equipment quantities on-hand for installation.

   b. Equipment damage in transit

   c. Equipment, port, and cable labeling

   d. Power supply integration and mounting

   e. Cable routing

   f. Unobstructed airflow to vented equipment

   g. Cable crimps, constrictions, and micro-bends.

3. Field Test. Contractor shall perform the following field tests on all CTS equipment installed:

   a. Confirm no standing alarms were generated on any equipment during transit or installation by way of front panel LED, LCD display, or other visual check. If standing alarms exist, Contractor shall resolve and retest prior to system final acceptance.

   b. Verify and record all power connections and levels.

   c. Verify ADM fan operation and airflow.

   d. Verify software / firmware revisions match existing CTS equipment.

   e. Verify and record dipswitch positions or other physical board level settings.

   f. Verify and record all switch configuration and software settings.

   g. Power shall be removed from the primary interfaces to ensure separate and operational secondary source.

   h. Ethernet continuity testing over media converters and fiber extension links from Communications Facilities to Substations, Signal Houses, or any
other remote facility utilizing media conversion equipment over fiber optic cable.

i. Contractor shall provide sufficient resources to correct deficiencies found under the Field Testing prior to Field Acceptance.

4. Systems Integration Test (SIT)

a. Contractor shall provide qualified technical staff to support this test as directed by the Authority’s System Integration Consultant.

b. Contractor shall provide sufficient resources to correct system integration defects, found during this testing period, within 10 days after notification.

c. Contractor shall demonstrate to the Authority that all defects found under the System Integration Testing were corrected and no new defects exist.

C. Other Required Tests. Existing System, Pre-Possession, and Equipment Validation Test.

1. Display and record any standing alarms on chassis prior to any modification activity. All attempts shall be made to rectify any alarm that may adversely affect modifications.

2. Existing nodes into which new subtended rings shall be terminated, shall be tested prior to any modification or integration.

   a. Test existing chassis power input and calculate the additional estimated load from new hardware additions to ensure that the modified configuration shall still operate within published power parameters.

3. The Authority provided fiber optic cable to be installed under this Contract shall be inspected and tested prior to installation in accordance with these Specifications.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this Section will not be measured separately for payment.
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section describes the detailed technical requirements for Power Supplies and Distribution to be designed, provided, installed and tested under this Contract. See the Contract Drawings for more details on Power Supplies and Distribution. Scope of Work for the Authority Light Rail Communications System includes:

1. Design, provide, install and test Alternating Current (AC) and Direct Current (DC) power supplies for communication equipment in Communications facilities, Communication Interface Cabinets (CIC), signal houses and Traction Power Substations (TPSS) as described in these Specifications.

2. Provide and install all power distribution related cables in accordance with these Specifications.

3. Provide and install grounding for all power supply equipment in accordance with these Specifications.

1.2 REFERENCED STANDARDS

A. Institute of Electrical and Electronics Engineers (IEEE):

2. IEEE 1100 - Powering and Grounding Sensitive Electronic Equipment

B. International Organization for Standardization (ISO):

1. ISO 9001 – Quality Management Systems - Requirements

C. National Fire Protection Association (NFPA):

1. NFPA 70 - National Electric Code (herein after referred to as NEC)

2. NFPA 75 - Standard for Protection of Electronic Computer/Data Processing Equipment

D. Underwriters Laboratories, Inc. (UL):

1. UL 1778 – UL Standards for Uninterruptible Power Supply Systems

1.3 SUBMITTALS

A. Submittal format and content shall comply with the general requirements of these Specifications.

1. Manufacturer Qualifications

a. Any manufacturer differing from those specified herein shall require the Authority prequalification and approval.

b. Acceptability of the manufacturer shall be based on the manufacturer’s experience, qualifications, certifications, (i.e. ISO 9001), equipment reliability, and compliance with referenced standards, and full compatibility with the Authority’s current system.

2. Preliminary Design Review (PDR) Technical Requirements. Contractor shall include the following information as part of the PDR submittal package for the Power Supplies and Distribution:

a. Manufacturer Data Sheets for Uninterruptible Power Supply (UPS), including batteries, battery charger, transformer, transfer switch, inverter and converter.

b. Manufacturer Data Sheets for DC Power Supplies.

c. A description of the power supply for each equipment site, including:

1) Configuration including dimensions, plan and elevation.

2) Power Draw.

3) Standby Time.

4) Battery dimensions and weight.

d. Schematic diagram of UPS components including, but not limited to the AC to DC converter, batteries and battery charger, inverter, transformer, transfer switch and ground connections.

e. Drawings showing the layout and rack mounting details of the UPS equipment.

f. Detailed drawings of connections to Chassis Main Grounding Buss.
bar (CMGB) and Chassis Ground Buss bar (CGB) showing routing of ground wires and mechanical details of connections.

g. Single line diagrams for communications house/ Facility and CIC. Drawings shall show utility feeds, transfer switches, generator connections, UPS, and all power panels.

h. Calculations for each power supply demonstrating the capability of the proposed equipment to adequately serve the load demands of the connected equipment.

3. Final Design Review (FDR) Technical Requirements. Contractor shall include the following information as part of the FDR submittal package for the Power Supplies and Distribution:

a. Updated PDR information. All drawings, calculations and design shall reflect a final design.

b. Final and detailed wiring drawings ready for construction and installation.

c. Final equipment list.

d. Final equipment installation details.

e. Final cable and equipment ID.

4. Installation Plan. Contractor shall submit the following installation document for each site no later than 60 days prior to the scheduled installation activity:

a. Step-by-step plan for installing each piece of equipment, interconnecting raceway and cabling details, including estimated time required for the installation.

5. Calculations and Certifications

a. Calculations as listed in the PDR and FDR.

b. Certifications: Copy of the following certifications shall be included:

1) ISO certification for all proposed manufacturers.

6. Product Samples: Product samples shall be provided and demonstrated when requested by the Authority.

7. Test Plan and Procedures. In accordance with the format and requirements described in these Specifications, as a minimum, the Contractor shall submit the following plan and procedures to satisfy the Power Supplies and Distribution testing requirements:

a. Test program plan: Contractor shall include all the required information for the communications Power Supplies and Distribution in the Test Program Plan as outlined in these Specifications.

b. Factory and Inspection Test Procedure: Contractor shall submit a complete factory test and inspection procedure to satisfy all the requirements outlined in Article 3.2 of this Specification.

c. Field Test Procedure: Contractor shall submit a complete field test procedure to satisfy all the requirements outlined in Article 3.2 of this Specification.

d. End-To-End Acceptance Test: There is no requirement for an End-to-End Test performed.

e. System Integration Test (SIT): Contractor shall provide qualified staff to support this test as described in Article 3.2 of this Specification. SIT will be directed by the Authority.

8. Test Records: Contractor shall submit the Test Records and Results for review 1 week after the completion of each test, in accordance and format in these Specifications.

9. As-Built Documentation: Contractor shall submit complete As-Built documentation and drawings for the communications Power Supplies and Distribution, and the contents.

1.4 QUALITY ASSURANCE

A. Contractor’s design, fabrication, inspection, installation and testing shall comply with all applicable Standards and Codes as listed herein. All equipment and methods shall comply with the latest version of the standards as applicable in Article 1.2, Reference Standards.

B. Material and Workmanship Requirements:

1. All equipment provided under this Section shall be UL listed.
2. All grounding shall be in accordance with local standards, and specifications required by this Contract except as modified herein. Each piece of equipment shall be grounded in accordance with the recommendations of the manufacturer.

3. Discontinued product models, refurbished equipment, products at their end-of-life, end-of-sale, or end-of-service shall not be used.

4. All products specified herein shall be subject to the Authority approval based on the Contractor’s ability to demonstrate adherence to the specified requirement and approval of the manufacturer’s quality process.

5. Any manufacturer differing from those specified herein shall require the Authority prequalification and approval. Acceptability of the manufacturer shall be based on the manufacturer’s experience, qualifications, certifications (i.e. ISO-9001), equipment reliability, and compliance with standards specified herein, and full compatibility with the Authority’s current system.

PART 2 - PRODUCTS

2.1 GENERAL DESIGN REQUIREMENTS

A. Uninterruptible AC Power Supply

1. This type of power supply shall be utilized to provide conditioned AC power to equipment during normal operation and to provide temporary backup AC power in case of a failure of normal AC.

2. UPS shall be provided at Communications Houses and Facilities, and CICs to supply power for all of the vital systems at locations shown on the Contract Drawings.

   a. Batteries shall provide 8 hours of backup power at Communication Houses and Facilities. Redundancy shall be provided as shown on the Contract Drawings.

   b. Power supplies shall provide DC power to equipment during normal operation. All DC power supplies used for communications equipment shall receive power from a UPS power source.

C. AC Power Supply

1. AC power for the Communications Houses and Facilities shall be provided either from a Station Electrical Panel, a TPSS, or Texas Utility.

   a. One 125A circuit shall provide power to all Communications equipment at each location.

   b. AC power distribution within the Communications House and Facility shall be in accordance with Contract Drawings.

   c. Contractor shall provide and install all required cables and connections between the TPSS breaker and the Communications House.

2. AC Power for Station CIC shall be provided from the Station electrical panel and distributed as shown on the Contract Drawings.

   a. A minimum of 3 separate circuits (UPS, AC Unit, and Non-Essential loads) from the Station electrical enclosure panel shall be provided for each CIC.

   b. Contractor shall provide and install all required cables and connections between the Station electrical enclosure panel and the CIC.

D. Grounding

1. Equipment within Communications House and Facility, and CIC shall be grounded to the building CMGB and CGB respectively, independent of the power supply ground or neutral connections.

2. The safety ground for UPS and power supplies shall be bonded to the CMGB or CGB, which provides a single point earth ground.

2.2 UPS SYSTEM

A. Each UPS system shall be sized for a minimum of 125 percent of the peak load connected. The
backup time shall be for full load, or as specified for the particular site.

B. Each UPS shall include a ferroresonant transformer, battery float charger, batteries, static inverter, and microprocessor controlled switch circuitry.

1. The load shall normally be powered from the secondary of the ferroresonant transformer; the primary of the transformer shall normally be powered from one of 120/208/240 VAC, 60 Hz sources, from either a TPSS, a station electrical power panel or the Texas Utility for a Communications House or Facility, and from a station electrical power panel for the CIC.

   a. Manual bypass switch shall be provided and installed as shown in Contract Drawings for the UPS such that the load can be powered from the normal source for maintenance without service interruption.

   b. Manual AC Disconnect Switch shall be provided as shown in Contract Drawings, if it is not an integral part of the UPS, to facilitate disconnecting the equipment for maintenance service.

   c. In the event of a UPS failure, the load shall revert to the normal AC source (even if that source is unavailable).

2. The static inverter shall normally be off, but shall be switched on automatically upon detection of a failure or irregularity in the normal power input and shall then supply power to the transformer primary. The batteries shall power the inverter.

3. The batteries shall be maintained at full charge by the battery charger. The battery charger shall be powered from the normal AC source in parallel with the transformer primary.

4. The microprocessor controlled switch circuitry shall monitor the AC input and output and the DC voltage and current levels. Switching from normal to battery power and back to normal shall be automatic and shall not affect output voltage and current waveforms.

C. Each UPS system shall provide power quality consistent with the equipment connected. In addition, the UPS shall meet or exceed the following specifications:

   1. Input Voltage: 120 VAC, Nominal

   2. Output Voltage: 120 VAC, Nominal

   3. Voltage Regulation: within plus or minus 3 percent with input 96 V AC to 138 VAC

   4. Spike Attenuation: 2000:1 (up to 6000 V and 200 A)

   5. Noise Attenuation: 120 dB Common Mode, - 60 dB Transverse Mode

   6. Output Frequency: 60 within plus or minus 0.005 Hz

   7. Input AC Overload Capacity: 125 percent Rated (10 Min), 150 percent (Surge)

   8. Output Waveform Distortion: 3 percent (Max) Single Harmonic, 5 percent Total Harmonic Distortion

   9. Operating Temperature: 32 degrees F to 104 degrees F

   10. Operating Humidity: Up to 95 percent Relative Humidity (R.H.)

   11. Line Powered Efficiency: 88 percent

   12. Audible Noise: 51dB

   13. Mean Time Between Failures: 100,000 Hours

D. Transformer: The ferroresonant transformer shall provide complete isolation from input to output. It shall be rated for continuous supply of 125 percent of the maximum draw of the communications equipment with input voltages in the range 96 to 138 V.

E. Inverter: The inverter shall utilize all solid state components and be rated for 125 percent of the continuous output required such that the transformer coupled output, as specified above, shall be realized when the inverter is on. There shall be no interruption of service to the load when the inverter is switched on or off.

F. Batteries: The battery shall be a multi-cell bank composed of sealed maintenance free cells. The battery bank shall be rated to provide power to the inverter such that 125 percent of the current draw of the protected equipment can be provided upon complete failure of the AC input for a period as stated in Paragraph 2.1A.2 of this Specification. The battery life shall be at least 200 charge/discharge cycles and 10 years.

G. Battery Charger: The battery charger shall utilize all solid-state components and shall be rated to fully charge the batteries within 24 hours from a fully discharged state while the normal load is connected. The battery charger shall include automatic tapering and floating controls.
H. Microprocessor Control: The microprocessor control and switching circuitry shall continually monitor the AC input voltage, current, and frequency. If one of these parameters is outside the range where the output voltage or frequency remains within the specified tolerances, the inverter shall be switched on-line within 8 milliseconds and the AC line disconnected. If the AC input comes back within range, the inverter shall be disconnected and the AC line re-connected automatically.

I. Light Emitting Diode (LED) indications for the following shall appear on the front panel of the unit: AC Line, Ready, Charging, Battery Power, and Alarm. In addition, the following functions shall be available on a keypad with Liquid Crystal Display (LCD) that shall be mounted on the front panel of the UPS, or plugs into a diagnostics output port:

1. Meter Functions
   a. AC Volts Output
   b. AC Volts Input
   c. Battery Voltage
   d. AC Current Input
   e. AC Current Output
   f. VA Load
   g. DC Current Input
   h. Frequency
   i. Heat Sink Temperature
   j. Projected Run Time Available
   k. Log of Power Outages and Alarms

2. Alarm Messages
   a. Low Battery
   b. Near Low Battery
   c. High Battery
   d. Low Run Time
   e. Low AC Output
   f. High AC Output
   g. Output Overload
   h. Ambient Temperature High
   i. Heat Sink Temperature High
   j. Transformer Temperature High
   k. Check Battery
   l. Check Inverter
   m. High AC Input
   n. Alarm Test

3. Operating Modes
   a. Off
   b. Automatic
   c. Line Conditioning
   d. Inverter On

4. Set Operating Parameters
   a. High AC Voltage
   b. Low AC Voltage
   c. High Battery Voltage
   d. Low Battery Voltage
   e. Near Low Battery
   f. High Ambient Temperature
   g. Frequency Tolerance
   h. Battery Capacity (run time)

J. Relay Alarm Contacts. Each UPS shall include 2 sets of alarm contacts (2 NO and 2 NC) rated at 125 VDC and 1 Amp. The following outputs shall be wired to the Remote Terminal Unit (RTU) equipment, to be provided by others, at the corresponding Communications House or Facility.

1. UPS Trouble: This relay shall change state when any of the parameters listed above move beyond the pre-established range. In addition, any faults with the battery chargers, batteries, or inverters shall cause this alarm to activate.

2. Loss of Primary AC: This relay shall change state when the primary 120 VAC power is lost and reset when it is restored.

2.3 DC POWER SUPPLIES

A. Communication equipment that requires other than –48 VDC shall be provided by manufacturer recommended power supplies. Data sheets for such power supplies shall be provided with the equipment data sheets for approval.
B. The DC power supplies shall be grounded in accordance with the manufacturer recommendations and the system designer to allow proper operation of all the equipment powered by the –48VDC, including use of investigative tools or equipment (such as laptops).

C. If DC power is required, the power supply cabinet shall be equipped with a fuse panel. Each panel shall have a minimum of 8 separately fused power output positions. The fuse current ratings shall be in accordance with equipment manufacturer recommendations. The fuses shall be indication type.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Each power supply, including batteries shall be provided and installed as shown on the approved Contract Drawings.

B. All cabling from the power supplies to communications equipment and the power panel shall be routed as Authority approved and so as not to interfere with other cables or equipment.

C. All cabling from the AC breaker panel to the power supply, where both are located within the same building, shall be installed within Electrical Metal Tubing (EMT) conduit.

D. Grounding

1. General Equipment Grounding: Within each Communications Facility, and CIC, power supply equipment and racks shall be grounded to the CMGGB and CGB per these Specifications. A power source neutral lead shall not be used as a ground.

2. Power Supply Grounding: The safety ground for all UPS and power supplies shall be bonded to the CMGGB or CGB per these Specifications and Contract Drawings.

3.2 EQUIPMENT MOUNTING

A. cabinets and Racks

1. The UPS components, exclusive of batteries shall be mounted within a freestanding cabinet with removable panels (except in the CIC, where UPS and batteries shall be mounted within the CIC). The cabinet shall include a ventilation opening for convection cooling such that the unit shall operate within the specified temperature range. The cabinet shall have an enamel finish, in a color that shall be Authority approved.

2. Equipment racks for mounting 19 inch EIA Standard equipment shall be in accordance with these Specifications.

B. Battery Racks: The batteries shall be mounted in a rack, or as recommended by the battery manufacturer. The battery rack shall be made of channel steel with an acid resistant gray paint finish. The battery racks shall allow access to all battery terminals without removing batteries from the rack.

C. Power Plug Mold Strip – Equipment Cabinets:

D. Contractor shall provide the required sized and rated UL power plug mold strip in each equipment rack or cabinet. The power plug mold strip shall be powered from the UPS AC source that is shown on the Contract Drawings. The plug mold strip shall be mounted vertically in the cabinet and contain a minimum of 10 power outlets.

3.3 TESTING

A. Testing of each power supply shall be conducted in accordance with these Specifications. Tests shall verify the following:

1. Output Power Levels
2. Output Quality
3. Transfer of load to standby source.
4. DC equipment holdup in the event of single rectifier failure.
5. Backup power holdup times under full load.
6. Accuracy of all meters.
7. Proper grounding connections and levels.
8. Functionality of all alarms, indications, and controls.
PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this Section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith shall be considered incidental to the Work specified under Section 16801 “Basic Technical Requirements - Communications System.”

END OF SECTION 16879
PART 1 - GENERAL

1.1 DESCRIPTION

A. The manuals and training provided under this Section shall provide the Authority personnel with the knowledge to operate, maintain, troubleshoot, and repair the equipment provided by these Specifications.

B. Existing Manuals

1. Rail Operations Controller (ROC) Manuals
2. Applications System Management Manuals (ASMM)
3. Distributed System Management Manuals
4. Operations and Maintenance (O&M) Manuals
5. Remote Terminal Unit (RTU) Operation and Maintenance Manuals
6. Communications System Maintenance Manuals (CSMM)

C. New Work: Provide new and customized information corresponding to the Authority’s design and equipment being provided under this Contract.

D. Manuals

1. General requirements and specifications for all manuals required under this Contract can be found in these Specifications.
2. Specific content requirements for Communications and Control System elements or subsystems shall be contained in this section.
3. The information to be provided shall include all required information required for the operation, maintenance, troubleshooting, repair, and restore of the equipment and systems.

1.2 SUBMITTALS

A. Manuals

1. Preliminary copies of all manuals shall be submitted for approval no later than 90 days following Final Design Review (FDR) submittal Authority approval.
2. Final copies of all manuals shall be submitted for Authority approval. Contractor developed manuals shall be provided in an Authority approved machine-readable format. When available, manufacturer manuals and
technical data shall be provided in an Authority approved machine-readable format, suitable for microfilming. Final copies of all manuals shall also be provided electronically, in both their native software format and PDF format, complete with any associated appendices.

4. The Training Manual shall be submitted as an electronic copy prior to training for record purposes. The printed quantities for the Training Manual to be provided shall be as described in Part 2 of this Specification.

B. Training Plan. Contractor shall submit a complete training plan for Authority approval. The training plan shall include the following information:

1. A proposed schedule for each course, including syllabus for training and lesson plan
2. Resumes of personnel proposed to be instructors for each course
3. A statement of the purpose of the training
4. An overview of the subjects to be covered in each course
5. An overview of the hands-on experience to be included as part of each course
6. A list of the manuals, As-Built Documentation, and other printed materials to be utilized as training aides
7. A description of the pre-requisite knowledge for each course

C. Training Course Program. Contractor shall submit 6 copies of a complete program for each course, at least 60 days prior to the scheduled start of the course for Authority approval. Each training program shall contain the following information:

1. A detailed outline of the material to be covered in the course and the duration in hours of the training for each topic
2. Course scheduling plan to cover all shift personnel.
3. Copies of all visual aides, manuals, As-Built Documentation, and other printed materials to be used during the course.
4. Detailed descriptions of the procedures to be performed by students during hands-on training, including test equipment to be used
5. Specific pass/fail criteria for the course, including a sample test, and a statement of the knowledge and skills students should possess at the conclusion of the course
6. Instructor Evaluation Survey

D. Training Materials. Contractor shall deliver all training materials to the Authority 5 days prior to the commencement of the associated training class.

1. Delivery location of associated materials shall be coordinated with the Authority personnel.
2. Sufficient copies shall be provided to accommodate all class attendees as well as auditors.
3. The Authority reserves the right to duplicate all training material to accommodate additional personnel.
4. Additional personnel may be added to the attendance roster at no additional cost to the Authority.

PART 2 - PRODUCTS

2.1 CONTRACTOR FURNISHED MATERIALS

A. Contractor shall provide new custom manuals for each subsystem provided under this Contract. Specific manual volumes are listed in Sections 2.2 and 2.3 of this Specification.

B. General requirements in addition to those specified in other sections of this contract include:

1. Manufacturer’s standard O&M Manuals, documentation, and configuration software provided with each piece of equipment furnished under this Contract.
2. Manufacturer’s Contact Information
3. Manufacturer’s Basic Product Information, including:
   a. Literature describing each piece of equipment, including major assemblies and subassemblies, and giving manufacturer’s model number and drawing number.
b. Catalogue cut sheets, illustrated parts list and parts breakdowns.

4. Release notes for new revisions of any software product provided, upgraded, or modified in any subsystem.

5. Safety Procedures and Precautions
   a. Ensure safety procedures and precautions are included and highlighted.
   b. These shall include procedures and precautions required to prevent damage to equipment, injury to personnel, or unsafe operational conditions.

2.2 O&M MANUALS

A. O&M manuals shall include each make and model of equipment installed or modified under this contract.

B. Identify O&M tasks including recommended periodic maintenance, precautions to be observed during maintenance work, degree of on-line repairs, numbers, qualifications and skills of personnel, special tools and test equipment, and estimates of maintenance time.

C. Prepare O&M manuals providing detailed instruction for the operation of each system condition; maintenance and safety actions required to ensure the operational requirements of the systems, subsystems, and equipment. Identify any safety markings, tags or similar identifiers to be maintained on any equipment.

D. Prepare the O&M manuals for each system and supplement with vendor instructions and data covering the O&M of individual items and equipment provided. This includes all configuration and software documents or CDs supplied with the equipment. Use this data as the training material for the individuals tasked to operate the installed equipment and systems.

E. Include in the manuals system-level step-by-step O&M procedures to be performed by journeyman operators or technicians, and provide the following elements, as required:
   1. Complete description of all systems with data sheets, bill of materials, flow, control and electrical circuit and wiring diagrams
   2. System Operation: This information describes the system operation, including operating parameters, interfaces with other systems, major equipment, and their physical and operating characteristics.
   3. Pre-operation Checkout: Include the required steps or tasks to completely check out the system and prepare it for operation following a shutdown condition.
   4. Operator’s instructions covering startup, shutdown and all procedures required to ensure safe operation. Repeat these instructions in a durable printed notice and mount in the operator’s area.
   5. Preventive Maintenance: Describe all maintenance to be performed on a periodic basis, e.g., inspection, calibration, voltages and amperage. Prepare scheduled maintenance checklists for each unique type of maintenance significant equipment. Submit the checklists to the Authority approval prior to implementation.
   6. Fault Isolation: Describe the procedures to be followed in determining the cause of a failure or malfunction. Base fault identification on monitoring devices and visual observations. Progressively order fault isolation, with the most likely fault listed first.
   7. Maintenance: Describe all maintenance that can be performed on installed equipment, including removal, replacement, and repairs that can be performed.
   8. System Restore: Describe step-by-step procedures for complete system restore in case of a catastrophic failure. Identify any specific tools required for system restore. Provide details of all user configurable settings for each piece of equipment.

F. Organize the O&M procedures in such a manner that all required preventive maintenance activities be accomplished without interference with operations. Emphasize in these procedures accessibility, ease of equipment or component removal and replacement, visual indications of component deterioration, and localization of failures. Where practical, configure subsystems so that failed components may be removed and operable replacements installed. Minimize requirements for repair-in-place activities.

G. Provide all like assemblies having identical characteristics interchangeable without altering unit or adjacent equipment except for adjustment. Provide assemblies interchangeable without selection for fit of performance, and without modification.
H. Logistics Data:

1. Provide a logistics plan of O&M, which encompasses the following aspects:
   a. Provide the required data on requirements for O&M logistics, support and procedures. Include the following:
      1) Identification of the extent to which preventive maintenance is performed on installed equipment as opposed to corrective maintenance performed at a maintenance facility.
      2) Identification of equipment requiring special handling or unique maintenance procedures.
      3) Determination of procurement lead times based on total order and shipping time to site for critical equipment and spares, and minimum and maximum inventory requirements.
      4) Identification of O&M personnel skills levels.
      5) Identifications of training requirements.
      6) Formulate and recommend operating rules for personnel.
   b. Vendor Data: Submit the following types of data and incorporate in the O&M manuals:
      1) Manufacturers’ brochures, catalogs, charts, performance curves, and parts bulletins
      2) Complete vendor list for each system subassembly
      3) Installation, operations, and service instructions
      4) Service bulletins.
      5) Shop drawings and other special drawings such as wiring diagrams, system schematics, assembly drawings, and interconnection diagrams.
      6) Illustrated parts breakdowns.
      7) Installation drawings.
      8) Performance data, e.g., maximum, minimum, and recommended speeds, capacities, voltage, amperage, wattage, temperatures, and other related operating information.
      9) Operating procedures.
      10) Preventive maintenance and inspection requirements and procedures
      11) Emergency operating procedures
      12) Removal and installation procedures
      13) Disassembly and assembly procedures
      14) Calibration instructions, including points of application, frequency, method of calibration, and special tools required.
      15) Troubleshooting procedures.
      16) Repair and overhaul instructions.
      17) Cleaning instructions.
      18) Include industry or generic part numbers with component parts.
      19) Special tools and test equipment.
      20) Hazards from unsafe operations, emergency release/stop functions

2. Provide a list of special tools and test equipment for each equipment item, including tools and equipment designated specifically for use with the item, or usual tools and equipment required for operation maintenance of the
items but not normally available to maintenance journeyman. Include the following data on the list for each item:

a. Nomenclature
b. Purpose
c. Manufacturer's part number or drawing number
d. Manufacturer's name and address
e. Quantity recommended by manufacturer
f. Unit price
g. Recommended source of supply
h. Estimated lead-time

2.3 TRAINING MANUALS

A. The Training Manuals shall supplement the O&M manuals. The Training Manuals shall focus on guiding technicians in identifying the source of a problem to a specific subsystem and a specific replaceable element as well as identifying, and describing interrelationships and with other subsystems. References to required replacement procedures within manufacturer's manuals shall be provided.

B. Provide a printed copy of the Training Manuals for each trainee and auditor attending training classes per Part 3 of this Section.

C. The Training Manuals shall at a minimum include the following sections and information:

1. Safety Procedures and Precautions: This section shall cover safety procedures and precautions required to prevent damage to equipment, injury to personnel, or unsafe operational conditions. Items to be addressed shall include:
   a. Safety with AC Power Sources.
   b. Safety with and verification of polarity of DC sources and batteries.
   c. Electrostatic procedures for handling circuit cards.
   d. Necessity for grounding of equipment.
   e. Procedures and tests that should only be done on unpowered or de-activated equipment

2. Test Equipment and Tools: This section shall contain an overview of the test equipment and tools required to troubleshoot and maintain the system.
   a. Tests performed by each piece of test equipment shall be described.
   b. Typical values for tests shall be provided.
   c. Sensitivity ranges and polarity checks of test equipment shall be discussed.

3. Public Address/Visual Message Board (PA/VMB) Remote Components: This section shall contain a discussion on the operation and maintenance of the PA/VMB components that are included in the Communications House and at Stations. This section shall identify and describe interrelationships between other subsystems and troubleshooting methods spanning between related or dependent subsystems.

4. Communications Transmission Subsystem: This section shall contain an overview of procedures for tracing circuit continuity from end to end, isolating noise sources, measuring levels at interfaces, determining bit error rates and cleaning equipment. This section shall identify and describe interrelationships between other subsystems and troubleshooting methods spanning between related or dependent subsystems.

5. Fire Detection and Alarms: This section shall contain an overview of procedures for checking detector circuits, checking detector sensitivity, cleaning detectors, verifying operation of control panels and batteries, maintenance of fire suppression systems, verifying operation of sensors, and verifying IP Communicator interfaces and RTU interfaces to the supervisory control system. This section shall contain detailed programming and wiring information for each Fire Alarm Control Panel (FACP) provided. This section shall identify and describe interrelationships between other subsystems and troubleshooting methods spanning between related or dependent subsystems.

6. Intrusion Alarms: This section shall contain an overview of procedures for checking detector circuit, alignment and sensitivity, cleaning detector, verifying operation of detector, alarm panel, keypad and batteries, and verifying RTU interfaces.
7. Telephones: This section shall contain an overview of procedures for testing and isolating problems with all telephone equipment and circuits provided and provisioned. This section shall identify and describe interrelationships between other subsystems and troubleshooting methods spanning between related or dependent subsystems.

8. Central Control System: This section shall be processed as a supplement to the existing DART manuals providing information regarding modifications to the DART CCS and the associated RTU’s.

9. CCTV: Provide an overview of the expansion of the DART CCTV system to include the new stations.

PART 3 - EXECUTION

3.1 SUPERVISOR FAMILIARIZATION AND OPERATIONS TRAINING REQUIREMENTS

A. Contractor shall develop and provide Familiarization and Operations Training thoroughly describing the modifications and additions made to each communications subsystem.

B. Personnel and Course Composition

1. Training shall consist of at least 2 classes, each class designed for 3 operational personnel supervisors, 3 maintenance personnel supervisors, and 2 auditors [16 total personnel]. Each class shall be at least 8 hours in length, unless otherwise Authority approved.

2. Auditors shall be provided the same class materials, handouts, and access to the instructor, hands-on activity or demonstration as class participants.

C. Training Goals: The goal of the Initial Familiarization and Operations Training is to provide the O&M supervisors with a high-level understanding of the subsystems provided under this Contract, sufficient for the supervisors to perform the following functions

1. Assign maintenance personnel required for routine maintenance and troubleshooting.

2. Assist maintenance personnel with use of manuals and As-Built Documentation.

3. Evaluate actual system performance vs. intended system performance.

4. Support additions to and expansions of any new or modified subsystem.

5. Coordinate with equipment manufacturers support personnel for obtaining warranty support and troubleshooting support.

D. Topics: Training shall include familiarization with system modifications, upgrades, or additions made to the following subsystems and equipment as a result of Work performed under this Contract:

1. Updated CTS topology and functional description with emphasis on issues that may impact network maintenance. Include complete description of the Gb/s Ethernet network configuration and its interface to the existing SONET.

2. Fiber optic communications equipment including Gb/s Ethernet Network switches, 100 Mb/s network switches, VoIP gateways and routers, optical modems, media converters, data switches, power supplies, and any other communications equipment provided under this Contract.

3. Fiber optic cable, connectors, distribution panels and splicing.

4. Communications cable, interface cabinets, junction boxes and terminations.

5. Fire and intrusion alarm control panels, IP-based DACT, IP based Fire Alarm Reporting unit (DACR), sensors, and annunciation devices.

6. PA and VMB subsystem and detailed description for all stations.

7. Telephone subsystem.

8. Changes to the Central Control System and new PLC equipment.

9. Additions to the CCTV system for the new stations.

3.2 TECHNICIAN FAMILIARIZATION AND OPERATIONS TRAINING REQUIREMENTS

A. Contractor shall develop and provide Familiarization and Operations Training thoroughly describing the modifications and additions made to each communications subsystem under this Contract.
B. Personnel and Course Composition

1. Training shall consist of at least 2 classes, each class typically designed for 12 maintenance technician personnel and 2 auditors for a minimum total of 28 total personnel. Each class shall be at least 16 hours in length, unless otherwise Authority approved.

2. Auditors shall be provided the same class materials, handouts, and access to the instructor, hands-on activity or demonstration as class participants.

C. Training Goals: Initial Familiarization and Operations Training goal shall be to provide O&M technicians with a high-level understanding of the subsystems provided under this Contract, sufficient to perform the following functions

1. Perform routine maintenance and troubleshooting.

2. Identify single points of failure and restore the affected subsystem in case of a catastrophic failure or incident.

3. Become familiar with the use of manuals and As-Built Documentation.

4. Test and evaluate actual system performance vs. intended system performance.

5. Support additions to and expansions of the CTS subsystem.

6. Coordinate with equipment manufacturers support personnel for obtaining warranty support and troubleshooting support.

D. Topics: Training shall include familiarization with system modifications, upgrades, or additions made as a result of Work performed under this contract.

3.3 OTHER O&M TRAINING REQUIREMENTS

A. For equipment for which a Part Number or Model Number is not expressly specified for use in these Specifications, or if equipment is provided in lieu of that for which a Part Number or Model Number is specified in these Specifications, the Contractor shall provide both Familiarization and Operations Training as well as product or subsystem specific Operations and Maintenance Training.

B. Course Goals: Each training course shall provide maintenance personnel with the knowledge and skills required to:

1. Gain a thorough understanding of the operation of the equipment.

2. Gain familiarity with the specific components and their role.

3. Gain familiarity with drawings and other design and installation documentation.

5. Be adept at using all tools, test equipment and built-in diagnostics and monitors.

6. Be adept at performing preventative maintenance.

7. Be adept at identifying the root cause of a subsystem failure and restoring the affected subsystem in the event of a catastrophic failure or incident.

8. Gain familiarity with system safety procedures and the potential for creating unsafe conditions during operation or maintenance.

9. Be adept at performing first level maintenance (to the Field Replaceable Unit), including:
   a. Using facilities, tools, test equipment and troubleshooting strategies and procedures to efficiently recognize problems, troubleshoot equipment in the field, isolate the problem, and determine units which have failed or are operating incorrectly.
   b. Removing failed or incorrectly operating equipment from service safely and with minimal impact on continued operation of the system.
   c. Capturing and recording supporting diagnostic data to help further troubleshooting of the FRU.
   d. Planning and implementing temporary workarounds.
   e. Ensuring candidate replacement units are operating correctly, and have correct settings.
f. Installing replacement units safely and correctly, checking that the replacement unit is operating correctly, and introducing the replacement unit into the operating system with minimal impact.

10. Be adept at performing shop maintenance to the Lowest Level Replaceable Unit and including:

a. Using tools and test equipment to efficiently isolate the problem within the subject FRU, troubleshoot, and determine which replaceable unit has failed or is operating incorrectly.

b. Removing replaceable units from the field replaceable units.

c. Capturing and recording diagnostic data.

d. Coordinating with manufacturer's support staff and information centers as needed, including actions such as downloading, installing and testing new firmware.

e. Rebuilding, configuring and verifying correct operation of higher-level replaceable units; up through and including field replaceable units.

PART 4 – MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this Section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith shall be considered incidental to the Work specified under Section 16801 “Basic Technical Requirements - Communications System.”

END OF SECTION 16897
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section specifies the technical support services, materials, and equipment to be provided:

1. Maintenance Until Final Acceptance
2. Warranty and Extended Services
3. Test Equipment
4. Spares

1.2 SUBMITTALS

A. Recommended Spare Equipment Listing

1. Contractor shall submit a list of recommended spares for a period extending from installation of the equipment to 1 year of operation of the equipment following Final Acceptance.

2. The list shall include all spare parts, by manufacturer and model number that the Contractor intends to provide in accordance with the minimum spares requirements defined below. In addition, the proposed quantities, unit prices, and total prices for spares shall be provided.

3. The submittal shall also include recommendations for changing quantities of spares, adding and/or deleting items in order to meet the Authority's goals of having spares for 1 full year of operation after system acceptance. Complete descriptions, part numbers, and prices for spare equipment, recommended to be added, shall be provided.

B. Specific Spare Parts: Contractor shall provide the specific spare parts listed in this Specification.

C. Recommended Test Equipment Listing

1. Contractor shall submit a list of required and recommended test equipment and special tools for performing maintenance and trouble shooting on the communications system.

2. The list shall include itemized pricing for all test equipment and tools.

3. The submittal shall also include a list of any additional test equipment that the Contractor recommends for the long-term maintenance and trouble shooting of the system in order to meet the system Mean Time to Repair (MTTR) goals. Complete descriptions, part numbers and itemized pricing for recommended test equipment shall be provided.

D. Specific Test Equipment: Contractor shall provide the specific test equipment listed in this Specification.

E. Warranty

1. Contractor shall submit warranty information as described in this Specification.

2. Contractor shall submit point-of-contact information as described in this Specification.

PART 2 - PRODUCTS

2.1 MAINTENANCE UNTIL FINAL ACCEPTANCE

A. Maintenance

1. Contractor shall perform all maintenance on the Communication Transmission Subsystem (CTS) and all other installed subsystems, equipment and software, from the time that the equipment is installed until Final Acceptance.

a. Contractor shall maintain inventory records of all spare equipment utilized in maintenance and the replacement of spare equipment for items covered under the manufacturer's warranty or the warranty specified herein.

b. Any equipment removed from service shall be made available to the Authority for inspection prior to return to manufacturer.

2) Equipment that is removed from service and is not returned to the manufacturer for replacement or repair shall be delivered to the Authority.

2. The maintenance to be performed shall include repair and/or replacement of all communications elements that fail prior to final system acceptance by the Authority.

a. Contractor shall commence repair of any CTS component that fails within 4 hours of notification of the failure by the Authority or discovery of the failure by the Contractor's personnel. For all other equipment elements, the Contractor shall commence within 24 hours of notification of the failure by the Authority or discovery of the failure by the Contractor's personnel. Contractor shall notify the Authority immediately upon discovery of an equipment failure and shall provide written notification within 24 hours.

b. Contractor shall perform all routine and preventive maintenance and clean all
installed equipment, in accordance with the equipment manufacturer’s recommendations.

c. Contractor shall repair any equipment that is damaged by vandalism.

2.2 WARRANTY AND EXTENDED SERVICES

A. Contractor shall warrant all equipment (including spares and test equipment), materials, software, and installation Work for a period starting upon installation and ending 1 year after Final Acceptance. This period is also referred to as the “Warranty Period.”

1. Contractor shall maintain all manufacturer warranties, prior to final acceptance. Contractor shall warranty any equipment if manufacturers’ warranty runs out prior to end of the Warranty Period.

2. Where a manufacturer’s warranty extends beyond the Warranty Period, the balance of manufacturer’s warranty shall be transferred to the Authority (at no cost to the Authority) at the end of the Contractor’s Warranty Period. Contractor shall provide complete warranty documentation to the Authority upon completion of the Warranty Period.

3. Contractor shall replace or repair any item that fails, at no additional cost to the Authority, during the Warranty Period.

4. Contractor shall provide the Authority with the name, address and telephone numbers of the warranty-period firm and of the primary contact person.

B. On-Call Support. During the Warranty Period, the Contractor shall provide on-call technical support.

1. Calls initiated by the Authority between 8:00 AM and 5:00 PM Central time shall be answered within 2 hours.

2. Calls initiated by the Authority between 5:00 PM and 8:00 AM Central time shall be answered no later than 10:00 AM Central time.

C. On-Site Support

1. If during the warranty period, the Authority determines the system is not meeting the equipment reliability requirement or system availability requirement, the Contractor shall provide on-site technical support to fully understand the problems identified and to correct the deficiencies.

2. Contractor shall coordinate all Work with the Authority in order to avoid any existing warranty disqualification on any component or system.

3. Contractor shall be responsible for reinstating or otherwise providing warranty for any component or system whose original warranty has been voided due to lack of coordination.

2.3 TEST EQUIPMENT – SPECIFIC

Not Used

2.4 SPARES – SPECIFIC

A. Ethernet Switches

1. Contractor shall provide 1 spare 1 Gb/s Ethernet switch of each type provided under this contract. The Ethernet switch shall include fiber optic interface and copper Ethernet ports as equipped for each station.

2. Contractor shall provide 1 spare 100Mb/s Ethernet switch of each type provided under this contract.

B. Fiber Optic Patch Cables

1. Contractor shall provide the following equipment, which shall conform to these requirements:

   a. A total of 24 SC to SC, singlemode duplex, 1 meter length patch cables.

   b. A total of 24 SC to SC, multimode, duplex, 1 meter length patch cables.

2. Media Converters

   a. Contractor shall provide 1 spare media converter of each type for every 10 installed under this Contract.

C. Public Address (PA) Subsystem Spares. Contractor shall provide the following PA subsystem spares:

1. One audio processor.

2. Two audio power amplifiers of each type.

3. One digital signal processor.

4. One speech processor.

5. Twelve speakers with backboxes.

6. One microphone.

D. Visual Message Board (VMB) Subsystem Spares. Contractor shall provide the following VMB subsystem spares:

1. One Local Video Message (LVM) (Laptop PC) equipped with proper software to maintain, program and troubleshoot the PA/VMB system.
2. One RS-232 to RS-422 converter if applicable.
3. Two strobes.
5. Six power supplies.

E. Power Supplies Spares

1. Contractor shall provide 1 spare power supply of each voltage rating, current rating, and application power supply that the Contractor provides in accordance with these Specifications.
2. Contractor shall provide 1 complete spare UPS of each type provided in accordance with these Specifications.

F. Protected Terminal Blocks (PTB) and Modules

1. Contractor shall provide 1 spare PTB, including enclosure, of each type and size, per these Specifications.
2. Contractor shall provide 100 spare protector modules of each type provided, per these Specifications.

G. Miscellaneous

1. Contractor shall provide 1 spare CCTV camera of each type for every 20 installed. A minimum of 1 spare of each type is required.
2. Contractor shall provide spare connectorized cables sufficient for complete wiring of 1 drop and insert node
3. Contractor shall provide 1 set of spare fire alarm equipment, sufficient to completely replace the fire alarm equipment at one Communications House.
4. Contractor shall provide 1 set of spare intrusion alarm equipment, sufficient to completely replace the intrusion alarm equipment at one Communications House.
5. Contractor shall provide 1 spare intrusion detection magnetic door switch for every 10 switches installed in CICs in accordance with these Specifications.
6. Contractor shall provide 1,000 feet of 50 pair cable if 50 pair is required per design plans. The cable shall in be in accordance with these Specifications.

PART 3 - EXECUTION

Not Used
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section describes concepts and basic technical requirements for Work to be performed by the Contractor to provide a signal system. This section is applicable for cab-signaled territories by substituting “interlocking indicator” or “junction indicator” for “signal.”

1.2 REFERENCED STANDARDS

A. American Railway Engineering and Maintenance-of-Way Association (AREMA):

1. Communications and Signals Manual of Recommended Practice (C&S Manual)

B. American National Standard Institute (ANSI)

2. ANSI/ISO/ASQ Q9001 – Quality Management Systems - Requirements

C. Institute of Electrical and Electronic Engineers (IEEE)

3. IEEE Standard 1012 – Software Verification and Validation

1.3 ABBREVIATIONS AND DEFINITIONS

A. Abbreviations

1. AC Alternating Current

18. UPS Uninterruptible Power Supply

B. Definitions

1. Refer to the AREMA C&S Manual for definitions.

1.4 SUBMITTALS

A. Design Review Submittals - General Requirements

1. This subsection defines the minimum set of design reviews to be conducted by the Contractor, and the minimum information and process requirements for Authority reviews.

2. Design Review Submittals shall be submitted to the Authority and shall consist of a complete design description, including detailed drawings, specifications, and submittals of all subsystems and elements within the subsystem. Each calculation, test procedure, final drawing and submittal shall be reviewed, signed and sealed by a licensed Texas Professional Engineer. The final design document shall contain sufficient details for construction and shall be approved prior to construction.

3. The Contractor shall include in each submittal phase all materials, equipment, assembly and installation required to carry out the functions and purposes indicated in these Specifications, and to make the system suitable for the purpose for which it is intended, whether or not such materials, equipment, assembly and installation are...
specially indicated in the requirements of these Specifications.

4. The design proposed by the Contractor shall be subject to Authority approval. The Authority may disapprove the proposed design if it fails in any way to achieve the result intended by the requirements of these Specifications or is not in accordance with sound engineering principles. If the design or any portion of the design is disapproved by the Authority, the Contractor shall revise the design until it meets with Authority approval in accordance with the requirements of these Specifications.

5. No Authority approval or disapproval, or failure to approve or disapprove shall relieve the Contractor of any responsibilities under this Contract including the responsibility to provide a sound and practicable system design, suited for the intended purpose outlined in these Specifications.

6. Where requirements posed by individual subsystems, as defined in other sections of these Specifications, are different or greater than those specified in this subsection, those other requirements shall be deemed to augment the requirements specified herein. Design requirements for each submittal are further defined within the individual subsystem Specification Sections. Conceptual, Preliminary and Final Design Review packages shall each be one complete submittal sufficient to provide all the required details for construction, overall system integration, and operation.

7. Contractor shall order the designated equipment and material only after Authority approval of the PDR submittal, which includes design, calculations, operational as well as the entire product data for that subsystem.

B. Conceptual Design Review (CDR) for Signal System

1. Documentation of a conceptual design for the signal system shall include product data for all proposed products, as well as typical circuits and application logic.

2. Present the documentation with a narrative describing the system and system products. The narrative shall address any areas where problems could arise in the application of the Contract requirements.

C. Preliminary Design Review (PDR) for Signal System

1. Documentation of a preliminary design for the signal system shall be organized by equipment location and shall form the preliminary drawing set plan book for each location. Documentation shall include preliminary material reference lists/apparatus tabulations, cable plans, circuit drawings, house/case layouts and rack layouts.

2. Preliminary Design package shall be submitted after submittal and approval of the conceptual design.

D. Final Design Review (FDR) for Signal System

1. Documentation of a final design for the signal system shall include apparatus tabulations, circuits and layout drawings with completed wiring details. Documentation shall also include application logic in ladder logic format.

2. Final Design documentation shall be submitted at least 30 days prior to factory test.

E. Installation Drawings

1. Installation drawings shall include typical installation drawings modified and annotated to provide installation instructions for each installation at the location.

2. Final design installation drawings shall be submitted with the final design documentation.

3. As-built installation drawings shall be submitted with the as-built signal system drawings.

F. As-Shipped Drawings and Documentation for Signal System

1. As-shipped drawings shall include any changes to the final design for a location made in the factory test of the location. As-shipped documentation shall include printed and electronic versions of application logic for the location, and checksums of application logic.

2. As-shipped drawings and documentation shall be submitted within 15 days after completion of factory tests for the location.

G. As-Installed Drawings for Signal System

1. As-installed drawings shall include any changes made during installation and field
testing. Installation drawings shall be included in as-installed drawing packages.

2. As-installed drawings for each location shall be submitted within 15 days of completion of field tests for the location.

H. As-Built Drawings for Signal System

1. As-built drawings shall include all changes to the as-installed drawings made during the integrated testing.

2. As-built drawings shall not be accepted until all punch-list items have been cleared and all Non-Compliance Reports have been resolved.

3. If errors or other discrepancies are identified by the Authority within 1 calendar year of the Substantial Completion date, the Contractor shall correct such deficiencies and provide the Authority electronic and hard copies of all revised drawings. Contractor shall provide 2 sets of drawings. One set will show the corrections clouded. The second set shall be free of revision clouds. The revision history shall be shown on the revised drawings.

I. Software Quality Assurance Plan

1. Contractor’s Software Quality Assurance Plan (CSQAP) shall be submitted for Authority approval no later than 60 days after Notice to Proceed (NTP). The CSQAP shall be submitted for each organization, e.g., Contractor or Subcontractor, which will be developing or modifying software or firmware or application required by this Contract.

2. The submittal shall include documentation of all referenced processes, procedures, standards, practices, and forms.

J. Software Verification and Validation

1. Contractor’s Software Verification and Validation Plan shall be submitted for Authority approval no later than 60 days after Notice to Proceed (NTP). The Software Verification and Validation Plan shall be developed and apply to each subsystem which contains firmware or application software which will be developed or modified as a direct result of this Contract.

2. The submittal shall include documentation of all referenced processes, procedures, standards, practices, and forms.

3. Software verification and validation activities and actions developed under this contract shall include Authority approved applicable tasks as listed in Table 1, “V&V Tasks, Inputs and Outputs,” Clause 5.4 Process: Development, Software Integrity Level 4 of IEEE Standard 1012.

1.5 QUALITY ASSURANCE

A. Contractor shall develop and employ a Contractor Software Quality Assurance Plan (CSQAP) for Signal System firmware, software, and applications. The CSQAP shall be consistent with the provisions of Standard Specification 01450, “Quality Control”, and the CSQAP shall address ANSI/ISO/ASQ Q9001 Section 4.0. The CSQAP shall include a Contractor Software Quality Control Plan (CSQCP) that contains written procedures for performing quality control objectives stated in the CSQAP.

B. The CSQAP shall be implemented to satisfy the requirements of the Software Quality Assurance Plan as described in IEEE Standard 730. The CSQAP shall be based on the requirements for Signal System engineering, manufacturing, software, firmware, and applications, inspection and quality procedures for the design, development, testing, and installation of Signal system software.

C. Contractor Software Quality control Engineers shall have relevant, actual and verifiable software experience commensurate with the required Quality Control duties and responsibilities. Software Quality Control Engineers shall have previous working experience in both software engineering and systems quality engineering.

D. Contractor Software Quality Assurance Engineers shall be assigned to the project from the software preliminary design through system integration and final acceptance. Software Quality Assurance Engineers shall have previous working experience in both software engineering and systems quality engineering.

E. Contractor Software Quality Control Engineers shall be members of the organization’s Quality Assurance Department or division, and they shall report to management in that department or division or to the Software Quality Assurance Manager.

1.6 DESIGN INTERFACE

A. Contractor is responsible for interfacing the new design with the existing system.

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIALS

Not Used
2.2 CONTRACTOR FURNISHED MATERIALS

A. General

1. Material Requirements: Discontinued product models, refurbished equipment, or products scheduled for end-of-life, end-of-sale, or end of service within three calendars year of the installation date shall not be allowed.

2. Cables between instrument houses, cases and wayside equipment shall be:
   a. In conduit
   b. In ductbank
   c. In cable trough
   d. Any combination of the above

3. Direct buried cable is not approved for this Contract.

B. Modular design shall be used throughout the systems. Electrical and mechanical components shall be organized in plug-in assemblies wherever practical and be rack mounted. Mixing of equipment associated with 2 subsystems in 1 plug-in assembly shall not be accepted.

1. Where practical, configure subsystems so that failed components may be removed and operable replacements installed. Minimize requirements for repair-in-place activities.

2. Provide all like assemblies having identical characteristics interchangeable without altering unit or adjacent equipment except for adjustment.

C. Rack Mounting

1. All equipment and components mounted on racks shall be accessible for testing or replacement without removal of other components.

2. Design shall provide for cooling air space around all transformers, rectifiers, reactors and other heat generating devices.

3. All relays, equipment and entrance racks shall have reference test points for all voltages that are associated with the equipment installed on such racks. Reference test points shall be located at the top of racks and clearly identified.

4. Rack-mounted equipment that has a switch or switches on the faceplate shall be mounted so that the switch(es) shall not be activated inadvertently. Where the equipment cannot be located in a manner that protects the switches, covers shall be provided over the switches.

D. Electronic

1. Printed Circuit (PC) Cards
   a. PC cards shall be in accordance with these Specifications, and be housed in card files within dust-proof enclosures.
   b. Printed circuit wiring shall be organized so that wires serving the same function shall be connected to the same terminal of PC cards. PC cards containing similar circuitry and programming, where applicable, shall be interchangeable between subsystems.
   c. Design and construction of PC cards of the same subsystems shall be similar. Cards of different subsystems shall be the same design and construction wherever practicable.

2. Card Files
   a. Card file plugboards shall be registered to agree with registry of the associated PC card. PC cards shall not project beyond the front of a card file when mounted.
   b. Card files shall be installed in an enclosed cabinet designed to protect against dust buildup.
   c. Insulated cable-clamping devices shall be located on the back of the file in such a way that wires terminating in the files are installed in a neat and secure bundle, rigidly supported and protected to prevent chafing of insulation. Cabling provisions on the file shall permit wires to enter or leave the enclosure from both right and left sides. Such cabling shall not restrict access to the card file when rear covers of card files are removed.

3. Adjustments, Test Points and Visual Indications
   a. Adjustable components for electronic equipment shall be avoided by the use of required circuitry, stable components, and high-tolerance circuits. Adjustable components used to
experimentally determine correct operational settings shall be eliminated in the final design. Adjustable components shall have locking devices or be self-locking to prevent inadvertent operation, subject to Authority approval. When practical, 2 or more points of adjustment which are required during the same operation shall be located within 12 inches of each other and in such a way as to be operated by 1 person. Interacting adjustments shall not be acceptable. Replacement of a component or PC card with a spare shall not require compensating adjustments to other components or modules.

b. Test points shall be provided for checking essential voltages and waveforms and injecting test signals. Test points shall permit detection of defective PC cards and equipment modules without disconnection of wires. All test points shall be readily accessible when the equipment is in the normal operating position and be clearly labeled. Test points shall be capable of accepting probes and connectors used with test equipment such as voltmeters and oscilloscopes.

c. Where built-in indicators or meters are associated with adjustments, the adjustment point shall be sufficiently close to the associated indicator so as to be observed simultaneously by 1 person. Built-in indicators or meters shall be provided when frequent observation or adjustments are required or when portable test equipment will not provide required information or accuracy.

E. Environment

1. Physical

a. All equipment housed in instrument houses and cases shall function in accordance with the specifications and without damage within a temperature range of negative 40 degrees F to 159.8 degrees F and relative humidity from 0 percent to 95 percent, except as otherwise specified.

b. All equipment shall withstand without damage, storage conditions of negative 40 degrees F to 159.8 degrees F and relative humidity from 0 percent to 95 percent.

2. Physical – Wayside: Signal equipment installed outside of instrument housings shall be designed to operate satisfactorily in all weather conditions such as rain, snow, dirt, temperature variations and humidity variations. These conditions shall be as defined below and as determined by the climatic conditions from data published by the United States Government, National Oceanic and Atmospheric Administration for Dallas and surrounding areas. In addition, recommendations of the AREMA C&S Manual, Part 2.4.25, shall be followed to minimize condensation buildup.

3. Climatic Conditions. The following particular conditions shall be used as design guidelines and shall be considered as operational requirements. Actual localized temperatures and conditions within spaces and enclosures may be more severe than the ambient climatic conditions and the Contractor shall be responsible for evaluating these during the design effort. Additionally, the Contractor shall be responsible for advising the Authority if there are any special environmental factors to which its equipment may be sensitive that are not listed below. Contractor shall insure that no equipment damage occurs during manufacture, storage, and shipment as a result of climatic conditions which differ from those below:

a. Temperature & Solar Load:

1) Minimum ambient air temperature external to equipment: negative 5 degrees F

2) Maximum ambient air temperature external to equipment: 115 degrees F

3) Maximum solar radiation: 275/BTU/hr-ft²

4) Maximum daily temperature range: 50 degrees F

5) Average days under 32 degrees F: 38 days

b. Precipitation:

1) Maximum rainfall rate (may occur simultaneously in a
worst case wind): 7 inches /hr

2) Maximum snowfall: 12 inches in 24 hours
3) Ice: Measurable quantities: (infrequently)
4) Average Relative Humidity
   a) Morning: 82 percent
   b) Afternoon: 56 percent
   c) Max Avg: 87 percent

c. Wind:
   1) Average speed: 11 miles per hour (mph)
   2) Maximum sustained for 1 minute: 73 mph
   3) Maximum gusting: 100 mph

d. Air Contamination: The equipment shall operate as specified in the atmosphere commonly found in rail vehicle environments and the Dallas Metropolitan region. These include the following:
   1) Particulates:
      a) Average: 0.175 mg/m³
      b) Maximum: 0.324 mg/m³
   2) Ozone: 0.200 ppm, max.
   3) NO2: 0.25 ppm, max.
   4) SO2: 262 µg/m³
   5) CO: 20 ppm, max.
   6) Chloride: 13.9 mg/m³
   7) Moisture Acidity pH: 4.41

2.3 FUNCTIONAL REQUIREMENTS

A. Fail-Safe Criteria

1. Component or system failures that are not self-detecting shall not cause unsafe conditions, even if added to other failures. Any number of simultaneous component or system failures attributable to the same cause or related causes shall not cause unsafe conditions. Any component or wire becoming grounded or any combination of such grounds shall not cause unsafe conditions.

2. Vital signal equipment and the circuit design proposed for this Contract shall have a minimum in-service operation history of 5 years in the United States. Certification shall be provided showing installed dates and locations.

3. All vital repeater relay circuits shall be designed on the cascade principle. Paralleling of vital repeater relays shall not be permitted.

4. Repeater relay contacts shall be assigned so safety shall not be compromised by a failure of any repeater relay to energize.

B. Unless otherwise specified, the signal system and signal equipment shall perform functions and requirements that include the following as a minimum:

1. Locking shall prevent unsafe switch operation and prevent the clearing of signals for opposing or conflicting routes. The types of locking to be provided are as follows:

   a. Approach locking shall lock all switches within a route governed by a cleared wayside signal when a train is occupying or has occupied
the approach limits to such signal while the signal is cleared.

1) Approach locking shall prevent clearing of wayside signals for opposing or conflicting routes for a predetermined time after a cleared wayside signal has been reset to stop, unless the approach to such signal is unoccupied. Approach locking shall not be reset by the loss of shunt of a train occupying the approach.

2) Approach locking shall also prevent simultaneous clearing of 2 opposing signals within the interlocking. Approach locking shall be provided for all controlled signals.

3) Approach locking shall be released without operation of the timer by acceptance of a cleared route by a train occupying the first 2 track circuits of the route.

b. Time locking shall be provided for electric lock hand operated switches within a route governed by a cleared wayside signal. Opposing or conflicting routes shall be locked until released by TCC or the local control panel. Time locking shall also prevent simultaneous clearing of 2 opposing signals. One time locking relay shall be provided for each wayside signal and electric lock. Time locking shall not be compromised by loss of power.

c. Route locking shall lock switches within a route after a train has accepted the wayside signal governing such route and shall prevent clearing of conflicting or opposing signals. Route locking shall also lock switches outside the route when required by the route-selection system.

d. Detector locking shall lock switches within the limits of a track circuit when such track circuit is occupied. It shall also lock any switches that could be fouled by train occupancy of an adjacent track.

e. Switches at interlockings shall be locked by approach locking, time locking, route locking and detector locking.

f. Switch locking shall be released when approach or time locking, route locking and detector locking are released.

g. Route locking circuits shall be designed with sectional switch release. Such design is required to release each switch after the final axle of a vehicle has cleared the detector locking track circuit.

h. Traffic locking prevents clearing of opposing signals into a section of track. Individual traffic locking circuits shall be provided for each section of track between signaled interlockings. Simultaneous opposing requests shall not prevent setting of traffic.

i. Direction of traffic shall be locked on a section of track over which traffic locking is provided when any track section is occupied, or when traffic direction is requested into that track section or when approach or time locking is effective for a signal which had been cleared into that track section. Once established, traffic direction shall remain in the last established direction until unlocked and a call is made requesting entrance from the opposite end.

j. A signal governing movement into a section of track for which traffic locking is effective shall not clear until traffic direction has been established and locked in the direction of movement and the individual traffic logic in each location is set in proper alignment for that direction of traffic.

k. Clearing of Automatic Block Signal (ABS) shall be controlled by the direction of traffic. ABS signals shall not clear until traffic relays for the proper direction are energized.

2. Switch Control and Indication Requirements

a. Switch operating circuits shall cause track switch movements to operate when locking is not in effect.

b. Switch correspondence circuits shall indicate correspondence
between switch position and switch request. One normal and one reverse switch correspondence circuit shall be provided for each turnout or crossover track. Switch correspondence circuit shall be energized when the position of the switch points, motor/hand selector lever locked in motor, and as indicated by the switch repeater circuit agrees with the switch request as produced by switch control circuits. Any switch not in correspondence shall cause the signal(s) governing movement over that switch to be red.

c. A switch blocking circuit shall be provided for each switch within an interlocking. The block shall be initiated from TCC and the local control panel. This block shall be vitally interfaced with switch and signal circuits to prevent operation of such switch when blocking is in effect.

3. Entrance-Exit System. The following functions shall be performed as part of the non-vital entrance-exit system at TCC and on the LCP:

a. Route initiation shall respond to a route entrance request and indicate all available exits. Available exits shall be flashed at the signal pushbutton for such exits. Logic shall permit pocket signals to be selected as exits. Pocket signals shall be entrances when the signal button is pressed while there are no other entrances initiated.

b. Where applicable, through routing shall be provided at adjacent interlockings. This function shall combine multiple routes with a single entrance/exit selection.

c. Completion of the route request shall determine positions to which track switches are to be called. Route completion line-of-lights shall respond to entrance and exit point designations produced by the route initiation. Route completion also shall select proper switch control and signal clearing circuits.

d. Switch control circuits shall call track switches to the required position and energize switch operating circuits.

e. Switch indication circuits shall indicate switch point position. Switch indication circuits shall flash the position indication when switch is not in correspondence. Such indication shall be provided for all powered and hand-operated switch locations specified in Contract Documents.

4. Automatic Mode Operation

a. Automatic mode shall allow override by:

1) LRT vehicle operator selecting a train route via TWC through train destination.

2) TCC Command when Local Control is not selected.

3) LCP Switch when TCC Control is not selected.

b. TCC shall have provisions to override TWC established route.

5. Signal Control and Indication Requirements

a. Route check circuits shall be provided to initiate signal clearing for each signal that governs movement over a track containing a track switch. A route check circuit shall be energized to initiate wayside signal clearing only when track switch positions correspond to positions required for the selected route, opposing signals have not been called and no conflicting movement is in progress.

b. Signal clearing shall be effective for the route called when the proper route check circuit is energized and approach, time, or traffic locking for an opposing route is not in effect. For signals that do not govern movements over track switches, signal clearing shall be initiated directly from the entrance point provided an opposing signal has not been called and an opposing train movement is not in progress.

c. Signal indication circuits shall indicate and distinguish between a signal being called, the same signal being clear and such signal being in time locking.
BASIC TECHNICAL REQUIREMENTS - SIGNAL SYSTEM

d. Fleeting Circuit Requirement

1) Fleeting circuits shall automatically re-establish energy to the signal clearing circuit, after train passage, whenever the control button for a signal has been placed in the fleeting position. Fleeting shall be provided for normal and reverse direction of traffic.

2) When a signal has been fleeted, it shall not re-clear until the circuit requirements are met as defined by control lines.

3) Canceling the fleeting feature shall not cancel the route.

e. Signal Blocking Circuits shall be provided for each interlocking signal. Blocking circuits shall be initiated from TCC and the LCP. Signal exit block circuits shall be interfaced with vital home relay circuits to prevent an exit at the signal selected and interfaced with nonvital circuits to prevent a preliminary exit indication at the signal selected.

f. Call-on Routes

1) A call-on signal shall allow a train to enter any section within the interlocking or junction that is already occupied by another train to enable coupling and shall permit 2 trains within a single track circuit.

2) Call-on routes shall only be available if the approach section is occupied.

3) Call-on routes shall be available for 1 signal at a time and only if the requested route has been previously established.

4) Call-on routes shall be available for the over-the switch (O/S) and exit track circuits.

5) Call-on’s shall be initiated by request from the operator to the TCC dispatcher or from the LCP.

TCC shall be able to set call-on routes for any occupied section within the interlocking or junction.

6) Call-on routes shall also be able to be set from the local control computer. Only parallel routes shall be allowed through the interlocking or junction when a call-on is lined.

7) Conflicting routes shall not be permitted through the interlocking or junction until the section is cleared.

6. Repeater circuits shall be provided as required. Circuit design utilizing repeater relays shall use accepted design practice and shall be subject to the Authority's approval. Home signal circuit design shall use the last repeater for all front contacts and the primary repeater for back contacts.

7. Switch lever and switch movement repeater requirements:

a. Auxiliary switch operation shall establish a call for a switch position.

b. Switch repeater circuits for switch-and-lock movements shall indicate the normal or reverse position of the track switch. One normal and one reverse switch repeater circuit shall be provided for each crossover or turnout. The normal switch repeater circuit shall indicate when the switch-and-lock movement is mechanically locked in the normal position and the point detector contacts correspond to proper normal switch point closure. The reverse switch repeater circuit shall indicate when the switch-and-lock movement is mechanically locked in the reverse position and the point detector contacts correspond to proper reverse switch point closure. If the switches are not in the locked normal or locked reverse positions, the circuit shall be shunted. When the switch repeater circuit is controlled by multiple switches of a crossover, all switches shall be mechanically and electrically locked in a normal or reverse position before switch repeater circuits can be energized.

c. Switch correspondence circuits shall be separate from switch
repeat circuits and indicate when position of the switch in the field is in agreement with the requested position.

d. Switch overload circuit shall protect each switch-and-lock movement by using a switch overload stick relay. Provide 1 overload stick relay for each switch machine. Overload circuit shall remove energy from a switch-and-lock movement if the operating current rises above the desired maximum due to a stalled switch or other overload. Once the overload has occurred, energy shall remain off until the switch call is canceled or the switch is called to the opposite direction. Where an electronic switch controller is allowed, all motor power to the electronic switch controller shall be controlled by a Vital Switch Control Relay, (VWCR) designed to break power through its heel/front heavy duty contacts for normal and overload operation.

8. Other circuit requirements shall include, but not be limited to, the following:

a. All timed circuits shall have their total adjustment time effective in switch locking.

b. Circuits shall be so arranged that a momentary loss of shunt for 5 seconds or less shall not cause flashing of proper cab signals or permit release of electric locking.

c. Circuits shall be so arranged that when cab signals or indicators are changing aspects, no other signal or code shall change or appear to change required code or aspect.

d. Cab signals shall progressively upgrade.

e. All nonvital circuits and those vital circuits which are entirely within 1 housing may be single-wire, single-break type. All other circuits shall be double-break.

f. Interlockings shall be provided with track circuits on all tracks and with no "dead" sections within the interlocking limits. Virtual track circuits shall not be used.

9. Circuit nomenclature shall be as designated in the Contract Drawings and be consistent with existing Authority signal practice, as shown on Contract Documents.

10. All vital and nonvital relay circuits shall be protected by ground detectors.

11. Primary power for all communications equipment within each signal house including RTU’s, media converters, Ethernet switches, etc. required to ensure communication of Signals, SCADA or Fire Alarm subsystem status to the Control Center shall be extended from a UPS or battery system. When the AC supply is interrupted, the UPS or battery backup system shall supply the RTU with the required power for a minimum of 8 hours.

PART 3 - EXECUTION

Not Used

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The payment for this Work, as specified, shall be full compensation for providing and installing the signal system complete in place including finalizing design, shop drawings, submittals, testing, and inspection, and for all Work as described in the Contract Drawings and in this Section and related Specifications sections; and for all operations, materials, tools, labor, equipment and incidentals required to complete the specified Work.

4.2 PAYMENT

A. The Work described in this section will be paid as a lump sum.

END OF SECTION 16901
SECTION 16902
BLOCK DESIGN CRITERIA - SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

A. The Work to be done under this Section shall include verification of the safe braking and headway design of the signal system with normal and reverse traffic direction capability. Contractor’s verification shall include applicable signal system components, including block signals, interlocking indicators and signals, and speed limit signs.

1.2 REFERENCED STANDARDS

A. Dallas Area Rapid Transit (DART) Light Rail Project Design Criteria Manuals
   1. Volume 2: Systems Design

1.3 SUBMITTALS

A. Contractor shall submit details of the software proposed for block design analysis for the Engineer approval. The software details shall include a program description, formulas used in the program, and sample input and output data.

B. Contractor shall submit a Preliminary Block Design Analysis for the Engineer approval and then as required by completion of track design and finalization of civil data. Analysis shall be finalized as the civil design of each line section alignment is finalized.

1. Contractor shall perform block design and headway analyses and verification using the approved program and submit the analyses. Submittals shall include all program input data.

2. The Block Design shall be an iterative process, in that the Contractor shall ensure that the design satisfies the design criteria throughout the duration of the Contract. Contractor shall ensure that the actual conditions that comprise the basis for the design are included in the design. As such, the design shall not be considered complete until analysis has been performed using final design alignment data and the design has been approved by the Engineer.

C. Contractor shall submit Control Line Diagrams in the format similar to the Contract Drawings at a scale of 2000 ft per sheet. The Drawings shall be updated as the design progresses and shall be confirmed in the Field Testing.

1.4 QUALITY ASSURANCE

Not Used

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIALS

Not Used

2.2 CONTRACTOR FURNISHED MATERIALS

Not Used

2.3 FUNCTIONAL REQUIREMENTS

A. Contractor shall analyze the Signal System block design and layout as shown on the Contract Documents and latest version of the required line section track plans. Contractor shall use analysis to determine final speed limit sign locations, signal control lines, and final track circuit boundaries. Contractor shall determine the speed codes to be transmitted to maintain safe spacing between following trains at the highest operating speed consistent with braking requirements.

B. All design details, such as track circuit boundaries, signal control lines, interlocking charts, signal aspects and speed sign locations to be utilized in each block shall be submitted to the Authority for review and approval before proceeding with the Work.

C. The design shall provide required headway for following moves for normal direction of traffic. Reverse operation on either mainline track shall be designed for maximum attainable headways for reverse signals located at normal-direction signal locations. Reverse headways shall be calculated and submitted to the Authority.

D. The block design shall include such track circuit boundaries as may be required for safe braking distance at maximum design speed, to maintain design headway, for crossbonding, for the initiation of crossing warning systems, to denote stations and for the operation of interlockings.

E. Contractor’s block design verification effort shall include analysis of the efficiency of the design and shall include recommendations of possible methods to increase MAS and throughput for the system.

F. Speed Limits

1. Maximum design speed in either direction on either track shall be 65 mph.

2. The speed limit in all station platform areas shall be 25 mph. For calculations, maximum allowable speed (MAS) approaching stations shall be considered according to the speed of a train applying full-service braking to the 25 mph limit, except where there is a mandatory station
stop. Where a station stop is mandatory, MAS shall permit sufficient braking distance for a worst case train.

3. Speed limits for curves shall apply to adjacent spirals as a linear progression from the MAS at the entrance to the spiral to the curve speed restriction at the entrance to the fixed curve section. Speed restrictions for track curves shall be calculated using a full-service brake rate.

4. To optimize performance and minimize run time, the speed restrictions through spiral portions of curves are calculated to establish detection criteria so that speed code reductions are made as close to the restriction as possible. Calculations are made to release the train as soon as the rear of the train reaches a point in the exiting spiral where the calculated speed restriction corresponds to the next higher speed command.

G. Vehicle Criteria: For direct requests for additional detailed information contact the Authority.

H. Brake System Characteristics for Calculations

1. Power removal time is defined as the time required for on board equipment to recognize that a penalty stop sequence has been initiated by the train passing over an active train stop and to remove power from the vehicle traction motors through train line controls.

2. Mode change dead time is the maximum time it takes for the vehicle control equipment to change between control modes, i.e. change from power mode to brake mode. During the mode change time the vehicle will be assumed to travel at a constant velocity.

3. Brake build up time is the interval required for the brakes to build up to full brake rate. The design shall assume during this time period the vehicle travels at constant velocity.

4. The design brake rate shall be adjusted for worst-case adhesion conditions.

5. Safe Stopping Distance Calculation

   a. The braking rate shall be based on an application of the friction disc brake system applied in a modified emergency mode. Block length shall be based on the braking distance calculated using the friction brake rate adjusted for rail adhesion and safety factors.

   b. Safe Braking Distance for determination of proper speed codes shall be based on a braking model that simulates the worst case braking effort. The model shall simulate braking as a series of consecutive events, defined as follows:

   1) Primary Reaction Distance – The distance traveled by a vehicle at the initial velocity as it crosses a block boundary. The distance is that traveled through the “dead” section where a valid code may be unavailable. The initial velocity to be used is the previous speed code plus the overspeed tolerance of the vehicle cab signal equipment. In the model, acceleration due to downhill slope should be considered.

   2) Code Recognition Time – The worst-case period that the vehicle equipment would take to recognize a valid speed code. Assume the vehicle is speed-maintaining through this period. Include acceleration due to downhill slope.

   3) Runaway Acceleration – Assumes a propulsion system control failure that sends the vehicle into full acceleration at the maximum available rate adjusted for grade. The runaway acceleration occurs for the duration of the Overspeed Detection time.

   4) Mode Change Time – The time for the vehicle equipment to remove power and initiate a brake command after an overspeed has been detected. During this period, power is removed and acceleration force of grade is included.

   5) Brake Build-up Time – The time from the initiation of braking until full deceleration is achieved. During this period, braking shall be calculated as a
6) Constant Braking – When the brakes have built up to maximum deceleration, the braking model shall complete the braking at a constant brake rate adjusted for grade. Final stopping point shall include allowances for vehicle overhang and track circuit characteristics.

c. Safe braking calculations shall be made using each possible consist of 1 to 4 LRVs, and the calculation that produces the longest safe braking distance shall govern the design.

I. Safety Requirements: The distance between the front of a worst-case train and the rear of the train that it is following shall always be greater than the distance required for the worst-case train to stop before reaching the train it is following. The distance between the front of a worst-case train and an interlocking signal displaying a stop aspect, when time locking or approach locking is not in effect shall always be greater than the distance required for a worst-case train to stop before reaching the interlocking signal. For such calculations, it shall always be assumed that the worst-case train is approaching a stationary train.

J. Location of Block Boundaries

1. Block boundaries and track circuits shall be located to ensure compliance with safety.

2. Block design shall permit required negative traction power return bonding and crossbonding. Track circuit boundaries shall be located adjacent to Traction Power Substations (TPSS).

3. Track circuits shall be provided for each station platform area, with circuit boundaries located so that that occupancy of the platform track circuit with adjacent circuits unoccupied provides an indication to the control center that a train is berthed, or nearly berthed. Track circuit boundaries shall be as near the platform ends as is practical. In no case, shall the boundary be near enough that an adjacent circuit is shunted with a train in the platform. The local control panel shall not display track circuits extending through grade crossings. If necessary, provide insulated joints to define the platform area.

a. Maximum authorized speed (MAS) over the platform track is 25 mph. The platform MAS command shall be maintained until the train exits the platform track circuit.

b. Except where the platform track circuit is used in a crossing approach thus requiring a mandatory station stop to satisfy minimum warning time or preemption time to the crossing, speed commands for track circuits approaching the platform track shall be designed with alignment MAS available. Where a station stop is mandatory, MAS for track circuits approaching platform track shall provide sufficient braking distance for the worst-case train to the near edge of crossing.

c. A speed limit sign shall be placed at the location for a train approaching at MAS to slow to 25 mph by the near edge of platform at a full-service brake rate.

4. Speed Restrictions

a. The block design shall include B-points or block boundaries in the approach to near-side stations and terminal stations that will cause speed codes to bring trains to a stop at the proper berthing locations.

b. B-points or block boundaries shall be used to slow trains for civil speed restrictions where a separate track circuit is not required. The initiating point of any speed reduction shall be optimized to be as near to the restriction as is safely possible. B-points or block boundaries shall be provided to allow trains exiting speed restriction zones to accelerate to the maximum allowable speed as soon as the rear of the train clears the speed restriction.

c. The signal system shall allow for defining and adjustment of speed codes of individual track circuits within a block. The endpoints of any track circuit controlled from a particular CIH shall be shown on the local control panel of that CIH.

5. Block boundaries shall ensure that any train traveling at MAS, and brought to a stop by an occupancy or interlocking signal at STOP, shall receive at least 1 non-zero speed command less than MAS prior to
arriving at a track circuit with a zero code. Braking profiles from MAS speeds greater than 40 mph shall contain at least 2 non-zero speed commands less than MAS.

6. Speed limit signs shall be used where civil speed restrictions are not enforced by the cab signal system.

K. Headway Analysis

1. The system design shall support a 2-1/2 minute scheduled operation in the Central Business District (CBD). Design headway for operations into the CBD and through junctions shall be 90 seconds. Design headways for all other sections shall be 180 seconds.

2. Headway analysis shall be determined using a 20 second dwell time for station stops.

3. The headway design analysis shall assume that every train stops at every station.

4. Exceptions to the design headway criteria shall be subject to the Authority’s approval.

L. The signal system shall be optimized at terminal interlockings to provide best achievable headway.

PART 3 - EXECUTION

3.1 PRODUCTION

A. Contractor’s final block design shall conform to the design criteria and train protection requirements as herein specified.

3.2 DELIVERY STORAGE AND HANDLING

Not Used

3.3 INSTALLATION

Not Used

3.4 TESTING

A. Field tests of block layout and train protection circuits and equipment shall be in accordance with these Specifications.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this section will not be measured separately for payment.

END OF SECTION 16902
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section describes concepts and basic technical requirements for the wayside Cab Signal system.

1.2 REFERENCED STANDARDS

A. American Railway Engineering and Maintenance-of-Way Association (AREMA)

1.3 DEFINITIONS

A. Definitions
   1. Refer to the AREMA C&S Manual for definitions.

1.4 SUBMITTALS

A. At least 30 days prior to the Conceptual Design Review, the Contractor shall submit drawings showing the physical characteristics, ratings, and operating characteristics for the proposed Cab Signal equipment.

B. At least 30 days prior to the Preliminary Design Review, the Contractor shall submit the following for approval:
   1. Drawings for Cab Signal transmitters and associated equipment with a bill of materials.

C. Contractor shall submit Test Procedures and Results in accordance with Section 16998, "TEST AND INSPECTION."

D. Prior to Field Testing of the first Audio Frequency (AF)/Cab Signal track circuit, the Contractor shall furnish 15 manuals describing operation and maintenance of Cab Signal equipment.

1.5 QUALITY ASSURANCE

A. Cab Signal equipment shall be manufactured and installed in accordance with the Contractor’s Authority approved Quality Assurance program. Cab Signal Equipment shall be tested according to Authority approved test procedures.

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIALS

Not Used

2.2 CONTRACTOR FURNISHED MATERIALS

Not used.

2.3 FUNCTIONAL REQUIREMENTS

A. Contractor shall supply a system to provide Cab Signals using equipment that is fully compatible with the Light Rail Vehicle (LRV) carborne Automatic Train Protection (ATP) equipment. Cab Signals shall transmit speed codes using a fixed frequency that is on/off modulated at specific rates.

B. Cab signal and track circuit system frequencies, modulation methods and modulation coding shall be non-proprietary. Contractor shall not introduce any element to the wayside/vehicle interface that could be considered proprietary. Contractor shall make full disclosure of any and all details, including tolerances necessary for others to correctly decode or produce Cab Signals.

C. Cab signals shall provide the following speed codes at frequency and modulation rates defined by the carborne ATP Equipment supplier:
   1. 0 mph.
   2. 10 mph.
   3. 15 mph.
   4. 20 mph.
   5. 25 mph.
   6. 30 mph.
   7. 35 mph.
   8. 45 mph.
   9. 55 mph.
  10. 60 mph.
  11. 65 mph.

D. The absence of code (No Code) in the CAB Mode of Operation shall be interpreted by the Carborne ATP equipment as a failure.
E. The Cab Signal generation equipment shall operate within the tolerances established by the carborne ATP equipment supplier.

F. Except for the special cases of Cab Signal Loops.

G. Cab Signals shall be applied to the exiting end of an associated track circuit.

H. Speed codes on each track circuit shall be as required by Section 16902, “Block Design Criteria” and Authority approved Control Line Drawings.

I. The carborne ATP equipment will reject any Cab Signal less than 75 mA. The Cab Signal generating equipment shall ensure that valid Cab Signals are above the minimum threshold accepted.

J. A single cable pair to each impedance bond shall be used for speed code frequency transmission on track circuits across the impedance bond. Contractor shall provide multiplexing and/or coupling devices as well as Cab Signal Loops as required. Frequency selection shall ensure that the combined signals do not interfere or cause interference with the operation of any other equipment.

K. Except for the special cases of Interlockings and Insulated Joint locations, speed codes shall be transmitted in the rails only when the track circuit for which it is intended is occupied.

L. At locations where the entrance boundary is equipped with insulated joints, the Cab Signal speed code shall be applied when the advance track circuit is occupied.

M. Apply Cab Signal speed codes inside interlockings when a track circuit in advance to interlocking boundary insulated joint is occupied. Apply valid speed codes to all track circuits or Cab Signal Loops in the route where a valid route is established.

PART 3 - EXECUTION

Not Used

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The payment for this Work, as specified, shall be full compensation for providing and installing the signal system complete in place including finalizing design, shop drawings, submittals, testing, and inspection, and for all Work as described in the Contract Drawings and in this Section and related Specifications sections; and for all operations, materials, tools, labor, equipment and incidentals required to complete the specified Work.

4.2 PAYMENT

A. The Work described in this section will be paid as a lump sum

END OF SECTION 16903
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section specifies the producing and providing of Signal System drawings. It describes the general format of drawings, types of drawings and the manner in which information shall be displayed on such drawings.

1.2 STANDARDS

A. DART Design Criteria Volume 3: Drafting (CADD) Standards Manual

1.3 SUBMITTALS

A. Submittals shall be in accordance with the requirements of these Specifications

1. Submit plans produced using Microstation software.

1.4 QUALITY ASSURANCE

A. The Contractor shall inspect drawings for form and content prior to submittal. Points to be checked shall include the following:

1. Conformance to the Authority Drafting Standards.
2. Conformance to Specifications.
3. Logical grouping and arrangement of subject matter.
4. Accuracy
5. Legibility
6. Neatness
7. Line Quality
8. Lettering Quality
9. Reproduction Quality
10. Inclusion of contract specified interfaces with related contracts.

B. The Authority will review drawings for conformance with the criteria listed above.

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIALS

A. None

2.2 CONTRACTOR FURNISHED MATERIALS

A. The types of drawings to be provided shall be as defined herein and in the Authority Drafting Standards.

1. Standard Abbreviations
2. Standard Signal Aspects and Indications
3. Material Reference List
4. Cable Assignments in Ductbanks: Provide drawing showing ductbank cable assignment including how cables are assigned to each duct.
6. Route and aspect charts.
7. Interlocking Track Circuit Drawing. Show all terminations and all transformer, relay and track connections.
8. Track Circuit Repeater Drawings
9. Line Circuits
10. Traffic Circuits
11. Signal Control Circuits
12. Route Check Circuits
13. Approach and Approach Stick Circuits
14. Route and Switch Locking Circuits
15. Signal Lighting Circuits
16. Train Stop Circuits Wayside
17. Switch Correspondence and Switch Repeater Circuits
18. Switch Control Circuits
19. Alternating Current (AC) and Direct Current (DC) Ground Detector Circuits
20. Supervisory Control System (SCS) Control Circuits
21. Non-Vital Signal and Switch Initiation Circuits
22. Non-Vital Switch and Signal Completion Circuits
23. Non-Vital Automatic Routing Logic Circuits

24. Local Control and Train Control Center (TCC) Control Circuit Drawings

25. Local Control and TCC Indications Circuit Drawings

26. Local or TCC Control Transfer Drawings

27. Entrance Rack Drawings

28. Signal Power Distribution Drawings

29. Relay Rack Drawings / Vital Processor Rack Drawings

30. Miscellaneous Rack Drawings

31. Wayside Cases Rack Layout Drawings

32. Wayside Cases Schematic Drawings

33. Signal Grounding System

34. Train to Wayside Communications (TWC) Circuit Drawings

35. Control Line Diagrams: Show single line representation of the tracks with stationing of all items relevant to the signal system. Drawings shall include:
   a. Insulated joints
   b. Signal equipment enclosures
   c. Automatic Train Protection (ATP), B-point and TWC Loops
   d. Speed restrictions
   e. Switch points
   f. Stations
   g. Signals and indicators
   h. Highway crossings
   i. Bridges, tunnels and structures
   j. Approach limits, average speed and calculated warning time for highway crossing warning systems. Show limits of advance approach sections
   k. Limits of approach locking
   l. Approach circuits for route requests
   m. Track circuits
   n. Indications of route indicators with control limits for each indication
   o. Civil and operating limits and maximum speed limits
   p. Maximum allowable speed commands
   q. Speed commands for each route and for each following move possible for each route
   r. Operations and Maintenance (O&M) signs
   s. Timer settings for any delay applied to an approach circuit

36. Input/Output Charts: The drawing shall include charts for all vital and non-vital inputs and outputs.

B. All equipment rack drawings:
   1. At bottom of each device shall be the part reference number.
   2. At top of each device shall be page number for schematic drawing of the circuit.
   3. Each relay contact shall show page number where the contact is used.
   4. Each relay contact shall show by shading when in use and when not.
   5. All resistors shall show reference number, size and page number where used on schematic drawing.

C. Application Logic
   1. Logic shall be documented in ladder logic format.
   2. Logic shall be bound for each processor.
   3. Each logic listing shall include annotation briefly describing the function of each variable and named bit used in the logic.
   4. When a logical name is an acronym, the definition shall be noted.
   5. Each type of logic shall be annotated with the logic type and basic function.

D. Each circuit drawing shall include a track layout at the top of the page showing all signals
switches, and track circuits relating to the circuits on that sheet.

E. Basic Drawing Format Requirements

1. Each drawing shall be of a standard size. Any other size drawing shall require the Authority approval.

2. Drawings shall not be crowded or cluttered, and shall be easily readable. Circuitry shall be presented on the drawing with a minimum of crossed or offset lines.

3. All symbols and circuit nomenclature shall conform to that indicated on Contract Drawings. Any additional symbols or nomenclature needed shall be submitted for Authority approval.

4. Single line Track and Signal Plans shall identify the starting point and show the effective distance of all approach locking and Automatic Highway Crossing Warning (AHCW) system approaches.

5. Complete circuits shall be shown on each drawing insofar as possible. A minimum of circuit continuations shall be used. When continuations are used they shall be clear and specific and include the identity of the continuation sheet.

6. Local circuits shall be drawn with relay coils, timers, motors, or other operated devices shown near the right or left border of the drawing wherever practical. Where there is a choice the right border shall be favored. Contacts in circuits shall be laid out in geographical succession insofar as possible.

7. Line circuits shall be arranged to geographically match the track layout. On line circuit plans, only line circuits shall appear on the right and left sides of the drawing. Relay contacts shall be lined up one below the other insofar as practicable.

8. Relay nomenclature shall be printed in three lines, as follows:

<table>
<thead>
<tr>
<th>Top - Rack No. and Position:</th>
<th>(7A6)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Middle - Name Identification:</td>
<td>2N</td>
</tr>
<tr>
<td>Bottom - Function Description:</td>
<td>ASR</td>
</tr>
</tbody>
</table>

9. Relay nomenclature and rack location shall appear above the relay coil or contact symbol.

10. Stick contacts shall line up under the coil of controlling relay.

11. A minimum distance of 0.20 inch shall be maintained between lines representing circuit wiring. Lettering or printing shall be at least 0.10 inch high. All spacing shall be in multiples of tenths of inches.

12. All Track and Signal Plans shall show the survey station for all wayside signals, interlocked and non-interlocked track switches, track circuit cut sections, switch locks, signal housings and wayside cases.

13. Schematics and circuit drawings shall accurately depict the actual connection and termination arrangements. Arrangement of circuitry shall be in such a manner that no more than two wires shall be shown connected to a single terminal or contact pin. A uniform method shall be used to indicate the actual location of double wire connections when it is not desirable to show both wires at the point of termination.

14. Contract Drawings included with these Specifications do not dictate the location of double wire connections, but shall guide the Contractor insofar as circuitry, symbols, lettering and drawing layout are concerned.

15. Circuit drawings shall provide sufficient information by means of contact type, terminal numbering and relay location to easily enable tracing and testing of such circuits.

16. All circuit drawings shall have a reference to all detailed drawings associated with each individual circuit drawing.

17. When the final circuit is not wired as shown on the Contractor's drawing, Contractor shall revise its drawings to indicate actual wiring before final As-Built prints are made.

18. Rack layouts, contact assignments and terminal details shall make reference to the page on which they are found. This information shall remain on the final As-Built.

19. Numbering: Sheets shall be numbered using the Authority's drawing number format.
F. Plan Books

1. The Contractor shall organize drawings for each field location into plan books as follows:

a. One set shall consist of all circuit drawings for the area controlled from a particular Instrument House include applicable prints from adjacent housings to show the non-local portions of traffic and other line circuits appearing in the local instrument housing.

b. A second set shall consist of detail drawings and arrangement of internal layout plans and wiring diagrams for the various pieces of equipment located in or controlled from the particular instrument housing.

PART 3 - EXECUTION

3.1 PRODUCTION

A. The effective date and identification number, to be inscribed on the final drawings, will be provided by the Authority prior to the time drawings reach As-Built condition and are ready for the Contractor's final processing.

B. The Contractor shall be solely responsible for the accuracy of wiring diagrams and final circuit drawings. The Contractor shall be responsible for the correctness of any drawings for existing circuits or equipment details that he reuses as part of a complete working system.

C. The Contractor shall prepare relay contact, relay location, and detail wiring assignments for the final design and provide arrangement drawings where contact usage of each relay is recorded. These arrangement drawings shall contain relay nomenclature and relay terminal identification. Time settings of timed relays shall be shown on circuit plans beneath the corresponding time element relay symbol.

D. Where vital or non-vital processors are provided, the Contractor shall provide drawings that use contact symbols to show the logic of application engineering. The symbology shall be an accurate representation of the application engineering interface.

E. The Contractor shall anticipate that Station names may change during the course of the Project and shall not have basis for claim due to changes of station names prior to the completion of the As-Built Drawings. Where a station is changed during the course of the Project, the Contractor may, at his discretion, retain Contract designated names on design drawings until the As-Built drawings are produced. As-Built Drawings shall include any name changes made prior to the completion of field testing.

F. Where an existing system is to be modified, the Contractor shall mark changes to an As-Built drawing for the existing system. Hard copy and, if available, electronic As-Built drawings will be provided to the Contractor. The modified drawings shall be incorporated into the working and As-Built drawing sets. Modifications shall be identified by clouding the modification and indicating addition or deletion using "X" or "O" on the clouding, where "X" shows deletion.

3.2 INSTALLATION

A. Not used

3.3 TESTING

A. Not used

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith will be considered incidental to the work specified under Section 16901 "Signal System Basic Technical Requirements."

END OF SECTION 16904
SECTION 16908
EXTERNAL CABLE - SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

A. The Work to be completed under this Section consists of designing, providing and installing all various types of cable required for signal system wiring external to wayside housings, cases, factory wired mechanisms and buildings.

1.2 REFERENCED STANDARDS

A. American Railway Engineering and Maintenance-of-Way Association (AREMA)
   1. Communications and Signals Manual of Recommended Practice (C&S Manual)

   1. IEEE 383 – IEEE Standard for Type Test of Class 1E Electric Cables, Field Splines and Connections for Nuclear Power Generating Stations

1.3 SUBMITTALS

A. Contractor shall submit the following to the Authority for approval:
   1. List of each cable manufacturer’s railway signal installations.
   2. Each cable manufacturer’s Quality Assurance Program.
   3. Full technical data for each type of cable, which each manufacturer intends to provide.

B. Contractor shall provide to the Authority product data cut-sheets and a sample specimen of a 4 foot length identical to each proposed cable type. Samples shall remain the property of Authority. Each sample shall contain at least 2 cable identification markings as described in Paragraph 2.2.D.
C. Contractor shall submit 2 certified copies of the following to the Authority for approval:

1. Prior to the purchase of any cable, the Contractor shall submit the qualifications of each proposed cable manufacturer for Authority approval.
2. Cable test reports for all demonstration tests required by the Authority.
3. Cable test and inspection reports for tests and inspections required by these Specifications.
4. Test reports of cable tests conducted in the field in accordance with approved testing procedures.
5. Certification that each cable provided complies with the requirements of these Specifications.
6. Information to be provided by certified cable test reports shall include the following:
   a. Report Number
   b. Date and location of test.
   c. Description of test and test conditions.
   d. Complete cable or wire description.
   e. Lot, batch, or reel identification number.
   f. Quantitative Test Results.
   g. Test Results Summary.
   h. Information on components of the cable tested to include batch numbers and physical and electrical properties.
   i. Contractor shall submit a complete, signed and notarized standard Wire and Cable Test Report Sheet as part of each cable test report.

D. Contractor shall submit to the Authority as required herein the cable manufacturer's instructions and procedures together with 1 sample end seal specimen for dressing of each type underground cable to be provided and installed under this Contract.

E. Contractor shall submit for approval detail plans of cable duct, cable trough and conduit installations showing all hardware to be used, methods of attachment, cable routing through manholes, hand holes, and fill.

1.4 QUALITY ASSURANCE

A. Contractor shall submit a notarized copy of the Engineering Report, Attachment A to this Section, and a notarized copy of the Quality Assurance Program Form, Attachment B to this Section.

B. All cable manufacturers supplying cable for this Contract shall be meet the qualification requirements described in this Section. Contractor shall provide all of the data required for the Authority's evaluation and make arrangements for all required demonstrations and tests.

C. Supplier qualifications shall be based on the following criteria:

1. Cable manufacturer(s) shall demonstrate previous successful experience in providing the type cable to the transit/railroad industry.
2. References shall be provided that identify past performance to the transit and/or railroad industry for vital signal control.
3. Provide an installation client list that indicates a minimum of 15 years successful operation shall be provided. The list shall contain three installations and the name, telephone number, company official, and title to be contacted.

D. Cable manufacture shall be in accordance with the requirements of this Specification and in compliance with a Quality Assurance Program that meets the requirements ASQ Q9001.

1. Quality compliance shall promote a thoroughly tested cable that will render 40 years service life.
2. Primary concern shall be focused on formal assurance requirements to ensure that cable failure cannot be attributed to a cause that is traceable to the manufacturer.

E. Contractor shall provide full technical data, which demonstrates compliance with the requirements of this Specification for each cable type to be provided.

F. Manufacturer shall certify compliance with the following warranty conditions prior to selection:

1. Manufacturer warrants that design, material and workmanship incorporated in each item of cable shall be the highest grade and consistent with established and accepted standards for underground, tunnel, and ductbank cable for vital railroad and transit signal circuits and that each such item and every part and component thereof shall comply with this Specification.
2. Manufacturer agrees that the warranty period shall commence with final system
acceptance and continue in force for each item of cable for a period of 40 years thereafter.

3. Manufacturer agrees that the warranty shall provide for replacement of defective cable should a patent or latent defect be discovered during the warranty period.

4. The warranty shall cover any length of defective cable.

5. The manufacturer shall replace any and all defective cable and a replacement cable warranty shall begin anew for a period of 40 years following final acceptance of replacement cable.

6. If a failure is found to be of major importance and affects any other item of cable, the affected item of cable shall also be replaced and its warranty reinstated herein Paragraph 1.4.F.5.

7. The warranty reinstatement provided for shall apply only to the first replacement of any such item and, in the case of failure of major importance, to the first warranty extension of affected items.

8. The foregoing warranties are exclusive and in lieu of all other warranties written, oral, implied, or statutory (except as to title and freedom from lien).

9. Manufacturer shall verify by written guarantee, signed by an officer of that company, that the wire and cable to be provided meets or exceeds the qualifications of this Specification.

G. Contractor shall monitor the manufacturer of wire and cable to assure that approved Quality Assurance Program is being closely adhered to and the wire and cable is being manufactured in accordance with this Specification and the approved submittals.

H. Each finished wire and cable shall be traceable to the test data on file for each step in its manufacturing process.

I. The Authority shall have the right to make such inspection and tests as required to determine if the cable meets the requirements of this Specification.

1. The Authority shall reserve the right to reject cable that is defective in any respect.

2. The Authority shall be given 10 days advance notice of the date the cable will be ready for final testing so that the Authority may witness the tests.

3. Physical tests shall be made on samples selected at random at the place of production.

4. Each test sample shall be taken from the accessible end of different reels.

5. Each reel selected and the corresponding sample shall be identified.

6. The number and lengths of samples shall be as specified under the individual tests.

7. All applicable tests for cable materials and cable construction specified shall be performed.

8. Manufacturer shall provide, at the point of production, apparatus and labor for making any or all of the following tests under the supervision of the Authority’s inspector, to include:

   a. Conductor size and physical characteristics.

   b. Insulation HV and IR tests.

   c. Physical dimension tests.

   d. Special tests on materials in coverings.

   e. Final HV, IR, and conductor resistance tests on shipping reels.

1) Certified electrical and physical test reports shall be provided for the finished multiple conductor cables no later than time of shipment.

2) Each test document shall, in addition to test results, indicate the date tests were performed and signature of manufacturer’s authorized representative.

3) The Authority reserves the right to perform any and all additional tests as the Authority shall deem pertinent to further satisfy the Authority that the cable is manufactured in accordance with all Specification requirements.

4) Contractor shall provide all required test samples as directed by the Authority at no additional cost to the Authority.
1.5 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Cable Shipping and Handling shall be as follows:

1. All cable shall be shipped on reels, adequately protected from damage in shipment by heavy wrapping or wood lagging; to include the hazard of reels moving obliquely against each other.

2. Manufacturer shall be responsible for any change in the shape of the cable occurring in transit, which results in an increase in the maximum diameter beyond that specified.

3. External protective wrapping on reels shall be secured by at least 2 steel bands to insure damage free shipment.

4. Each length of cable shall be wound on a separate reel. Reels shall be substantial to withstand handling and be so designed that the inner end of the cable will be secured and accessible but protected from injury.

5. If the inner end of the cable projects through the flange of the reel, the inner end shall be protected by a suitable cover of metal having rounded ends and sides and securely fastened in place to protect the cable end. Both ends of cable on reel will be secured in place, to prevent their becoming loose in transit or handling of reel.

6. Reel drum diameter shall be at least 14 times the cable diameter to prevent damage to the cable during reeling operations. The arbor hole shall admit a spindle 2 1/2 inches in diameter without binding. The reels shall be designated and constructed as non-returnable when drum size and cable weight and volume permit. Maximum width of reel shall not exceed 48 inches unless otherwise specified.

7. After passing factory tests, cable shall be effectively sealed against entrance of moisture. Both ends of each length of cable shall be protected by heat shrink end caps or other suitable means that has Authority approval. Use of friction tape, other than as external mechanical protection over an adequate rubber and/or plastic tape, will not be accepted. Cable end protection will be adequate to protect the cable in shipment and prolonged external storage in the weather without regard to the position of the reel while so stored.

8. Cable shall be closely and tightly wound, in a uniform manner, in each layer on reels.

9. An arrow shall be painted on one head of each reel pointing the opposite direction from the outer end of the cable with the words "Roll This Way" employing letters not less than 3/4 inch height and an arrow not less than 6 inches in length and 1/2 inch in width.

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIALS

Not Used

2.2 CONTRACTOR FURNISHED MATERIALS

A. Maintenance Materials: Contractor shall furnish 1,000 feet of each type of wire and cable used on this contract.

B. General requirements for signal cable provided under this Specification shall be as follows:

1. Material and workmanship shall be of the highest quality assuring durability for minimum life expectancy of 40 years. Single conductors and the individual conductors of multi-conductor signal cables shall be suitable for use in the environment to be encountered on a rail transit signal system and certified for continuous operation at 194 degrees F in wet or dry locations with no conductor failing in continuity or with loss of insulation to cross or ground less than 1 megohm per 1000 feet for the insulation resistance constant.

2. Multi-conductor main cable containing more than 2 conductors shall contain 20 percent spare conductors or 2 spare conductors, whichever is greater. Local distribution cable shall contain 10 percent spare conductors or 1 spare conductor whichever is greater. Two conductor cables will not require spare conductors.

3. Contractor shall provide and install signal cables in tunnel area with low smoke and low toxicity.

C. Material Requirements. Conductors shall satisfy the following:

1. Material: Soft Annealed Copper ASTM B3

2. Coating: Continuous tin, ASTM B33

3. Resistance: ICEA S-19-81, Section 2.6

4. Stranding: Class B ASTM B8

5. The conductor shall be free of longitudinal or lateral nicks or scratches and be uniform in gauge.

D. Single and multi-conductor cable jackets shall identify the cable using durable markings with the following data where markings are written in contrasting ink and repeated every 3 feet as follows:

1. Manufacturers Name (A) (B)/C (C) AWG CU Insulation Type (EP) (D) volts (Year of Manufacture); where
2. (A) = Manufacturers Plant Number
3. (B) = Number of Conductors
4. (C) = Conductor Size
5. (D) = Voltage Rating
6. The Multiple conductor cables shall have the marker tape so located as to be readily identified.

E. Requirements for low smoke signal cable provided under this Specification shall be as follows:

1. Insulation material shall be Ethylene Propylene Rubber (EPR) and have moisture and heat resistance characteristics suitable for operation at 194 degrees F continuously, 266 degrees F emergency overload for standard prescribed periods, and 482 degrees F for short circuits.
2. Substances that are injurious to the conductor or insulation shall be tested in accordance with the latest revision of ASTM D470 and Table B-III.
3. Insulation shall be properly vulcanized, homogeneous in character, tough, elastic and applied concentrically about the conductor and shall fit tightly thereto; the insulating compound shall be clean and free stripping, leaving the coated conductor, upon stripping, unimpaired and ready for soldering.
4. Insulation thickness shall be in accordance with Table A-I and Table A-II.
5. Average insulation thickness shall be no less than the specified thickness. The thickness at any point shall not be less than 90 percent of that specified.
6. Insulated conductors intended for assembly into multi-conductor cables shall be imprinted with the conductor identification at intervals of not more than 6 inches. The identification shall be in the form of numbers (both number and work number, i.e., "1-one") per ICEA S-58-679 Method 4.
7. Printed legend shall be duplicated on opposite sides of each conductor. A tracer wire is required in each layer per ICEA S-58-679 Method 6.
8. Smoke generation values also apply to the EPR insulation. All smoke tests are in 3-inch by 3-inch square slabs of material having a thickness of 100 mils.
9. Each length of conductor, insulated with prime insulation, prior to application of any outer jacket and prior to cabling or twisting, shall be randomly wound on spools and immersed in water for 24 hours, then subjected to the AC test voltages given in Tables A-I or A-II for 5 minutes, without showing signs of puncture, overheating, or self-healing of punctures. Voltage to be applied between conductor and water (ground).
10. Immediately after the AC test specified above and while still submerged, an insulation resistance test shall be made on each length of conductor. The insulation resistance constant shall not be less than 35,000 megohms per 1000 feet when corrected to 60 degrees F.
11. The DC test may be done either following an insulation resistance test or at least 8 hours prior to the AC test, providing the insulated conductor has been continuously immersed for a period not less than 16 hours prior to the DC voltage application. Each length of insulated conductor, while submerged, shall withstand, without failure, the high voltage DC test for 5 minutes at the potentials given in Tables A-I and A-II.
12. Single Conductor Cables shall be in accordance with attached Table A-1.
13. The test voltages for Tandem Extruded insulation and jacket for single conductor wire are as found in Table A-1, Modified.
14. Individual insulated conductors not intended for assembly into multi-conductor cables shall be covered with a low smoke cross-linked polyolefin compound sheath in accordance with the properties in Table A-IV. Testing of single conductors shall be done on finished composite of insulation and jacket, per Table A-I. The average thickness of sheath compound shall be not less than the value specified for single conductors in Table A-III.
15. The sheath of single conductor cables shall be surface painted with a legend identifying the manufacturer, year of manufacture, conductor size and voltage rating in contrasting ink; durable surface colors are required.
16. Multiple conductor cables shall be made by assembling individually insulated, printed conductors into a tight cylindrical form. Individual conductors in a cable having 2 or...
more conductors shall be assembled helically and with adjacent layers wound in opposite directions.

17. When fillers are required to make the cable round, they shall be non-hygroscopic and flame retardant.

18. Cable tape shall be applied around the cable core of multiple conductor cables and be non-hygroscopic and flame retardant.

19. Cable tape shall conform to Section 4.4 of ICEA, except that compound-filled tape shall be treated on both sides and thoroughly filled with a rubber compound.

20. A continuous tubular outer sheath of high tensile strength moisture and flame-resistant properly cured base product of low smoke cross-linked polyolefin compound shall be tightly formed around the insulated conductor(s) to provide protection against mechanical damage and the entrance of moisture, earth acids and alkalis into the cable.

   a. The sheath shall not adhere to the insulated conductors of multiple conductor cables and shall conform to Table A-IV.
   b. The sheath shall be applied by the continuous tube method, without joints and be properly cured to meet test requirements
   c. Average sheath compound thickness for single conductor and multi-conductor cables shall be not less than values specified in Table A-III.

21. In addition, low smoke, thermoset jacket, when tested at a thickness of 100 mils for smoke generation, shall not exceed the values in Table A-IV. Low smoke thermoplastic jacket shall not exceed the values in Table A-IV Modified.

22. Where colored tapes are called for, the colors shall be clear, durable and of easily distinguishable shades; and have no harmful effect on any part of the cable.

23. The maximum outside diameter or finished wire and cable shall not exceed the nominal outside diameter by more than the following tolerances:

   a. Nominal Diameter (Inch) 0 to 0.600: Tolerance shall be 0.030 Inch
   b. Nominal Diameter (Inch) 0.601 to 2.000: Tolerance shall be 5.0 percent

24. Each completed multi-conductor cable, when on the shipping reel, shall be subjected to and successfully pass twice the AC test voltage levels given in Table A-II for 1 minute as applicable. This voltage to be applied to each conductor against all others grounded, or between conductors utilizing a midpoint grounded test transformer to assure that each conductor is tested against each adjacent conductor in its layer and conductors in adjacent layers. This required repeat application of test voltage should be done by reversing voltage combinations between layers. Cable shield, if any, shall be connected to ground. When a shielded cable is provided, voltage should not be doubled.

25. The insulation resistance test shall be made in accordance with Section 6.23 of ICEA, using a well insulated and sensitive galvanometer. When the temperature at which the cable is tested differs from 60 degrees F, the insulation resistance shall be corrected to that at 60 degrees F.

   a. The insulation resistance constant shall not be less than 35,000 megohms per 1000 feet when corrected to 60 degrees F.

26. All completed cable shall pass the IEEE 383, 70,000 BTU/Hr., Vertical Tray Flammability Test.

27. Requirements for underground signal cable provided under this Specification shall be as follows:

   a. Insulation of twisted pairs shall be polyethylene, ASTM D1248 Type I, Class C, Category 4 or 5, Grade J3 or E5 in accordance with ICEA S-61-402, Part 3. Insulation thickness shall comply with ICEA S-61-402, Part 7 Table 7-6.

   b. All single conductors shall be as follows:

      1) Insulation material shall be a vulcanized EPR. EPR shall be tested in accordance with the latest revision of ASTM D470 and Table B-III. Each individual insulated conductor shall be covered with a CSPE (chlorosulfonated polyethylene) outer jacket in accordance with Table B-I and B-II that meets the characteristics of Table B-IV.

      2) Conductor insulation shall be applied directly to the surface of the conductor and adhere tightly to that surface but be
free stripping and leave the conductor clean.

3) Organic matter or mineral substance which will in itself or in combination with other substances in the compound be injurious to the conductor or insulation shall not be used.

4) Insulation shall be applied by the continuous tube method without joints; it shall be properly vulcanized; homogeneous in character, tough, elastic and concentrically applied around the conductor. Application of subsequent CSPE sheath shall not destroy the properties of the conductor insulation, nor cause the conductor to shift or be displaced from the center of the insulation.

5) Repairs in the insulation shall be made in a workmanlike manner. The repair and all other parts affected by the Work shall be as strong and durable electrically and mechanically as the remainder of the insulation. The insulation thickness shall comply with Table B-I, Table B-II as applicable.

6) Average insulation thickness shall be not less than the specified thickness given in the required table. The thickness at any point shall not be less than 90 percent of that specified.

7) Single conductors of multi-conductor cables for underground installation shall have a composite insulation thickness consisting of EPR and CSPE per Tables B-I and B-II and AREMA Part 10.3.17, Table 1 and 2, underground Type II insulation.

28. Prior to assembly of the multi-conductor cable, individual conductors shall be tested as follows:

a. Dry "Spark" Test: The single insulated conductors shall be passed through high voltage test electrodes energized with a 10 Kilovolts, at no less than 3 KHz AC to insure detection of damaged insulation.

b. Each reel, before immersion for insulation testing will have its continuity and length checked by means of an end-to-end resistance check to an accuracy not less than three significant figures.

c. After 16 hours immersion, and while still submerged, each reel or reel length of insulated conductor shall be subjected to and withstand the DC voltage as indicated in Tables B-I and B-II as applicable, for the size conductor involved.

d. Every individual conductor, before any further assembly steps, shall be subjected to and withstand without failure for 5 minutes the AC - 60 Hertz test voltages as indicated in Tables B-I and B-II as applicable, for the size conductor involved. This test shall be made while still submerged after not less than 24 hours immersion in water.

e. After the AC Test and while the conductor is still submerged, an insulation resistance test shall be made on each length of conductor. The insulation resistance constant, "K", in the following formula, when corrected to 60 degrees F shall not be less than 35,000 Meg ohms-1000 feet where: 

\[ R = K \log_{10} \frac{D}{d} \]

29. Where used in this Specification, the term "multi-conductor signal cable" and "single conductor signal cable" shall be interpreted as meaning any cable applied in circuits, either vital or nonvital, the function of which has a direct effect upon the operation of trains or the ability of the system or subsystem to implement control upon the trains.
30. The outer jackets of completed cable shall be made of extruded black, low density, high molecular weight polyethylene of new unused Type 1, Class C, Grade E5, of ASTM D1248 with the following characteristics:

a. Melt Index: the melt index as determined by ASTM D-1238 (Condition E), on polyethylene removed from inner and outer cable jacket shall not exceed 0.4 grams per 10 minutes.

b. Tensile and Elongation: Samples of unaged polyethylene material removed from the inner and outer cable jacket shall meet the following requirement when tested in accordance with ASTM D470 having the speed of jaw separation of 20 inches per minute;

c. Tensile Strength: Minimum 1700 psi

d. Elongation: Samples of unaged polyethylene material removed from the inner and outer cable jacket shall meet the following requirement when tested in accordance with ASTM D470 having the speed of jaw separation of 20 inches per minute.

e. Elongation at rupture, minimum 400 percent.

f. After an air oven test at 212 degrees F within plus or minus 1.8 degrees F for 48 hours.

g. Tensile Strength and elongation at rupture shall have 85 percent of unaged values.

h. Impact: A polyethylene jacketed cable specimen of approximately 15 inches in length is secured across the bottom of a tube 1-1/4 inches in diameter. This assembly is placed on a firm surface in a cold chamber at a temperature of negative 49 degrees F within plus or minus 1.8 degrees F, for 4 hours after which a weight is released at the top of the tube. The length of the tube and the weight used shall be such that a 3-pound/foot force is delivered to the jacketed specimen. The weight shall be a cylinder 1 inch in diameter with a flat striking face. The cable shall show no cracks after impact.

i. Environmental Stress Cracking - Test specimens die cut from the polyethylene jacket, both inner and outer shall be subjected to an environmental stress cracking test as described in ASTM D1693, except that the depth of the controlled imperfection shall be proportional to the jacket thickness.

31. Multi-conductor cable assembly shall be per ICEA S-73-532, Part 5, unless otherwise specified herein.

a. Multi-conductor underground cable shall be made by assembling individual and twisted pairs of insulated conductors into a tight cylindrical form.

b. Individual and twisted pair conductors in a cable having more than 2 conductors shall be assembled helically and with adjacent layers wound in opposite directions.

c. Twisted pairs, where required, shall consist of 2 individually insulated conductors cabled with a length of lay as short as good construction will permit, but not longer than 10 inches. Where more than 1 twisted pair is included, the length of lay of adjacent pairs shall differ by at least 1/2 inch.

d. The average mutual capacitance of all twisted pairs in any reel shall be 0.083 mfd. per mile within the limits specified by ICEA S-56-434, Part A, Section 16.

e. The output-to-output, far end cross-talk loss of twisted pairs shall comply with the provisions and tolerances of ICEA S-56-434, Part A, Section 17.

f. Twisted pairs, when provided, shall be located in the center of the cable and individual conductors arranged concentrically about the core thus formed.

g. Interstices shall be filled with material compatible with the insulation.

h. A moisture resistant marker tape printed with the name of cable manufacturer and the year in which the cable was manufactured, displayed at intervals of not more than 12 inches, shall be placed within the core. The marker tape shall also be printed with a numerical sequence of numbers at 1-foot intervals, to facilitate determination of cable length and/or cable remaining on reel. The material employed for tape, and the application of tape, shall be such that with use of number sequence at...
no time will a cable be shorter than the length indicated by the tape and cable will not exceed 1/2 of 1 percent actual length when cut in accordance with tape markings.

i. A shock-absorbing layer of moisture-proof elastomeric compound with a thickness of 45 mils shall be applied over the cable core.

j. A 10 mil flat bronze tape shall be helically wrapped and overlapped over this inner jacket so that at least 20 percent overlap is obtained. A 7 mil copper alloy tape C-19400 per ASTM B465 shall be acceptable.

k. An overall outer jacket shall be extruded over the bronze tape. The outer jacket shall be made of extruded black, low density, high molecular weight polyethylene conforming to new unused Type I, Class C, Category 4 or 5, Grade J3 or E5 of ASTM D1248 with thickness in accordance with Table B-VI as applicable.

Calculated Core Average
Inner Diameter, Inches Polyethylene Jacket Thickness
0.0 to 0.425 0.078 inches
0.426 to 0.700 0.094 inches
0.701 to 1.050 0.109 inches
1.051 to 1.500 0.125 inches
1.501 to 2.000 0.156 inches
2.001 to 3.000 0.188 inches
3.000 and larger 0.218 inches

32. In addition to the internal sequential marker tape, cables shall have the following cable identification and conductor marking information imprinted on the surface of the outer jacket at intervals of not more than 3 feet:

a. Manufacturer's Name
b. Number of Conductors
c. Conductor Size
d. Voltage Rating
e. Each conductor shall have its conductor number clearly marked on it per ICEA S-58-679 Method 4.
f. Each conductor shall have a tracer wire in each layer per ICEA S-58-679 Method 6.

g. Each completed multi-conductor cable shall be tested for conductor resistance. Voltage tests shall be performed between each conductor and every other conductor in the cable. Test voltage shall be AC and double the values shown for Alternate B as shown in Tables B-I or B-II, as applicable.

F. Contractor shall be responsible for sizing of all conductors and cable makeup. The cable consists and conductor sizes described herein and shown on the Contract Drawings specify the minimum that will be accepted. Contractor shall calculate all voltage drops and losses for each installation to ensure that the system will operate within accepted limits.

1. Low smoke type cable is required in tunnels.

G. Contractor shall provide track circuit connections for installation between instrument housings and the track riser as follows:

1. Cables shall be 2 individual twisted single-conductors, No. 6 AWG factory twisted together with at least three twists per foot.

2. Cable provided for installation between the track riser and web of rail shall be 2, single-conductor No. 6 AWG jacketed cables.

3. The cable shall be marked or color-coded to indicate the polarity of the track circuit connection.

4. Unless otherwise Authority approved color-coding shall be black and red to indicate instantaneous reference polarity, negative and positive, respectively.

5. Cable provided for installation between the impedance bond terminal lug and rails and between impedance bond neutrals shall be 535 KCMil 600 Volt Diesel Electric Locomotive and Car Wire with insulation thickness of 7/64". Cable shall have 194 degrees F continuous rating, 257 degrees F emergency overload rating and 482 degrees F short circuit rating.

H. Cable provided for installation between instrument housings and junction box or for each color light signal head shall be a 5 conductor, No. 14 AWG.

I. Cable provided for electric switch-and-lock movement installation between instrument housings and the switch junction box shall be a combination cable consisting of three No. 6 AWG and 12 No. 14 AWG conductors.

J. Cable provided for circuit controllers installation between instrument housings and circuit controllers, not associated with electric locks, shall be a 7 conductor, No. 14 AWG.
K. Cable provided for electric lock installation between instrument housings and electric lock junction boxes shall be a 12 conductor, No. 14 AWG.

L. Cable provided for train stop installation between junction box and train stop shall be a 2 conductor No. 6 AWG.

M. Underground express signal cable, or trough installed express cable provided for installation along the right of way shall be 7, 12, 19, 27, or 37 conductor, No. 14 AWG cables, or a combination thereof to provide the required spare conductors, as specified by these Specifications and support the functions of the system.

N. Cable provided and installed for other applications as indicated on the Contract Drawings shall be sized for requirements of the Contractor’s final design, i.e., interface with traffic signal controller and yard switch machine.

O. Fiber Optic Cable used for VMIS serial communication between locations shall satisfy Standard Specification Section 16845, “Fiber Optic Cable Subsystem - Communications System,”

**PART 3 - EXECUTION**

3.1 INSTALLATION

A. Contractor shall install 2 principal cable classes: Main Cable and Local Distribution Cable.

1. Main cables are defined as those cables that run between housings or those cables containing conductors for more than one system function.

2. Local distribution cables are defined as those cables that run between a housing and an individual equipment unit.

B. Splices: Contractor shall make no splices in any vital or nonvital signal cable.

C. Installation of wire and cable shall conform to Part 10.4.1 of the AREMA Manual, except as modified herein.

D. Contractor shall give the Authority 24 hours notice prior to installing cables.

E. Contractor shall provide sufficient slack in cable conductors at all terminating posts to enable three re-terminations of the conductor due to broken eyelets without re-servicing or re-dressing the cable.

F. In certain types of installation, the cable cannot be constrained; therefore, ample cable slack shall be provided for additional flexibility due to vibration of such equipment.

G. Cables shall not be bent to a radius less than 10 times the diameter of the cable during installation or as finally installed.

H. All signal cable runs shall be continuous without splices between cable terminating locations.

I. Tags to identify cables shall be of plastic material. Tags shall be lettered to correspond with the cable destination and number of conductors in the cable. The type of tag to be used shall be in accordance with these Specifications.

J. All cables shall be terminated in conductor order. Individual cable conductors shall be identified at each cable termination with plastic tags as specified in these Specifications. All spare conductors in each cable shall be terminated and identified.

K. All cable entrance openings in equipment enclosures and junction boxes shall be sealed with either a compression type fitting or pliable sealing compound after the cable is in place. Sealing compound shall be used to seal the area around cable where the cable emerges from the end of a conduit, or ductbank. All spare conduits shall be sealed or plugged in an approved manner.

L. A suitable lubricating medium, noninjurious to the cable insulation, shall be used when pulling cables into conduit, or ductbank.

M. Where cable transfers from trays or troughs to conduit the ends of the conduit shall be fitted with plastic end bells to prevent damage to cable.

N. Wherever multiple conductor cables are terminated the outer sheath of the cable shall be carefully removed so insulation is not nicked to the point of cable entrance. At the end of cable sheath or covering, 2 layers of plastic electrical tape shall be applied.

O. Outdoor Locations Underground Buried Installation

1. Cable shall be buried to a uniform depth of 30 inches below the bottom of tie or 42 inches from top of rail when passing under tracks, whichever is deeper. Cable shall be laid loosely in trench with a sand bed and backfill in accordance with the requirements of this Specification.

2. Upon request, and only under extreme circumstances and because of installation hardship will installation of a cable be allowed to a depth of less than 30 inches, subject to the Authority’s approval. The cable shall be protected in a manner that has Authority approval.

3. Restoration of backfill and ballast shall be in accordance with the requirements of this Specification.
4. Should any signal cable pass under pavement or roadway, if existing conduit is not provided, cable shall be installed in a 4 inch galvanized rigid steel conduit, protected with bushings on each end. Conduit shall extend 2 feet beyond the edges of the pavement. It shall be the Contractor's responsibility to restore the pavement or roadway to its original condition, subject to the Authority approval. Polyvinyl Chloride Pipe (PVC) coated galvanized rigid steel (GRS) conduit shall be used at points 4 feet below grade to 2 feet above grade.

5. Where cable leaves the ground at other than buildings or in foundations, it shall be protected by a bootleg or other covering extending above the ground line. Top of such protective coverings shall be filled with a sealing compound.

6. Where buried cables enter a concrete foundation, junction box, or a case, a 5 foot slack coil in each cable shall be left in a trench below the foundation or pedestal. Cable marker tape shall be installed over the slack coil. Slack coils shall not be used for cables carrying solid state audio track circuit frequencies.

7. Cable carrying 480 or more volts shall not be installed in the same trench or conduit as signal or communication cable, except as otherwise provided for, herein.

8. Should signal or track cables be installed in the same trench, or required to intersect, with cable carrying 480 or more volts, due to installation hardships, these cables shall be installed so that the distance between such cable and the 480 Volts cable will not be less than 12 inches, while maintaining the depth of not less than 30 inches for the cable. The 12 inches between any intersecting direct burial cables of different voltages as specified herein shall be filled with sand to a distance of 2 feet from each cable from the point of intersection.

9. Contractor shall install polyethylene cable marking tape at a depth of approximately 12 inches below final grade while backfilling each cable trench. Tape shall be as specified in these Specifications.

10. Dressing of buried cables shall be applied whenever cable is terminated in signal equipment and such termination is within 2 feet of the grade level. Neoprene end seal pothead shall be installed in accordance with the manufacturer's instructions.

P. Ductbank Installation

1. Prior to cable installation, the Contractor shall ensure that each conduit to be used in the ductbank has been blown or swabbed dry, rodded and successfully mandrelled.

2. Cables shall be placed in the lowest available duct. All cables to be placed in 1 duct shall be installed simultaneously. Extreme care shall be used in installing cables so as to avoid twisting, kinking, or in any way injuring the cable or its sheath.

3. When pulling cable, an approved wire cable grip extending not less than 18 inches back from the end of cable shall be used and the clutch on the pulling device shall be set to slip at 50 percent of the weight per 1000 feet of cable to be pulled. Equipment used for pulling cable shall be equipped with a dynamometer that will indicate pulling force in pounds.

4. Glycerized liquid lubricant or other Authority approved lubricant shall be applied to the cable when installing cables in ducts.

5. Cable ends shall be immediately sealed until such time as terminating and protecting of the cable in manholes, cases and houses is effected.

6. All conduits entering manholes or housings shall be filled with sealing compound.

7. When required, the Contractor shall pump water out of manholes and handholes before installing cables and be responsible for maintaining manholes and pull chambers in a dry condition while cables are being pulled.

8. Cable installation in conduit shall not exceed 40 percent fill per conduit, unless otherwise allowed by the Authority.

9. Cables installed in manholes shall be properly constrained and fastened to the walls of manhole in accordance with approved installation drawings.

Q. Non-Buried Installation

1. Cable installed in trays or troughs shall be laid therein and not pulled in place. Cables installed in trays and troughs shall have a minimum amount of crossover and shall not be pulled tightly around bends. Cable troughs will be equipped with dividers to separate power, signal and communication cables.

2. Cables shall not cross one another when they are pulled into a conduit and care shall be taken not to have the conductors pulled tight or kinked in conduit fittings or boxes. All cables to be installed in a conduit shall be pulled and installed simultaneously.
R. Contractor shall provide required special protection for cables in areas where the cables are unavoidably exposed to hazardous conditions such as vibration or sharp corners on equipment. Contractor shall be responsible for replacing, at no additional cost to the Authority, any installed cable that is damaged prior to acceptance as a result of the failure to provide such special protection.

S. Contractor shall install bonding or track circuit cabling in excess of 30 feet in trough or in buried galvanized rigid steel conduit in accordance with these specifications.

3.2 FIELD TESTING

A. All installed external cable shall be field tested. Test procedures for testing of insulation resistance shall include tests to verify the following:

1. All wire and cable installed along the right-of-way and wire and cable entering or leaving wayside instrument case shall be tested after installation. Test shall ensure insulation of wires and cable and connected equipment meet the specified resistance value. A direct reading instrument, having a 0-megohm to 200-megohm scale range and a self-contained DC power supply rated 500 volts minimum to 1000 volts maximum, shall be used to measure insulation resistance. Resistance between conductors, and between the conductors and ground shall not be less than 500,000 ohms.

2. Insulation resistance of each conductor to ground and between each conductor and all other conductors in each multi-conductor cable shall be tested. Power sources, made grounds and connections to rails shall be disconnected from the circuits during testing.

3. The point used as ground shall be the most convenient ground available.

4. Insulation resistance test values shall be recorded on Authority approved Insulation Resistance Record Forms and submitted for approval.

5. Defective Cables: Any Contractor installed cable that is found to be defective during testing shall be replaced with Authority approved cable at no additional cost to the Authority.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith will be considered incidental to the work specified under Section 16901 “Signal System Basic Technical Requirements.”

ENGINEERING REPORT

INTRODUCTION

Certain railroad specifications call for rather specific qualification tests on the insulation. These tests involve long-term voltage aging, moisture resistance and thermal aging. __________________________ insulation used in railroad signal cable was tested according to these qualifications. Standard factory production cables were used as samples.

SUMMARY & CONCLUSIONS

_________________________ insulation tested in accord with the procedures below meets the requirements of the railroad specifications.
**DETAILS**

**Thermal Aging** - The specification reads as follows: “The insulation shall be tested in a circulating air oven on 80 mil thick slabs and shall have an elongation not less than 50 percent after a minimum aging time of 25 hours of 136°C and 100 hours at 121°C”. The insulation tested as above gave the following results:

- Elongation at Break - Initial: _______________%
- Elongation after 25 hours @ 136°C: _______________%
- Elongation after 100 hours @ 121°C: _______________%

**Moisture Resistance:** The specification reads: “A single conductor No. 14 AWG or larger size with 80 mils or thicker insulation wall, shall have at least 10 feet immersed in water at room temperature. The insulation conductor without any coverings over the insulation shall be continuously energized as follows:

<table>
<thead>
<tr>
<th>DC Voltage</th>
<th>Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>V/Mil</td>
<td></td>
</tr>
<tr>
<td>325</td>
<td>2 months, or</td>
</tr>
<tr>
<td>280</td>
<td>3 months, or</td>
</tr>
<tr>
<td>240</td>
<td>4 months, or</td>
</tr>
<tr>
<td>200</td>
<td>6 months,</td>
</tr>
</tbody>
</table>
No insulation failure shall occur within the test period. The bare ___________________ insulation 80 mils thick on a ________________ tinned copper conductor of ___________________ length was placed in tap water at room temperature for _______________ months at a stress of ___________________ v/mil. No failure occurred during the test period.

Voltage Aging

The dielectric strength stability shall have been demonstrated by voltage aging, a test sample of a single conductor No. 14 AWG or larger size wire with 80-mil or thicker insulation, shielded with the shield grounded. The cable shall be tested in free air with a minimum of 10 feet between terminals. One of the following voltage stresses shall have been applied to voltage age the sample.

<table>
<thead>
<tr>
<th>Test Voltage</th>
<th>Age</th>
</tr>
</thead>
<tbody>
<tr>
<td>60 - Hz AC</td>
<td>Time</td>
</tr>
</tbody>
</table>

Table I

<table>

</tr>
<tr>
<td>180</td>
<td>for 3 years, or</td>
</tr>
<tr>
<td>135</td>
<td>for 5 years</td>
</tr>
</tbody>
</table>

No insulation failure shall occur within the test period. The shielded _______________ insulation 80 mils thick on a ________________ tinned copper conductor of ___________________ length was placed in free air at room temperature for _______________ months at a stress of ___________________ V/mil time for a duration of ___________________. No failure occurred during the test period.
QUALITY ASSURANCE FORM

This statement will certify that ____________________________________________

(Name of Company)

will manufacture and test the cable under the control of a quality assurance program which meets the requirements of Section 10CFR50, Appendix 8, of the Federal Register and ANSI N45.2.

Notary                                                                   Cable Co. Representative

END OF SECTION 16908
PART 1 - GENERAL

1.1 DESCRIPTION
A. Work to be performed under this Section consists of designing, providing and installing power cable for the Alternating Current (AC) signal power distribution system, auxiliary power supply and other AC power wayside applications as described herein.

B. Material and workmanship shall be of the highest quality assuring durability for minimum life expectancy of 40 years. Cables shall be suitable for use in the environment to be encountered on a transit or railroad signal system. Cables shall be certified for continuous operation at 90 degree Celsius (C) (194 degrees Fahrenheit (F)) in wet or dry locations with no conductor failing in continuity or with loss of insulation to cross or ground less than 1 meg-ohm per 1,000 feet.

1.2 REFERENCE STANDARDS
A. American Railway Engineering and Maintenance-of-Way Association (AREMA)
B. American Society for Quality (ASQ)
    1. ASQ Q9001 - Quality Management Systems - Requirements
C. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM)

    1. NFPA 70 - National Electrical Code (NEC)
G. Underwriters Laboratory (UL)
    1. UL 224 – UL Standard for Safety Extruded Insulating Tubing

1.3 SUBMITTALS
A. The Contractor shall submit the following for Authority approval:
    1. List of each cable manufacturer's railway/transit installations.
    2. Each cable manufacturer's Quality Assurance Program.
    3. Full technical data for each type of cable.
    4. Four foot samples of each type of cable proposed. Each sample shall include at least two identification markings as described in Paragraph 2.2.C.
B. The Contractor shall submit for approval:
    1. Projected loads and voltage drop calculations.
    2. Cable manufacturer's instructions and procedures for potheading of each type underground cable to be provided.
C. As required herein, the Contractor shall submit certified copies of the following for Authority approval.
    1. Cable test reports for all demonstration tests required by the Authority.
    2. Cable test and inspection reports for tests and inspections required and described by these Specifications.
    3. Test reports of cable tests conducted in the field in accordance with Authority approved testing procedures.
4. Certification that each cable provided complies with requirements of these Specifications.

5. Information to be provided by certified cable test reports shall include the following:
   a. Report Number
   b. Date and location of test.
   c. Description of test and test conditions.
   d. Complete cable description.
   e. Lot, batch, or reel identification number.
   f. Quantitative Test Results
   g. Summary of the test results.
   h. Information on the components of the cable tested to include batch numbers and physical and electrical properties.
   i. The manufacturer shall provide not less than six copies of instructions for splicing. The instructions shall be forwarded with certified test results for each reel of cable. The instructions shall specify exact nature of splicing materials to be employed and manner they are to be spliced.

D. The Contractor shall submit for approval detail plans of cable duct, cable trough and conduit installations showing all hardware to be used, methods of attachment, cable routing through manholes, hand holes, and fill.

1.4 QUALITY ASSURANCE

A. Pre-Qualifications

1. All cable manufacturers providing cable for this Contract shall be pre-qualified by the Authority. The Contractor shall provide all data required for the Authority's evaluation and make all arrangements for required demonstrations and tests.

2. Qualifications shall be based on the following criteria:
   a. Past Performance and Experience. Cable manufacturer(s) shall demonstrate previous successful experience in providing cable to the railroad/transit industry for use as AC power cables.
   b. References identifying past performances to the railroad/transit industry for signal power distribution systems are required. A list of such installation with a minimum 15 years successful operation shall be provided. The list shall contain a minimum of three installations and the name, telephone number and title of the company official to be contracted.
   c. Quality Assurance Program. The manufacture of cables, in accordance with the requirements of these Specifications, shall be accomplished in compliance with a Quality Assurance Program that meets the requirements of American Society for Quality (ASQ) Q9001 Quality Management Systems - Requirements. Such compliance shall promote a thoroughly tested cable that shall render long service life to the user. Prime concern shall be focused on the required formal assurance requirements to insure that cable failure cannot be attributed to actions or lack of actions by the manufacturer. The Contractor shall submit a notarized copy of the Engineering Report, Attachment A to this Section, and a notarized copy of the Quality Assurance Program Form, Attachment B to this Specification.
   d. Technical Data. The Contractor shall provide full technical data that demonstrates compliance with the requirements of these Specifications for each specified cable type the Contractor plans to provide.
   e. Manufacturer shall certify that he shall comply with the following warranty prior to selection:

1) Manufacturer warrants that design, material, and workmanship incorporated in each item of cable shall be of the highest grade and consistent with established, and generally accepted, standards for aerial and underground cable for railroad/transit AC power circuits; and each item of cables and every part and component comply with these Specifications.

2) The manufacturer agrees that this warranty shall commence with the acceptance of each item of the cable, whether the defect be patent or latent, and continue for a period of 40 years after initial satisfactory operation of the item.
3) Warranty covering any length of defective cable shall be replaced by the manufacturer under the above conditions and be reinstated for a period of 40 years. If the failure is found to be of major importance and affects any other item of cable, the reinstatement of the warranty shall then be extended to cover the item so affected as well and will start as of the date of such replacement. The warranty reinstatement provided for in this paragraph 3. shall apply only to the first replacement or repair of any such item and, in the case of failure of major importance, to the first extension of said warranty.

f. Foregoing warranties are exclusive and in lieu of all other warranties written, oral, implied, or statutory (except as to title and freedom from lien).

g. The Contractor shall verify by written guarantee, signed by an officer of that company, that the cables to be provided meets or exceeds the qualifications of the Specification.

B. After Selection

1. The Contractor shall monitor the cable manufacturer to assure Authority approved Quality Assurance Program is being closely adhered to and the cables are being manufactured in accordance with these Specifications and the Authority approved submittals.

2. Each finished cable shall be traceable to the test date on file for each step in its manufacturing process.

3. Inspection:

a. The Authority shall have the right to make such inspection and tests as required to determine if the cable meets the requirements of these Specifications. Inspector for the Authority shall have the right to reject cable, which is defective in any respect.

b. The Authority shall be given 10 days advance notice of final cable testing date so that the Authority may witness the tests.

c. Physical tests shall be made on samples selected at random at the place of production. Each test sample shall be taken from accessible end of different reels. Each reel selected and corresponding sample shall be identified. Number and lengths of samples shall be as specified under the individual tests. All applicable tests for the cable materials and cable construction specified shall be performed.

d. Manufacturer shall provide, at point of production, apparatus and labor for making any or all of the following tests under supervision of the Authority’s inspector, to include:

1) Conductor size and physical characteristics

2) Insulation HV and IR Tests

3) Physical Dimension Tests

4) Special tests on materials in coverings.

5) Final HV, IR, and conductor resistance tests on shipping reels.

e. Certified electrical and physical test reports shall be provided for the finished cables no later than time of shipment. Each test document shall, in addition to test results, indicate the date tests were performed and signature of the manufacturer's authorized representative.

f. The Authority reserves the right to conduct itself those tests it so elects to further satisfy itself that the cable is manufactured in accordance with requirements of these Specifications.

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIALS

A. Not Used

2.2 CONTRACTOR FURNISHED MATERIALS

A. Maintenance Materials:

1. The Contractor shall furnish one thousand feet of each type of wire and cable used on this contract.

B. AC Power Distribution Cables

1. AC power distribution cables for signal power supply, provide for utility wiring and other AC power requirements under 600 volts, shall be
Type RHH, RHW or USE, intended for use as direct burial, in raceways or aerial applications. Conductors shall be stranded copper per ASTM B-3 or B-8. Insulation shall be cross-linked polyethylene in accordance with NEMA WC 7/ ICEA S-66-524 standards.

C. Conductor Labeling
1. Conductors shall be marked indicating the manufacturer's name, conductor size, conductor material, insulation type, voltage rating and year of manufacture, repeated every 3 feet on the outside of the cable jacket.

D. Cable Connectors
1. Provide connectors for No. 8 AWG and larger of pressure indent type with nonflammable, self-extinguishing insulation of temperature rating equal to that of the cable being connected.
2. For conductors No. 8 AWG through No. 22 AWG, use low smoke, low toxic insulated compression terminals, or Authority approved equal.
3. Where insulated connectors are not required, use uninsulated terminals or Authority approved equal.
4. Terminate cable No. 6 AWG and larger using bolted, pressure-type connectors. Design connectors compatible with conductors for which they are used.
5. Provide connectors for connecting lighting fixtures to branch circuit wiring of the pre-insulated permanent pressure electrical spring connector type encased in an insulating cover.
6. Provide compression terminals for all control and instrumentation cables

E. Wye Resin Cable Splices
1. Splices in Signal Power cables shall be permitted only in electrical distribution boxes located in a signal equipment enclosure.
2. Cable splices for "T" tap cable connections shall be made using wye resin splicing kits with compression type connectors. Splice kit shall consist of a two-piece transparent mold body, tape for sealing mold ends, funnels, abrasive cloth strip and resin compound. Splices shall provide a waterproof seal for environmental protection.
3. Kits shall be factory engineered and shall accommodate any common form of cable construction without the need for special adapters. Kits shall accommodate a wide range of cable sizes and be completely independent of cable manufacturer's tolerances. Kits shall allow splicing of cables with different conductor sizes and shielded construction. Kits shall accommodate commercially available standard connectors.

F. Identification Tags
1. Description: Heat-shrinkable radiation crosslinked, thermally stabilized, flame-retarded modified polyolefin sleeves. Markers shall be recognized to UL Standard 224.
2. Sleeves tags shall be smear resistant prior to shrinking and achieve mark permanency when shrunk without need for permatalizing equipment. Sleeves shall achieve mark permanency when standard ball-point pens or high-carbon content fabric ribbons are used. The markers shall be flattened and mounted on a carrier suitable for use with typewriters or printers. Markers shall be resistant to common industrial fluids including Freon TF, isopropyl alcohol, and Ethylene Glycol.
3. Markers shall be compatible with an integrated hardware and software system allowing high speed, automated, set or batch, wire list printing. System shall allow external data to be imported from mainframe computers. System shall be compatible with panel and wraparound markers as specified in this Section.

G. Cable Application
1. Signal Power Express Cables
   a. The Contractor shall size the signal power express cables (including tap conductors) in accordance with the criteria specified herein.
2. Signal Power Branch Circuits
   a. Signal power branch circuits shall be two, single conductor No. 6 AWG, as specified herein.
3. Auxiliary Wiring
   a. Auxiliary wiring for lighting, receptacles and heating/air conditioning/ventilating combination units shall be in accordance with the NEC for the duty and service indicated. Sizes shall be adequate for 125 percent of the maximum load of indicated equipment but not less than No. 12 AWG. All wiring shall be installed in conduit. Conduit size shall also be in accordance with the NEC.
2.3 FUNCTIONAL REQUIREMENTS

A. General

1. Material and workmanship shall be of the highest quality assuring durability for minimum life expectancy of 40 years. Cables shall be suitable for use in the environment to be encountered on a transit or railroad signal system. Cables shall be certified for continuous operation at 90 degree C (194 degrees F) in wet or dry locations with no conductor failing in continuity or with loss of insulation to cross or ground less than 1 meg-ohm per 1,000 feet.

PART 3 - EXECUTION

3.1 PRODUCTION

A. Not Used

3.2 DELIVERY, STORAGE AND HANDLING

A. The Contractor shall provide required special protection for cables in areas where the cables are unavoidably exposed to hazardous conditions such as vibration or sharp corners on equipment. The Contractor shall be responsible for replacing, at no additional cost to the Authority, any cable installed which is subsequently damaged prior to acceptance as a result of failure to provide such special protection.

3.3 INSTALLATION

A. Installation of power cable shall conform to applicable sections of the NEC and the requirements as specified herein.

B. The Contractor shall give the Authority 24 hours notice prior to installing cables.

C. In certain types of installation where cable cannot be constrained, ample cable slack shall be provided for additional flexibility due to vibration of such equipment.

D. Cables shall not be bent to a radius less than eight times the diameter of cable during installation or as finally installed.

E. All cables shall be tagged at their termination points. All cables shall be tagged within Traction Power Substations (TPSS), Signal Power Distribution Center (SPDC), manholes, handholes, housings, cases and on each side of any barrier cable passes through. Cables shall also be tagged at aerial exits from conduit risers.

F. All cable entrance openings shall be sealed with a compression type fitting or pliable sealing compound after the cable is in place. Sealing compound shall be used to seal the area around cable where cable emerges from the end of a conduit. All spare conduits shall be sealed or plugged in an Authority approved manner. Cable openings within substation floors and/or walls shall be sealed with an Authority approved fire sealant.

G. Where cables leave conduits, the ends of conduit shall be fitted with end bells to prevent damage to the cable.

H. The Contractor shall arrange cables to allow free access to all existing cables for maintenance.

I. Cable connections and splices shall be made in accordance with manufacturer's instructions.

J. Installation in Conduit

1. Reels shall be stripped of all nails in outside edges of reel heads before pulling of cable. Reels shall be conveniently located for feeding cable into conduit without excessive bending or possible injury to cable by abrasion on sides of pull boxes where pull boxes are required. Reels shall be jacked to clear ground level by at least 6 inches before pulling of cable.

2. Cable reels shall be carefully handled to avoid injury to persons or cables. Movement of reels on loading skids or sloping grades shall be controlled by use of a snub line or wedge. Reels shall always be blocked after positioning.

3. Cable shall be pulled into conduits with the use of an Authority approved pulling eye. Pulling ropes shall be attached to the pulling eye with ball-bearing swivels to prevent twisting of cable during pulling.

4. Personnel shall be stationed between the reel and the conduit entrance during pulling operations to inspect, control and direct the passage of cable. Conduit mouth shall be equipped with conduit shields to prevent chafing cable.

5. During pulling operations, cables shall be lubricated with an Authority approved material in accordance with the manufacturer's recommendation.

6. Cable shall not be allowed to chafe on the ground, in manholes or handhole edges, or any sharp surfaces during pulling. Flexible cable pulling tubes shall be provided to guide and protect the cable.

7. All cut ends of cable shall have a watertight seal installed immediately after installation, until the cable is spliced or terminated.

8. Cables shall be installed with freedom of horizontal movement to accommodate expansion and contraction of cables in the conduits.
K. Splices

1. The Authority shall approve all power cable splices prior to installation by the Contractor.

2. Splices can only be made in manhole or hand hole locations. Splices in the middle of conduit or trough shall be prohibited.

3. Splices shall be indicated on the final As-built drawings and detailed on a splice location schedule, by cable size, manhole number and station location.

3.4 TESTING

A. General

1. The Contractor shall provide all instruments, materials and labor required for tests specified herein.

2. Tests conducted at the factory shall include:
   a. Manufacturer's standard tests
   b. Tests relevant to NEMA WC 7/ICEA S-66-524 standards not included in the manufacturer's standard tests. These tests include, but are not limited to:
      1) NEMA 6.4 - Test Samples and Specimens for Physical and Aging Tests
      2) NEMA 6.6 - Accelerated Water Absorption Tests
      3) NEMA 6.11 - Tests for Discharge Resistance
      4) NEMA 6.12 - Volume Resistivity
      5) NEMA 6.14 - Voltage Tests
      6) NEMA 6.15 - Insulation Resistance

3. Tests and checkouts in the field shall include:
   a. Continuity Test
   b. Insulation Resistance Test

B. Conditions for Tests

1. Prior to performing any cable testing, the following conditions shall be fulfilled by the Contractor:
   a. The Contractor shall submit cable testing procedures for the Authority's approval at least 45 days in advance of testing. No testing shall be performed unless the Contractor has obtained Authority approved test procedures.
   b. For factory tests, a four weeks advance notification shall be given to the Authority on the schedule date of tests to enable the Authority to witness the tests.
   c. Field tests shall be scheduled in consultation with the Authority.

C. Witness Tests

1. The Contractor shall ensure that the Authority has the opportunity to witness complete testing on all cable installation.

D. Field Tests

1. General. All AC power cables shall be subjected to Acceptance Tests as specified below to ascertain that the dielectric strength of cable insulation shall not impaired during installation, that connections and splices are properly made and to confirm the integrity of the cable system prior to energization. Tests shall include continuity and insulation resistance tests.

2. Acceptance Tests. Tests shall be conducted before cables are terminated at the electrical equipment. After installation of the entire length of a cable, the Contractor shall perform the tests listed below on each cable.
   a. Continuity Test
      1) This test shall be performed to prove the continuity of the conductor.
   b. Insulation Resistance Test
      1) This test shall be performed to determine cable insulation resistance to ground.
      2) Tests shall be conducted with a motor-driven megger. Test voltage shall be applied between the conductor and ground and be held until the reading reaches a constant value for five minutes. Insulation resistance values obtained by the megger tests shall not be less than two megohms. The Contractor shall advise the Authority when the results of similar tests having unequal readings with variations of 25 percent or more.
3) The Contractor shall record the temperature, humidity, and duration of each test.

3. Defective Cables
   a. Any cable installed under this Contract and found defective during testing shall be replaced with new cables at no additional cost to the Contract.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL
   A. The Work specified in this section will not be measured separately for payment.

4.2 PAYMENT
   A. All costs connected herewith will be considered incidental to the work specified under Section 16901 “Signal System Basic Technical Requirements.”
ENGINEERING REPORT

INTRODUCTION

Certain railroad specifications call for rather specific qualification tests on the insulation. These tests involve long-term voltage aging, moisture resistance and thermal aging. ________________ insulation used in railroad signal cable was tested according to these qualifications. Standard factory production cables were used as samples.

SUMMARY & CONCLUSIONS

______________ insulation tested in accord with the procedures below meets the requirements of the railroad specifications.
**DETAILS**

**Thermal Aging** - The specification reads as follows: "The insulation shall be tested in a circulating air oven on 80 mil thick slabs and shall have an elongation not less than 50% after a minimum aging time of 25 hours at 136°C (276.8°F) and 100 hours at 121°C (249.8°F)". The insulation tested as above gave the following results:

- Elongation at Break - Initial: ______________________ %
- Elongation after 25 hours @ 136°C (276.8°F): ______________________ %
- Elongation after 100 hours @ 121°C (249.8°F): ______________________ %

**Moisture Resistance** - The specification reads: "A single conductor No. 14 AWG or larger size with 80 mils or thicker insulation wall, shall have at least 10 feet immersed in water at room temperature. The insulation conductor without any coverings over the insulation shall be continuously energized as follows:

<table>
<thead>
<tr>
<th>DC Voltage</th>
<th>Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>V/Mil</td>
<td></td>
</tr>
<tr>
<td>325</td>
<td>2 months, or</td>
</tr>
<tr>
<td>280</td>
<td>3 months, or</td>
</tr>
<tr>
<td>240</td>
<td>4 months, or</td>
</tr>
<tr>
<td>200</td>
<td>6 months,</td>
</tr>
</tbody>
</table>

DART – October 2005
No insulation failure shall occur within the test period. The bare ________________ insulation 80 mils thick on a ________________ tinned copper conductor of ________________ length was placed in tap water at room temperature for ___________ months at a stress of ________________ v/mil. No failure occurred during the test period.

**Voltage Aging**

The dielectric strength stability shall have been demonstrated by voltage aging, a test sample of a single conductor No. 14 AWG or larger size wire with 80-mil or thicker insulation, shielded with the shield grounded. The cable shall be tested in free air with a minimum of ten feet between terminals. One of the following voltage stresses shall have been applied to voltage age the sample.

<table>
<thead>
<tr>
<th>Test Voltage</th>
<th>Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>60 - Hz AC</td>
<td>Age Duration</td>
</tr>
<tr>

<td>for 5 years</td>
</tr>
</tbody>
</table>

No insulation failure shall occur within the test period. The shielded ________________ insulation 80 mils thick on a ________________ tinned copper conductor of ________________ length was placed in free air at room temperature for ___________ months at a stress of ________________ V/mil time for a duration of ________________.

No failure occurred during the test period.
ATTACHMENT B

QUALITY ASSURANCE FORM

This statement will certify that ____________________________________________ (Name of Company) will manufacture and test the cable under the control of a quality assurance program which meets the requirements of Section 10CFR50, Appendix 8, of the Federal Register and ANSI N45.2.

____________________________
Inquiry No. _____________________________
Notary                                                                   Cable Co. Representative

END OF SECTION 16909
PART 1 - GENERAL

1.1 DESCRIPTION
A. The Work consists of providing and installing 110 volt Direct Current (DC) dual control power switch-and-lock movement layouts for each interlocked track switch at locations as shown on the Contract Drawings. A symbol form, shown on the Contract Drawings, is used to indicate various locations where power switch-and-lock movement layouts are to be provided and installed.

1.2 REFERENCED STANDARDS
A. American Railway Engineering and Maintenance-of-Way Association (AREMA)
   1. Communications and Signals Manual of Recommended Practice (C&S Manual)

1.3 SUBMITTALS
A. Contractor shall submit for Authority approval, drawings for assembly of each type of power switch-and-lock movement layouts together with a bill-of-materials, and name and type of graphite lubricant proposed for switch tie plate lubrication.

B. Contractor shall submit installation drawings showing tie straps and mounting details of the power switch-and-lock movement layouts including connections to the track switch points. Circuit drawings shall be submitted for each switch. Typical drawings with connection charts shall not be accepted.

C. Contractor shall submit Test Procedures and Results.

D. Contractor shall provide manuals describing operation and maintenance (O&M) of power switch-and-lock movements.

1.4 QUALITY ASSURANCE
A. Power switch-and-lock movements shall meet the requirements established by AREMA C&S Manual, Part 12.2.1 and in accordance with these Specifications, where the requirements of the AREMA specification do not conflict with any requirement specified in these Specifications.

B. Each switch-and-lock movement shall be pretested before shipping. This factory testing shall be conducted in accordance with the Contractor's Factory Test Procedure for power switch-and-lock movements as approved by the Authority.

C. Contractor shall inspect each power switch-and-lock movement layout after it has been installed and correct any deficiencies noted. This inspection shall be conducted in conformance with the requirements of the Contractor's Installation Inspection Procedure as Authority approved.

D. Final operational tests of switch-and-lock movements shall be conducted as described in accordance with the requirements of these Specifications

1.5 PRODUCT DELIVERY, STORAGE AND HANDLING
A. Prior to shipment, all parts of the layout that are not painted, or made of non-corroding material, shall be coated with an Authority approved grease to prevent corrosion. All unused threaded outlets shall be suitably plugged or capped.

B. Switch-and-lock movements and their component layout parts shall be protected against damage during handling and shipment, and be secured against loss during storage.

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIAL
Not Used

2.2 CONTRACTOR FURNISHED MATERIALS
A. Power Switch-and-Lock Movements
   1. Power switch-and-lock movements shall be as manufactured by US&S Co., Style M-23A; or Authority approved equal. Lock rods and detector rods shall be the double adjustable type.

   2. Any proposal for an equivalent switch-and-lock movement shall be submitted in writing for Authority approval. Proposal Authority approval will be based on such evidence and tests as the Authority may require. Contractor shall bear all proposal, certification, testing, and other incidental costs and no additional cost to the Contract shall result for any such proposal.

   3. Fifteen watt internal heaters shall be provided in the contact compartment and motor compartment of each power switch-and-lock movement. Wiring for these heaters shall be terminated on the mechanism terminal board.
4. Heater type, location and mounting details shall be included as part of the drawing submittal.

5. Each power switch-and-lock movement shall be provided with an internal wiring diagram protected by a plastic laminate and fastened to the underside of the mechanism cover.

6. Wire terminal binding posts shall be numbered using stencils or other Authority approved devices.

7. Switches that include a latch-out shall be circuited so that the latch-out is activated when the switch is trailed. The latch-out shall prevent control of the switch until the latchout has been reset.

B. Rods and Hardware

1. Should the power switch-and-lock movement layouts, as submitted by the Contractor, require offsets in the track connecting rods, such offsets shall be made during manufacture of the rods.

2. Ample threaded area shall be provided on each rod to accommodate wide latitude in operating adjustments.

3. All front rods shall be of the swivel type, insulated and adjustable.

4. Two malleable cast metal letters, "N" and "R", at least 3 inches high, painted white, shall be provided to denote the switch point normal and reverse position for each layout. Each letter shall have 4 holes drilled to receive:
   a. No. 12 brass wood screws suitable for securing letters to wood ties.
   b. Fasteners suitable for securing letters to concrete ties or direct fixation structure.

5. For each letter the following shall be provided:
   a. Four, 1-1/2 inch, No. 12 brass, flathead wood screws.
   b. Four fasteners, suitable to affix letters to concrete.

6. Each power switch-and-lock movement mechanism shall be provided with identification letter-numbers not less than 3 inches high, made of malleable cast metal, painted white or embossed or engraved on a metal plate and securely fastened to the outside of the movement cover. Where more than one switch mechanism is operated by one control, the switch number shall be supplemented by letter "A", "B", "C", centered on the mechanism cover.

C. Junction Box: Each power switch-and-lock movement layout shall include a junction box in accordance with requirements of these Specifications.

D. Stranded Wire: Contractor shall provide insulated No. 14 AWG, 19-strand wire (minimum) between junction box and the power switch-and-lock movement.

E. Electrical Fittings: Contractor shall provide all connectors and electrical fittings as required for each power switch-and-lock movement layout.

F. Hose: Metallic Flexible Conduit shall be Type UA, or Authority approved equal. Metallic conduit shall be used with switch-and-lock movements and electric locks.

G. Connectors

1. Hose connectors shall be a watertight and oil tight compression fitting furnished with a locknut and sealing ring.

2. Hose connectors shall provide insulation between hose and junction box; and hose and switch machine housing.

3. The material shall be zinc-plated steel.

H. Factory Painting: All equipment described in PART 2 - PRODUCTS of these Specifications shall be painted in accordance with instructions in Paragraphs 29 and 30 of the AREMA C&S Manual, Part 2.4.30. The finish shall be applied in the factory and the color shall be black.

I. Security

1. Provisions shall be made for the use of padlocks as follows:
   a. A signal padlock to restrict entry to inside of the power switch-and-lock movement.
   b. A signal padlock to restrict entry to inside of the motor compartment.
   c. A signal padlock to restrict entry to inside of the hand crank selector lever, where applicable.
   d. Switch padlocks to secure the selector lever and hand-throw lever.

2. Padlocks shall be provided and installed in accordance with the requirements of these Specifications.
2.3 FUNCTIONAL REQUIREMENTS

A. Power switch-and-lock movement motors shall be suitable for continuous normal operation at 90 to 130 volts DC and shall not be damaged when operated intermittently at 130 to 150 volts DC. Each switch-and-lock movement shall sustain a 150-volt factory test operation without damage to diodes or other components.

B. Power switch-and-lock movements shall complete a full stroke, within the time specified on the Switch Operating Time vs. Voltage Curve, while driving a load meeting the requirements shown in AREMA C&S Manual, Part 12.2.5.

C. Switch-overload circuit shall remove energy from a switch-and-lock movement if the operating current rises above the desired maximum due to a stalled switch or other overload. One overload circuit shall be provided for each power switch machine. If an over current condition develops, the overload stick relay shall energize. The overload circuit shall remain in force until the switch operating control is canceled or reversed. While overload circuit is in force, energy shall be removed from the affected switch machine. Time for pick-up of the overload circuit shall be manufacturer’s recommendation, but shall not exceed 5 seconds.

PART 3 - EXECUTION

3.1 PRODUCTION

A. Each installed switch-and-lock movement shall bear an Identification number corresponding to the number as indicated on the Contract Drawings. Where additional switch-and-lock movements are required for double-slip track switches and crossover and operated by one auxiliary lever, the number of the switch shall be supplemented by the letter "A", "B", "C", centered below the switch number as shown on Contract Drawings.

3.2 INSTALLATION

A. Contractor shall mechanically couple the power switch-and-lock movement to the track switch points and mount the movement on the ties, using the Contract Drawing switch-and-lock movement layouts that include an electric switch-and-lock movement, pedestal mounted or direct fixation junction box, throw rod and basket, insulated swivel front rod, point lug, lock rod, detector rod, gauge plate extensions, shims, identification numbers and letters, all required screws, nuts, washers, pins, grease fittings, cotter keys, plates, adjusting brackets and all other required hardware.

B. Contractor shall mount and adjust the complete power switch-and-lock movement layout as specified in these Specifications and as shown on the Contract Drawings.

C. Contractor shall provide and install tie straps for each power switch-and-lock movement layout as shown on the Contract Drawings.

D. American standards shall apply to threaded layout parts that require periodic adjustments or maintenance, such as: throw rods, lock rods, detector rods, mounting bolts, and other parts. American standards shall also apply to threaded conduit outlets. All adjustable parts shall be centered to provide maximum adjustment capabilities.

E. Contractor shall verify that the track switch layout is in accordance with dimensions indicated on the Contract Drawings and as shown on Authority approved installation drawings prior to commencement of installation Work. Contractor shall provide personnel and resources as required to ensure that the switch layout is adjusted properly.

F. Prior to mounting the power switch-and-lock movement, the Contractor shall verify that switch headlock ties (T1 and T2) are at right angles to the straight stock rail in accordance with the Authority approved installation drawing and condition the switch points to move without binding. Should the switch ties require adjustment, the Contractor shall perform all Work as required in connection with tie adjustment without cost to the Authority. Contractor shall install tie straps as indicated on Contract Drawings and in accordance with the Authority approved installation drawing.

G. Tie Preparation

1. For wooden tie installation, the Contractor shall dap and drill ties to meet the requirements of these Specifications. Whenever the Contractor drills, adzes or daps ties, the cut surfaces shall be thoroughly saturated with copper napthanate, or other type of Authority approved wood preservative. Cutting or dapping shall not exceed 2 inches.

2. For concrete tie installation, switch machines shall be mounted on ties using bolts which protrude through the tie as shown on the Contract drawings.

3. Concrete ties shall be manufactured so that the switch machine is mounted at right angles to the tie at the proper elevation. All mounting holes required in the tie shall be factory installed using a non-conductive sleeve.

4. The tie manufacturer shall coordinate with the switch machine manufacturer for switch machine mounting requirements.
H. Contractor shall be responsible for removing any stone ballast required for installation of each power switch-and-lock movement layout and for replacing and tamping the ballast after installation has been completed. Excess ballast shall be spread evenly between ties in vicinity of the power switch-and-lock movement layout.

I. Contractor shall be responsible for any costs incurred by the Authority in restoring track alignment and surface occasioned by the Contractor's Work on track switches.

J. Contractor shall make a preliminary adjustment of the power switch-and-lock layout at the time of installation and a final adjustment when placing in service. This shall result in the adjusting nuts being centered on the threads, plus or minus 30 percent of thread length.

K. Adjustment shall be such that when the switch point is obstructed 1/4 inch or more and switch and lock movement is manually or electrically operated, the obstruction will prevent the switch-and-lock movement to lock up. Contractor shall also verify that power switch-and-lock movement circuit controller contacts will be made when the switch point is within 1/8 inch closed. Measurements shall be made over No. 1 switch rod for both Normal and Reverse positions of the switch points.

L. Underground cables terminating in the switch junction box shall be dressed in accordance with the requirements of these Specifications. Individual conductors shall be fanned, tagged and terminated. Wiring between the switch junction box and power switch-and-lock movement shall be accomplished using insulated flex wire, No. 6 and No. 14 AWG, 19 strand, minimum. All wires shall be tagged and terminated. Wires between the switch junction box and power switch mechanism shall be installed in a required length of Authority approved flexible watertight conduit. The flexible conduit shall be fastened to the switch junction box and switch mechanism with two, 3-inch stainless steel conduit clamps in accordance with the requirements of these Specifications. Maximum length of the flexible conduit shall not exceed 21 inches unless otherwise Authority approved.

M. During storage and after installation, power switch-and-lock movement layouts shall be properly lubricated and maintained by the Contractor on a regular timed program until accepted by the Authority.

N. Contractor shall exercise care that switches, including switch tie plates, are thoroughly lubricated at all lubricating points, that all machined surfaces susceptible to rusting, both external and internal, are thoroughly coated with an Authority approved grease and threaded portions of switch rods and nuts are similarly coated and protected.

O. Switch tie plates shall be lubricated with an Authority approved graphite lubricant. Tie plates shall be thoroughly steam cleaned to remove all oil or grease prior to application of graphite. Contractor shall periodically renew the protective coating until such time as the Authority assumes responsibility for maintenance of the equipment.

P. Contractor shall install, for each layout, the letters "N" and "R" for the purpose of identifying the position of the switch points. The "N" shall be placed on the normally closed point side as shown on the Contract Drawings.

Q. Field Painting: After installation, the Contractor shall inspect each switch machine and repair all scratches and blemishes in the paint finish of the switch machine. If surface rust is evident, it shall be removed prior to preparation of the surface for touch-up painting. The surface shall be smoothed, cleaned and completely dried prior to application of paint. The same brand and shade of paint applied in the factory shall be used in field painting. Finish color shall be black.

3.3 TESTING

A. Contractor shall test all functions of each power switch-and-lock movement layout in accordance with these Specifications.

B. Field testing shall include the following procedures:

1. Continuity check field wires to switch-and-lock movements to verify proper nomenclature in junction boxes and switch circuit controllers.

2. Adjust throw bar so that proper tension is placed on switch points in both positions.

3. Manually throw switch machine normal and adjust lock rods and point detector rods to allow switch machine to lockup with no obstruction. Repeat above for switch machine in reverse position.

4. Turn on switch machine power and request switch machine normal and observe in field that switch machine corresponds to position called and observe in wayside instrument housing that proper switch correspondence relay is energized.

5. With switch machine normal, check openings of circuit controller contacts to see that they meet equipment specifications. Operate machine reverse and repeat procedure.

6. Open each contact in switch circuit controller and observe that proper switch correspondence relay is de-energized. Repeat this procedure for both switch positions.
7. Place ammeter in series with motor control energy and adjust clutch such that it causes overload relay to energized in less than 10 seconds with 1/4 inch obstruction in switch point. Record current reading. Repeat for opposite position.

8. Throw selector level to HAND and observe switch mechanism cannot be operated by power. Restore lever and verify that switch mechanism can be powered.

9. Operate switch, then place shunt in switch detector track circuits and observe that switch machine is stopped in middle of stroke and does not complete movement.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith will be considered incidental to the work specified under Section 16901 "Signal System Basic Technical Requirements."

END OF SECTION 16911
SECTION 16915
MOTOR CONTROL CENTERS AND STARTERS

PART 1 - GENERAL

1.1 DESCRIPTION
A. This section specifies furnishing and installing motor control centers, motor control starter unit compartments, individually mounted AC motor starters, and supporting devices, as shown.

B. Work Allocation:
1. Individual starters (and their enclosures) to be used with equipment specified under Division 15, "MECHANICAL", shall be supplied under Division 15, "MECHANICAL". Refer to Section 15040, "Electrical Requirements for Mechanical Work". They shall be installed and wired under Division 16, "ELECTRICAL".

2. Starters other than those in Paragraph 1.1.B.1, including those in motor control centers, shall be supplied, installed and wired under Division 16, "ELECTRICAL".

1.2 REFERENCE STANDARDS
A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM):
   1. ASTM B187 - Standard Specification for Copper Bar, Bus Bar, Rod, and Shapes

B. National Fire Protection Association (NFPA):
   1. NFPA 70 - National Electrical Code (NEC)

C. Underwriters Laboratories, Inc. (UL):
   1. UL 845 - UL Standard for Safety Motor Control Centers
   2. UL 489 - UL Standard for Safety Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit-Breaker Enclosures

1.3 SUBMITTALS
A. Product Data.

B. Certification: Submit certified copies of field test reports.

C. Shop Drawings: Provide to scale to show all elements clearly legible.

D. Field Testing: Submit a detailed plan of the proposed methods of scheduling of testing the motor control centers and motors at least 30 calendar days prior to initiating the testing program.

E. Operations and Maintenance Manuals, and Training: In accordance with Section 16001, "Electrical Systems - General".

F. Manufacturer’s Data:
   1. At least two weeks before start of any shop coating paint work submit to the Contracting Officer for approval three each of the following:
      a. Complete Paint Data Sheets with surface preparation, recommendations, and the coating paint materials to be used, identified by the manufacturer, brand name, and product number.

1.4 QUALITY ASSURANCE
A. Experience:
   1. Manufacturer: Select a firm regularly engaged in the manufacture of motor control centers and motor starting equipment, of the type and sizes specified herein.

   2. Incorporate equipment into this work which essentially duplicates equipment that has been in satisfactory use for a period of five years prior to the Bid Opening of this Project.

1.5 EXTRA MATERIALS
A. Accessories and Spare Parts:
   1. Accessories: Provide special tools or other devices normally furnished or required for installation, care, and maintenance of equipment.

   2. Spare Parts: In addition to the recommended spares by the manufacturer, include the following:
      a. One spare circuit breaker for each 10 or less circuit breakers of given type, frame size, and trip rating.
      b. One spare contactor (motor starter) for each 10 or less contactors (motor starters) of given size.
      c. One set of spare overload heater elements for each 2 or less sets of specific size.
d. 10 percent spare fuses (minimum of two of each type and rating) for both primary and secondary of control power transformers.

e. 100 percent replacement of indicating lamps.

f. 50 percent replacement of indicating lamp lenses.

**PART 2 - PRODUCTS**

**2.1 GENERAL REQUIREMENTS FOR MOTOR STARTERS**

A. Interchangeable: Provide equipment of same type, rating and size and of functional characteristics and make to be interchangeable.

B. Provide for continuous current rating suitable for associated motor as shown.

**2.2 MANUAL MOTOR STARTERS**

A. Provide quick-make, quick-break, toggle switch type, or push button, with thermal alloy type overload protection. Use manual motor starters for single-phase motors rated less than 1/2 horsepower.

B. Toggle Switch Operator: Provide operator guarded and equipped with a red indicating light to show when the switch is in the closed position.

C. Provide manual motor starters with the following additional requirements: For starters located remote from motors provide thermal type.

**2.3 MAGNETIC MOTOR STARTERS**

A. Provide full voltage, across-the-line or reduced voltage start, reversing or non-reversing type as required, rated for design load requirements, sized to conform with standard NEMA ratings for given horsepower. Provide minimum size of NEMA size 1, and design for use on nominal 480 volts; 3-phase, 60 Hertz service unless otherwise indicated; with 120 volts control circuits; minimum three thermal type ambient compensated as indicated, manual reset, overload relays for motor protection; two convertible auxiliary contacts with provision for field mounting of minimum two future auxiliary contacts; red, green, and amber indicating lights; start-stop pushbuttons as indicated; and hands-off-automatic switch where automatically controlled, as indicated. Additionally, provide indicating lights, pushbuttons, and selector switches with legend plates.

B. Provide overload relays selected, and sized, based on actual full load amperes of particular motor. Additionally, install heaters in conformity with NFPA 70 and manufacturer's recommendations.

C. Provide control transformers for magnetic starters. Provide two fuses in the primary circuit and one in the secondary.

D. Furnish all magnetic starters with three ambient compensated overload relays. Select and size overload heaters based on the actual full load amperes of the particular motor. Install heaters in conformity with NFPA 70 (NEC) and the manufacturer's recommendations. For fans to be used for emergency ventilation, provide magnetic starters sensitive to fault current only.

**2.4 REVERSING STARTERS**

A. Provide such starters as shown, equipped with minimum three overloads. Additionally, interlock starters electrically and mechanically.

**2.5 TWO-SPEED REVERSING MOTOR STARTERS**

A. Provide starters for two-speed, single or two-winding, constant or variable torque motors, as shown, with automatic sequence accelerating relay which will start motor on low speed first at all times.

**2.6 CONTROL UNITS**

A. For control units for power and lighting feeders, provide circuit breakers only. For control units for motors, provide an across-the-line starter, either reversing or non-reversing as required, and a circuit breaker. Provide circuit breakers with molded case, 3-pole thermal magnetic type, with frame size and trip rating as indicated. Provide minimum interrupting capacity of 14,000 amperes RMS symmetrical or as indicated.

B. Mount units on a unit support pan or in a bucket type housing. Provide units of the draw-out type utilizing rails in order that rearrangement or relocation of individual units can be readily accomplished.

C. Securely mount starter and feeder unit doors with rugged hinges which allow the door to swing open for ease of unit maintenance. Fasten unit doors to the stationary structure so they can be closed to cover the unit space when the unit has been temporarily removed. Provide closed doors with captive type knurled or screw driver operable screws designed to help keep doors closed under fault conditions and to discourage unauthorized opening of the doors.

D. Provide combination motor starter unit doors, in addition to an overload reset button, oil tight pilot
lights and push button stations or selector switches as required or specified.

E. Provide units with an integral circuit breaker handle, color coded to indicate ON, OFF or TRIPPED position. Interlock the operating handle with the unit door so that the circuit protector cannot be switched to the ON position unless the unit door is closed. Provide the interlock to prevent opening the unit door unless the circuit protector is in the OFF position. Provide an override feature so that qualified personnel can gain access to the unit without interrupting service. Make provisions that all unit door operating handles can be locked in the ON or OFF position with a minimum of three padlocks.

F. Assemble control units with control leads for all starters and motor leads to fully shielded terminal boards with disconnecting type terminal blocks located with the unit cell. Provide a minimum of 20 percent spare terminals. Load terminal blocks for branch circuit breakers are not required. Furnish individual unit drawings as required, for NEMA Class 1, Type B wiring.

2.7 MOTOR CIRCUIT PROTECTORS (MCP)

A. Provide motor circuit protectors with the following characteristics:

1. UL 489 molded-case, quick-make/quick-break, mechanically trip-free, switching mechanism with adjustable magnetic trip for instantaneous short-circuit protection.

2. Rating:
   a. Continuous current rating: As shown but not less than full load current of motor.
   b. Voltage: 480 volts, 3-phase, 60 Hertz.
   c. Interrupting rating: As shown.
   d. Trip range: As necessary to provide maximum motor protection.

3. Where shown or necessary, individually removable current limiter, internally mounted on load side of MCP, with the following additional requirements:
   a. Limiter current rating and time-current limiting characteristics coordinated with time-current characteristics of motor circuit protector (MCP) to provide the following:
      1) Interruption by MCP under fault-current level up to interrupting capacity of MCP.
      2) Interruption by current limiter in conjunction with the MCP of fault-current level above interrupting capacity of MCP.
      3) Where necessary to protect associated motor starter, limit fault current below withstand capability of the starter.
   b. Current limiter housing interlocked with MCP tripping mechanism so that breaker will trip upon removal of cover.
   c. Equipped with common trip mechanism for tripping poles simultaneously on blowing of current limiter to prevent single phasing.
   d. Capable of interrupting minimum fault-current up to 100,000 RMS symmetrical amperes at 480 volts AC.

2.8 AUTO TRANSFORMER STARTER

A. Where shown on drawings, provide motors with closed transition transformer starter operable on 480 volts, 3-phase, 60 Hertz supply and having the following additional features:

1. Reversing or nonreversing closed transition type, as shown.
2. NEMA size as indicated on the drawings.
3. Adjustable taps for 50, 65, and 80 percent of line voltage.
4. 480 volts primary to 120 volts secondary control transformer with fuses in both legs of the circuit.
5. Manual reset, overload relay, one per phase:
   a. In starter for motors in fan shafts: magnetic type sensitive to fault current only.
   b. In starters for motors in remote locations: thermal type.

6. One pneumatic adjustable timing relay.

7. Two NO contacts with provision for addition of two NO or NC contacts.

8. Nonreversing type: START/STOP push button mounted on door.

9. Reversing type: FORWARD/REVERSE/STOP push button mounted on door.

10. HAND/OFF/AUTO selector switch provided where specified.

2.9 MOTOR CONTROL CENTERS

A. Provide motor control centers complying with NEMA ICS, Class 1, Type B, rated 480 volts, 3-phase, 60 Hertz, totally enclosed, deadfront, free standing, modular assembly with vertical and horizontal buses, wireways, compartments equipped with circuit breakers, MCP, and starters as shown.

B. Enclosure: Reinforced with adequate steel framework to form a rigid structure with smooth outer surface free of burrs, ridges, and other blemishes. Modular assembly to allow a maximum of six compartment units in one vertical assembly and units layout in any combination without structural interference, with the following additional requirements:

   1. NEMA type as described in 2.11 of this section.

   2. Main Incoming Lug Compartments: Provide a front accessible main lug compartment with suitable main lugs. Locate the compartment in the top most or bottom most unit space of the section to accommodate the user's cables entering the Motor Control Center. Provide cover with a hinged door, on the main incoming lug compartment for maintenance access. Provide captive type screws to keep this door closed and to discourage unauthorized access. Provide a unit door padlock attachment to lock the door in the closed position with one 5/16 inch diameter shackle padlock. Fabricate attachment to accept a meter type seal.

   3. Horizontal Wireways: Provide horizontal wireways in the top and bottom of each vertical section and arranged to provide full length continuity throughout the entire assembly. Provide the top horizontal wireway having a cross sectional area of not less than 20 square inches with openings between sections of not less than 11-1/2 square inches. Extend the bottom horizontal wireway through the length and depth of the vertical sections and provide with openings of not less than 11-1/2 square inches to allow for full length continuity throughout the entire assembly. The bottom horizontal height shall be minimum 9-1/4 inches. Provide covers with captive type screws for all wireways to prevent loss of hardware during installation. Isolate all wireways from the bus bars.

   4. Vertical Wireways: Locate a vertical wireway on the right hand side of each vertical section and extend from the top horizontal wireway to the bottom of the available unit mounting space. Provide each vertical wireway with a cross sectional area of not less than 19 square inches and isolated from the bus bars to guard against accidental contact. Provide a separately hinged door with captive type screws covering the vertical wireway for easy access to control wiring without disturbing control units.

   5. Wiring:
      a. For internal wiring in the motor control center use stranded copper with Type TEW 105 deg. C insulation.
      b. Power wiring minimum size No. 12 AWG.
      c. Control wiring minimum size No. 16 AWG.

C. Auxiliary Devices:

   1. Each combination motor starter unit: Provide a control transformer to handle the starter coil burden plus two pilot lights. In addition, size each control transformer to carry 100 VA more capacity than required.

   2. Control transformers: Provide two dual element primary fuses sized at approximately 125 percent of the transformer full load amperes. In addition, provide a single secondary dual element fuse and size to protect against transformer overload. Ground the coil side of the
transformer secondary to the unit support or back pan.

3. Indicating instruments:
   a. 4-1/4 inch square concentric scale type, with white background scales, black scale graduations and black pointer at indicator.
   b. Design for mounting on steel panels.
   c. The accuracy classification: three percent.
   d. The scale: Approximately 6-3/4 inches in length with a spread of not less than 250 deg. F of the instrument face.

2.10 MATERIALS

A. Vertical sections support the horizontal and vertical buses, combination starter units, covers, and doors, and designed to allow for easy rearrangement of units. Provide vertical sections with structural supporting members formed of a minimum of 13 gauge USSG hot-rolled steel. Provide all finished surfaces blemish-free. Where needed, provide reinforcement structural parts of 10 gauge USSG steel for a strong, rigid assembly. Provide each section 90 inches high and with 3 inch high removable lifting angle. Divide complete control center line-ups into shipping splits no wider than approximately 60 inches. Provide the lifting angle on the top of each shipping split extending the entire width of the shipping split. Provide lifting angles designed to support the entire weight of the MCC section. Provide base channels with holes to permit bolting the Motor Control Center(s) to the floor. Construct and package the entire assembly to withstand all stresses induced in transit and during installation.

B. Design Motor Control Centers so that matching vertical sections of the same current rating and manufacture can be added later at either end of the line-up without use of transition sections and without difficulty or undue expense. Provide removable end closing plates to close off openings on the end of the Motor Control Center line-up. Provide a removable top plate on each vertical section of one piece construction for added convenience in cutting conduit holes. In the design, allow use of the standard conduit entrance area without significant sag or deformation of the top plate.

2.11 ENCLOSURE

A. Select motor controller and switch enclosures suitable for the environment in which they are to be used, as follows:
   1. Enclosures for indoors and in dry, dust-free areas: NEMA Type 1.
   2. Enclosures for outdoor locations or where moisture is present: Use NEMA Type 3R, Type 4, or Type 4X, weatherproof as indicated.
   3. Enclosures for areas where dust and dirt are likely to be present: NEMA 12 industrial type.

2.12 PAINTING

A. Factory degrease and provide phosphate coating, after fabrication, to surfaces which are to be painted. Apply undercoat of rust-resistant paint such as zinc chromate over the phosphate coating (except for stainless steel). Apply finish painting of baked enamel, gray.

2.13 HORIZONTAL AND VERTICAL BUSES

A. Main horizontal buses provided at top of structure. Vertical buses for feeding power to each compartment provided in each vertical assembly and securely bolted to main buses.
   2. Each horizontal and vertical bus rated for a minimum of 600 amperes and 300 amperes respectively to meet ANSI temperature of 50 deg. C rise unless otherwise shown.
   3. Hold each bus rigidly by bus supports which have high dielectric qualities, are moisture-resistant, noncarbonizing and nontracking and have vertical creepage surfaces to prevent faults due to buildup of conductive dirt.
   4. Provide bus assembly braced to withstand short circuit rating of 22,000 symmetrical amperes, RMS or available short circuit determined by short circuit calculations, whichever is greater.
   5. Provide unit guides in unit compartment for aligning starter stubs.
   6. Provide continuous bare copper ground bus, 1/4 inch by 2 inch cross section throughout length of control.
7. Motor Starters: As specified under motor starters general requirements.

2.14 CIRCUIT BREAKER
A. Main circuit breaker (if used): One 480 volts, 3-pole, rating as indicated with ammeter and ammeter switch, voltmeter and voltmeter switch; and ground fault protection if required by NFPA 70 (NEC).
B. Branch circuit breaker: One 480 volts, 3-pole for each unit compartment.

2.15 UNIT SPACE HEATERS
A. Provide space heaters in all motor control centers located outdoors or in unheated spaces (only).
B. Provide heaters of required rating to prevent condensation for each vertical section of motor control centers. Additionally, locate heaters such that components in same vertical section are uniformly heated.
C. Provide space heater bus rated 120 volts, 60 Hertz supplied from stepdown transformers connected to the motor control center buses.
D. Do not load each space heater circuit more than 10 amperes, and additionally provide each circuit with one set of fused disconnect, adjustable thermostat and bypass switch in common.

2.16 ACCESSORIES AND SPARE PARTS
A. Furnish special tools or other devices normally furnished or required for installation, care and maintenance of the equipment.
B. Specifically include the items listed in Paragraph 1.5 of this section.

PART 3 - EXECUTION

3.1 INSTALLATION
A. Provide concrete housekeeping pad in accordance with Section 16001, “Electrical Systems - General”.
B. Embed iron sills for anchoring motor control center flush with raised concrete pad as shown.
C. Install motor starters and control centers as shown in accordance with manufacturer’s recommendations and as approved by the Contracting Officer.
D. Install conduit in accordance with Section 16111, "Conduits".
E. Connect power cable and control wire as recommended by manufacturers and as follows:
   1. Make power cable and control cable connections to manual starters, across-the-line magnetic starters and autotransformer starters by means of integral mechanical connectors. If such items are not furnished with integral mechanical connectors, make connections using compression connectors in accordance with Section 16120, "Wires and Cables".
F. Ground motor starters and complete motor control center in accordance with Section 16450, "Grounding and Bonding".
G. Apply touch-up paint as necessary.
H. Level motor control centers on the foundations, and place non-shrink grout between cabinet bases and the foundations.
I. Mount individual starters 5 feet above floor unless noted otherwise.

3.2 TESTING START-UP
A. Refer to Section 16030, "Testing of Electrical Systems".
B. Furnish necessary equipment and perform the following tests:
   1. Test circuits for connections in accordance with wiring diagram.
   2. Test to ensure that insulation resistance to ground of nongrounded conductor is in accordance with the grounding and bonding section.
   3. Test equipment enclosures for continuity to grounding system.
   4. Test operation of circuits and controls.
   5. Submit certified field test reports in accordance with Section 16030, "Testing of Electrical Systems".

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL
A. In accordance with Section 16001, “Electrical Systems - General”

END OF SECTION 16915
PART 1 - GENERAL

1.1 DESCRIPTION
A. The Work to be done under this Section consists of designing, providing and installing color light type signal and indicator layouts. Except where otherwise noted, standard railroad signals shall be used for indicators. Indicators for embedded switch machines in unsignaled areas shall be in accordance with these Specifications. Herein, the term "signal" is used to refer to all indicating devices. A symbol form shown on the Contract Drawings is used to indicate the approximate locations where signal layouts are required.

1.2 REFERENCED STANDARDS
A. American Railway Engineering and Maintenance-of-Way Association (AREMA):
1. AREMA - Communications & Signals Manual Of Recommended Practice (C&S Manual)

1.3 SUBMITTALS
A. Submittals shall be in accordance with the requirements of these Specifications.
1. Contractor shall submit for approval, complete drawings for each type of signal layout proposed, including all mounting and wiring details. For 110V circuits, the drawings shall also show the transformer type to be provided and the manner of mounting. A key-numbered parts list and complete material ordering reference numbers shall be included for each type of layout.
2. Contractor shall submit installation drawings that include signal foundation and signal mounting details. Circuit drawings shall be submitted for each signal.
3. Contractor shall submit in conjunction with the factory test of the first Central Instrument House (CIH), an operating test. The operating test shall be performed in the factory with all controlling equipment. Lamp driver and lightout operations shall be verified through the entire range of operating voltages.
4. Contractor shall provide manuals describing operation and maintenance of each type of wayside signal.

1.4 QUALITY ASSURANCE
A. Each lamp unit shall be inspected prior to shipment. Inspection shall conform to the Contractor's Factory Inspection Procedure as Authority approved.
B. Signals shall meet the requirements of the AREMA C&S Manual, Section 7.1.1.
C. Each layout shall be inspected after it has been installed in the field. This inspection shall conform to the Contractor's Installation and Inspection Procedure as Authority approved. Installation shall not be considered complete until all installation defects have been corrected to the Authority's satisfaction.
D. Final operating tests to determine acceptability of each complete layout shall be performed.

1.5 PRODUCT DELIVERY, STORAGE AND HANDLING
A. Layouts and their component parts shall be properly crated to prevent damage throughout delivery, storage and handling.

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIALS
Not Used

2.2 CONTRACTOR FURNISHED MATERIALS
A. Maintenance Materials: Provide 2 complete layouts of every indicator used within the system, including hardware required for installation.
B. Each signal layout shall be provided with lenses, lamps, lamp receptacles, phankill, tapped transformers if required, terminal boards, wiring, number plates, backgrounds, hoods, padlocks and mounting hardware.
C. Each signal layout shall be provided with split-base junction boxes, signal mast and ladder.
D. Signals shall be internally wired at the factory.
E. Each signal shall contain colored lenses as shown on Contract Drawings. Each head shall be wired complete and cable conductors shall be terminated at the junction box and CIH terminal board. Where an aspect is not required by the design, the lamps shall not be installed, and test links shall not be installed on the CIH terminal board for the circuit.
F. Lenses and Hoods

1. If lenses are necessary for the provided LED lighting unit, they shall be doublet type and the inner lens diameter shall not be less than 5-1/2 inches and the outer lens diameter shall not be less than 8-3/8 inches. The outer lens shall be manufactured from high impact resistant LEXAN as Authority approved.

2. Lenses shall be uniform in shade and density for each respective color. Lenses shall be secured to the signal head in a manner such that their removal shall not affect adjustment of lamp receptacles. Lenses shall be provided with neoprene gaskets to provide a weatherproof and dust-proof seal between lenses and signal housing.

3. Contractor shall provide all equipment and material, including shims or special tools required to properly focus and align signals both horizontally and vertically to obtain the proper sighting distance.

4. Each lens unit shall be equipped with a hood and the hood shall be not less than 9 inches in length.

5. To prevent occurrence of phantom aspects, each lens shall be equipped with a phankill device.

G. Lamp Compartments

1. Signal housings shall be made of cast aluminum and shall have individual lamp compartments. Lamp compartments shall be separated from each other by partitions that prevent the passage of light between the compartments and, also, provide a means to pass wiring between units.

2. Each housing shall have a hinged removable door manufactured from cast aluminum. The doors shall be provided with ventilating openings, covered with fine mesh stainless steel, copper, or brass screen on the inside, and protected with hoods to keep precipitation out. Doors shall have gaskets as specified in the AREMA C&S Manual, Section 15.2.10. Ventilation openings in the housing are an acceptable alternative.

3. Doors shall have a provision for padlocks and padlocks shall be keyed in accordance with the Authority signal equipment standard. Contractor shall obtain keying information from the Authority to ensure that Contractor provided keying is identical to existing system keying. Door locking arrangement shall be so arranged that the door cannot be locked until fully closed. All lamp compartment doors shall have a stop that will prevent them from swinging where they may be struck by a passing train. The design shall permit opening of a single compartment door without opening the others. Contractor shall provide a means of locking all doors with a single device such as a lockable rod that fits though all door hasps. As an alternative, the Contractor shall provide a lock for each door.

4. Each lamp compartment shall be of proper size to provide ample space for lamps, lamp receptacles, terminals and such adjusting devices as required.

H. LED Lighting Units

1. LED lighting units shall be installed in lamp compartments.

2. Lighting units shall operate properly and be clearly visible when operated between 8 and 20 volts.

3. LED unit chromacity shall meet the requirements of AREMA C&S Manual, Section 7.1.10. Beam pattern shall meet requirements of AREMA C&S Manual, Section 3.2.37.

4. The LED unit shall withstand either 130 VAC or 54 VDC for 80 milliseconds without damage.

I. Painting

1. The lamp compartment interior shall be painted to the manufacturers’ standard.

2. Each layout shall have 1 primer coat of rust-preventive paint and 1 finish coat of paint at the point of assembly prior to shipment. The lamp compartment housing exterior paint finish coat shall be dull black. The finish coat of paint for the mast, ladder and base casting shall be black.

J. Signal Number Plates

1. Signal number plate shall be placed under the lowest signal lens in the layout and shall be fastened by 4 brass screws.

2. Each number plate shall meet the requirements of the AREMA C&S Manual, Section 14.6.1.

3. Characters and numbers for the number plates shall be 3 inches high round type, black letters on a white reflective background.
K. Mounting, Mast Mounting

1. Mast mounted signals shall be provided for locations as shown on the Contract Drawings. A mast shall consist of a 5 inch aluminum pipe post suitably equipped at the top to accommodate the signal unit(s) and provided at the bottom with an approved base.

2. Base shall be a split base junction box type with AREMA approved terminals as shown on Contract Drawings. The terminals are to be made accessible by a cover or door, with provisions for padlocking, without removing any other part of the signal assembly. Bolt hole center dimensions in this base shall be 11-11/16 inches by 11-11/16 inches.

L. Ladders

1. Ladders shall be provided by the Contractor to provide access to all signal layouts. Ladders shall be complete with cast iron ladder base for layouts in ballasted at-grade construction, with all required bolts, nuts, washers and associated mounting hardware.

2. Ladders shall be provided with all required bolts, nuts, washers and associated mounting hardware for installation of ladder for signals on above grade structures.

3. Ladders shall be equipped with rungs along the full length of the ladder and shall not impede access to any lamp compartment. The top rung shall be no more than 4 feet from the top of the ladder.

M. Where signals are mounted back-to-back, installation shall not create unsafe or restricted working conditions.

N. Contractor shall provide elevated bases for conduit entrance for signals installed on above grade structures.

O. Contractor shall provide mounting brackets for all layouts to allow for adjusting vertical, horizontal, left, and right.

P. Signal layouts shall not be mounted as to require personnel lifting equipment of any type for access.

PART 3 - EXECUTION

3.1 INSTALLATION

A. In areas where mainline signals cannot be installed due to space restriction or where indicated on the Contract Drawings, transit LED color light signals shall be used with the Authority approval.

B. All layouts shall be installed at locations as shown on Contract Drawings and in accordance with approved installation drawings.

C. Layouts shall be properly installed, aligned, and focused, both horizontally and vertically, in order to ensure that each lens configuration is distinctive when viewed from a height of 9 feet above the top of rail.

D. After installation and prior to Contract completion and acceptance, the Contractor shall touch up the exterior of each layout as required to cover all scratches, chips, and blemishes in the painted surface. Touch up paint shall be of the same quality, texture, and appearance as manufacturer’s finish coat.

E. Ladders shall be installed in accordance with approved installation drawings.

F. Contractor shall provide foundations of sufficient depth to ensure stability. In areas where the grade slopes, the Contractor shall build up the earth around the signal installation and, if required to maintain the build-up, shall construct retention structures of treated lumber such as railroad ties.

3.2 TESTING

A. Field testing shall be performed on all signal layouts. These tests shall include:

1. Continuity check of field wires and verification of all nomenclature.

2. Application of energy to signal lighting circuits and adjustment of all lamp voltages to 10 percent less than the lamp rating.

3. Break down of signal clearing relay contacts and observation that proper signal aspect is displayed.

4. Sighting of signals for maximum visibility.

5. Checking of light-out feature, where used.

6. Verification of approach lighting.

B. Contractor shall support the Authority’s System Integration testing.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this section will not be measured separately for payment.
4.2 PAYMENT

A. All costs connected herewith will be considered incidental to the work specified under Section 16901 “Signal System Basic Technical Requirements.”

END OF SECTION 16917
PART 1 - GENERAL

1.1 DESCRIPTION
A. The Work to be done under this Section consists of designing, providing and installing audio frequency (AF) track circuits for train detection. AF overlay track circuits shall not be used for long range train detection.

B. Main line AF track circuits shall provide broken rail detection for both rails.

C. AF track circuit equipment shall detect the failure of insulated joint and protect against it causing any unsafe condition or shall be arranged so that failure of an insulated joint shall not cause an unsafe condition.

D. Selected frequencies of AF track circuits for main line detection and for highway crossing island circuits shall not interfere with the cab signal functions and shall operate properly when coupled with the cab signal frequency.

E. Track circuit shall be compatible with the traction power negative return and not be affected by traction power return current imbalances.

F. Restoration of power after a power failure shall automatically restore the track circuits to normal operation.

G. Reset of de-energized track circuit shall not be based on adjacent track circuit occupancy.

H. Track circuit shall function properly in an uncontrolled temperature environment from negative 40 degrees F to 160 degrees F.

I. AF track circuits shall be protected from lightning and power surges.

1.2 REFERENCED STANDARDS
A. American Railway Engineering And Maintenance-of-Way Association (AREMA):
   1. AREMA – Communications and Signals Manual of Recommended Practice (C&S Manual)

1.3 SUBMITTALS
A. Submittals shall be in accordance with the requirements of these Specifications.
   1. Contractor shall submit drawings showing the physical characteristics, ratings and operating characteristics for the proposed track feed transformers, adjustable resistors and track fuses.

   2. Contractor shall submit the following for Authority approval:
      a. Drawings for AF track circuits together with a bill of materials.
      b. Complete performance data of each type of track circuit to be provided for this Contract.
      c. Test report of lightning and surge protection.

   3. Contractor shall submit installation drawings showing tie straps and mounting details of the AF track circuits including rail connections. Circuit drawings shall be submitted for each track circuit.

   4. Contractor shall submit Test Procedures and Results in accordance with these Specifications.

   5. Contractor shall provide manuals describing operation and maintenance of each type of AF track circuits

1.4 QUALITY ASSURANCE
A. Each AF track circuit component shall be inspected prior to shipment. Inspection shall conform to the Contractor's Factory Inspection Procedure as approved by the Authority.

B. AF track circuits shall meet the requirements of the AREMA C&S Manual, Sections 8.2.1 and 8.6.10.

C. Each AF track circuit shall be inspected after it has been installed in the field. This inspection shall conform to the Contractor's Installation and Inspection Procedure as approved by the Authority. Installation shall not be considered complete until all installation defects have been corrected to the Authority's satisfaction.

D. AF track circuits shall be tested according to Authority approved test procedures.

1.5 PRODUCT DELIVERY, STORAGE AND HANDLING
A. Where AF track circuits drive a relay, the relays shall be delivered, stored and handled as required in these Specifications.
PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIAL

Not Used

2.2 CONTRACTOR FURNISHED MATERIAL

A. Maintenance Materials: Two complete sets of AF track circuit equipment, both the transmitting and receiving ends, including coupling unit and tuning devices and any other equipment needed for installation for each frequency used within the system.

B. Keys, Special Tools, and Test Equipment: Contractor shall provide C&S1 test stand for AF track circuit PC cards. The test stand shall allow shop test and troubleshooting of each type PC card used in the track circuit equipment.

C. In interlockings, power frequency (PF) track circuits shall be provided through crossovers. Equipment for PF track circuits shall be in accordance with these Specifications.

D. Track circuit lengths shall match Authority approved block design.

E. Each AF track circuit shall consist of the following basic components and characteristics:

1. A device for generating proper vehicle/train detection frequency signals (Track Module).

2. A device for receiving the proper detection frequency and driving a vital, biased neutral track relay or interfacing to a vital processor’s input when this frequency is received (Receiver Module).

3. Built-in diagnostics with test points and Light Emitting Diode (LED) indicators on modules.

4. AF track circuit modules shall fit in standard 19 inch instrument racks. Means shall be provided to easily and independently adjust both track circuits transmitting energy and receiving sensitivity.

5. Power to each track and receiver module shall be individually fused. A fused buss shall not be permitted.

F. Frequency selection, modulating techniques and signal strengths shall not cause interference and be immune to interference from traction power or conducted and induced emissions generated by light rail vehicles (LRV).

G. AF track circuits shall be immune to improper operation due to crossed or grounded wires or any other influences such as capacitive and inductive coupling or stray currents.

H. No combination of frequencies and/or code rates shall produce an output signal that may improperly energize a track circuit.

I. Detection signal shall be modulated carrier signal to distinguish the presence of a legitimate signal from any noise.

J. AF track circuit receiver shall verify the carrier and coding of the detection frequency in order to energize the track circuit.

K. AF track circuits shall operate satisfactorily under the environmental conditions present on the system.

L. If a track relay is used, it shall be a vital DC biased relay as required in these Specifications.

M. Cable and wiring for AF track circuits shall be as required in these Specifications.

N. Other track circuit system components shall comply with applicable portions of these Specifications.

2.3 FUNCTIONAL REQUIREMENTS

A. AF track circuits shall detect a shunt anywhere within the track circuit boundaries. Shunting sensitivity for AF track circuits shall be 0.25 ohm impedance with rail-to-rail leakage impedance of 3 ohms minimum per 1000 feet of track at the operating frequency and shall be under the following conditions:

1. Train moving or stopped.

2. Traction power on or off.

3. Rail condition for prevalent operation for any track.

B. Failure of track circuit component shall not permit the shunting sensitivity to fall below that specified after the track circuit has been properly adjusted.

C. AF track circuit equipment shall consist of a transmitter, a receiver, and vital track logic. AF track circuits shall be vital and fail-safe. In cab signaled territory, AF track circuit frequencies shall be selected so that the proper operation of the track circuit is not affected by the cab signal frequency. The selected track circuit frequencies shall not cause interference or improper operation of the cab signal system.

D. Reliability of AF track circuits shall comply with the requirements of these Specifications.
E. Insulated Joints (IJ) shall not be required except at interlocking areas.

F. Boundary definitions shall be no more than actual boundary within plus or minus 16 feet at each end at all locations except adjacent to IJs, where the boundary shall be within plus or minus 0 feet.

G. Lightning Protection

1. Contractor shall provide lightning protection and surge protection which are effective in protecting all signal circuits and equipment from damage and operational malfunction. This shall be accomplished by providing as many applicable types and stages of protection as required to protect each type of circuit and equipment involved.

2. Primary surge arrestors shall have the ability to shunt relatively high current surges to ground with relatively little overshoot.

3. Secondary surge suppressers shall have the ability to shunt-to-ground any surge overshoot from the primary arrester devices.

4. Protection devices shall be wired, mounted and located so that triggering or fault of the device shall not damage the facility or other equipment. If required, protection devices shall be fused to prevent damage.

H. Electromagnetic Interference Requirements

1. AF track circuits shall be compatible with Electromagnetic Interference (EMI) generated by the vehicle, the traction electrification system (TES), the communications system, local power lines, rail system environment and any other anticipated electromagnetic noise.

2. Track circuit shall be wired with twisted pair on the wayside and whenever possible in the signal bungalows or cases. Track circuit leads on the wayside shall be properly tagged and labeled to indicate the transmitting and receiving ends.

3. Any form of EMI between adjacent track circuits on the same track or track circuits on adjacent tracks shall not affect the safe operation or reliability of the Signal System.

PART 3 - EXECUTION

3.1 PRODUCTION

Not Used
PART 1 - GENERAL

1.1 DESCRIPTION

A. The Work to be done under this Section consists of designing, providing and installing power frequency (PF) Alternating Current (AC) track circuits for train detection at locations as shown on the Contract Drawings.

B. PF track circuits shall be designed to operate on 100 Hz and employ two-element vane type induction relays.

C. Single rail PF track circuits shall be provided in crossovers and turnouts.

D. Track circuit shall be compatible with the traction power negative return and not be affected by traction power return current imbalances.

E. Restoration of power after a power failure shall automatically restore the track circuits to normal operation.

F. Reset of de-energized track circuit shall not be based on adjacent track circuit occupancy.

G. Track circuit shall function properly in an uncontrolled temperature environment from negative 40 degrees F to 160 degrees F.

1.2 REFERENCED STANDARDS

A. American Railway Engineering and Maintenance-of-Way Association (AREMA)

1. Communications and Signals Manual of Recommended Practice (C&S Manual)

1.3 SUBMITTALS

A. Submittals shall be in accordance with the requirements of these Specifications.

B. Contractor shall submit drawings showing the physical characteristics, ratings and operating characteristics for the proposed track feed transformers, relay pickup transformers, adjustable resistors and track fuses.

C. Contractor shall submit the following for approval:

1. Drawings for PF track circuits together with a bill-of-materials.

2. Complete performance data of each type of track circuit to be provided for this Contract.

3. Test report of lightning and surge protection.

D. Contractor shall submit installation drawings showing tie straps and mounting details of the PF track circuits including rail connections. Circuit drawings shall be submitted for each track circuit.

E. Contractor shall submit Test Procedures and Results in accordance with these Specifications.

F. Prior to Field Testing of the first PF track circuit, the Contractor shall provide 15 manuals describing operation and maintenance of each type of PF track circuits.

1.4 QUALITY ASSURANCE

A. Each PF track circuit component shall be inspected prior to shipment. Inspection shall conform to the Contractor's Factory Inspection Procedure as approved by the Authority.

B. Each PF track circuit shall be inspected after it has been installed in the field. This inspection shall conform to the Contractor's Installation and Inspection Procedure as approved by the Authority. Installation shall not be considered complete until all installation defects have been corrected to the Authority's satisfaction.

C. PF track circuits shall be tested according to Authority approved test procedures.

1.5 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Track relays shall be delivered, stored and handled as described in these Specifications.

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIAL

Not Used

2.2 CONTRACTOR FURNISHED MATERIAL

A. General

1. PF track circuits shall meet the requirements of the AREMA C&S Manual, Section 8.4.

2. Adjustable resistors shall be as specified in these Specifications, and as described herein:

   a. Resistor in the feed end shall have a minimum continuous capacity of 200 watts. It shall handle a current of 10 amperes without damage. The resistor shall be of the variable sliding type and shall allow adjustment in the entire range of
allowed resistance for PF track circuits on the System.

b. Resistor at the relay end shall be adjustable with a continuous capacity of 100 watts. The resistor shall be of the sliding variable type and shall allow adjustment in the entire range of allowed resistance for PF track circuits on the System.

c. Terminals on adjustable resistors shall be standard binding posts that conform to the AREMA requirements.

3. Track fuses shall be as specified in these Specifications and as described herein:
   a. Fuse in the feed end of track circuit shall be 600 volts, 8 amperes minimum.
   b. Fuse in the relay end of track circuit shall be 600 volts, 2 amperes minimum.

4. Track relay shall be vital AC relay as specified in these Specifications.

5. Cable and wiring for PF track circuits shall be in accordance with these Specifications.

6. Other track circuit system components shall comply with applicable portions of these Specifications.

B. Lightning Protection

1. Contractor shall provide lightning protection and surge protection, which are effective in protecting all signal circuits and equipment from damage and operational malfunction. This shall be accomplished by providing as many applicable types and stages of protection as required to protect each type of circuit and equipment involved.

2. Primary surge arrestors shall have the ability to shunt relatively high current surges to ground with relatively little overshoot.

3. Secondary surge suppressers shall have the ability to shunt-to-ground any surge overshoot from the primary arrester devices.

4. Single rail track circuits shall not be provided with lightning arrestors on the track leads.

2.3 FUNCTIONAL REQUIREMENTS

A. PF track circuits shall be relay based, 100 Hz, and of the matching transformer type. Feed voltage shall be adjusted through a transformer and resistor network. Receiving end shall route the 100 Hz current from the track through a transformer and filter to an AC vane type relay where it will be compared to a reference voltage for relay pickup.

B. Design of the track circuit system shall be compatible with Audio Frequency (AF) track circuits.

C. PF track circuit shall detect a shunt anywhere within the track circuit boundaries. Shunting sensitivity for PF track circuits shall be 0.25 ohm impedance with rail-to-rail leakage impedance of 3 ohms minimum per 1000 feet of track at the operating frequency and shall be under the following conditions:

1. Train moving or stopped.
2. Traction power on or off.
3. Rail condition for prevalent operation for any track, i.e., mainline (continuous use), crossover (any type from seldom used to continuous use).

D. Failure of track circuit component shall not permit the shunting sensitivity to fall below that specified after the track circuit has been properly adjusted.

E. Electromagnetic Interference (EMI) Requirements

1. Track circuit shall be compatible with EMI generated by the vehicle, the traction electrification system (TES), the communications system, local power lines, rail system environment and any other anticipated electromagnetic noise.

2. Track circuit shall be wired with twisted pair on the wayside and whenever possible in the signal bungalows or cases. Track circuit leads on the wayside shall be properly tagged and labeled to indicate the transmitting and receiving ends.

3. Any form of EMI between adjacent track circuits on the same track or track circuits on adjacent tracks shall not affect the safe operation or reliability of the Signal System.

PART 3 - EXECUTION

3.1 PRODUCTION

Not Used
3.2 INSTALLATION
A. Track circuits shall be installed at all locations indicated on the Contract Drawings and in a manner as shown on approved installation drawings and described within the approved Installation and Inspection Procedure.
B. PF track circuits shall be installed using 2 single conductors as specified in these Specifications.
C. Any track circuit jumpers in excess of 50 feet shall be installed in conduit and/or cable trough.

3.3 TESTING
A. Tests shall be made in accordance with approved test procedures and in accordance with requirements of these Specifications.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL
A. The Work specified in this section will not be measured separately for payment.

4.2 PAYMENT
A. All costs connected herewith will be considered incidental to the work specified under Section 16901 “Signal System Basic Technical Requirements.”

END OF SECTION 16919
PART 1 - GENERAL

1.1 DESCRIPTION

A. The Work to be done under this Section consists of designing, providing and installing a Train-to-Wayside solid-state digital Communication (TWC) link between train and wayside.

1.2 REFERENCE STANDARDS

A. American Railway Engineering And Maintenance-of-Way Association (AREMA)

1.3 SUBMITTALS

A. Submittals shall be in accordance with the requirements of these Specifications.

1. The Contractor shall submit drawings showing the physical characteristics, ratings and operating characteristics for the proposed train-to-wayside communications equipment.

2. The Contractor shall submit the following for approval:

a. A typical layout showing wayside antennas including cable connections, antenna mounting hardware and case location.

b. Typical circuit details.

3. The Contractor shall submit installation drawings showing mounting details of the TWC equipment including rail connections. Circuit drawings shall be submitted for each TWC installation.

4. The Contractor shall submit Test Procedures and Results in accordance with these Specifications.

5. The Contractor shall provide manuals describing operation and maintenance of each type of TWC unit.

1.4 QUALITY ASSURANCE

A. Each TWC component shall be inspected prior to shipment. Inspection shall conform to the Contractor's Factory Inspection Procedure as approved by the Authority.

B. TWC components shall meet the requirements of the AREMA Signal Manual.

C. Each TWC component shall be inspected after it has been installed in the field. This inspection shall conform to the Contractor's Installation and Inspection Procedure as approved by the Authority. Installation shall not be considered complete until all installation defects have been corrected to the Authority's satisfaction.

D. TWC components shall be tested according to Authority approved test procedures.

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIALS

A. Not Used

2.2 CONTRACTOR FURNISHED MATERIALS

A. TWC system shall be compatible with existing Meister Electronics Vehicle Tagging (Vetag) on-board equipment.

B. The interrogation frequency shall be 100 Khz.

C. Current to the loop shall be adjustable between 100 and 440 ma.

D. Duration of the interrogation pulse shall be 2 ms.

E. The Interrogator shall sample and compare successive messages. Messages shall be validated when two consecutive messages are identical.

F. The Interrogator shall have the capability to decode up to 99 different messages.

G. TWC unit shall have an internal event recorder capable of storing 5000 events. Data entry shall be replaced on first-in-first-out occurrence.

H. The Contractor shall provide all required hardware for installation of the TWC system.

I. TWC system shall be capable of interfacing via modem.

J. TWC system shall be capable of interfacing with a lap top computer using Windows-based software.

K. The Contractor shall provide a TWC layout for locations as shown on the Contract Drawings.

2.3 FUNCTIONAL REQUIREMENTS

A. TWC provided by the Contractor shall be functionally compatible with the existing TWC system. It shall have capability to interface with existing vehicle equipment and other subsystems to provide a continuous flow of information between the train and specified wayside equipment. Vehicle borne TWC equipment is not included in this Contract.

B. The TWC system shall be capable of being utilized as an integral part of a centralized traffic control system to provide the following data functions: vehicle identification, automatic routing, data transmission,
sign display, train tracking, with a minimum of ten percent spare bits.

C. The Contractor shall provide a CANCEL command available via TWC for route requests and “Ready to Depart” controls that are initiated by the same TWC loop.

2.4 DELIVERY, STORAGE AND HANDLING

A. Not Used

PART 3 - EXECUTION

3.1 PRODUCTION

A. Not Used

3.2 INSTALLATION

A. Wayside layouts shall be installed as shown on Contract Drawings. TWC loop placement in station areas shall be coordinated with the installation of berthing markers.

3.3 TESTING

A. Factory and field testing shall be in accordance with approved test procedures.

1. A test train shall be used to test all function at each TWC location.

2. At the TWC loop under test activate a TWC function and verify that the proper TWC function relay is energized in the Central Instrument House (CIH) or equipment case.

B. The Contractor shall support the Authority’s System Integration testing.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith will be considered incidental to the work specified under Section 16901 “Signal System Basic Technical Requirements.”

END OF SECTION 16920
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes specifications to provide and install wayside Automatic Train Protection (ATP) signal transmission and B-point loops.

1.2 REFERENCE STANDARDS

A. American Railway Engineering And Maintenance-of-Way Association (AREMA)

1.3 SUBMITTALS

A. Submittals shall be in accordance with the requirements of these Specifications.

B. The Contractor shall submit manufacturer’s product literature and specifications for ATP signal transmission loops components for Authority approval.

C. The Contractor shall submit manufacturer’s product literature and specifications for B-point loops components for Authority approval.

D. The Contractor shall submit Test Procedures and Results in accordance with these Specifications.

E. The Contractor shall provide manuals describing operation and maintenance (O&M) of ATP loop and B-point loop circuit components.

1.4 QUALITY ASSURANCE

A. Each ATP loop and B-point loop circuit component shall be inspected prior to shipment. Inspection shall conform to the Contractor’s Factory Inspection Procedure as approved by the Authority.

B. ATP loop and B-point loop circuit components shall meet the requirements of the AREMA Signal Manual.

C. Each ATP loop and B-point loop circuit component shall be inspected after it has been installed in the field. This inspection shall conform to the Contractor’s Installation and Inspection Procedure as approved by the Authority. Installation shall not be considered complete until all installation defects have been corrected to the Authority’s satisfaction.

D. ATP loop and B-point loop circuit components shall be tested according to Authority approved test procedures.

E. Field inspect and test ATP and B-point signal transmission loops in accordance with Authority approved procedures and these Specifications.

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIAL

A. Not Used

2.2 CONTRACTOR FURNISHED MATERIAL

A. Cab Signal Transmission Loops

1. ATP signal transmission loops shall be provided to transmit continuous ATP signaling speed commands within an interlocking where power frequency track circuits are used.

2. Contractor shall determine the exact layout of the loop or loops through the special track work so as to provide continuous ATP signaling speed commands. Loop layout shall be submitted for Authority approval.

3. Loops shall be transposed to minimize coupling to the rails. Loop feeds shall be twisted to minimize radiation.

B. B-Point Loops

1. Independent track frequency “receive-only” B-point layouts consist of a track loop, matching transformer, a receiver, and an input to the vital track logic. Connection to the rails at these locations shall be without an impedance bond. These receivers may use current coupling pick-up coils in lieu of or in addition to rail connections. Receive point locations shall have a shunting definition not to exceed 10 feet from the point where rail connections or pick-up coils are installed.

2. Contractor shall differentiate between B-points and complete track circuits for event recorder inputs. Failure of a receive point shall not result in a false “occupied” indication of a track circuit.

3. B-points may be used to define the limits of all or a portion of highway crossing warning approaches, highway crossing extended approaches, highway crossing island circuits, indication and release of civil speed restrictions, and for enforcement of speed reductions upon approaching a red home signal.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Cab Signal Transmission Loops

1. ATP signaling transmission loops shall be installed at locations designated in the
Contract Drawings in accordance with Authority approved installation drawings.

2. Contractor shall provide and install No. 6 AWG minimum, stranded, insulated and jacketed wire, rail clips and all equipment required for a complete operation and testing of cab signal transmission loops as specified herein.

B. B-Point Layouts

1. Receive Point Loops shall be installed at locations designated in the Contract Drawings in accordance with Authority approved installation drawings.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith will be considered incidental to the work specified under Section 16901 “Signal System Basic Technical Requirements.”

END OF SECTION 16922
PART 1 - GENERAL

1.1 DESCRIPTION

A. The Work to be done under this Section consists of designing, providing and installing impedance bonds or functionally equivalent devices.

1.2 REFERENCE STANDARDS

A. American Railway Engineering and Maintenance-of-Way-Association (AREMA):

1.3 SUBMITTALS

A. Submittals shall be in accordance with these Specifications.

1. The Contractor shall submit drawings showing the physical characteristics, ratings and operating characteristics for the proposed impedance bonds.

2. The Contractor shall submit drawings of a typical layout showing impedance bond, including cable and track connections and conductive flux to be used for connections to impedance bond plugs.

3. The Contractor shall submit installation drawings showing mounting details of impedance bonds including rail connections.

4. The Contractor shall submit Test procedures and results in accordance with these Specifications.

5. The Contractor shall provide manuals describing operation and maintenance of each type of impedance bond.

1.4 QUALITY ASSURANCE

A. Each Impedance bond shall be inspected prior to shipment. Inspection shall conform to the Contractor’s Factory Inspection Procedure as approved by the Authority.

B. Impedance bonds shall meet the requirements of AREMA Signal Manual, Part 8.4.5.

C. Each Impedance bond shall be inspected after it has been installed in the field. This inspection shall conform to the Contractor’s Installation and Inspection Procedure as approved by the Authority. Installation shall not be considered complete until all installation defects have been corrected to the Authority’s satisfaction.

D. Impedance bonds shall be tested according to Authority approved test procedures.

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIALS

A. Not Used

2.2 CONTRACTOR FURNISHED MATERIALS

A. Maintenance Materials:

1. The Contractor shall supply two of each type of impedance bond used for the Contract where up to 100 bonds are provided. An additional spare shall be provided for every 50 bonds or portion thereof, above 100 installed bonds.

2. The Contractor shall supply four of each type of tuning unit installed for the Contract.

B. Impedance bonds shall be provided with all mounting hardware, connectors, cables and required appurtenances.

C. Two track winding terminal lugs shall be provided on each impedance bond. Each track winding lug shall accept two 535 KCMIL cables. Center tap on impedance bond shall be required to terminate cross-bonding cables; neutral cables to another impedance bond on the same track at insulated joints and for terminating DC negative returns. Where the center tap lug size does not permit termination of the required conductors, a copper plate shall be provided of sufficient size to accommodate all terminations required and for maximum current to be encountered.

D. Impedance bonds shall be arranged for mounting as shown in the Contract drawings.

2.3 FUNCTIONAL REQUIREMENTS

A. The track winding of each impedance bond shall be rated to carry 2000 amperes per rail continuously. The impedance bond shall function properly with a traction current imbalance of up to 12 percent. DC resistance of the impedance bond, from track lug to track lug, shall not exceed 0.00005 ohms.

B. Impedance bonds in cab signaled territory shall have provisions for three parallel resonant tuned circuits, tuned for the cab signal frequency, track circuit transmitter frequency and receiver frequency of the adjacent track circuit. Basic impedance bonds shall be identical, with capability of either selecting track circuit frequencies within the bond or by interchangeable tuning units. Impedance bonds shall be provided with removable identification plates that identify the frequencies of the tuned circuits.

2.4 DELIVERY, STORAGE AND HANDLING

A. Impedance bonds shall be properly crated to prevent damage throughout delivery, storage, and handling.
PART 3 - EXECUTION

3.1 PRODUCTION
A. Not Used

3.2 INSTALLATION
A. Impedance bond layouts shall be installed at locations as shown on Contract Drawings in accordance with approved installation drawings.
B. Cable interconnections shall be installed in accordance with these Specifications.
C. The Contractor shall coordinate with Traction Power Substation (TPSS) Contractor for crossbond and negative return locations, termination schedule and temporary bond removal requirements.
D. The Contractor shall be responsible for any required adjustment of tie spacing and for removing any stone ballast required for installation of each impedance bond layout and for replacing and tamping ballast after installation has been completed. Excess ballast shall be spread evenly between ties in the vicinity of the impedance bond layout.
E. The Contractor shall be responsible for any costs incurred by the Authority in restoring track alignment occasioned by the Contractor's Work.
F. All cable connecting lugs shall be insulated in such a manner that the lugs shall not short out the insulated floating running rail return current to the casing of the impedance bond. If multiple cables are installed on a single connection, insulators shall be installed between the cable lug and the impedance bond casing.

3.3 TESTING
A. The Contractor shall test the impedance bond layout as per the approved Field Test Procedure.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL
A. The Work specified in this section will not be measured separately for payment.

4.2 PAYMENT
A. All costs connected herewith will be considered incidental to the work specified under Section 16901 “Signal System Basic Technical Requirements.”

END OF SECTION 16923
SECTION 16930
RAIL BONDING - SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION
A. Work to be done under this Section consists of designing, providing and installing all required material to bond the track rails for traction negative return and signal track circuits.

1.2 REFERENCE STANDARDS
A. American Railway Engineering and Maintenance-of-Way Association (AREMA)

1.3 SUBMITTALS
A. The Contractor shall submit the following for approval:
   1. Material composition, electrical and mechanical characteristics for power bonds, signal bonds and track circuit connectors.
   2. Mechanical and operating data for the compression tool required for installation of track circuit connections.
   3. Field installation procedures for welded signal and power bonds.
   4. Descriptions of all mechanical devices for securing and protecting rail bonding.
   5. Exothermic weld material.
   6. Installation drawings indicating details of design to show methods of ensuring that bonding is protected from damage, theft or vandalism. Installation drawings shall indicate locations and types of all bonds.

B. The Contractor shall submit for approval, a plan showing detailed typical designs for bonding of special trackwork to assure all pieces of special trackwork are properly connected electrically.

C. The Contractor shall show bonding detail on installation drawings.

D. The Contractor shall submit Test Procedures and Results in accordance with these Specifications.

1.4 QUALITY ASSURANCE
A. The Contractor shall install each welded bond and mechanical rail connector in accordance with requirements of these Specifications.

B. Rail bonds shall meet the requirements of the AREMA Signal Manual, Parts 8.1.20

C. Each Rail bond shall be inspected after it has been installed in the field. This inspection shall conform to the Contractor’s Installation and Inspection Procedure as approved by the Authority. Installation shall not be considered complete until all installation defects have been corrected to the Authority’s satisfaction.

D. The Contractor shall test each welded bond in accordance with the requirements of these Specifications.

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIALS
A. Not Used

2.2 CONTRACTOR FURNISHED MATERIALS
A. Power Bonds
   1. All non-insulated joints in track circuit territory, including guardrail joints, shall use 250 KCMil size, two for each joint, as manufactured by Cembre, Inc., or Authority approved equal.
   2. Power bonds for frog and switch fouling connections and expansion joints shall be two 535 KCMil Locomotive Cables as shown on the Contract Drawings and specified in these Specifications.

B. Restraining Rail Bonds and Signal Rail Bonds
   1. Signal rail bonds shall be rail web type manufactured bonds. The bonds shall be two 250 KCMil extra flexible of required length as described on the Contract Drawings, two for each joint, as manufactured by Cembre, Inc., or Authority approved equal.
   2. Restraining rail bonds shall be rail web type manufactured bonds. The bonds shall be 250 KCMil extra flexible of required length, as manufactured by Cembre, Inc., or Authority approved equal. Bonds shall be installed in accordance with Authority approved drawings.
   3. When space constraints prevent mechanical bonds, then bonds shall be manufacturer's bonds prepared for welding by the exothermic process, Cadweld or Authority approved equal. Installation drawings shall indicate locations where welded bonds are to be used and require Authority approval. Bonds, bonding materials and types of molds shall be Authority approved.
   4. Cable for frog and switch jumpers and end of storage track crossbonds shall be 535 KCMil Locomotive Cable, as shown on Contract Drawings and in these Specifications.

2.3 DELIVERY, STORAGE AND HANDLING
A. Not Used
PART 3 - EXECUTION

3.1 PRODUCTION
A. Not Used

3.2 INSTALLATION
A. Power bonds shall be installed at all non-insulated rail joints.
B. Where restraining rails and guard rails are installed, bonds shall be installed in accordance with the Authority’s requirements.
C. Frog, switch jumper, and crossbonding shall be installed at locations shown on Contract Drawings, and as required by these Specifications. All special trackwork shall be bonded in accordance with Authority approved installation drawings to establish electrical continuity and conductive capacity for traction power return and signal track circuits.
D. For all welded connections to the rails, surface of the rails where bond is to be applied shall be ground clean with a reinforced grinding wheel, of a type recommended by the bonding material manufacturer. After grinding, surface shall be cleaned with an Authority approved non-toxic solvent to remove all traces of grease and dirt.
E. After the surface has been ground and cleaned, it shall be heated to drive out any moisture. The cable bond shall then be welded by the exothermic process in such a manner as to ensure a thorough mechanical and electrical connection.
F. Welding material shall consist of a copper exothermic mixture suitable for connection to load bearing rail, as manufactured by Cadweld (F-80), or Authority approved equal, and shall meet the requirements of the AREMA Communications & Signals Manual, Part 8.1.34.
G. Each rail connection shall be thoroughly welded to the rail web. To ensure quality, the Authority reserves the right to test each weld by hammer and striker or in any other manner which in the opinion of the Authority is reasonable.
H. The Contractor shall install temporary bonds around insulated joints installed as shown in the Contract Drawings.

3.3 TESTING
A. The Contractor shall demonstrate that bonding is in accordance with the requirements of these Specifications and as shown on Contract Drawings, and as specified in the AREMA Signal Manual, Part 8.1.20, Part 8.1.31 and Part 8.1.33.
B. Any bond, weld, or connection installed by the Contractor which is found to be defective prior to acceptance, shall be removed and a new bond installed at no additional cost to the Authority.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL
A. The Work specified in this section will not be measured separately for payment.

4.2 PAYMENT
A. All costs connected herewith will be considered incidental to the work specified under Section 16901 “Signal System Basic Technical Requirements.”

END OF SECTION 16930
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes specifications for designing, providing and installing automatic highway crossing warning system layouts as specified herein and shown on the Contract Drawings.

B. The Contractor shall visit each crossing with state and local regulatory bodies to review the layout of each crossing.

C. The Contractor shall provide gate malfunction indication for each Automatic Highway Crossing Warning (AHCW) to the Train Control Center (TCC) for display as approved by the Authority.

D. Where required to achieve sufficient warning time, cab signals shall be held to a lower speed until the crossing warning system has provided indication that the crossing gates are horizontal.

E. At near-side stations, speed commands shall ensure that each train stops at the platform. Detection of a train in the platform of a near-side station shall initiate a crossing warning timer. The timer value shall ensure that the crossing warning devices are activated so that sufficient warning time is given. An additional dwell timer shall be used to restore required speed commands to the train at the end of a nominal dwell time. TWC loops in the station shall be provided to permit the operator to cancel or restart the sequence.

1.2 REFERENCE STANDARDS

A. American Railway Engineering And Maintenance-of-Way Association (AREMA):

1. AREMA – Communications and Signals Manual, Section 3 – Highway-Rail Grade Crossing Warning System

2. AREMA - Communications and Signals Manual, Section 7 – Signals

3. AREMA - Communications and Signals Manual, Section 10 – Wire and Cable

4. AREMA - Communications and Signals Manual, Section 11 – Circuit Protection

5. AREMA - Communications and Signals Manual, Section 14 – Electrical Devices, Foundation, Hardware

6. AREMA - Communications and Signals Manual, Section 15 - Materials

B. Texas Manual on Uniform Traffic Control Devices (MUTCD):

1. Texas MUTCD - Chapter 8 – Traffic Control for Rail Road and Light Rail Transit Grade Crossings

C. Texas Department of Transportation (TXDOT)

1. TXDOT – Standard Plans RCPM-96

D. State of Texas Health and Safety Code

1.3 SUBMITTALS

A. The Contractor shall submit the following for approval:

1. Shop drawings for each of the signs to be installed at the crossing.

2. Shop drawings for the assembly of AHCW layouts shall include bills of material.

B. The Contractor shall submit for Authority approval:

1. Final circuits and detail wiring plans showing control of specified equipment for each location.

2. Detailed installation drawings for each layout.

C. The Contractor shall submit manuals describing maintenance and operation of AHCW layouts provided under this Contract.

D. The Contractor shall submit Test Procedures and Results in accordance with these Specifications.

1.4 QUALITY ASSURANCE

A. Each AHCW layout component shall be inspected prior to shipment. Inspection shall conform to the Contractor’s Factory Inspection Procedure as approved by the Authority.

B. The AHCW layout shall meet the requirements of the AREMA Communications & Signals Manual.

C. AHCW systems shall meet applicable requirements of Texas MUTCD.

D. Each AHCW layout shall be inspected after it has been installed in the field. This inspection shall conform to the Contractor’s Installation and Inspection Procedure as approved by the Authority. Installation shall not be considered complete until all installation defects have been corrected to the Authority’s satisfaction.
E. The AHCW layout shall be tested according to Authority approved test procedures.

1.5 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Prior to shipment, all parts of automatic gate crossing mechanism that are not painted and not made of non-corrosive material shall be coated with an approved grease to prevent corrosion. All unused threaded outlets shall be plugged or capped.

B. Relays shall be delivered, stored and handled as described in these Specifications.

PART 2 - PRODUCTS

2.1 AUTHORITY PROVIDED MATERIAL

Not Used

2.2 CONTRACTOR PROVIDED MATERIAL

A. Maintenance Materials:

1. Gate Arms: Two of each length used within the system including all installation hardware.

2. Flashing Light Signals: One complete LED flasher unit for every 25 LED flasher units installed or portion thereof, including all installation hardware.

3. Gate Mechanisms: Two complete layouts including installation hardware.

4. Gate Keepers: Two complete layouts including installation hardware.

5. Solid State Crossing Controller: One complete unit of each size used within the system.

B. General

1. Highway crossing warning equipment shall be in accordance with applicable sections of AREMA Communications & Signals, Section 3.3.1 and 3.1.15.

2. Highway crossing warning equipment and associated power supply equipment shall be housed in wayside instrument cases. Crossing controllers, event recorders and any other electronic equipment shall be mounted in the upper portion of the case to minimize exposure to weather when the case doors are opened. Electronic devices shall be installed in the air conditioned side of the case.

3. Solid State crossing controllers similar to Safetran Model SSCC-TC or Authority approved equal shall be provided.

4. Main line Audio Frequency (AF) track circuits shall be used to create approach circuits in the nearest Instrument House. Copper line circuits shall be used to send the approach circuits to the nearest AHCW case, CIH or IIH. Where approved, vital timer functions shall be used to adjust the warning time.

5. Audio Frequency Overlay (AFO) track circuits shall be used for crossing island track circuit. The island circuit equipment shall be located in the AHCW.

6. Crossing signs shall be provided in accordance with sections of AREMA Communications & Signals Manual and Texas MUTCD at all highway crossings indicated on the Contract Drawings.

7. Crossings shall be equipped with warning bells in accordance with applicable sections of AREMA Communications & Signals, Part 3.2.60 and Texas MUTCD.

8. Traffic Preemption shall be provided wherever an intersection is within 300 feet of a crossing or as required in the Contract Drawings. Preemption time shall be derived from track circuit occupancy and an adjustable timer. At each crossing requiring preemption, occupancy and timer shall be configured to provide a preemption signal, adjustable from at least 60 seconds to zero seconds prior to the crossing. The Contractor shall supply and install cable to the handhole at the base of the traffic controller pole or to the nearest manhole if a handhole at the traffic controller is not provided. Sufficient cable length shall be provided so that the cable may be pulled from the interface handhole/manhole to the traffic controller and terminated by others.

C. Flashing Light Signals

1. The Contractor shall provide LED flashing light signals to be mounted on masts and cantilever arms as shown on Contract Drawings.

2. Flashing light assemblies shall consist of various configurations of back-to-back and single direction units as indicated on Contract Drawings. Additional side lights may be added as required to assure every approach roadway has a view of at least one pair of lights.
3. Each lamp housing shall be constructed of cast aluminum or other Authority approved material. The housing shall be equipped with a door with front access, hinged at one side with a weatherproof seal. A ventilation opening shall be provided at the bottom of housing and covered with brass or copper wire screening. A side light shall be provided on both sides of lamp housing complete with gasket, lens and retainer.

4. Flashing light assemblies shall house LED lighting units. The LED units shall meet the requirements of AREMA Communications & Signals Section 7.1.10. The LED unit shall operate at a range of 8-20 Volts. Power consumption of a single unit shall be 18 watts at 10 Volts. LED units shall meet or exceed AREMA Communications & Signals requirements for beam pattern in Section 3.2.37 and shall meet or exceed the power surge rating requirements in Section 11.3.3.

5. Each flashing light unit shall be equipped with, or incorporate, a roundel and phankill device in accordance with American Railway Engineering and Maintenance-of-Way Association (AREMA) Communications and Signals Manual. It shall be highway crossing high intensity red polycarbonate, with a two inch center hot spot with a 30 degree horizontal spread and a 15 degree downward deflection except roundels for cantilever flashing light units shall have a 20 degree horizontal spread and a 30 degree downward deflection. The roundel shall be 12 inch diameter.

6. Each flashing light unit shall be equipped with a 20-inch black, high-density plastic background.

7. Each flashing light unit shall be equipped with a black high density visor.

8. Each flashing light shall be focused in accordance with sections of AREMA Communications & Signals, Section 3.3.5.

D. Masts

1. The Contractor shall provide masts for supporting flashing light signals, flashing light signals with gates and pedestrian gates as indicated on the Contract Drawings. Mast shall be five-inch aluminum pipe complete with pinnacle cap and aluminum split base. Length of mast shall be as indicated on Contract Drawings.

2. Junction boxes for flashing light signal masts, flashing light signals with gate mast and pedestrian gate masts shall be in accordance with these Specifications.

3. In any portion of the Work where gate junction box elevations will be below the flood plain, the Contractor shall provide a secondary mast-mounted junction box above highest anticipated flood levels and make cable connections in the secondary junction box. Cables may not be terminated below maximum anticipated flood plain levels.

4. When there is a curb and no sidewalk, a horizontal clearance of at least 2 feet shall be provided from the face of the vertical curb to the closest part of the signal or gate arm in its upright position in accordance with Texas MUTCD Chapter 8D.01 Flashing-Light Signals, Gates, and Traffic Control Signals Section.

5. Where there is a shoulder, but no curb, a horizontal clearance of at least 2 feet from the edge of a paved or surfaced shoulder shall be provided, with a clearance of at least 6 feet from the edge of the traveled way in accordance with Texas MUTCD Chapter 8D.01 Flashing-Light Signals, Gates, and Traffic Control Signals Section.

6. Where there is no curb or shoulder, the minimum horizontal clearance shall be 6 feet from the edge of the traveled way in accordance with Texas MUTCD Chapter 8D.01 Flashing-Light Signals, Gates, and Traffic Control Signals Section.

7. Where there is a curb and sidewalk, a horizontal clearance of at least 7 feet shall be provided from the face of the vertical curb to the centerline of the closest signal or gate mast in accordance with Texas MUTCD Chapter 8 - Traffic Controls For Highway Light Rail Transit Grade Crossings.

8. Warning gates/flashers shall be installed at all highway crossing indicated on the Contract Drawings measured perpendicular from the centerline of near track, maintaining a minimum distance of 12 feet, usual distance is 15 feet in accordance with Texas Department of Transportation – Standard Plans RCPM-96.

E. Cantilevers

1. The Contractor shall provide cantilever mast and arm assemblies in accordance with these Specifications and as shown on Contract Drawings.

2. Cantilever structure shall be an aluminum non-retractable walkout type. Mast shall be constructed from a minimum 10-inch aluminum pipe with a solid base for arms up to 20 feet. The structure shall be a single 12-inch mast for arm lengths of 22 to
24 feet and double 10-inch mast for arms over 24 feet. A pole mounted junction box shall be provided with provisions for terminating signal cable on AAR terminals. Junction box shall be equipped with a gasketed front door with means of padlocking.

3. Cantilever shall be designed to withstand a wind velocity of 100 mph, gusts of 130 mph, with a maximum horizontal deflection of three degrees 15 minutes and capable of supporting a 500 pound load at the end of the arm with all flashing light units and signs installed.

4. Structure shall be equipped with a ladder, ladder guard and walkway. Ladder shall be provided with a lockable cover plate and padlock to prevent unauthorized use. Walkway shall be equipped with handrails on both sides and shall be a minimum of 20 inches wide, constructed of expanded metal to provide good footing and prevent ice buildup. Handrails shall consist of a top rail 30 inches above the walkway and an intermediate handrail 18 inches above the walkway.

5. The minimum clearance from high voltage overhead wires shall be in accordance with the Texas Health and Safety Code (Chapter 752) during and after cantilever installation. Minimum clearance from low voltage lines (less than 600 volts) shall be 10 feet over the walk and 4 feet from the edges of the cantilever structure.

6. Cantilever shall be installed perpendicular to roadway and the tip of the cantilever arm shall extend to the most inside travel lane. The Authority must approve any deviation from perpendicular installation.

7. When there is a curb and no sidewalk, a horizontal clearance of at least 2 feet shall be provided from the face of the vertical curb to the centerline of the closest signal in accordance with Texas MUTCD Chapter 8D.01 Flashing-Light Signals, Gates, and Traffic Control Signals Section.

8. Where there is a shoulder, but no curb, a horizontal clearance of at least 2 feet from the edge of a paved or surfaced shoulder shall be provided, with a clearance of at least 6 feet from the edge of the traveled way in accordance with Texas MUTCD Chapter 8D.01 Flashing-Light Signals, Gates, and Traffic Control Signals Section.

9. Where there is no curb or shoulder, the minimum horizontal clearance shall be 6 feet from the edge of the traveled way in accordance with Texas MUTCD Chapter 8D.01 Flashing-Light Signals, Gates, and Traffic Control Signals Section.

10. Where there is a curb and sidewalk, a horizontal clearance of at least 7 feet shall be provided from the face of the vertical curb to the centerline of the closest signal in accordance with Texas MUTCD Chapter 8. Traffic Controls For Highway Light Rail Transit Grade Crossings

11. Warning signals shall be installed at all highway crossing indicated on the Contract Drawings measured perpendicular from the centerline of near track, maintaining a minimum distance of 12 feet, usual distance is 15 feet in accordance with Texas Department of Transportation – Standard Plans RCPM-96.

F. Gates

1. General

a. The Contractor shall provide automatic highway crossing gates complete with gate mechanism, gate arm, counterweights, gate arm lights, wind guards when gates are 20 feet or longer, and all required mounting hardware as specified herein, in accordance with AREMA Manual, Section 3 and as shown on the Contract Drawings.

b. General design, painting and striping of gate arm shall conform to the AREMA Communications and Signals Manual, Section 3.2.25 or 3.2.26. Striping shall consist of 16-inch alternate reflectorized red and white stripes on both sides of the arm. The arm shall be constructed of fiberglass and be designed to ensure reasonable durability and rigidity to prevent undue sway or whipping. Clearance between the gate arm and any fixed portion of the assembly shall be a minimum of two inches. Gate over 30-feet in length shall be wooden A-frame configuration. Gate arms shall be attached to the gate mechanism with a "break-away" arm utilizing a pivot pin and shear bolts.

c. A gate test push-button, externally mounted on the side of the case nearest the crossing, shall be provided, with provisions for a hasp and lock.
e. Gate malfunction alarm shall be activated when any of the following conditions are met:

1) There is a failure of the solid state crossing controller.
2) A crossing gate is down with the approaches and island circuits vacant.
3) The approach has been occupied with gates down for two minutes.

2. Gate Arm

a. Gate crossing arm similar to EZ Gate with fiberglass first section and telescoping fiberglass second section or Authority approved equal shall be provided.

b. Highway crossing gate arms shall be of sufficient length to extend to within one foot of the extent of the lanes it is intended to warn and provide a minimum clearance of two feet from low voltage (less than 600V) overhead wire and cable.

c. Where gate arms are 6 feet or longer, the Contractor shall provide a gate light within one foot of the gate tip.

d. Where shown on Contract Drawings, the Contractor shall provide auxiliary gate arms complete with auxiliary shafts and required mounting hardware.

e. Where gate arms are provided, the Contractor shall provide fiberglass arms with the same requirements as for main gate arms.

f. Gate arm shall cover adjacent sidewalk.

g. Gate arm counter weights shall not intrude into sidewalk envelope.

h. Ten-volt LED weatherproof, bi-directional gate arm lights similar to EZ GATE system lamps or approved equal shall be provided in accordance with AREMA Communications and Signals Manual, Section 3.2.40 with highway crossing red lenses.

3. Wind Guards: Gate arm lengths of 20 feet or longer shall have wind guards.

4. Gate Mechanism

a. Gate mechanism shall be housed in one enclosure and include a 12 volt DC motor, gear train, control elements, wire terminals and suitable counterweights.

b. Gate mechanism housing shall be weatherproof and of ample size to house the equipment properly without crowding. Housing shall be equipped with a door for convenient and ready access and be designed with at least two hooded ventilation openings with brass or copper wire screens. Housing shall be constructed of cast aluminum.

c. Gate mechanisms shall be provided with an internal wiring diagram protected by a plastic laminate and shall be fastened to the inside of mechanism cover.

d. Mechanism shall be equipped with a hold clear device to hold the mechanism in the clear position with 450 foot-pounds applied to the shaft.

e. A mechanism support shall be provided with each gate mechanism. The mechanism support shall provide a base upon which the gate mechanism rests and support the weight of the mechanism when it is required to swing gate mechanism for repairs.

f. Circuit controller shall be equipped with copper or brass contacts with sufficient mechanical strength, current carrying capacity, and self-clearing design. Contacts shall be accessible and adjustable. Circuit controller shall be equipped with sufficient contacts to accommodate control and indication circuits as shown on Contract Drawings.

g. Relays in the gate operating unit shall be non-vital type in accordance with these Specifications.

h. Gate Keeper similar to General Signals, Inc., part #SK-1000-C or with Authority approved equal shall be provided.
i. Gate mechanism shall be equipped with an on board gate monitoring system that provides protection of the mechanism if any of the existing conditions exist:

1) Rapid descent of the counterweights caused by a gate arm being knocked off.

2) Rapid descent of the gate arm caused by a loss of power (entrance gates).

3) Rapid ascent of the gate arm caused by a loss of power (exit gates).

4) The gate arm pumps.

5) The motor overloads due to an obstructed gate arm.

j. The gate mechanism shall be equipped with (as standard) a power down and test switch that operates the mechanism to the horizontal position without a gate arm in place.

k. Gate mechanisms shall be provided with circuit protection, either by a fuse or a circuit breaker.

l. Gate mechanisms similar to Western-Cullen Hayes model 3597, Invensys Rail model S-60 or Authority approved equal shall be used.

G. Audio Frequency Overlay Track Circuits

1. Audio frequency overlay track circuits shall be provided for the island track circuits.

2. The overlay track circuits shall be audio frequency, compatible with AF track circuit frequencies, with cab signal frequency, and with the traction power negative return system.

3. The AFO track circuit shall be designed to detect occupancy throughout the length of the circuit. Shunting sensitivity shall be 0.25 ohm impedance at the receiving end of the circuit at the operating frequency.

4. The Contractor shall be responsible for assigning frequencies to the audio frequency overlay track circuits that are compatible with each other and shall not falsely energize or interfere with other track circuits, or interfere with cab signals.

5. AFO track circuits shall be set-up in accordance with the manufacturer’s procedures and be protected with lightning arrestors, equalizers and field side fuses.

H. Solid State Crossing Controller

1. A solid-state crossing controller shall be provided for each AHCW location as indicated on the Contract Drawings. The solid-state crossing controller shall meet all requirements of AREMA Communication & Signals Manual, Section 3.1.25 and Section 3.1.15 as Authority approved.

2. The crossing controller shall be fully integrated, vital, solid-state circuitry device, providing lamps, bells and crossing gates.

3. The crossing controller shall provide a voltage adjustment feature. The output voltage, once adjusted shall be constant.

4. The solid-state crossing controller shall be voltage surge protected.

5. The lamp flash rate shall be 45 to 50 flashes per minute.

I. Other Equipment

1. Crossarms for flashing light units shall be in accordance with AREMA Communications & Signals Manual, Section 3.2.51 as Authority approved.

2. Crossarms for flashing light units shall be constructed of cast aluminum in accordance with AREMA Communications and Signals Manual, Section 3.2.50.

3. Bells shall be provided with 12-inch diameter by two-inch-deep gong with a steel faced clapper in a weatherproof housing. Housing shall be constructed of cast aluminum. The door shall be designed with suitable hinges and a gasket. Bell shall conform to AREMA Communications and Signals Manual, Section 3.2.60. Normal operating voltage shall be 10 VDC.

4. Railroad crossing signs shall be white reflex-reflective sheeting on sheet aluminum with the words “RAILROAD CROSSING” in black letters, in accordance with Texas MUTCD, Article 8 B-2.

5. Number-of-track signs shall be constructed of aluminum alloy and be corrosion resistant. Black letters and numbers on a white background shall be of reflex-reflective sheeting on sheet aluminum.
6. Emergency Notification signs I-13, or I-13A shall be in accordance with Texas MUTCD, Chapter 8.

7. The crossing control shall be provided with an “Out of Service” switch for each track crossing the highway. Activation of the switch shall disable the warning system for the associated track. In cab signaled territory, activation of the switch shall set speed commands such that approaching trains on the out-of-service track are stopped prior to arrival at the crossing and run time sufficient to ensure approaching trains have stopped prior to disabling the warning system for the associated track.

8. Batteries and chargers shall be sized to provide proper operating voltages and currents throughout the highway crossing warning cycle.
   a. An additional battery cell shall be provided for grade crossings where activation of the warning system causes the voltage measured at any gate mechanism to drop below 85% of the rated voltage.

9. Binding posts, nuts, washers and insulators shall conform to AREMA Communications and Signals Manual, Section 14.1.11.

10. Enclosures housing AHCW equipment shall be provided with signs on the front and back of the enclosure identifying the street name and milepost number of the crossing.

PART 3 - EXECUTION

3.1 PRODUCTION
Not Used

3.2 INSTALLATION

A. Contractor shall install AHCW layouts including all flashing light signals, gates, signs, masts, junction boxes and interfaces in accordance with these Specifications and approved installation drawings.

B. Flashing Light Signal Installation

1. Flashing light signal mast shall be securely fastened within the split base in a manner such that the distance between the split halves of the base shall be equal. Heads of bolts in the base assembly shall be squared with each other and facing oncoming highway traffic.

2. Base shall be securely fastened to the concrete foundation with hardware provided for that purpose. Mast shall be plumb when base assembly is fastened to foundation. Shims, spacers, or other filler devices shall not be used to level and plumb flashing light signal equipment.

3. A hole shall be factory drilled in the mast for the bottom crossarm. Centerline of the hole shall be located so that, when the crossarm with light units is attached thereto, center of lens of the light unit shall be seven feet-ten inches above the top of foundation. Holes for additional crossarms, when required, shall be located in the field after bottom crossarm has been secured to the mast. Location and drilling of hole shall result in the centerline of additional light units to be 23 inches above centerline of lower light unit.

4. Bell(s) shall be installed on top of mast of flashing light unit. A minimum of one (1) bell per crossing shall be provided. Where gate mechanisms are more than 80 feet apart a second bell shall be provided. Face of bell gong shall be parallel with highway.

5. Underground cables shall be installed within the mast and terminated in crossarm junction box in a manner as required in these Specifications.
   a. Wiring for flashing light units and bell shall be 37 strand, No. 10 AWG (minimum) in accordance with requirements of AREMA Communications and Signals Manual, Section 10.3.11.
   b. Wiring for bells shall go directly from bottom crossarm junction box to the bell.
   c. Terminations for flasher unit and bell wiring shall be solderless compression type terminals as required by these Specifications.

6. With AC power off and standby battery in a fully charged condition, lamp voltage shall be adjusted to 9-1/2 volts (measured at the lamp) by varying resistor for the flasher unit; then, with AC power on, lamp voltage (measured at the lamp) shall be adjusted to the same voltage by varying lighting transformer taps.

7. Front lights of flashing light unit shall be focused to provide maximum visibility for oncoming highway traffic. Backlights of flashing light unit shall be focused to provide close up visibility for oncoming highway traffic from the opposite direction.
C. Cantilever Installation

1. Base of cantilever shall be securely fastened to the concrete foundation with hardware provided for that purpose. Mast shall be plumb when base assembly is fastened to the foundation. Shims, spacers, or other filler devices shall not be used to level and plumb cantilever layouts.

2. Railroad crossing sign for cantilever arm shall be securely fastened with hardware provided for that purpose.

3. Front lights of the main mast and cantilever unit shall be focused to provide maximum visibility for oncoming highway traffic. Back lights of the main mast and cantilever unit shall be focused to provide close up visibility for oncoming highway traffic from the opposite direction.

4. Installation of cantilever shall provide a minimum clearance of 17 feet 6 inches above roadway.

D. Vehicle Warning Gates

1. Base shall be securely fastened to concrete foundation with hardware provided for that purpose.

2. Heads of bolts in base assembly shall be squared with each other and facing oncoming highway traffic.

3. Masts shall be securely fastened within junction box base in a manner such that the distance between split halves of base shall be equal when tightened.

4. Mast shall be plumb when base assembly is fastened to foundation. Shims, spacers, or other fillers shall not be used to level and plumb highway crossing warning gates.

5. Gate operating mechanism, including counter-weight arms, shall be securely fastened to the mast with hardware provided for that purpose.

6. Mechanism shall be located on mast in a position that shall allow for gate arms, when in down position, to be not more than 4 feet-6 inches, or less than 3 feet-6 inches, above roadway crown.

7. Fiberglass gate arms shall be fastened to gate arm mounting assembly with hardware provided for that purpose.

8. Underground cables shall be installed in the split base junction box or auxiliary junction box in flood areas. Cables shall be dressed, tagged and terminated as required by these Specifications.

9. Gate arm counterweights shall be adjusted in accordance with manufacturer's standards for the length of gate arm specified.

10. Gate arm tip light shall be steadily illuminated and other gate arm lights will flash in unison with mast and/or cantilever mounted lights.

11. Gate arm torque shall be adjusted in accordance with manufacturer's standard.

12. Gate mechanism shall employ a drive down feature where descending time can be adjustably controlled to permit gate arm to descend smoothly and evenly from clear to horizontal position within 10 to 15 seconds. Gate arm shall ascend to upright position in not more than 12 seconds.

13. Operation of mechanism shall be such that it will reverse its direction of movement to reflect a change in track occupancy.

14. Gate mechanism shall operate smoothly and complete all movements without rebounding. It shall be securely held in the clear position until conditions require gate to be lowered.

15. Install gate malfunction indication for indication at Train Control Center (TCC) via the Signal Remote Terminal Unit (RTU).

E. Pedestrian Warning Gates

1. Base shall be securely fastened to concrete foundation with hardware provided for that purpose.

2. Heads of bolts in base assembly shall be squared with each other and facing oncoming highway traffic.

3. Masts shall be securely fastened within the junction box base in a manner such that the distance between split halves of base shall be equal when tightened.

4. Mast shall be plumb when base assembly is fastened to foundation. Shims, spacers, or other fillers shall not be used to level and plumb highway crossing warning gates.

5. Gate operating mechanism shall be securely fastened to the mast with hardware provided for that purpose.
6. Mechanism shall be located on the mast in a position that shall allow for gate arms, when in down position, to be not more than 4 feet 6 inches, or less than 3 feet 6 inches, above the sidewalk.

7. Fiberglass gate arms shall be fastened to gate arm mounting assembly with hardware provided.

8. Underground cables shall be installed in the split base junction box or auxiliary box in flood areas. Cables shall be dressed, tagged and terminated as required by these Specifications.

9. Gate arm tip light for arms 6 feet or longer shall be steadily illuminated.

10. Gate arm torque shall be adjusted in accordance with manufacturer's standard.

11. Gate mechanism shall employ a drive down feature where descending time can be adjustably controlled to permit the gate arm to descent smoothly and evenly from clear to the horizontal position within 10 to 15 seconds. Gate arm shall ascend to upright position in not more than 12 seconds.

12. Operation of mechanism shall be such that it will reverse its direction of movement to reflect a change in track occupancy.

13. Gate mechanism shall operate smoothly and complete all movements without rebounding. It shall be securely held in the clear position until conditions require gate to be lowered.

F. Wind Guards: Where gate arm lengths are 20 feet or longer, wind guards shall be mounted on the mast.

3.3 TESTING

A. Automatic highway crossing warning layouts shall be tested in accordance with these Specifications.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith will be considered incidental to the work specified under Section 16901 "Signal System Basic Technical Requirements."
PART 1 - GENERAL

1.1 DESCRIPTION
A. Work to be done under this Section consists of designing, providing and installing signal power distribution and supply systems.

1.2 REFERENCE STANDARDS
A. National Fire Protection Association (NFPA)
   1. NFPA 70 - National Electrical Code (NEC)
B. National Electrical Manufacturers Association (NEMA)
   1. NEMA 4 - NEMA Standards Publication 250-2003 Enclosures for Electrical Equipment (1000 Volts Maximum)
   2. NEMA 12 - NEMA Standards Publication 250-2003 Enclosures for Electrical Equipment (1000 Volts Maximum)
   3. NEMA AB-1 - Molded-Case Circuit Breakers, Molded Case Switches, and Circuit-Breaker Enclosures

1.3 SUBMITTALS
A. The Contractor shall submit the following for Authority approval:
   1. Catalog cuts and descriptive literature for all power system material.
   2. AC and DC power calculations based on the total peak load that will exist at each signal equipment location. Calculations shall include 25 percent spare capacity of total peak load at each location for future expansion.
   3. Voltage drop calculations for 480 VAC single-phase signal power express cables in accordance with these Specifications.
   4. Plans showing layout of a typical signal power distribution center.
   5. The Contractor shall include schematic plans showing energy distribution of signal power equipment at each signal equipment location. These plans shall include ratings of protective devices and transformers, as well as required cable and wire sizes.
   6. Circuit drawings and drawings showing power layout of feeders, transformer switches, fuses, breakers and buses.
   7. Test Procedures and Results in accordance with these Specifications.

1.4 QUALITY ASSURANCE
A. Materials and equipment provided and installed shall conform to the latest edition of the NEC and all applicable state and local ordinances.
B. Each signal power system component shall be inspected prior to shipment. Factory tests and inspections of the signal power system equipment shall be to manufacturer's standard as approved by the Authority.
C. Each signal power system component shall be inspected after it has been installed in the field. This inspection shall conform to the Contractor's Installation and Inspection Procedure as approved by the Authority. Installation shall not be considered complete until all installation defects have been corrected to the Authority's satisfaction.
D. Performance tests of the equipment and materials provided and installed shall ensure compliance with these Specifications.

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIAL
A. Not Used

2.2 CONTRACTOR FURNISHED MATERIAL
A. General
   1. Power feed to signal power distribution equipment shall be obtained from traction power substation's 480 VAC 60 Hz provided in the Traction Power Substation (TPSS). The Contractor shall provide and install the circuit breakers in the TPSS.
   2. From the SPDC, the Contractor shall provide and install a signal power distribution system. The system shall consist of a 480 VAC 60 Hz single-phase two wire transmission feeders with wayside signal power taps as required.
   3. Ventilation fans shall be provided in all SPDC and shall be sized to provide adequate cooling with outside air temperatures of 110 degrees Fahrenheit (F) and summer radiant heat levels.
B. Signal Power Distribution Equipment
   1. SPDC equipment shall be mounted in a wayside case or as shown on the Contract Drawings. Case shall comply with the requirements these Specifications.
   2. The SPDC shall include a wireway box to tee cable from TPSS to sectionalizing switches for each power distribution cable. Disconnect
switches shall be manually operated, double pole, single throw, fusible, rated for heavy-duty application intended to sectionalize energized 480 VAC single-phase 60 Hz circuits. Short circuit ratings shall be equal to or greater than the maximum short circuit to which the switch would be subjected. Ampere ratings shall be determined by the Contractor for the projected loads and shall include 25 percent spare capacity for future expansion.

3. The SPDC shall be provided with a 480 volt to 120 volt step-down transformer for SPDC hotel power. A 120 volt breaker panel shall be provided. The panel’s main breaker shall be rated at 40 amps minimum. Individual breakers in the panel shall be provided for the case lights and outlets and for the ventilation system.

4. The ventilation system shall be thermostat controlled. Thermostat shall be initially set to operate the ventilation system at 90 degrees F or above.

5. Each SPDC will be fitted with a Generator plug mounted on the exterior of the case with weatherproof cover. An interlocked disconnect within the SPDC shall allow selection of the generator plug as the power source for the SPDC. The interlocked disconnect shall ensure that the TPSS feed and the generator plug are never simultaneously connected.

C. AC Power Equipment

1. Circuit Breakers
   a. Circuit breakers for power feed to Instrument Houses and wayside signal cases for 480 VAC distribution shall be thermal magnetic, molded case type, two pole, rated at 480 VAC. Ampere ratings shall be determined by the Contractor for projected loads. Loads shall not exceed 80 percent of the circuit breaker ampere rating. Ampere ratings shall include 25 percent spare capacity for future expansion.
   b. Circuit breakers shall provide adequate overcurrent protection for connected equipment. Circuit breakers shall be UL listed conforming to the requirements of NEMA AB 1-1986.
   c. Short circuit rating shall be equal to or greater than the maximum short circuit to which they would be subjected, with a UL listed interrupting rating of not less than 14,000 symmetrical amperes rms.
   d. Molded case circuit breakers shall have toggle type mechanisms, providing quick-make, quick-break operation. Circuit breakers shall be calibrated for operation in an ambient temperature of 40 degrees Celsius (C). Each circuit breaker shall have a permanent trip unit containing individual thermal and magnetic trip elements in each pole. Circuit breakers shall have reverse connection capability and be suitable for mounting and operating in any position.
   e. Circuit breakers shall be provided with removable lugs. Lugs shall be UL listed for 90 degrees C. copper wires.
   f. Circuit breaker enclosures shall be NEMA type 12, provided without knockouts. Enclosure shall be fabricated from galvanized steel, with an electrodeposited, gray baked enamel finish. The external operating handle shall be an integral part of the box, not the door. Enclosure shall be UL listed.

2. Signal power isolation transformers shall conform to the requirements of these Specifications.

D. Signal Power Distribution Centers

1. SPDC shall be enclosed in equipment cases and installed near TPSS. The Contractor shall verify specific site assignments as shown on Contract Drawings.

2. Power distribution centers shall consist of a 480 VAC two pole, thermal magnetic, molded case circuit breakers housed in NEMA type 12 enclosures. Ampere ratings shall be determined by the Contractor for the projected loads. Loads shall not exceed 80 percent of the circuit breaker ampere rating. Ampere ratings shall include 25 percent spare capacity for future expansion.

E. Power cables for the distribution of power to signal equipment locations shall be as required in these Specifications.

F. Instrument House Power Equipment

1. Ground Detectors
   a. Each DC ground detector shall be sensitive enough to detect leakage currents from either terminal of the floating supply to ground through leakage paths having resistance as high as 7,000 ohms.
   b. Ground detection scheme shall be immune to transient current flows that may be the result of charging distributed supply-to-ground
capacitances. It shall also be immune to induced power line ripple that may exist between the supply leads and ground.

c. Ground detectors shall have a memory capability to provide an indication of a momentary leakage condition. The memory shall be held until reset by a push button provided for that purpose.

d. Operation of ground detectors shall not interfere with operation of power or signal circuits or equipment.

e. Ground detector circuits shall meet the fail-safe design criteria with respect to open circuits. Furthermore, the shorting and opening of any component part of the ground detector circuits shall be detectable.

f. Made ground in the ground detecting part of circuits shall be checked to validate its presence. This check shall be made in a fail-safe manner.

g. Ground detector repeater relays shall be vital relays and shall be energized when no ground is detected.

h. Ground detector circuits shall operate in a stable condition over the specified temperature range and over the voltage range specified for each power supply being monitored as specified within these Specifications.

i. Each ground detector shall be equipped with a three-position, center off, momentary contact test switch to check the operation of that detector, by providing momentary 7,000 ohm-to-ground leakage paths for the DC buses being monitored.

j. It shall be required to manually reset the ground detectors to their normal operating condition after a ground has been detected and eliminated.

k. Each ground detector shall be equipped with indication lights:

   1) to indicate that both buses are clear of grounds.

   2) to indicate that a ground has occurred on that bus.

l. Each ground detector shall be equipped with one independent isolated contact for remote indication of alarm condition.

2. Storage Batteries

a. Design

   1) Each cell of the battery assembly shall be hermetically sealed.

   2) Battery shall be leak and spill proof. No electrolyte shall be lost when battery is stored or mounted in any position, or if a cell container should become ruptured.

   3) Battery shall not be capable of explosion under any condition, including a short circuit discharge.

b. Operating Characteristics

   1) Battery shall produce the rated capacity when operated in any position.

   2) Battery shall be capable of a minimum of 1000 charge-discharge cycles to 80 percent discharge without loss of capacity.

   3) Battery shall not release gas, fumes, or any toxic substances when operated under normal conditions, or when charged or discharged at a maximum recommended rate.

   4) Battery shall be capable of normal operation and suffer no damage after being frozen and thawed.

   5) Battery shall not require charging voltages of more than 2.25 volts per cell to maintain rated capacity and life.

   6) Battery shall, if totally discharged, be capable of being recharged to rated capacity with charging voltages of no more than 2.30 volts per cell.

c. Maintenance

   1) Battery shall be "maintenance free," meaning that no addition of water will be required and no overcharge will be required.
### Battery size and application

1) The Contractor shall calculate loads based upon the equipment he proposes to furnish. All batteries shall be sized for a minimum 8-hour standby capacity.

### Battery Chargers

a. Battery Charger similar to Cragg Railcharger model ETC-12V or Authority approved equal shall be provided.

b. Charger shall be a panel-chassis combination with a perforated protective cover. The design shall provide natural convection cooling.

c. Front mounting shall be designed to mount in a standard 19-inch rack space with EIA hole spacing.

d. Front panel shall contain one voltage failure light, output ammeter and output voltmeter. Meter accuracy shall be plus or minus two percent with nominal voltage readings at center scale.

e. Terminal binding posts for input, output and alarm circuits shall be provided. Each terminal shall be insulated from the frame of the unit.

f. All chargers shall be clearly and permanently labeled with manufacturer's name, serial number, part or model number and input and output rating.

g. Battery charging equipment shall be designed for continuous operation.

h. Battery charging equipment shall be designed to deliver rated outputs with input voltage of 100 to 130 volts AC, with a 60 or 100 Hz, single phase, two wire input.

i. Battery charging equipment shall have a reserve capacity at least 25 percent above calculated requirements.

j. Each charger shall be provided with independently adjustable float and recharge voltages, current limiting and automatic charge control. The battery charger shall have automatic, electronically controlled temperature compensation for float voltages.

### Lightning and Surge Protection

1. The Contractor shall provide lightning protection and surge protection that is effective in protecting all power equipment and downstream equipment from damage and operational malfunction. The Contractor shall provide as many applicable types and stages of protection as required to protect each type of circuit and equipment involved.

2. Primary surge arrestors shall have the ability to shunt relatively high current surges to ground with relatively little overshoot.

3. Secondary surge suppressers shall have the ability to shunt-to-ground any surge overshoot from the primary arrester devices.

### Inverters

a. Inverters shall operate with DC input voltages of 9.0 to 18.0 volts.

b. Output shall be 100 Hz of sufficient voltage and current to operate a single power frequency track circuit. Alternatively, the inverter may be used to drive a follower to achieve the required output.

### Functional Requirements

A. The Signal Power System shall be designed to provide normal operations for 8 hours using a battery back-up, with the exception of switch machine operation.
B. Switch machine control at junctions and terminal interlockings shall be provided with an alternate source of AC power. Automatic transfer switches shall be provided to switch between the primary and alternate source.

C. Power frequency track circuits shall receive power from 12V/100V 100Hz invertors.

D. Ventilation systems shall be designed to operate on back-up power.

2.4 DELIVERY, STORAGE AND HANDLING

A. All signal power equipment shall be protected from damage during shipping and delivery.

B. Any damage incurred in transit or caused by mishandling or improper storage shall be at the expense of the Contractor.

C. Batteries shall be stored and delivered in a fully charged state. Batteries shall not be stored for more than 90 days. Batteries shall be shipped separately from housings in which they are to be used.

PART 3 - EXECUTION

3.1 PRODUCTION

A. Not Used

3.2 INSTALLATION

A. Source energy, 480VAC 60 Hz, for the signal power distribution systems shall be obtained within the traction power substations. The Contractor shall install a breaker for signal power from the auxiliary transformer in the substation. Power cables shall be installed from the breaker panel through the interface manhole to the SPDC. Unless otherwise approved, the Contractor shall limit the distribution from a single SPDC to 50 KVA for worst-case loading.

B. Each SPDC shall be installed on a precast pillars in accordance with the requirements in these Specifications and the Contract Drawings. SPDC’s shall be installed in the areas shown on the Contract Drawings and not less than 8 feet-6 inches from centerline of tracks at any point. Access shall be provided to the foundation bolts from inside the enclosure.

C. Each SPDC shall be level and plumb. SPDC’s installed on slabs shall be mounted on an Authority approved neoprene pad. Pad shall be installed between the base of the enclosure and the concrete foundation.

D. Each SPDC shall be externally grounded as required by these Specifications.

E. Cables shall enter SPDC by entrance knockouts with fittings and entrance conduits provided. Cables shall be dressed, tagged and terminated as required by these Specifications.

F. Exterior paint of each SPDC shall be inspected after installation and any damage repaired in accordance with the paint manufacturer’s instructions and as Authority approved.

G. Signal Power Equipment

1. Wayside signal power equipment shall be installed in accordance with manufacturer’s recommendation, NEC, and the Authority approved Contractor plans.

2. Circuit Breakers

a. 480 VAC two pole molded case circuit breakers shall be mounted within the TPSS and SPDC using galvanized steel screws and associated hardware.

3. Signal Power Isolation Transformers

a. Signal power isolation transformers shall be installed as required by these Specifications.

4. Disconnect Switches

a. Disconnect switches shall be wall mounted. Disconnect switches shall not be mounted close to entrance door.

b. Disconnect switches shall be mounted level and plumb.

5. 100 Hz. Invertors

a. 100 Hz invertors shall be installed in Central Instrument Houses.

b. Invertors shall be installed in accordance with Authority approved Contractor plans and manufacturer’s installation instructions.

6. Power Cables

a. Install cables from SPDC to TPSS through the interface manhole in conduits and terminate on breakers in the TPSS.

b. All cable entrance to signal equipment housings shall be from the bottom.

c. Cables shall be installed as specified in these Specifications.

7. AC Ground Detectors
a. AC ground detectors shall be mounted on instrument racks in instrument houses.

H. Rectifiers and Battery Chargers

1. The Contractor shall provide all mounting hardware, terminals and terminators, for mounting wall mounted rectifiers and battery charger units in wayside cases and signal instrument houses.

I. Storage Batteries

1. Battery cells are to be arranged in wooden trays which shall be mounted on steel racks of a design and size subject to the Authority approval. Wood trays shall be painted with two coats of paint resistant to the acid in the batteries. Unless otherwise approved, batteries shall be mounted on battery racks having a single tier.

2. Battery posts shall be coated with an approved grease and battery connectors securely fastened to the battery posts.

3.3 TESTING

A. The signal power system shall be tested in accordance with these Specifications.

B. Simulated load tests in accordance with Authority approved signal power system test procedures shall be satisfactory completed prior to final connection of signal facilities at each equipment location.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith will be considered incidental to the work specified under Section 16901 “Signal System Basic Technical Requirements.”
PART 1 - GENERAL

1.1 DESCRIPTION
A. The Work to be done under this Section consists of designing, providing and installing factory wired Central Instrument Houses (CIH) and Intermediate Instrument House (IIH) as described in these Specifications and as shown on Contract Drawings.

1.2 REFERENCED STANDARDS
A. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM)
   1. ASTM B117 - Standard Practice for Operating Salt Spray (Fog) Apparatus

B. American Railway Engineering And Maintenance-of-Way Association (AREMA)
   1. AREMA - Communications and Signals Manual, Section 14 – Electrical Devices, Foundations, Hardware

1.3 SUBMITTALS
A. The Contractor shall submit for Authority approval, drawings and product detail for each type instrument house required.

B. The Contractor shall include:
   1. Drawings of each instrument house construction showing proposed size, empty and fully equipped weight, rack layout, location layout, method of house mounting, local control panel, vital relays, microprocessors, communications equipment, event recorders, plan rack and plan table. The Authority's approval shall be obtained prior to manufacture of each instrument house.
   2. Foundation and house mounting details.
   3. Drawings of the grounding grid arrangement.
   4. Details for the fire detection system, intrusion detection system, and environmental control equipment for all instrument houses.

C. The Contractor shall submit Test Procedures and Results in accordance with these Specifications.

1.4 QUALITY ASSURANCE
A. The Contractor shall factory test each instrument house and the functioning of equipment contained within each house in accordance with Authority approved Factory Test Procedures.

B. Instrument houses shall meet the requirements of the AREMA Communications and System Manual, Section 14.4.

C. The Contractor shall inspect each instrument house after it has been installed and correct any deficiencies. This inspection shall be conducted in conformance with requirements of Authority approved Installation and Inspection Procedures.

D. Instrument houses shall be tested according to Authority approved test procedures.

1.5 DELIVERY, STORAGE AND HANDLING
A. All equipment shipped within each instrument house shall be properly fastened and braced to prevent damage during transit. Any equipment damaged during transit, installation, testing and before being placed in service shall be replaced at no additional cost to the Authority.

B. Relays shall be delivered, stored and handled in accordance with these Specifications.

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIAL
Not Used

2.2 CONTRACTOR FURNISHED MATERIAL
A. General
   1. Central Instrument Houses (CIH) are to be located near each interlocking, and shall contain all equipment required for the safe and reliable operation of the interlocking. Equipment enclosure designated Intermediate Instrument House (IIH) are located between interlockings where the distance from CIH to adjacent CIH is more than double the manufacturer’s recommendations for maximum distance permitted between the controlling CIH and the track circuit coupling device at the rail. Equipment provided in an Intermediate Instrument Houses shall include power supply and battery, track circuit equipment; code generating equipment; and vital processor for code selection logic and vital communication between adjacent equipment locations.
2. The size of each instrument house shall be determined by the Contractor in accordance with these Specifications and be of adequate size to house all equipment and provide 25 percent spare space as described in these Specifications. Instrument houses shall not exceed the footprint as shown on the Contract Drawings unless Authority approved.

3. Each instrument house shall have adequate space for housing communications interface equipment as shown on Contract Drawings.

4. The Contractor shall secure all required building permits and jurisdictional approvals prior to installation of instrument houses.

B. Design and Fabrication

1. General Requirements for CIH and IIH
   a. Each instrument house shall be of modular construction of 12 gauge minimum sheet steel, unless otherwise Authority approved. Tops and sides of the houses shall be lined with a fire resistant insulating material complying with a flame spread of 0-20 and a fire rating of seven in accordance with ASTM-E-84 and having a minimum insulation rating of R-16.
   b. Exterior doors shall be hinged and employ a gasket that provides a dust proof and weatherproof seal. Doors shall be designed with a two-position latching device. Doors shall be provided with handles, hasps, and a three-point locking device that will ensure door cannot be locked when not fully closed. Panic bars shall be provided to open doors from the inside.
   c. A 1/4 inch by 2-inch by 2-inch angle plate shall be securely fastened on the exterior of all instrument house doors with provisions made for a vandal proof lock to secure the door angle plate to an angle plate securely fastened on the instrument house. This locking arrangement shall be provided in addition to the normal locking mechanism and handle. Hinges shall be separate castings securely fastened to the housing and door. Hinges shall be equipped with bronze hinge pins, pressure-lubricating fittings and lubricated by the manufacturer before the instrument house is shipped.
   d. Instrument house width shall not exceed 10 feet. The length shall vary in 2-foot lengths from 8 feet to a maximum of 48 feet. Interior headroom shall be a minimum of 7 feet. Spacing between instrument racks shall be as required in these Specifications.
   e. Instrument house shall be dust tight and insulated to provide maximum heating and cooling system efficiency.
   f. Instrument houses shall be provided with signage above each door to identify the house. The sign shall have a white, reflective background with three inch black lettering. The signs shall display the location name and either “CIH” or “IIH”, as appropriate for the location.

2. CIH Requirements
   a. There shall be two areas in each instrument house: a large area to accommodate the signal equipment; and a smaller area to accommodate the local control panel (LCP) and communication equipment. An inside door shall separate the two areas and an outside access door shall be provided for each area. The areas shall be separated by steel mesh panel construction. It shall be equipped with a lock arranged for access from the signal equipment side. The operations area shall be large enough to allow at least one foot of clearance on each side of the LCP.
   b. The LCP area shall be equipped with a desk and chair for use while operating the LCP. Desk shall be sized to accommodate a telephone and full size drawings.
   c. In each instrument house, the Contractor shall make provisions for two administrative telephones.

3. IIH Requirements
   a. An area to accommodate the local control panel (LCP) and communication equipment shall be provided.
b. The LCP area shall be equipped with a desk and chair for use while operating the LCP. Desk shall be sized to accommodate a telephone and full size drawings.

C. Cable Entrance Facilities and Utilities

1. Cable entrance knockouts in the floor shall be provided for full flexibility in arrangement of entrance racks such that cables entering from underneath will not require bending for proper termination.

2. A dedicated cable entrance knockout or sleeve access shall be provided for the signal power line cable.

3. In each instrument house, a dedicated cable entrance shall be provided for Communications cable.

4. A minimum of two conduits shall be spare.

D. Cable Trays

1. Cable trays shall be of open ladder type, aluminum, or other material commercially available and providing support spacing and strength of material characteristics equal to or greater than the aluminum.

2. Ladder rung spacing shall be approximately six inches.

3. Each cable tray shall be designed and fabricated with sufficient capacity to provide 50 percent of the cross-sectional area as free air space after the full number of cables and wires are installed. Corners shall have a minimum radius of 6-inches, for either horizontal or vertical turns. Sufficient overhead space shall be available after installation to permit wires and cables to be inspected.

4. Where practicable, the tray shall be constructed in straight sections joined with approved couplers. Electrical continuity of the tray shall be maintained across sections by bonding straps.

5. Using the manufacturer's standard, the tray shall be laid out using a minimum number of sections, but providing maximum continuous runs without gaps.

6. All fittings, supports, and accessories shall be provided in accordance with the manufacturer's recommendations.

7. To prevent damage to wire and cable, no metal edges of any description shall protrude and no sharp corners shall exist in the completed layout.

8. If the Contractor's system requires separation of wires in the cable trays for electrical interference (EMI) protection as required by these Specifications, EMI mitigation barriers shall be provided.

E. House Facilities

1. Interior lighting shall utilize fluorescent lighting ballasts equipped with LED retrofit tubes to provide lighting above aisles, to both sides of the equipment racks, wall shelves and the local control room area. Light fixtures shall be installed higher in the instrument house than the tops of the instrument racks.

2. Exterior lighting shall be LED and utilize E26 standard sockets and either type A19 or A21 LED bulbs. Exterior lighting shall be in compliance with IECC Green Building Code requirements. The light level at the instrument house entrances shall be a minimum of 2 foot-candles.

3. Heating and air conditioning units shall control environment in the instrument house. Thermostat shall have high and low control position settings for automatically regulating heating and air conditioning units which shall be adequate to maintain a temperature range between 65 degrees Fahrenheit (F) and 85 degrees F with all equipment functioning at peak load, plus spare equipment. Air conditioning units shall not be roof mounted.

a. Air conditioning/heat units shall be wall-mount units in galvanized 20 gauge zinc coated steel cabinets finished with a baked-on textured enamel. The units shall be mounted to the external wall of the instrument house with grilled supply and return openings in the wall. The cabinet shall have a sloped top to direct moisture away from the instrument house and shall be installed with a top rain flashing.

b. Air conditioning/heat units shall have a barometric fresh air damper that will allow a mix of up to 25 percent outside air. The barometric damper shall allow manual adjustment from a full-open position to a full-closed position.

c. The units shall be provided with one-inch washable filters.

d. Air conditioning and heater units shall incorporate built-in circuit breakers. Ventilation fans shall be...
multi-speed and a minimum of 18 inches in diameter. Fans motors shall be a minimum of 1/5 hp.

e. Heating capacity shall be at least 16,000 BTUH.

f. The outside of each air conditioner shall be protected with a hinged, heavy gauge, hot-dipped, galvanized vandal-resistant security mesh cage. The cage shall be constructed with a slot on the frame that, when in its closed position, will not pinch the air-conditioner’s condensation drainage tube. The drainage tube shall direct the condensation away from the instrument house and its foundation.

g. The cage shall be constructed of an angle iron frame and be enclosed with 1-1/2 inch by 10-gauge steel expanded metal to form a 5-sided box.

h. The cage shall be hinged to swing horizontally open to allow for 90 degree maintenance access. Provide 2 locking hasps to hold the cage in the closed position. A mechanical device shall be provided for securing the cage in the 90 degree opened position. Cage design shall allow for a single maintenance technician to gain access and perform any maintenance activity on the HVAC unit. An open HVAC cage shall not impede on the right-of-way.

i. The cage shall be attached to the wall using tamper-proof screw/bolts attached to the instrument house to ensure mounting integrity. The cage shall have an oversized width, additional 1-foot minimum, on the hinged right side to accommodate air conditioner maintenance.

j. Thermostat-controlled ventilation systems shall be provided in instrument housings that contain electronic equipment, battery chargers or batteries. The thermostats should have sufficient upper range so that the ventilation is started automatically after an air conditioning system failure. Fans and vents shall be sized such that the interior temperature will not exceed 115 degrees F. Vents shall be closed by dampers while air conditioning is operating.

k. Ventilation systems shall be disabled when the fire detection system alarms.

4. Fire Detection System: Each instrument house shall be equipped with fire alarm systems in accordance with the requirements of Section 16854, “Fire Alarm Subsystem – Communications System”.

5. Contractor shall provide and install event recorders as required by these Specifications.

6. Contractor shall provide a plan rack for storage of plans. The rack shall be of sufficient size to easily hold all circuit and detail plans for the location. The plan rack and a plan-reading table shall be provided in the Signal Portion of the instrument house.

7. Plan rack and plan table shall be provided in each IIH.

8. In each corner of the instrument house, a 3/8-inch high tensile strength, silicon-manganese bronze stud bolt, for externally grounding the housing shall be provided.

9. The Contractor shall paint all instrument houses in accordance with the following:

   a. Exterior surfaces shall be galvannealed and prepared for finish painting with a vinyl wash primer.

   b. Apply electrostatic powder coat using manufacturer’s recommendations for heat application.

   c. The color shall match Sierra Tan, Federal Standard 595b, Color Number 20372 (semi-gloss). The finish shall have passed the Salt Spray Test per ASTM B117, certified by an independent laboratory.

   d. Interior of the instrument house shall be painted in accordance with the manufacturer’s recommendations. The color shall be white.

10. Instrument house foundations shall be provided as show in the Contract Drawings. Unless otherwise specified the Contractor may choose to use the concrete slab or the concrete pier type foundation.
PART 3 - EXECUTION

3.1 PRODUCTION
Not Used

3.2 INSTALLATION

A. Each instrument house shall be mounted on a concrete slab foundation or on drilled piers as required by these Specifications and Contract Drawings.

B. Instrument houses shall be installed not less than 8 feet-6 inches from centerline of tracks at any point. When a door faces the tracks, the minimum distance from track centerline to the instrument house shall be 12 feet. The Contractor shall be responsible for final grade around each instrument house installation. The Contractor shall ensure that the finished grade around the house is level at least 4 feet from the house in all directions. The Contractor shall spread a minimum depth of 6 inches of crushed rock or ballast from the house to 8 feet in each direction. Where the distance from the finished grade to the floor of the installed instrument house is greater than eight inches, the Contractor shall provide concrete step(s) at each personnel entrance.

C. Each instrument house and foundation shall be oriented such that the local control panel area and operator access is on the track side.

D. Where mounted on a slab, each instrument house shall be level and plumb and mounted on an approved neoprene pad. Pad shall be installed between the base of instrument house and the concrete foundation. Access shall be provided to the foundation bolts from inside the instrument house.

E. Each instrument house shall be externally grounded in accordance with these Specifications.

F. The plan rack and plan tables shall be mounted to the wall in the instrument house. The rack shall be a swing-out type and the plan tables shall be a drop-down type to minimize the space required.

G. Cables shall enter instrument houses by entrance knockouts with fittings and entrance conduits provided. Cables shall be dressed, tagged and terminated as specified in accordance with the requirements of these Specifications.

H. Relays shall be installed on plugboards corresponding to the relay nomenclature and securely fastened in place with the hardware provided.

   1. In designing the detail layout of equipment within the housing, the Contractor shall group instruments so similar types of equipment or functions of a similar nature will be together.

   2. Layout of instruments on all racks shall be uniformly structured. Track and control relays shall be mounted in geographical succession in relation to the track arrangement.

   I. Batteries shall be installed in accordance with the requirements of these Specifications.

   J. Exterior paint of each instrument house shall be inspected after installation and any damage shall be repaired in accordance with the paint manufacturer's instructions and as Authority approved.

3.3 TESTING

A. The functioning of equipment contained within the instrument house shall be tested in accordance with these Specifications.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith will be considered incidental to the work specified under Section 16901 “Signal System Basic Technical Requirements.”

END OF SECTION 16938
PART 1 - GENERAL

1.1 DESCRIPTION

A. Work done under this Section consists of designing, providing, and installing junction boxes for use with switch-and-lock movement layouts, electric lock layouts, signal layouts, pushbutton layouts, crossing warning gates, flashers, cantilever signals and other signal equipment as required by these Specifications and Contract Drawings.

1.2 REFERENCE STANDARDS

A. American Railway Engineering and Maintenance-of-Way Association (AREMA)
   1. AREMA - Communications & Signal Manual, Part 7
   2. AREMA - Communications & Signal Manual, Part 15

1.3 SUBMITTALS

A. The Contractor shall submit for Authority approval, drawings and product detail for each type junction box required.

B. The Contractor shall submit drawings of each junction box provided including terminal boards, terminals, wiring, mounting details and any other integral parts.

1.4 QUALITY ASSURANCE

A. The Contractor shall inspect each junction box after it has been installed and wired and correct any deficiencies. Inspection shall be conducted in conformance with the requirements of the Contractor's Installation and Inspection Procedure as Authority approved.

B. Junction boxes shall meet the requirements of the AREMA Signal Manual, Parts 7 and 15.

C. Each junction box shall be inspected after it has been installed in the field. This inspection shall conform to the Contractor's Installation and Inspection Procedure as approved by the Authority. Installation shall not be considered complete until all installation defects have been corrected to the Authority's satisfaction.

PART 2 - PRODUCTS

2.1 AUTHORITY PROVIDED MATERIALS

A. Not Used

2.2 CONTRACTOR PROVIDED MATERIALS

A. All junction boxes shall be provided with gaskets to prevent entrance of moisture and dust, in accordance with the AREMA Communications & Signal Manual, Part 15.2.10.

B. Switch-and-lock movement layout and electric lock layout junction boxes.

1. Junction boxes for switch layouts shall be the manufacturer's standards with adequate space for double post AREMA approved terminals, terminal boards, cable and other associated apparatus.

2. Each switch-and-lock movement and electric lock layout shall include one junction box, designed for use in railroad applications. The box shall have sufficient space for terminals, disconnects and other components as may be necessary. Terminals and components shall be located in the junction box so that they are accessible and that manipulation of a terminal wrench is not hindered by the structure of top of the box.

3. For at-grade installations, junction boxes complete with pedestal shall be provided. Junction box pedestals shall have a cable entrance near the bottom of the riser section. Pedestals shall be of sufficient length that the box can be securely installed without need for foundation.

4. Knockouts shall be provided on the sides of the junction box to accommodate conduits to switch machine.

5. Junction boxes shall have ventilation breathers with fine wire mesh screen covering the breather holes.

6. Junction box shall be provided complete with double post terminals in accordance with the requirements of these Specifications.

C. Mast-mounted Equipment

1. Junction boxes for the bases of masts shall be the split base type junction box with AAR terminals.

2. Junction boxes for masts shall be steel or cast metal and be in accordance with AREMA Communications & Signal Manual, Part 7.2.36A, Part 7.2.36B, Part 7.2.41A and Part 7.2.41B.

D. Painting

1. Exterior and interior finish and painting requirements shall be in accordance with the requirements of these Specifications.
E.  Security

1. Junction boxes shall be equipped with a locking device capable of being secured, upon closure, with the Authority's standard signal padlock, in accordance with the requirements of these Specifications.

2.3 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Junction boxes shall be protected from damage throughout delivery, storage and handling.

PART 3 - EXECUTION

3.1 PRODUCTION

A. Not Used

3.2 INSTALLATION

A. Switch-and-lock movement, or electric lock layout junction boxes shall be installed to terminate underground cable for the switch layout, as shown on Authority approved installation drawings.

B. Junction boxes for signal and pushbutton layouts shall be installed to terminate signal cables, as shown on Authority approved installation drawings.

3.3 TESTING

A. Not Used

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith will be considered incidental to the work specified under Section 16901 "Signal System Basic Technical Requirements."

END OF SECTION 16940
PART 1 - GENERAL

1.1 DESCRIPTION

A. Work done under this Section consists of designing, providing and installing sectional type instrument racks in Instrument Houses.

B. Work to be done under this Section shall include preparation of detail drawings for each instrument rack, the equipment arrangement thereon and associated circuits.

1.2 REFERENCE STANDARDS

A. American Railway Engineering and Maintenance-of-Way-Association (AREMA):
   1. AREMA – Communications & Signals, Part 6
   2. AREMA – Communications & Signals, Part 14

1.3 SUBMITTALS

A. The Contractor shall submit product data for equipment racks for approval.

B. The Contractor shall provide:
   1. Submittal of detail arrangement of equipment layout on instrument racks.
   2. Drawings showing proposed arrangement of instrument racks, including a drawing to show methods of grounding and mounting and relation to other equipment in the house.

C. The Contractor shall submit test procedures and results in accordance with these Specifications.

1.4 QUALITY ASSURANCE

A. Racks and all equipment mounted thereon shall be assembled, identified, wired and factory tested in accordance with the requirements of these Specifications, prior to shipment.

B. Each instrument rack shall be inspected prior to shipment. Inspection shall conform to the Contractor's Factory Inspection Procedure as approved by the Authority.

C. Instrument racks shall meet the requirements of the AREMA Signal Manual, Parts 6 and 14.

D. Each instrument rack shall be inspected after it has been installed in the field. This inspection shall conform to the Contractor's Installation and Inspection Procedure as approved by the Authority. Installation shall not be considered complete until all installation defects have been corrected to the Authority's satisfaction.

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIALS

A. Not Used

2.2 CONTRACTOR FURNISHED MATERIALS

A. Instrument racks shall include relay racks, electronic equipment racks, power racks, rectifier racks and racks containing track circuit equipment.

B. Instrument racks shall be fully equipped with the required numbers and types of power supplies, transformers, relay plugboards, printed circuit boards, plug connectors, buses, terminals and all miscellaneous electrical and mechanical components specified. A terminal and plug connector panel shall be located on the upper portion of the rack for connecting external wires and cables. Spare space and terminals shall be provided as specified. Insulated terminals shall be spaced as specified in AREMA Communications & Signal Manual, Part 14.1.5.

C. Instrument Racks shall be open frame weldments designed to accommodate mounting of standard 19 inch panels. The frame shall be constructed of 14-gauge minimum cold rolled steel. Width shall not exceed 24 inches. Panel-mounting angles shall be constructed with standard EIA hole spacing. The Contractor may propose other rack dimensions for specialty equipment where it can be demonstrated that the arrangement offers more efficient space usage.

D. Racks shall be shock-mounted and secured to 12-gauge minimum cold rolled steel bases. The base shall be the same width as racks, with a height of 3-1/2 inches.

E. Chassis supports or guides shall be provided for support of heavy equipment such as power supplies. Chassis supports shall be made of 11-gauge minimum cold rolled steel, capable of being mounted directly to the panel-mounting angles and shall permit side-to-side guide adjustment. Relay plugboard support bars shall be provided for each row of relays and be of sufficient strength to support the manufacturer's equipment mounted thereon.

F. Terminal, plug connector and power panel shall be located on the upper portion of the rack for connecting wires and cables. Panel material shall be fire-retardant. A minimum of ten percent spare terminals shall be provided on each instrument rack.

G. Rows of racks shall be oriented to have adjacent rows either front-to-front or back-to-back. Row-to-row and row-to-wall spacing shall be a minimum of three feet, measured at the base of racks.

H. Each instrument rack shall be fully equipped with the required numbers and types of power supplies, transformers, relay plugboards, buses, terminals and all...
INSTRUMENT RACKS - SIGNAL SYSTEM

miscellaneous electrical and mechanical components specified. Terminals and resistors for energy buses where required, shall be located on the upper portion of the rack. Vital inter-rack wiring shall be direct from relay to relay. Insulated terminals shall be as specified in Part 14.1.5 of AREMA Communications & Signal Manual.

I. Wire supports which form interior wire raceway on instrument racks shall be fabricated from steel or material of non-flammable composition.

J. Relay and Component Mounting

1. In designing the detail layout of racks and other equipment, the Contractor shall group the rows of racks and instruments therein so similar types of equipment or functions of a similar nature will be together.

2. Relays or components shall not be mounted at a height of more than 6 feet - 6 inches from house floor nor closer than 10” to the floor. Overall rack height shall not exceed 7 feet - 6 inches.

3. A minimum of 20 percent spare space on each group of instrument racks for additional relays and two spare cable plug couplers for each rack equipped with plug couplers shall be provided.

K. Plug Connecting Cables

1. Plug connectors and cable and wire for plug-connecting cables shall be in accordance with these Specifications.

L. Resistors, Capacitors, Electronic Components and Fuses

1. Approved types of resistors, capacitors, electronic components and fuses shall be connected into track, line and power circuits as shown on Contract Drawings. These components shall be of such design and capacity to protect the equipment and provide positive and safe operation.

2. All fuses shall be locally and remotely alarmed or indicated, except main power fuses and power frequency track circuit fuses.

M. Convenience Outlets

1. Convenience outlets shall be mounted on the front of each row of instrument racks, no more than four feet apart. Convenience outlets shall be provided from the utility panel and those inside the signal equipment area shall be grounded.

N. Wiring

1. Wiring of instrument racks shall be as specified in these Specifications.

2. All instrument racks shall be pre-wired at the place of manufacture.

O. Grounding Posts

1. Grounding posts and ground jumpers shall be provided with each rack. These posts shall be bolted type to permit isolation of the rack for testing by removal of ground wire connections.

P. Identification

1. A white identification number shall be stenciled at the top front and rear of the frame of each rack, including approved vertical coordinate numbering from top to bottom.

2. There shall be an identifying nameplate for each component or device mounted on instrument racks. Nameplates shall be front and back where the device or its connections are on both sides.

3. The back of each relay plugboard shall be equipped with a tag or other approved means of identification, to indicate the nomenclature of the relay for which it is wired. It shall not be necessary to remove the nameplate in order to remove wires. Nameplate shall be readable when wires are in place.

4. Contact numbering system shall be uniform for each type of relay used.

5. Wiring to each removable contact shall carry an approved tag indicating the relay contact number and circuit nomenclature assigned to the wire.

6. Signal power racks shall have special high voltage labels at terminals above 120 volts, affixed in color, format and size approved by the Authority.

Q. Painting

1. Instrument racks shall be painted in accordance with the requirements of this Specification. Finish color shall be Gray ANSI-61, or approved equal.

2.3 DELIVERY, STORAGE, AND HANDLING

A. Instrument racks not factory installed in a house shall be properly crated to prevent damage during shipment. Protected inside storage shall be provided in the event racks cannot be mounted in place upon delivery to the site.

B. Vital relays shall be shipped separately but identified for the racks in which they are to be used. Relays shall be stored in a protected area until installed in racks.
PART 3 - EXECUTION

3.1 PRODUCTION

A. Not Used

3.2 INSTALLATION

A. Instrument racks shall be installed as shown on approved installation drawings. Racks, relays and other equipment, plus all required mounting and fastening materials to mount racks, shall be installed as required. All racks shall be supported at top and bottom.

B. Racks shall be electrically insulated from each other and from the supporting framework. Grounding of racks shall be as required by these Specifications.

C. All interconnecting cables, wiring and connections to power sources and entrance racks shall be installed as shown on approved plans, including interconnections to self-contained rack-mounted equipment units.

D. Interconnecting cables from entrance racks and power racks shall be trained in cable trays and be connected on terminal and power panels of each individual instrument rack. Slack shall be provided for each interconnecting cable or wire.

E. Plug-connected interconnecting cables shall be the same cables used in the factory test of instrument racks.

F. Field-installed wire bundles within rack shall be harnessed in a neat manner and tied with nylon tie-wraps.

G. Lighting fixtures, cable ladders, trays or other equipment shall not extend below the top of instrument racks.

3.3 TESTING

A. Instrument racks shall be tested in accordance with requirements of these Specifications.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith will be considered incidental to the work specified under Section 16901 “Signal System Basic Technical Requirements.”

END OF SECTION 16953
THIS PAGE INTENTIONALLY LEFT BLANK
PART 1 - GENERAL

1.1 DESCRIPTION

A. Work to be done under this Section consists of designing, furnishing and installing wire and cable in signal instrument houses, wayside cases, relay rooms, control panels and in enclosures where it will not be exposed to the elements. All intra-rack and rack-to-rack wire and cable shall conform to the requirements of this Section.

B. Where there is a difference between the requirements of this Contract Specification Section and other Contract Specification Sections referenced herein, requirements of this Contract Specification Section shall govern.

C. Definitions – As used in this Section, the listed terms shall be defined as follows:

1. Ampacity: The ampacity of a wire is a rating of the steady current in the conductor that causes exposure of the insulation to the design temperature for a particular exposure condition. Ampacity is dependant upon the installation environment of the conductor, e.g. exposed in air (higher ampacity) or buried within a tray with other heat-producing conductors (lower ampacity).

a. The ampacity values given in this Section are estimates determined by the following:

1) Wire sizes AWG 24-20: Per NFPA Panel 16 proposal for NEC Articles 725 and 760, Power Limited Circuits.

2) Wire Sizes AWG 18, 16, and 500 MCM: Per NEC Table 310-16, “Allowable Ampacities of Insulated Conductors rated 0-2000 Volts” with a 35 percent increase due to the use of 150 degrees C rated insulation.

3) Wire Sizes AWG 14-4/0: Per NEC Table 310-18, “Allowable Ampacities of Three Single Insulated Conductors rated 0-2000 Volts Using Type Z (150 degrees C), in Raceway at Ambient Temperature of 40 degrees C.”

2. Cable: Two or more insulated conductors in a common covering, or two or more insulated conductors twisted or molded together without a common covering, or one or more insulated conductors with a common shield with or without an outer covering.

3. Cable Core: The diameter of cabled wires excluding overall shields and/or jackets.

4. Conductor: An uninsulated single strand, or the assembly of two or more uninsulated strands whose primary function is to transmit electrical energy.

5. Conductor Stranding: The construction characteristics of a stranded conductor, categorized as follows:

a. Bunch Stranding (BUN): Composition of any number of wires of the same diameter twisted together without regard to the geometric arrangement of the individual strands. This type of stranding is least likely to be uniform in cross section due to the tendency of the strands to cross over one another and to migrate from one layer to another during the twisting operation. Common constructions are 7, 10, 16, 26, 41, 65, and 105 strands.

b. Concentric Stranding (CON): Composition with a central wire surrounded by one or more layers of helically laid wires, with a reversed direction of lay, and an increased length of lay, for each successive layer.

c. Unilay Stranding: Composition of more than one layer of helically laid wires, with the same direction of lay, the same length of lay, for each successive layer.

d. Rope Stranding: Composition of groups of any of the above strandings combined in a concentric configuration. This construction has greater flexibility and is generally used for conductors 8 AWG and larger. Rope Stranding is generally specified by the number of components in the rope, and the number and size of the wires in each component.

6. Insulation: The layer or layers covering a conductor whose primary function is to act as an electrical barrier.

7. Jacket: An integral covering that is applied over the insulation, core, shield, or armor of a cable and whose primary function is to provide mechanical and/or environmental protection for the components it covers.

8. Lay: The lay of any helical element of a conductor is the axial length of a turn of the helix
of that element, such that, if a single component wire of a conductor is unwound, the lay in inches will be the length measured along the axis of the conductor that is required to make one complete turn about the axis of the conductor. Usually, the number of turns in one foot of a conductor is measured in order to allow for normal manufacturing variations. Lay lengths are expressed as a decimal or a fraction.

9. Manufacturer: The organization that makes the wire and/or cable sold to the Contractor or purchaser.

10. Material Tests: (Intrinsic properties of material.) Tests that must be performed for the original Certification of Quality and every five years thereafter, or as requested by the purchaser.

11. Multi-Conductor Cable: Two or more wires in a common covering, or two or more wires twisted or molded together with or without a common covering.

12. Purchaser: The Contractor’s organization or subcontractor that issues the purchase order for wire and cable.

13. Qualified Manufacturer: A wire and cable manufacturer that has submitted wire and cable, with required data, that has passed all required tests and has been informed by writing by the purchaser that he is a qualified manufacturer.

14. Routine Test: (Properties affected by the manufacture.) Test that must be performed for each purchase order and at other times as requested by the purchaser.

15. Separator: A layer of insulating material that is placed between the conductor and its insulation, between a cable jacket and the components it covers, or between various components of a multi-conductor cable.

16. Shield: A sheet, screen, or braid of metal, usually copper or aluminum placed around or between electric circuits or cables or their components, to contain any unwanted radiation, or to keep out any unwanted interference.

17. Vendor: The recipient of a purchase order from the purchaser or the supplier of wire and cable to the purchaser. The vendor may or may not be the manufacturer.

18. Wire: (An insulated conductor.) The assembly of a conductor and insulation.

1.3 SUBMITTALS

A. The Contractor shall submit the following for Authority approval:
   1. List of each cable manufacturer's railway signal installations.

B. The Contractor shall submit product data cut-sheets and a sample specimen of a four foot length for each proposed cable type. Samples shall remain the property of the Authority.

C. The Contractor shall submit certified copies of the following to the Authority for approval:
   1. Cable test reports for all demonstration tests required by the Authority.
   2. Cable test and inspection reports for tests and inspections required by these Specifications.
   3. Test reports of cable tests conducted in the field in accordance with approved testing procedures.
   4. Certification that each cable supplied complies with the requirements of these Specifications.
   5. A complete, signed and notarized standard Wire and Cable Test Report Sheet as part of each cable test report.

D. Test procedures and results in accordance with these Specifications.

1.4 QUALITY ASSURANCE

A. Quality Assurance Provisions shall be followed in the manufacture of wire covered by this Section. The Contractor shall be responsible for witnessing and reporting the results of any and all required qualification tests. The Contractor shall be responsible for monitoring the manufacturer's conformance to quality assurance requirements and the Authority reserves the right to audit conformance in accordance with the Special Provisions.

B. All other Work covered by this Section shall be accomplished in compliance with the latest version of a Quality Assurance Program that meets the intent of the ASQ Q9001.

C. It shall be the Contractor's responsibility to ensure that the Manufacturer adheres to all testing and production requirements.

D. The Contractor shall secure certification of compliance with these Specifications for each production run. The manufacturer shall provide a Certificate of Compliance with each shipment. The Contractor shall keep the Certificates on file and shall make them available at the Authority's request.

E. The Contractor shall ensure that the manufacturer performs the “Material Tests” at least once every five years and submits the resulting data to the Contractor.
Wire to be used for qualification shall be No. 20 AWG rated 0-600 volts and No. 12 AWG rated 0-2000 volts.

F. The Contractor shall ensure that the manufacturer performs “Routine Tests” on each production lot.

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIALS

A. Not Used

2.2 CONTRACTOR FURNISHED MATERIALS

A. Maintenance Materials:

1. The Contractor shall furnish one thousand feet of each type of wire and cable used on this contract.

B. Conductors

1. Stranded Conductors
   a. Conductors shall be tin plated, soft or annealed copper wire for electrical purposes, per the latest revision of ASTM B33 and B-3.
   b. Strands and rope members shall be concentrically stranded using unilay (UNI), concentric (CON), and bunch (BUN) constructions as specified in Table A.

2. Solid Conductors
   a. Conductors shall be tin plated, soft or annealed copper wire for electrical purposes, per the latest revision of ASTM B33 and B-3.
   b. Solid conductors for wire wrap shall be as specified in Table B.

C. Insulation

1. The insulation material for stranded and solid conductor wires shall be modified ethylene tetrafluoroethylene (EFTE) per ASTM D3159-91a, unless otherwise specified.

2. Insulation for Stranded and Solid Wires
   a. All insulation for AWG 12 through AWG 24 shall be Tefzel 200 or equivalent. Tefzel HT-2127, Tefzel 750 or equivalent, may be substituted for Tefzel 200 for enhanced flexibility.
   b. All insulation for AWG 10 through 500 MCM shall be Tefzel 280 or equivalent.
   c. All insulation for solid conductor wire wrap wire shall be Tefzel 750 or equivalent, per UL Subject 758, Style 10125.

D. Wire Constructions

1. The finished wire diameters, weights, and ampacity ratings are shown for 0-150, 0-300, 0-1000, and 0-2000 volt rated stranded wires in Tables C through G.

2. The finished wire diameters and weights for 0-300 volt solid conductor wire are shown in Table H.

E. Insulation Thickness – Stranded and Solid Wire

1. The nominal or average thickness of the insulation shall be as specified in Tables C through G. The minimum thickness at any point shall not be less than 90 percent of the nominal thickness per NEMA HP 100-1991, Section 3.2.

F. Identification

1. Each stranded wire shall be marked with the following information repeated at intervals no greater than 24 inches:
   a. Manufacturer's name
   b. Year in which wire is manufactured
   c. Size of conductor
   d. Type of insulation
   e. Voltage rating

2. Identifying markings shall be permanent and shall be easily readable and understandable. The marking shall withstand 125 cycles (250 strokes) using a scrape abrasion tester with a 250 gm weight, a wire mandrel with a diameter of 25 +/- 2 mils (.635 +/- .051 mm), a stroke length of 0.375 inch (1.905 mm) and a frequency of 60 cycles/minute.

3. Each solid wire surface shall be printed with the UL Style Number, the manufacturer and the conductor gauge. This information shall be repeated at intervals no greater than 24 inches.

G. Color Coding of Wires

1. Stranded Wires
   a. Cables with unpaired wires shall be solid colored in the color sequence per Table I. Where two colors are indicated, the second color shall be achieved using a stripe that is clearly identifiable and permanent.
b. In paired cables, one wire of each pair shall be white and the other wire shall be coded in accordance with the sequence given in Table I of this Section, omitting the solid white.

2. Solid Conductor Wire (Wire Wrap)
   a. Solid colors as specified by the purchaser shall be used.

2.3 PERFORMANCE REQUIREMENTS

A. All wire and cable specified within this Section shall meet or exceed the requirements of the AREMA Signal Manual, Part 10.3.14 and 10.3.24.

B. Internal plug-connected cable assemblies shall be as specified herein and in accordance with these Specifications.

C. The insulation shall be applied directly to the surface of the specified conductors and shall adhere tightly to the surface, but shall be free stripping and shall leave the conductor clean.

2.4 MULTI-CONDUCTOR CABLES

A. Multi-conductor cables shall be made by assembling individual or twisted pairs of stranded wires into a tight cylindrical form using non-hygrosopic, flame and smoke resistant fibers and tape. The jacket material shall fit tightly to form a tight assembly.

1. Individual wires that are used to make up the cables shall be in accordance with Clause 2.2 of this Section.

2. The color sequence for paired and unpaired wires shall be in accordance with this Section.

3. Fillers used to make the cable assembly round shall be able to shape themselves to fill the depressions. Fillers shall be compatible with the other materials in the cable.

4. Cable lay shall be 12 to 16 times the cable core diameter and pair lay (multi-pair cables) shall have 20-25 times the diameter of the individual wire within the pair. Cable marked “High Twist” shall have a nominal pair lay of 12 to 16 times the single wire diameter, with a cable lay of 8 to 10 times the cable core diameter.

5. Binder Tape – Each layer of two or more wires shall have a helically applied tape with a minimum overlap over the layer, to serve as a binder. Tape thickness shall be 0.002 inches minimum. The tape shall be compatible with the other materials in the cable.

6. Separator tapes shall be used between the outer surface of the cable core and the jacket to assist removal of the jacket. The Tapes may be smooth or corrugated with a thickness of 0.002 to 0.005 inch with a 50 percent overlap. The tapes shall be compatible with the other materials in the cable.

7. Shields – Where shielding is required over single wires, component groups or the overall cable core, in any combination, it shall be a metal laminate tape. The tape shall consist of a laminate of polyester, polyamide, aromatic polyamide or ethylene tetrafluorethylene layer with a thickness of 0.9 mil (0.023 mm) and a copper or aluminum foil layer with a thickness of 0.9 mil (0.023 mm). The tape shall be helically wrapped so that the metal side is in contact with the drain wire over the full length of the cable using a 30 percent overlap. The drain wire shall be uninsulated tin plated copper per 2.1 of this Section and shall be the same AWG size as the basic wire conductors in the cable.

8. Jackets shall be smooth and tight over the cable core and shall be easily strippable.
   a. Tefzel 280 ETFE or equivalent shall be used as a jacket material. For jackets over a calculated core diameter of 0.250 inches (6.35 mm) and less, Tefzel 200 ETFE or equivalent resin can be used.
   b. The jacket thickness shall be in accordance with NEMA HP100.2-1991, Normal Duty as shown in Table I(a).
   c. Identification – Individual wires of multi-conductor cables shall be identified by means of solid colors and stripes in accordance with this Section.

1) Multi-conductor cable color-coding shall be durable and recognizable. Color sequence shall be per Table I of this Section.

2) Each cable jacket shall be marked with the following information repeated at intervals no greater than 36 inches.
   a) Manufacturer's name
   b) Year manufactured
   c) Number and size of conductors
   d) Voltage Rating
   e) Jacket material (ETFE)

3) The identifying marking shall meet the requirements of paragraph 2.2.E.2 of this Section.
PART 3 - EXECUTION

3.1 PRODUCTION

A. Not Used

3.2 PACKAGING, SHIPPING AND STORAGE

A. When delivered from manufacturer, stranded wire and cables shall be wound on reels or spools. Each reel or spool shall have a required diameter for the respective wire size. In no case shall the barrel of the reel or spool have a diameter less than 50 times the nominal diameter of the wire for wire sizes AWG 24 through AWG 14; 40 time for AWG 12 and AWG 10; 30 times for AWG 8 and larger, or less than four inches, whichever is larger. For multi-conductor cables, the minimum barrel size of the reel or spool shall be 20 times the finished cable diameter or larger.

B. Reels or spools shall be finished to prevent corrosion under typical storage and handling conditions. The method of attachment of the flanges to the barrels on metal reels or spools shall be structurally equivalent to a full circumferential crimp.

C. Wire on reels or spools shall be closely and tightly wound in layers. All cable ends must be sealed to prevent the entrance of moisture. The cable ends shall be securely fastened so that they do not come loose during transit.

D. Solid conductor wire (wire wrap) shall be packaged on 16 inch computer spools or in barrel pack to reduce wire curl.

E. Purchase orders shall specify the requirements for minimum continuous wire lengths acceptable and the number of continuous wire lengths permitted per reel or spool.

F. Each reel or spool shall be marked with weather resistant tags, identifying the amount of wire per continuous length and the number of lengths. In addition, the following information shall be included on the tags.

1. Purchaser’s specification number
2. Specification sheet number, if applicable
3. Wire size and stranding
4. Date of manufacture
5. Name of manufacturer
6. Cable description, if applicable

3.3 INSTALLATION

A. General

1. Internal wire and cable shall be installed in accordance with applicable requirements of AREMA Signal Manual, Part 10.4.1, and as specified herein.

a. Wires and cables shall be installed in a neat manner. Cables in trays or troughs shall be laid therein and not pulled into it. Cables shall be installed with a minimum amount of cross-over in the trays and troughs and shall not be pulled tightly around bends. All exposed wires and cables entering or leaving equipment racks or housings shall be protected from abrasion or sharp metallic edges.

b. Nylon straps shall be provided and installed for bundling and cabling of conductors where two or more single conductors are exposed in internal rack bundles, cable trays or cable troughs, or whenever wires are to be bundled. Tape shall not be used for this purpose. Straps shall be installed at intervals of two feet or shorter if required to maintain good standards along the cable run. Wires of multi-conductor cables exposed by the stripping of cable jacket for terminations shall be trained in a neat manner and tied approximately every three inches with nylon straps.

c. There shall be no point-to-point redundancy of wires for increased current capacity.

d. Single conductor No. 14 stranded wire shall be used for interconnecting signal junction boxes, lamp compartments and other miscellaneous equipment.

e. Strain relief shall be provided where needed.

f. Wire or cable splices are not permitted.

g. All wires and cables shall be fully protected against any contact with any surface other than that designed specifically to support or protect them.

h. Wires and cables shall be laid in place with sufficient slack at the bends so such wires and cables will clear the inside bend surface of the wireway to prevent crushing of insulation.

i. All wire and cable shall be free of kinks and insulation damage. Wire installation shall not be subject to accumulations of moisture or foreign matter.

j. Wire and cable dress shall allow for sufficient slack to provide for shock and vibration induced movements,
k. Wiring and cabling dress in harness arrangements shall be tied with a high strength approved dielectric tie designed not to damage wire insulation. Wires and cable ties shall be trimmed and located to eliminate damage from sharp edges.

l. All wires and cables shall be clear of metal edges, bolt heads and other interference points and have electrical clearance from covers.

B. Module Wiring

1. Unless otherwise Authority approved, all module and display panel wiring shall be accomplished with solderless connections using solid wire for wire wrap connections, and stranded wire for crimped connections as specified herein. Minimum wire size shall be No. 22 AWG for stranded wire and No. 24 AWG for solid wire.

C. Rack Wiring

1. Unless otherwise Authority approved, all vital rack wiring shall be accomplished with Authority approved solderless connections. Wire for vital rack wiring shall be stranded wire as specified herein, minimum size No. 16 AWG, or multi-conductor cables as specified herein.

2. All nonvital rack wiring shall be accomplished with approved solderless connections. Wire for nonvital rack wiring shall be stranded wire as specified herein, minimum wire size No. 22 AWG or multi-conductor cables as specified herein.

3. Rack wiring shall be neatly tied into compact bundles. Main bundles and branches shall be secured to the racks in a manner that preclude physical damage due to pressure of abrasion and prevent the wire weight from being supported by the wire terminations, connections or plug connection. Arrangement of wire bundles and cables shall be such that they do not interfere with visual inspecting, troubleshooting or repair of rack-mounted equipment.

D. Rack-to-Rack Wiring

1. All rack-to-rack wiring shall be routed via the overhead cable trays with sufficient slack between cable tray and each rack to which the cable or wire is connected.

a. Vital Racks

1) All rack-to-rack wiring for factory wired housings shall be accomplished using single conductors tied into bundles to form unjacketed multi-conductor cables. For relay circuits, unjacketed multi-conductor cables shall consist of individual conductors of size 16 AWG or larger wire and shall have a maximum tie spacing of six inches. Vital microprocessor cables may be made up of 20 AWG wires in terminated in keyed plugs.

b. Nonvital Racks

1) All rack-to-rack wiring for nonvital racks shall be accomplished using multi-conductor cables as specified herein and nonvital plug connectors as specified within these Specifications. All nonvital racks shall have a plug coupler panel to terminate all wiring from the rack.

c. Nonvital Racks to Vital Racks

1) All wiring between nonvital racks and vital racks shall consist of single conductors, tied into bundles, between the nonvital rack plug connector panel and vital rack connection points. These individual conductors shall consist of size 20 AWG or larger wire and have a maximum tie spacing of six inches.

E. Rack to Local Control Panel

1. Made-up cables and multi-conductor cables for the local control panel shall be installed from vital and nonvital instrument racks to plug connectors installed on the local control panel. Made-up cables shall consist of single conductors, No. 20 AWG stranded or larger, with bundle ties spaced a maximum of six inches.

F. Entrance to Instrument Rack Wiring

1. Wiring from entrance racks to instrument racks shall be accomplished using stranded wire, as specified herein, minimum size No. 20 AWG, as approved by the Authority.

G. High Voltage Wiring

1. Internal wire used in circuits directly connected to the rails and internal wire used in circuits that operate at voltages in excess of 600 volts shall meet the requirements of External Cable, as specified herein.

H. Energy Distribution
1. Vital Racks
   a. Unless otherwise approved, all wiring for energy distribution shall be accomplished using single conductor stranded wire as specified herein. Wiring shall be sized for maximum circuit load, but shall not be less than a stranded wire, size No. 16 AWG. Rack-to-rack wiring shall be accomplished with solderless connections.

2. Nonvital Racks
   a. All wiring for energy distribution shall be accomplished using single conductor stranded wire as specified herein. Rack wiring shall be accomplished with solderless connections using stranded wire, minimum size No. 20 AWG. Rack-to-rack wiring shall be accomplished with solderless connections using stranded wire, minimum size No. 14 AWG.

3. Energy loops on vital and nonvital racks shall not exceed two rows.

I. Conductor Sizing
   1. All conductors must be sized per the National Electrical Code, but shall not be smaller than the minimum conductor sizes specified herein.

3.4 TESTING
   A. The following “Routine Tests” shall be performed for each production run.
      1. Impulse dielectric, high frequency, or direct-current spark test 100 percent of the wire using the requirements in Table H(a)
      2. Insulation Strip Force Test
         a. Use a tension testing apparatus suitably equipped to operate in a tensile mode in conjunction with a fixture attached to one jaw of the tensile testing machine. The fixture is a metal plate approximately 0.2 inches (5 mm) thick with a hole 5 percent to 10 percent larger than the conductor diameter.
         b. The test specimens shall be approximately 5 inches (127 mm) long. Test a minimum of three specimens.
         c. Allow the specimen to completely stabilize at room temperature. Prepare the specimen for testing by carefully removing 3.5 inches (90 mm) of the insulation from one end of the specimen. Trim the insulation and conductor flush at the other end, so as to have 1 inch +/- 1/16 (2.54 +/- 1.6 mm) of undamaged insulation left on the conductor. Both the stripped end and the cut end of the insulation should be square to the conductor. Insert the exposed conductor through the fixture hole and clamp in the free jaw of the tensile tester, without applying any force to the insulation test specimen. Leave approximately 0.5 inch (13 mm) of slack between the fixture hole contact point and the insulation piece. Using the tensile tester, pull the conductor through the insulation at a rate of 2.0 inches/minute (50 mm/minute) and record the maximum force indicated.
         d. For stranded conductors, the force required to remove the insulation shall be as follows:
            1) No. 12 AWG or smaller, 2 – 14 lbs.
            2) No. 1 AWG – 10 AWG, 6 – 25 lbs.
            3) No. 1/0 AWG and larger, less than 35 lbs.
            4) For solid conductors, the force required to remove the insulation shall be a minimum of 0.5 pounds and a maximum of five pounds.
   3. Insulation Shrinkage Test
      a. The shrinkage test measures the ability of insulation to be exposed to an elevated temperature without changes in length at the termination of the wire, to ensure that complete coverage of the conductor at a termination is maintained and that the electrical barrier remains intact.
         1) One inch of insulation shall be stripped from each end of a 14 inch specimen of finished wire using razor blade, or equivalent instrument, held perpendicular to the axis of the wire for the insulation removal operation. The length of exposed conductor at each end of the specimen shall be measured to the nearest 0.01 inch. The specimen shall be exposed to 180° C for six hours in an air oven. At the end of the six hours, the specimen shall be removed from the oven and allowed to return to room temperature. The shrinkage of the insulation shall then be measured as the greatest additional distance which any
layer of the insulation has receded from either end of the specimen. The measurement obtained at the end showing the greater shrinkage shall be recorded as the shrinkage of the specimen. Three specimens shall be tested.

2) The maximum allowable shrinkage for wire sizes AWG 30-16 is 0.125 inches; AWG 14-6 is 0.25 inches; and for AWG 4 – 500 MCM is 0.375 inches

4. The insulation must meet the tensile strength, elongation at rupture, heat shock, and cold bend requirements of NEMA HP100.2-1991, Table 2-B.

B. Material Tests

1. The insulation must meet the aging requirements, heat distortion, insulation resistance, and dielectric constant requirements of NEMA HP100.2, Table 2-1 and the additional tests specified herein. These "Material Tests" shall be performed at least once every five years.

a. Flammability and Smoke Evolution Test

1) The testing shall be according to ASTM E 1354, Standard Test Method for Heat and Visible Smoke Release Rate for Materials and Products Using an Oxygen Consumption Calorimeter.

2) Specimens shall be 100 mm in length and placed side by side in a single layer to cover the entire surface of the specimen holder. The apparatus shall be operated at a heat flux of 35 kw/sq. m in the horizontal orientation.

3) The following information shall be reported: (numbers in parenthesis refer to corresponding paragraphs in the test method)

   a) Specimen thickness, or diameter of cable d, in mm. (13.1.6)
   b) Time to sustained flaming, t, in seconds. (13.1.12)
   c) Average heat release rate for the period beginning when 10 percent of the ultimate specimen mass loss has occurred and ending at the time when 90 percent of the sample mass loss has occurred, q", in kw/sq. m. (13.1.14)
   d) Average mass loss per unit area for the same period as above m", in g/sq. m. (13.1.19)
   e) Average specific smoke extinction area o, in sq. m/g. (13.1.20)

4) Requirements

   a) Smoke Evolution Rate – The product of the average mass loss rate, m", and the specific smoke extinction area, o, shall be equal to or less than (16/d) sq. m/s, where d is the cable diameter: (m") (o) ≤ 16/d
   b) Heat Release Rate – The average release rate, q", shall be equal to or less than (1400/d) kw/sq. m, where d is the cable diameter: q" ≤ 1400/d
   c) Tenable Smoke Density – The product of the smoke toxic potency, LC (50), the smoke specific extinction area, o, and the percent of the sample vaporized, f, shall be equal to or greater than 0.2: (LC (50)) (o) (f) ≥ 0.2

b. Smoke Toxicity Test

1) Testing shall be according to the University of Pittsburgh Smoke Toxicity Test Protocol as described in the New York State Flammability regulations.

2) If the insulation has already been tested according to the filing requirements of the New York State Uniform Fire Prevention and Building Code, Article 15, Part 120, the data bank on file is used which applies to the product registration category to which the wire insulation belongs.

3) If the data is not on file with the State of New York, test the wire insulation according to published procedures.
4) Regardless of filing status, the following shall be reported:

a) LC (50), the toxic potency in grams

b) The percent residue, \( p \)

c) The fraction of the sample vaporized, \( f = (100-p)/100 \)

5) Requirement

a) Toxic Gas Production – The toxic gas parameter, \( T \), shall be less than or equal to \( 2100/d \), where \( m' \) is the average mass loss rate, \( f \) is the fraction of smoke vaporized, \( LC(50) \) is the toxic potency, and \( t_{ig} \) is the ignition time at 35kW/m²:

\[
T = \frac{(m')(450 - t_{ig})}{2100/d} \leq \frac{(f)(LC(50))}{d}
\]

b) These tests and requirements replace the IEEE 383 flame propagation tests included in the NEMA HP100-1991 and NEMA HP100.2-1991 standard.

c) The qualification tests under these requirements shall be conducted with 12 AWG and 20 AWG conductors rated at 2000V and 600V respectively.

6) Corrosion Test

a) The copper mirror corrosion test shall detect corrosive materials that may be driven off the insulation material at elevated temperatures, and have a potential for conductor corrosion.

b) Cut a piece of insulation into small pieces and place 0.4 grams of the insulation into each of two test tubes. Use a third test tube as a control. Suspend a copper glass mirror about 0.25 inches wide by 1.0 inch long in each of the test tubes.

Suspend a thermometer six or seven inches above the bottom of one of the test tubes. Fine copper wires attached to a cork may be used to suspend these items. Seal the test tubes with a cork wrapped in aluminum foil.

c) The mirror shall be vacuum deposited copper with a thickness equal to \( 10 \pm 5 \) percent transmission of the normal incident light at 5000A. Use the mirrors only if no oxide film is present and the copper is not visibly damaged.

d) The bottom two inches of the three test tubes shall be immersed in an oil bath at 175°C for 16 hours. Keep the portion of the test tubes containing the mirror at a temperature below 60°C.

e) After cooling, the mirrors shall be examined by placing them against a white background in good light. Any removal of copper from the mirrors will be a sign of corrosion. Disregard any removal of copper from the bottom 0.6 inches of the mirror, since drippings can cause this condition. Do not consider discoloration of the copper film or reduction of its thickness as corrosion. Consider the removal of copper that renders the mirror transparent as the corrosion, and estimate the area of copper removal.

f) Examine the control mirror for corrosive damage and compare with the exposed mirrors. When compared to the control mirrors, the removal of 5 percent or more of the area of either of the test mirrors shall be considered a failure.
C. Multi-Conductor Cable Testing

1. All cables shall meet the requirements of the following "Routine Tests".
   
a. Cables shall be voltage tested, each conductor to all other conductors, in accordance with either 7.4.1.2 or 7.4.1.3 of NEMA HP100-1991 at the following test voltages.

<table>

<td>4.0 12.0</td>
</tr>
</tbody>
</table>

   b. Shielded cables shall be tested with shields grounded. For cables having shields over individual conductors, the test voltage shall be applied between the insulated conductor and the shield.

   c. For multi-conductor cables with non-shielded individual conductors having a shield over the cable assembly, the test voltage shall be applied between each insulated conductor and all other conductors and the grounded shield.

   d. Shrinkage of the jacket shall be determined by using the procedure described in Clause 3.4.A.3 of this section. The maximum allowable shrinkage is 0.375 inches (9.525 mm).

   e. Cable jackets shall be voltage tested according to Clause 3.4.C.1.a of this Section, using the individual conductors under the jacket as ground or the shield directly under the jacket as ground.

   f. Cable jackets shall meet the tensile strength, elongation at rupture, heat shock and cold bend requirements of NEMA HP100.2, Table 2-1.

   g. All cables shall meet the requirements of the following "Material Tests".
      
      1) Cables shall meet the smoke requirements of NFPA 258. The optical density in both the flaming and non-flaming modes must not exceed 300 within four minutes of the start of the test.

      2) Cables shall meet the flame requirements of IEEE-383, 2.51 through 2.5.4.4.4.

   3) Cable jackets shall meet the aging requirements, heat distortion, insulation resistance and dielectric constant requirements of NEMA HP-100.2, Table 2-1

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith will be considered incidental to the work specified under Section 16901 "Signal System Basic Technical Requirements."

END OF SECTION 16955
PART 1 - GENERAL

1.1 DESCRIPTION

A. Work to be done under this Section consists of designing, furnishing and installing multiple position plug connector assemblies required to connect multi-conductor cables or individual wires to internal wiring of control panels, specified plug-connected racks or equipment modules. These assemblies shall hold and insulate individually mated, extractable pin-and-socket contacts which shall be mechanically crimped to individual wires or wire wrap pins.

B. Each plug connector assembly shall meet applicable requirements as listed in paragraphs 1.2.1 through 1.2.5.

C. Documents applicable to solderless pin and socket contacts refer to paragraphs 1.2.6 through 1.2.11.

1.2 REFERENCE STANDARDS

A. American Society of Mechanical Engineers (ASME)

1. ASME B 46.1 - Surface Texture (Surface Roughness, Waviness and Lay)

B. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM)

2. ASTM B 19 - Standard Specifications for Cartridge Brass Sheet, Strip, Plate, Bar and Disks.

3. ASTM B 36/B 36M - Standard Specification for Brass Plate, Sheet, Strip, and Rolled Bar

4. ASTM B 140/B 140M - Standard Specification for Copper-Zinc-Lead (Red Brass or Hardware Bronze) Rod, Bar, and Shapes

C. Federal Standard (FS)

1. FS QQ-S-766 Steel, Corrosion Resistant

D. Military Standards (MS)

1. MIL-M-14 - Molding Plastics and Molded Plastic Parts; Thermosetting

2. MIL-C-8384B - Connectors; Plug and Receptacle - Electrical Rectangular Type, Molded Body

3. MIL-W-1687D - Wire, Electrical Insulated, Copper

4. MIL-STD-202G - Test Methods for Electronic and Electrical Component Parts

5. MIL-HDBK-454A - General Requirements for Electronic Equipment

6. MIL-G-45204 - Gold Plating; Electrodeposited.

7. MIL-STD-I916 - Sampling Procedures and Tables for Inspection by Attributes

E. Society of Automotive Engineers (SAE)

1. AMS QQ-N-290 - Nickel Plating; Electrodeposited

1.3 SUBMITTALS

A. The Contractor shall submit for approval, product data for each type of plug connector to be used.

B. The Contractor shall submit for approval, complete drawings and sample of each type of plug connector to be used. Drawings shall include complete parts lists and information required to order replacement parts. Drawings shall be required for the following components:

1. Molded plug connector blocks

2. Protective shells for blocks

3. All locking and keying devices

4. Strain-relief clamping devices

5. Extractable pin-and-socket contacts

1.4 QUALITY ASSURANCE

A. Each plug connector shall be inspected prior to shipment. Inspection shall conform to the Contractor’s Factory Inspection Procedure as approved by the Authority.

B. The Contractor shall inspect each plug connector assembly after it has been installed and correct any deficiencies. This inspection shall be conducted in conformance with requirements of Authority approved Installation and Inspection Procedures.

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIALS

A. Not Used

2.2 CONTRACTOR FURNISHED MATERIALS

A. Connector assemblies shall be easily connected and disconnected by hand and be provided with mechanical locking and keying devices.
B. Two basic types of connectors shall be provided, a vital circuit type and nonvital circuit type. Unless otherwise approved, the number of contacts in a vital circuit plug connector shall not exceed 28 contacts and in nonvital circuit plug connector, 50 contacts.

C. Basic Consist

1. Each plug connector assembly shall consist of the following:
   a. A two-part molded plastic connector block equipped to hold an appropriate number of solderless pin-and-socket contacts.
   b. Devices for the mechanical locking and keying of connector block halves.
   c. Protective shells for both connector block halves.
   d. A strain relief device for the external wiring portion of the connector assembly.
   e. Solderless extractable pin-and-socket contacts.
   f. Where required, embedded wire wrap terminals for internal wiring portion of the connector block.

2. Connector Blocks
   a. Connector blocks shall consist of molded dielectric plastic shaped to accept the required number and types of contact pins, contact sockets and locking, keying and mounting devices. The dielectric material shall exhibit a minimum insulation resistance of 100 megohms as measured between adjacent pairs of contacts and between the accessory hardware and the closest contacts in each connector assembly half.
   b. Contact cavities shall be arranged in a rectangular grid configuration. The opening for each contact shall be uniquely identified by a coordinate molded into both the mating and wiring faces of each part of the connector block.
   c. Vital plug connector blocks shall provide a surface leakage distance of not less than 1/4 inch between contacts and between the contacts and any other metallic part of the connector assembly.

3. Locking and Keying
   a. Each plug connector assembly shall include a device for mechanically locking the two mated parts together.
   b. Mechanical devices and facilities shall be provided to allow mating parts of connector assemblies to be keyed in such a manner that they cannot be coupled except when in the correct position relative to each other and cannot be coupled to the mating parts of other coupler assemblies keyed in a different pattern.

4. Protection and Strain Relief
   a. Each half of the plug connector block shall be protected by a metal shield which shall extend beyond the mating surface. These two shields shall overlap when connector halves are coupled.
   b. External wiring portion of each plug connector assembly shall be equipped with a device to grip the external wiring firmly in order to prevent strain on the plug connector contacts.

5. Pin-and-Socket Contacts
   a. Pin-and-socket contacts shall be fabricated from commercial bronze or brass and plated with gold over nickel underplate. Retention springs of the pin-and-socket contacts shall be fabricated from stainless steel.
   b. Contacts shall be fabricated and classified in the required selection of sizes to accept wire sizes 16 through 22, AWG.
   c. Contact current rating and termination resistance shall meet the requirements of the following table with properly sized contacts applied to the wire sizes specified.

<table>
<thead>
<tr>
<th>Wire Size (AWG)</th>
<th>16,18,20,22</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum Current: Rating (Amperes)</td>
<td>13.0, 10.0, 7.5, 5.0</td>
</tr>
<tr>
<td>Maximum Termination: Resistance (Milliohms)</td>
<td>1.7, 2.0, 2.7, 4.0</td>
</tr>
<tr>
<td>Contact termination resistance shall be measured in accordance with Method 307 of MIL-STD-202G at the rated current specified for each wire size.</td>
<td></td>
</tr>
</tbody>
</table>
2.3 DELIVERY, STORAGE AND HANDLING

A. Not Used

PART 3 - EXECUTION

3.1 PRODUCTION

A. Not Used

3.2 INSTALLATION

A. The 28-way, vital plug connector assembly shall be required where any vital circuits are to be interconnected and the 50-way nonvital plug connector assembly used where nonvital circuits are to be interconnected.

B. When plug connectors are dedicated to single multi-conductor cables, 20 percent of the wires and connector contacts shall be reserved for future working circuits. When a plug connector is used for made up, un-jacketed cables, 20 percent of the connector contacts shall be reserved for future working circuits.

C. When a plug connector is assembled to a multi-conductor cable, strain relief device shall grip the cable outer sheath.

D. When a vital or nonvital plug connector is dedicated to a cable, each wire shall be terminated properly on a connector contact.

E. In each case, a uniform scheme shall be followed in assigning specific cable wires to specific connector contacts.

F. Where a full hand grasp is required to connect or disconnect a plug connector, a minimum of two inches of clear space shall be provided around the connector. A minimum 3/4-inch clear space shall be provided around connectors, which can be connected or disconnected with thumb and fingertips only.

G. Plug connectors shall be located and installed in such a manner that no part of the plug connector or its cable will extend beyond the wire routing as defined by wire supports and in no circumstances shall the connector or its cable be permitted to protrude into an aisle-way.

H. Each plug connector assembly, as finally installed, shall be marked in such a manner that its mating halves be distinctly identified as being related to each other, but to no other plug connector assembly within the immediate area. These identification markings shall be applied in such a manner that they will not be obscured or worn off in normal use.

I. Tools used to apply plug connector contacts to wire and tools used to extract contacts from the plug connector blocks shall be the size and type recommended by manufacturer of the plug connector assemblies. Four of each tool shall be provided to the Authority.

3.3 TESTING

A. Testing of plug connectors shall be in accordance with the requirements of these Specifications.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith will be considered incidental to the work specified under Section 16901 “Signal System Basic Technical Requirements.”

END OF SECTION 16957
PART 1 - GENERAL

1.1 DESCRIPTION

A. Work to be done under this Section consists of designing, providing and installing all required relays for use in wayside house or case applications only.

1.2 REFERENCED STANDARDS

A. American Railway Engineering and Maintenance-of-Way Association (AREMA)

1. AREMA – Communications and Signals Manual, Section 6 - Relays

1.3 SUBMITTALS

A. Contractor shall submit for Authority approval all relay specifications, any special mounting or supporting arrangements and contact stacking arrangements for all relay types proposed to be provided. Submittal shall include any required arc suppression components.

B. Contractor shall submit for Authority approval the type of relay identification tag, including method of mounting.

1. In the event of excessive long relay nomenclature on relay identification tags, Contractor shall submit for Authority approval its method of identifying such relays.

C. Contractor shall submit for Authority approval, manuals for each relay type. Each relay manual shall give comprehensive descriptions and illustrations of each type of relay to be provided for this Contract, including such items as operation, overhaul, adjustments, part numbers and other pertinent information.

D. Upon approval of relay manuals, Contractor shall provide 15 additional relay manuals and 15 copies of relay specification and calibration sheets for each type of relay provided.

E. Contractor shall submit an applicable Office Record Test Form for each vital relay provided under this Contract as found in the AREMA Communications and Signals Manual. The use of typewritten characters shall be used to fill in all information requested on the form and then verified in the field in its final configuration, for accuracy of relay serial number, location and relay identification. Indexing of form cards shall be by serial number and turned over to the Authority upon final verification.

1.4 QUALITY ASSURANCE

A. Each relay shall be inspected prior to shipment. Inspection shall conform to Contractor's Factory Inspection Procedure as approved by the Authority.

B. Vital relays shall meet the requirements of AREMA Communications and Signals Manual, Section 6.2.1.

C. Non-vital relays shall meet the requirements of AREMA Communications and Signals Manual, Section 6.3.1.

D. Factory testing of each relay shall be in accordance with the manufacturer's standard procedures.

E. Each relay shall be inspected after it has been installed in the field. This inspection shall conform to Contractor's Installation and Inspection Procedure as approved by the Authority. Installation shall not be considered complete until all installation defects have been corrected to the Authority's satisfaction.

F. Each relay shall be tested according to Authority approved test procedures.

1.5 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Vital relays shall be shipped separately from the wired racks in which they are to be used. Relays shall be stored in a protected area until tested and installed.

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIALS

Not Used

2.2 CONTRACTOR FURNISHED MATERIALS

A. General

1. Unless otherwise indicated, relays shall be plug-in type. Relays of each type shall be uniform in design and contact assembly.

2. A sufficient number of contacts for the number of circuits to be controlled plus spare contacts shall be provided. Unless otherwise approved, each relay or relay-repeater combination shall have at least one spare dependent front-back contact or one spare independent front and one spare independent back contact.
3. All relays and equipment specified shall be capable of rated performance through an operating temperature range of minus 40 degrees F to plus 185 degrees F.

4. All relays shall be in dust-proof enclosures. A provision shall be made for ventilation for heat dissipation, where required.

B. Maintenance Materials

1. Provide one percent of each type of relay (vital, non-vital, timer, flasher) used in the system. All quantities shall be rounded up to the next whole number.

2. All units are to include plug boards.

C. Keys, Special Tools, and Test Equipment

1. Contractor shall provide two complete sets of all vital relay adjustment tools, including:
   a. Contact Adjustment Tools
   b. Front and Back Horizontal adjustment Tool
   c. Heel Horizontal Adjustment Tool
   d. Contact Tension Gauge
   e. Permanent Magnet Hold-Down Gauge
   f. Front and Back Test Plugs
   g. All space gauges needed to adjust armature stroke and contacts.

2. Contractor shall provide one manually operated relay test stand. The stand shall accommodate each type vital and non-vital relay supplied under this Contract. Each stand shall include all instruments and equipments completely installed in the test stand, including all applicable relay plugboards and power supplies needed to be operable from normal 120 volts AC power source. Final configuration of relay test stand shall require approval of the Authority.

D. Vital Relays

1. Vital DC relays shall be of plug-in type and rack-mounted. They shall have a transparent dust cover made of a non-flammable composition meeting the requirements of AREMA Communication and Signal Manual, Section 6.2.1.

2. Vital relays, with a nominal operating voltage of 10-16 volts, shall be capable of operating continuously and successfully without resultant damage with a voltage range of 7-21 volts inclusive applied to their operating circuits.

3. Biased neutral vital relays shall be designed so that gravity alone will prevent the armature from picking up if the permanent magnet is de-energized or if no current is applied to the coil due to interruption of the normal magnetic circuit. Biased neutral vital relays shall be designed so that up to at least 50 times working energization applied for two seconds at both normal and reverse polarity will not affect their operating characteristics by more than two percent and will not pick up their armature on reverse polarity.

4. With the exception of special-purpose relays, each vital relay shall have a minimum of four dependent front-back contacts, two independent front contacts, and one independent back contact. All front contacts shall be silver-to-metalized carbon.

5. When three contacts of DC vital relays, suppressed as specified herein, are connected in parallel and operated from their nominal operating voltage, a vital relay front or back contact which breaks this load shall be capable of at least five million operations at this load without the contact resistance, measured with a 10 milliamp current, exceeding five ohms.

6. Arc suppression for vital relays, when required, shall be built into the relay or mounted directly on its plugboard.

7. Contact arrangements shall be identical for similar types of relays except special function relays.

8. All vital plug-in relays, except vital time-element relays and special application relays, shall be equipped with front current testing facilities. Where required by the Authority, facilities shall be provided to enable testing of voltage from the front of relay.

9. Vital relays shall be equipped with a registration plate to prevent relays of the wrong style, contact arrangement or operating characteristics from being inserted into the plugboard.
E. Switch Operating Relays:

1. Vital switch operating relays used for control of switch-and-lock movement shall meet the same requirements as specified for vital biased neutral relays, except that a minimum of two front-back dependent contacts or two independent front contacts and two independent back contacts shall be required.

2. Each contact shall be equipped with a magnetic blow-out feature to effectively interrupt high currents and minimize contact wear. Each contact shall be capable of interrupting the normal switch-and-lock movement operating current 10,000 times without its resistance exceeding ten ohms measured at five amperes. All switch operating relays shall be identical. One normal and one reverse switch-operating relay shall be provided for each switch-and-lock mechanism.

F. Vital Overload Relays

1. Vital overload relays shall meet the requirements of vital relays except as modified and be used to detect a switch over-current condition. One overload relay shall be provided for each switch mechanism as indicated on Contract Drawings.

2. Switch overload relays shall be of the same manufacture as the switch mechanism, unless otherwise approved by the Authority.

3. Each overload relay shall be provided with a sufficient number of contacts to perform the functions as described in these Specifications. This relay shall be equipped with two non-biased coils; one series connected to detect over-current conditions, the other coil used as a stick circuit. Make-before-break contact shall be utilized as indicated on the Contract Drawings.

G. Light-Out Relay

1. Light-out relays shall meet the requirements of vital relays.

2. Rectifiers required for each light-out relay shall be the manufacturer's standard.

H. Slow Acting Relays: Slow acting relays (slow pickup or slow release), shall have their slow acting characteristics provided by the use of copper or aluminum washers or slugs applied to the relay core.

I. Time Element Circuits: Contractor shall provide solid-state vital and non-vital timers where required in Circuit Drawings consistent with AREMA Communications and Signals Manual Section 6.1.20.

J. Flashers: Flasher rates shall be provided by either vital relay or by solid-state flashers. Flashing rate shall be no less than 45 times per minute nor more than 55 times per minute and shall be in accordance with AREMA Communications and Signals Manual, Section 3.2.55.

K. AC Vital Track Relays

1. AC Vital track relays shall be plug-in, two-element, 100 Hz., vane-type induction relays. AC relays shall be capable of operating continuously and successfully without resultant damage, with a minimum voltage range of 100 volts to 135 volts inclusive applied to the local winding and with a minimum voltage range of 0.75 volt to 5.0 volts inclusive applied to control winding.

2. Each vital AC track relay shall have a minimum of two dependent front-back contacts. Each front contact shall be of silver-to-metalized carbon type.

3. Vital AC track relays shall meet the requirements established by AREMA Communications and Signals Manual, Section 6.1.35, with the exception these relays will be plug-in type and not have screened breathers or equipped with binding posts. These relays shall also meet requirements established in Article 7 of AREMA Communications and Signals Manual, Section 6.2.1.

L. Non-vital Relays

1. Stationary contacts shall be bifurcated silver, palladium or approved equal. Movable contacts shall be bifurcated silver, palladium with gold overlay or approved equal.

2. Each non-vital relay shall meet or exceed the following requirements:
   a. Maximum Temperature Rise: 175 degrees F at 30V DC.
   b. Insulation Resistance: $1.5 \times 10^{10}$ ohms
   c. Ambient Operating Temperature: minus 60 degrees F to 160 degrees F.
d. Dielectric Strength: 500 volts RMS, 60 Hz between all mutually insulated parts.

e. Mechanical Life: 100 million cycle operations.

f. Electric Life: 10 million operations (0.5 ampere resistive load at 77 degrees F).

g. Contact Resistance:
   1) Before Life: 100 milliohms max. at 6 VDC, 100 milliamps.
   2) After Life: 200 milliohms max. at 6 VDC, 100 milliamps.

3. Non-vital relays shall be mounted in dust-proof cabinets having transparent front plates that shall not support combustion. Cabinets shall be mounted in racks as specified. As an alternate, non-vital relays may be provided with individual transparent covers that will not support combustion and be rack mounted.

4. Design of individual relay covers and cabinet in which relays are mounted shall permit viewing the relays without disassembly or other mechanical manipulation to determine the status of each relay.

5. Non-vital relays shall be plug-in, DC neutral relays with a nominal operating voltage of 12 volts. Relays shall pick up with 9 volts or more applied to their operating circuit and must drop out when this voltage decreases below two volts. These relays shall be capable of operating continuously up to a maximum of 21 volts applied to their operating circuit. Non-vital relays shall pick up in less than 25 milliseconds when energized with 9 volts and shall drop out when de-energized from 14 volts in less than 50 milliseconds. These times shall be measured as a front contact closure or opening from the instant the switch applying voltage closes or opens.

6. Contact resistance of non-vital relay contacts shall not exceed 5 ohms after 10 million operations when breaking a test load equivalent to three non-vital relays connected in parallel and supervised as required. Operating voltage for this test shall be 12 volts. Contact resistance shall be measured with a 10-milliamp current. All non-vital relays shall be identical by type and class or function.

M. Relay Plugboards

1. Plugboards shall be designed for insertion of removable type contacts. Plugboards shall be designed so the removable contact will have a direct connection with the relay coil and contact prongs. Plugboards shall be in accordance with applicable sections of the AREMA Communications and Signals Manual, Section 6.2.1.

2. Wire and cable conductor identification tags for terminal board mounting shall be in accordance with the requirements of this Specification.

N. Identification

1. There shall be an identifying nameplate for each relay, relay rack and terminal board.

2. Back and front of relay plugboards shall be equipped with a tag, in accordance with the requirements of this Specification. This tag shall indicate the nomenclature of the relay.

3. Contact numbering system shall be uniform for each type of relay used.

4. Wiring to each removable contact shall be identified with a wrap-around tag in accordance with the requirements of this Specification. This tag shall indicate the relay contact number assigned to the wire.

O. Motor Control Relays for Gate Crossing Mechanisms

1. Relays shall be DC neutral relays with a nominal operating voltage of 12 VDC. Input voltage tolerance (DC) shall be 80% to 110% of nominal voltage.

2. Coil nominal power shall be 14VA, 4.4W.

3. Relay contacts shall meet or exceed the following requirements:
   a. Relay configuration shall be 4 double throw pole (4PDT) type and shall be rated for 35A at 277 VAC or 20A at 28VDC.
   b. Stationary and moveable contacts shall be silver alloy or approved equal.
   c. Insulation Resistance: 1000 megohms at 500VAC.
RELAYS - SIGNAL SYSTEM

3.2 TESTING

A. Contractor shall test all relays in accordance with the requirements of these Specifications.

B. All DC vital relays shall be tested for values in accordance with field requirement values stated in Table 1 of AREMA Communications and Signal Manual, Section 6.4.1.

C. All AC vital relays shall be tested for values in accordance with field requirement values stated in Table 1 of AREMA Communications and Signal Manual, Section 6.4.5.

D. Measured values of all vital relays shall be recorded on relay record forms as specified in AREMA Communications and Signal Manual, and turned over to the Authority upon acceptance of this test requirement.

E. Tests shall be performed at housing locations after housing has been set.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith will be considered incidental to the work specified under Section 16901 “Signal System Basic Technical Requirements.”

END OF SECTION 16958

PART 3 - EXECUTION

3.1 INSTALLATION

A. Contractor shall ensure that relay operating characteristics are not altered due to damage during shipping.

B. Contractor shall ensure that all DC power buses are open while installing relays and shall not reconnect buses until all relays are installed.

C. Power feeds through switch mechanism control relays shall be closed only during testing, prior to in-service operation.
PART 1 - GENERAL

1.1 DESCRIPTION

A. The Work to be done under this Section consists of designing, providing, installing and testing of vital solid-state microprocessors at interlockings and signal locations shown on the Contract Drawings.

B. Referenced Sections

1. Section 01786 – Operations and Maintenance Instructions

1.2 REFERENCED STANDARDS

A. American Railway Engineering and Maintenance-of-Way Association (AREMA):

1. AREMA - Communications & Signals, Part 2

B. American Society of Mechanical Engineers

1. ASME B46.1 – Surface Texture (Surface Roughness, Waviness, and Lay)

C. ASTM International (Formerly known as American Society for Testing and Materials) (ASTM)

2. ASTM B 19 - Standard Specification for Cartridge Brass Sheet, Strip, Plate, Bar, and Disks
3. ASTM B 36/B 36M – Standard Specification for Brass Plate, Sheet, Strip, and Rolled Bar
4. ASTM B 140/B 140M - Standard Specification for Copper-Zinc-Lead (Red Brass or Hardware Bronze) Rod, Bar, and Shapes

D. Federal Standard (FS)

1. FS QQ-S-766 - Steel, Stainless and Heat Resisting, Alloys, Plate, Sheet and Strip

E. Military Standard (MS)

1. MIL-G-45204 - Gold Plating; Electrodeposited
2. MIL-STD-202G - Test Methods for Electronic & Electrical Component Parts
3. MIL-STD-1916 - Sampling Procedures and Tables for Inspection by Attributes

F. Society of Automotive Engineers (SAE)

1. AMS QQ-N-290 - Nickel Plating (Electrodeposited)-FSC MFFP

1.3 SUBMITTALS

A. Contractor shall submit for Authority approval:

1. System data flow and software architecture diagrams for all Vital Microprocessor Interlocking System (VMIS) modules and all system interfaces.
2. Circuit drawings specified for all system and subsystem interfaces, including interconnections of all hardware to the system.
3. A manual for a software developmental training program for engineering-design personnel.
4. Where more than one processor is used to control an interlocking, the Contractor shall submit complete control zone drawings showing, on a copy of approved track plan, segments of interlocking plant controlled by each individual vital controller.
5. Power calculations for all power sources energizing vital controllers or controlled, or switched, by vital controllers. Where manufacturer's specific ripple or regulation specifications exist for vital controllers or associated equipment relying upon these power sources, compliance with such ripple or regulation specifications shall be demonstrated to the Authority's satisfaction.

B. Each Final Design Package shall include:

1. Complete power distribution circuit drawings and schematics as required by these Specifications.
2. Complete rack layout and arrangement plans.
3. Complete equipment plans and installation drawings showing all components of the system. Drawings shall include complete keyed parts lists for all components of the system, racks, terminal boards, plug connectors, cable boots, mounting hardware and all other rack mounted equipment and hardware.
4. Wire routing diagrams showing power distribution, hardware interface, serial data link and any other wire and cable associated with the system. Wire routing within instrument racks, between instrument racks.
and from instrument racks to entrance racks, power racks and any other destinations shall be shown in detail.

5. Software listings and ladder logic diagrams for application dependent software.

6. Drawings showing details of interconnecting cables, plug couplers, terminal boards and other interconnecting devices complete with keyed parts lists and cable assembly instructions.

7. Electronic copy of all vital and non-vital application logic for the location.

C. Contractor shall submit for Authority approval, a manual for a maintenance training program for technical maintenance personnel. Contractor shall include in the submittal all maintenance and development hardware and software, and manuals.

1. Each training manual shall include an outline of the course material, details of text materials, syllabus and lesson plan for training.

D. Contractor shall submit for Authority approval a complete set of application, service and development system manuals including manuals covering all software and hardware provided as part of the development system.

E. Contractor shall provide manuals describing operation and maintenance of the vital microprocessor interlocking system.

F. Contractor shall submit Test Procedures and Results in accordance with these Specifications.

1.4 QUALITY ASSURANCE

A. System shall be designed to operate in accordance with all applicable AREMA requirements for control and indication of interlocking safety functions.

B. System design shall comply with Rules and Regulations Governing Railroad Signal and Train Control Systems as issued by the office of Safety, Federal Railroad Administration, effective February 27, 1984 and of any supplements thereto that become effective before this Contract is awarded.

C. The Vital Microprocessor Interlocking System shall be tested according to Authority approved test procedures.

D. Contractor shall provide written certification that the entire vital microprocessor system to be provided has been tested and successfully functioned in an operating light rail system with its characteristic high electromagnetic interference environment.

E. Contractor shall provide written certification that the system has been successfully operated after being exposed to vibration of 2-10 Hz, 0.2-inch displacement, peak-to-peak and 10-500 Hz at 1.0 G as prescribed by MIL STD 810C, method 514.2, category F, and to shock of 3 G as prescribed by MIL STD.810C method 516.2, Sawtooth Procedure I, Transit Drop Procedure I.

F. All system components, shall be capable of continuous operation at temperatures of negative 40 degrees F to 160 degrees F and humidity levels of 5 percent to 95 percent, non-condensing, without the need of any external environment controls. CRT terminals, printers, and data logging units shall be capable of continuous operation at temperatures of 0 degrees F to 105 degrees F and humidity levels of 10 percent to 95 percent.

G. The system shall meet the requirements of an Authority approved reliability assessment program in accordance with these Specifications. Each vital microprocessor interlocking system, or complete zone thereof, shall exceed a minimum 36,000 hour Mean Time Before Failure (MTBF). Failures are defined in these Specifications.

H. Failure of any component of the vital controllers shall not cause the vital interlocking system to fail in a less restrictive mode.

I. Printed circuit board pin and socket contacts shall be in accordance with the following:

1. ASME B-46.1
2. ASTM A-167
3. ASTM B-19
4. ASTM B 36/B 36M
5. ASTM B 140/B 140M
6. AMS QQ-N-290
7. FS QQ-S-766
8. MIL-G-45204
9. MIL-STD-202G
10. MIL-STD-1916 -

1.5 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Equipment provided under this Section shall not be shipped until factory test reports have been approved by the Authority.

B. Each item of the VMIS shall be inspected by the Contractor and the Authority for shipping damage prior to installation.
C. Any equipment showing signs of damage shall be repaired or replaced, at the Authority's option, without cost to the Contract.

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIALS

Not Used

2.2 CONTRACTOR FURNISHED MATERIALS

A. Vital Microprocessor Interlocking System shall be Microlok II ® or Authority approved equal.

B. Design Requirements

1. System shall be designed to control and indicate all safety and other functions traditionally implemented with vital relays. Software logic shall be developed using ladder logic.

2. Interconnection with non-vital supervisory control equipment and interface with other vital field control systems shall be as shown on Contract Drawings and in these Specifications.

3. Vital Microprocessor Interlocking System (VMIS) shall be designed on the basis of a single microprocessor philosophy using closed loop principles to achieve safety. Use of multiple processor arrangements based upon voting with a vital comparator is an acceptable alternative to the single microprocessor system. Multiple processor systems shall have at least three processors.

4. Each VMIS shall have an identical on-line backup unit. The system shall assume a safe state while any changeover occurs. The back-up unit shall assure that all interlocking signals have run full approach time before restoring routing functions.

5. Where an interlocking cannot be controlled without maximum single event control and indication delays at the communication interface of three seconds, the VMIS shall be designed with multiple processors on an operational zone principle wherein a unit failure in one zone will not disable operation of the entire interlocking. Zones shall be designed by the Contractor and submitted for Authority approval.

6. VMIS design shall be based upon solid-state microprocessor technology and shall not require any off-line storage devices for operation or start up.

7. The operating instructions for the VMIS shall be divided into application (site specific) and executive dependent portions.

a. The application and executive software shall be stored in separate memory devices.

b. The application dependent software shall be stored in Electronically Erasable Programmable Only Memory (EEPROM) devices.

c. The executive dependent software shall be stored in solid state flash Erasable Programmable Only Memory (EPROM) devices.

d. Executive and application software shall be downloadable to the CPU using a laptop or notebook PC connection to the CPU serial board port. Application programming shall not require the extraction or insertion of the EEPROMs.

e. Processors shall perform those entrance-exit functions commonly supplied for a route-setting system. In addition, other functions as specified shall be part of this system.

8. Single processor VMIS shall consist of normal and "warm" standby microprocessor facilities physically located in card files for mounting in 19-inch racks.

9. Instrument Rack Arrangement Plans shall be provided for all instrument racks housing vital controller card files. Placement of all rack mounted components shall be clearly shown. Front, side, and rear views shall be shown on each rack arrangement plan. Only one instrument rack shall appear on each sheet. All rack grounding and component grounding details shall be shown.

10. All rack mounted components and mounting hardware shall be clearly identified on the drawings by a reference number and shown on the Material Reference List/Apparatus Tabulation.

11. All plug connected cables associated with the instrument rack shall be identified by reference numbers and be shown connected to proper plug receptacle.

12. Cable Assembly Drawings shall be provided for all cables employed by the interlocking system. All plug or receptacle pin assignments shall be shown. All wire gauge, wire color-coding and wire lengths shall be shown. Shield grounding arrangements shall be shown. A list of tools
required and instructions for fabrication of
cables shall be provided on the drawings.
All parts or materials required for reordering
shall be shown and identified with a
reference number. Reference number shall
 correspond with a tabulation of material
showing part numbers and quantities
included on cable assembly drawings and
as shown on the Material Reference
List/Apparatus Tabulation.

13. Complete Cable Schematic Drawings shall
be provided for all data communications
cables employed by the system. All plug or
receptacle assignments shall be shown. All
wire color-coding, functional wire
nomenclature and plug, slot and rack or card
file destinations shall be shown.

14. Complete Circuit Drawings shall be
designed and provided. All hardwire input
and output circuit drawings shall be shown
complete with all terminal designations,
terminal board locations, printed circuit
board edge connector or plug connector
designations and functional wire
nomenclature. Card file or rack number and
slot locations of all printed circuit boards
shall be shown.

15. Signal Lighting Circuit Drawings shall
include all wires and termination points from
printed circuit cards to signal lamps on one
sheet.

16. Switch Operating Circuit Drawings shall
include all wires and terminations from
printed circuit boards to switch control relays
on one sheet.

17. Switch Indication Circuit Drawings shall
show all wires and terminations from the
printed circuit boards to the entrance racks.

18. Track Repeater Circuit Drawings shall show
all wires and terminations from printed circuit
boards to track relays.

19. Wire sizes shall be clearly identified on each
circuit drawing.

20. Power distribution schematics shall be
provided showing all transformers, circuit
breakers, fused disconnects, fuses,
rectifiers, power supplies, terminals, cables,
busses, wires and wire sizes for all power
sources energizing the vital controllers or
controlled or switched by the vital
controllers.

21. VMIS application software shall be
developed using ladder logic. Complete
documentation shall be provided, showing
progression of switch control from
supervisory system inputs to switch control
relays, examples of route, time and switch
locking, progression of signal control from
the supervisory system inputs to the signal
lamps and examples of all other logic
executed by vital interlocking system.
Ladder logic shall emulate typical
interlocking circuitry as required by these
Specifications.

22. All data passed from one vital controller to
another vital controller and all data passed
from any vital controller to the supervisory
system shall be identified as well as all
hardwire interfaces. All ladder logic and all
data received by or sent from controllers
shall be identified with standard relay logic
nomenclature as shown in Contract
Drawings. Translation tables will not be
acceptable.

23. Vital Processor Units shall be equipped with
on-board diagnostics. Diagnostics shall
quickly and reliably identify failed printed
 circuit boards. The nature of failure as well
as specific location of failure shall be
indicated.

24. Vital processor systems shall be provided
with external lightning protection and surge
suppression. Protection shall be sufficient to
protect all power and input/output paths.

C. Diagnostics and Data Logging

1. Vital Processor Units shall be equipped with
on-board diagnostics. Diagnostics shall
quickly and reliably identify failed printed
circuit boards. The nature of failure as well
as specific location of failure shall be
indicated.

2. The Vital Processor Unit shall have internal
event recording capabilities. The internal
event recorder shall comply with the
requirements within Specification 16972.

3. Vital Processor Unit’s diagnostics shall allow
immediate retrieval of user data logs, event
logs, and error logs.

4. The Vital Processor Unit shall allow
monitoring of the state of every application
data bit and allow user selection of
information to be stored in the log.

5. The Vital Processor Unit shall display the
application program name, current version
of the application logic, and the current
version of the executive version on the front
panel.

6. The Vital Processor Unit’s diagnostics bit
monitoring shall provide displays for
standard log-type and timing diagram type
monitoring.
D. Vital Controller Software

1. VMIS shall continuously test for a loss of control over state of hardwire outputs, a loss of control over RAM, a loss of vital data communications and a spontaneous change in application dependent software. VMIS shall include a vital watchdog function to control an external device that disables outputs when a Vital Processor Unit is off-line, in stand-by, or has failed.

2. VMIS shall log all vital and non-vital failures and identify faulty printed circuit card or function.

3. VMIS shall supervise a closed loop monitoring system for all hardwire input and output functions.

4. VMIS software shall be stored on an EPROM or EEPROM device.

E. Application Dependent Software

1. Application dependent software shall define operation of VMIS; operation of individual functions shall be as indicated on Contract Drawings and include:
   a. Cab Signal Selection
   b. Route Check (RCSR).
   c. Signal Control (HR, COR)
   d. Signal Lighting (HG, HY, HR, HCO)
   e. Signal Indication (RGPR)
   f. Light Out RELAY (LOR) including vital hot filament and non-vital cold filament light out protection.
   g. Time Locking (ASR, TER, ASPR, POSR)
   h. Route Locking (NSR, SSR)
   i. Switch Locking (LR)
   j. Switch Control (NLPR, RLPR, NWZR, RWZR)
   k. Switch Indication (NWPR, RWPR)
   l. Switch Correspondence (NWCR, RWCR)
   m. Loss of Shunt (TPSR)
   n. Switch and Signal Blocking
   o. Traffic Circuits

2. Software development system shall contain all hardware and software required for the composition, debugging, simulation and EPROM storage of the application dependent software.

3. Development system software prepared by the manufacturer of the vital controller shall be provided.

4. No copy protection schemes, including product or software keys, shall be employed on any of the software.
5. All hardware and software supplied with the development system shall be demonstrated to be completely compatible.

6. One complete development system shall be provided for the Authority’s use and the Contractor shall maintain one complete development system in perfect working order on-site.

7. Contractor shall provide training on the application logic development system hardware and software, including composition and, debugging, of the application logic, simulation, and EPROM storage.

F. Application Dependent Firmware Development System

1. The application dependent firmware development system shall contain all hardware and software required for the composition, debugging, simulation, and electrically erasable programmable read only memory (EEPROM) program storage for the application dependent firmware.

2. The hardware shall consist of an Intel® based laptop or notebook computer with the following minimum requirements:
   a. Processor: Dual-core 1.6 gigahertz (GHz) central processor unit (CPU) and a 512 kilobyte (KB) L2 cache
   b. Operating System: Windows © 7 based (minimum)
   c. Memory: 2GB Synchronous Dynamic Random Access Memory (SDRAM) expandable to 4 GB at 667 megahertz (MHz) input and output bus speed
   d. Storage: 80 GB hard drive at 7200 RPM
   e. Optical Drive: CD-RW/DVD-ROM removable with read speed of 24x (CD)/4x (DVD), write speed of 24x, and rewrite speed of 4x.
   f. Display: 15 inch widescreen WXGA color liquid crystal display capable of 1280 X 800 pixels
   g. Communications: 802.11g wireless, 10/100/1000 Ethernet
   h. Interfaces and Connections: S-video, 15 pin HD D-sub, RS-232, RJ-45, VGA, USB 3.0 (2), SD card slot, SDHC, or SDXC card slots.
   i. Battery life shall be minimum of 6 hours operating time.
   j. Accessories shall include an AC charger and carrying case.

3. Other hardware shall include one EEPROM programmer, compact disc storage case which shall contain up to 50 CD-RW compact discs, minimum 4.7 GB DVD read and write device operating at 16X speed complete with 100 write once, read many DVD media disks, computer table with working area of not less than 16 square feet, power plug strip with surge protection, and all required cables, documentation, software, and interface electronics. The computer system shall be fully assembled and ready for service.

4. The computer shall be equipped with an internal hard disk drive and system random access memory (RAM) required for proper operating and development systems operation. The hard disk drive and system RAM shall be provided such that each has 50 percent unutilized capacity as measured by peak usage for a fully disk resident operating system and application software load including at least 200 percent of RAM as virtual memory and the most extensive software application execution.

5. All hardware shall be readily available over the counter throughout the United States and the system shall be provided with not less than a three-year warranty for each component and the system in its entirety. The choice of the particular hardware items shall be subject to Authority approval.

6. The application dependent firmware source code editor shall be supplied as part of the development system.

7. Development system software prepared by the manufacturer of the vital controller shall be provided.

8. No copy protection scheme, including product or software keys, shall be employed on any of the software supplied as part of the development system.

9. All hardware and software supplied with the development system shall be demonstrated to be completely compatible.

10. One complete development system shall be provided for the Authority’s use and the Contractor shall maintain one complete development system in perfect working order on-site.
G. General Hardware and Operating Requirements

1. VMIS shall consist of Vital Processor Units and associated cables, plugs, wire connectors, terminal boards, data transmission equipment, power conditioning equipment, instrument racks and hardware.

2. Each Vital Processor Unit shall consist of printed circuit boards mounted within cardfiles in one instrument rack. Vital Processor Units shall allow individual removal and insertion of printed circuit boards (PCBs) from the rear.

3. All plug connectors, data transmission equipment, power supplies, power conditioning devices, terminal boards, wire connectors and other equipment required to achieve a complete, stand-alone subsystem shall be mounted within the instrument rack along with associated Vital Processor Units.

4. Each Input, Output and Input/Output printed circuit board shall be equipped with a lighted status indicator on each port. Indicator shall be illuminated when the respective port is energized.

5. Vital Processor Units shall be provided with Double Break Vital Output (DBVO) Printed Circuit Boards and Vital Input (VI) Printed Circuit Boards. A sufficient number of these types of printed circuit boards shall be installed in each Vital Processor Unit to accommodate all vital hardware inputs and outputs.

6. Vital Processor Units shall be provided with Non-Vital Input/Output Printed Circuit Boards (PCBs). A sufficient number of these type printed circuit boards shall be installed in the Vital Processor Units to accommodate all non-vital hardware inputs and outputs.
   a. NVI and NVO PCBs shall have a minimum of 32 isolated inputs and 32 isolated outputs.

7. Hardware interface board shall indicate, with logically grouped lights mounted on the interface boards, the status (Hi or Lo) of each input or output. An approved lamp labeling system shall be provided as part of the unit, visible when viewing the status lamps.

8. Vital Processor Units shall be provided with Vital Output Printed Circuit Boards and Vital Input Printed Circuit Boards. A sufficient number of these types of printed circuit boards shall be installed in each Vital Processor Unit to accommodate all vital hardware inputs and outputs within that Vital Processor Unit’s scope of control. Alternatively, the Vital Processor Unit may incorporate vital outputs to drive lamps directly.

9. Use of external relays as interface devices between the Vital Processor Units and external circuits shall be as required by these Specifications.

10. Vital Processor Units shall have a twenty percent expansion available for storage of application dependent firmware and capability.

11. External apparatus and circuits controlled by the VMIS via hardware interfaces shall include:
   a. Speed command
   b. Powered Switch and Lock Movements
   c. Electric Switch Locks
   d. Signal Lamps
   e. Signal Mechanisms
   f. Traffic and Line Circuits
   g. Event recorders and other miscellaneous functions as specified, or shown on Contract Drawings.

12. External apparatus and circuits passing indications to the VMIS via hardware interfaces shall include:
   a. Track Relays
   b. Electric Switch Locks
   c. Switch Circuit Controllers
   d. Signal Mechanisms
   e. Traffic and Line circuits
   f. Other miscellaneous indications as specified, or shown on Contract Drawings.

13. Provide programmable controller; MICROLOK or approved equal.

14. Each Vital Processor Unit shall be provided with Vital Serial Communication Ports as required by these Specifications. The number of Vital Serial Communication Ports shall be sufficient to allow interconnection of all Vital Processor Units. Communication of data between Vital Processor Units shall be transmitted through these Vital Serial Ports.
15. Each Vital Processor Unit shall also be provided with Non-Vital Serial Communication Ports as required by these Specifications. The number of Non-Vital Serial Communication Ports shall be sufficient to allow interconnection of Non-Vital Processor units, and supervisory control system.

16. All data communications between the supervisory control system and vital controllers shall conform to RS232 or RS423 standards. Each vital controller shall be connected by one cable to the supervisory system. If multiplexing of supervisory communications is employed, required cable junctions and any steering devices shall be located on or near the supervisory system.

17. All data communications between the supervisory control system and vital and non-vital controllers shall utilize the DF-1 protocol via the Ethernet.

18. Each Vital Processor Unit cardfile(s) shall contain printed circuit boards of the types described herein. Additional types of printed circuit boards required for operation of Vital Processor Units shall be provided and installed as required. Combination of functions among board types shall be allowed only as required by theses Specifications.

19. All data communications between vital controllers shall conform to RS232 or RS423 standards.

20. If required, all data communication between vital controllers located within outlying instrument cases and vital controllers located within a central instrument house, shall be via a 20 milliamp current loop or modem. All modems, current loop interfaces and any other data communications equipment shall be located on a data communications rack and conform to all environmental requirements as required by these Specifications.

21. VMIS shall not use any custom or semi-custom integrated circuits.

22. Printed circuit boards shall be housed within a cardfile and be plug-in type. Keys shall be provided on the cardfile to prevent insertion of improper printed circuit board types.

23. Cardfiles shall be factory mounted in standard 19 inch instrument racks. All wire connections to cardfiles shall be via plug connected cables. Forced air ventilation shall not be used.

24. All cables or wiring leaving instrument racks shall be routed through rubber boots at the top of racks and provided with means to be neatly routed and securely fastened with tie straps.

25. All power conditioning including surge protection and noise suppression required on power feeds for rack mounted power supplies shall be located on power distribution racks. All inputs and outputs of microprocessor systems shall be protected from surges and lightning.

26. Hardwire inputs of vital controllers shall not respond to AC of any voltage level. Hardwire inputs shall be biased and shall not, under any failure condition, respond to any voltage of improper polarity.

27. Hardwire outputs of vital controllers shall provide security equal to conventional double-break relay circuits.

28. Plug connectors shall comply with all of the requirements of these Specifications.

29. Power input into the Vital Processor Unit shall be controlled by a circuit breaker.

H. Vital Processor Unit Printed Circuit Boards

1. Each Vital Processor Unit shall be equipped with one Central Processing Unit Printed Circuit Board (CPU PCB). CPU PCBs shall conform to the requirements shown below:

a. CPU PCBs shall contain microprocessor, clock, RAM, Application Dependent Software, data bus, address bus and all other components of the computing portion of the system. Other printed circuit boards comprising the system shall be input-output adapters and interfaces only.

b. CPU PCBs may contain hardware for Vital and Non-vital Data Serial Communication Printed Circuit Boards (VI PCBs, DBVO PCB's and NV PCBs).

c. Wire jumpers and piggyback boards shall not be permitted.

2. Each Vital Processor Unit shall be equipped with one Non-Vital Serial Interface Printed Circuit Board (NVSI PCB). NVSI PCBs throughout the Vital Processor System shall be identical. NVSI PCBs shall conform to the following requirements:

a. NVSI PCBs shall contain two RS232C compatible serial ports.
b. One port shall be configured as a master with the ability to initiate communications with and discretely address an approved number of other serial ports electrically connected to a common serial line. Maximum number of such slave ports shall be the manufacturer's standard.

c. Slave port shall be configured with the ability to select one of an assigned number of address codes. Slave port shall receive and transmit data only when the master port connected to common serial line specifies an address that corresponds to the slave port's address.

d. Data transmission rates for all non-vital serial ports shall be independently adjustable. Method of adjustment, maximum adjustable Bauds per second (BPS), and optimum adjusted BPS shall be as approved by the Authority.

e. Communications protocol for all serial data communications lines shall be compatible with all connected devices.

f. Data communications cables in accordance with the requirements of these Specifications shall be plug connected to the NVSI PCBs. Cable shielding shall be connected to ground on one end only.

3. Each Vital Processor Unit shall be equipped with Vital Input Printed Circuit Boards (VI PCBs) as required by these Specifications.

a. VI PCBs shall be provided and installed in sufficient number to accommodate all vital inputs within the VMIS's scope of control including:

1) Input from each vital track relay front contact.
2) Inputs from switch and lock movements for normal and reverse position indications.
3) Input from each electric switch lock for a normal position indication.
4) Input from each signal lighting control network, indicating the stop position.

b. VI PCBs shall accept inputs without the use of external or board mounted interface relays. Energy for inputs shall flow directly from relay contacts, line circuits or signal equipment.

c. VI PCBs shall have a minimum of 16 inputs.

4. Each Vital Processor Unit shall be equipped with Vital Output Printed Circuit Boards (VO PCBs) as required by these Specifications.

a. VO PCBs shall be provided and installed in sufficient number to accommodate all vital outputs within the Vital Processor Unit's scope of control including:

1) Outputs to each switch and lock movement for normal and reverse controller relays.
2) Outputs from each color light signal control network.
3) Output for each possible polarity of each vital line circuit feed.
4) Outputs for train stops and other miscellaneous functions as required by the Contractor's design.

b. VO PCBs shall output energy directly to relay coils, line circuits or signal equipment.

c. VO PCBs shall have a minimum of 16 outputs.

5. Each Vital Processor Unit shall be equipped with vital timers as required by these Specifications.

a. Vital timers shall be provided in sufficient number to accommodate all vital timing functions within the Vital Processor Unit's scope of control, including:

5) Input from each signal lighting control network, indicating the approach or proceed position.
6) Input for each possible polarity of each vital line circuit.
7) Miscellaneous inputs as required by the Contractor's design.
1) Loss of shunt time for track repeater relays (TPSRs)
2) ASR timers for each signal (TER).

b. Vital timers shall be field adjustable by a means other than by modification of application software designed for the interlocking.

c. Vital timer selection switches shall be covered to insure the integrity of the settings and prevent accidental contact.

6. Each Vital Processor Unit shall be equipped with Vital Lamp Driver Printed Circuit Boards (VLD PCBs).

a. VLD PCBs shall be provided and installed in sufficient number to accommodate all vital signal lamps within the Vital Processors Unit's scope of control.

b. VLD PCBs shall output energy to signal lamps.

c. VLD PCBs shall have a minimum of 16 outputs for non-LED signals and 12 outputs for LED signals.

d. Wattage for VLD PCB outputs shall be adequate to handle designed maximum signal lamp load.

e. Lamp driver modules shall be equipped with light out detection. The Vital Processor Unit shall log light out detection.

f. Detection of a lamp out or replacement of a lamp shall not cause the Vital Processor Unit to reset and/or transfer to the offline Vital Processor Unit.

g. When normal and standby Vital Processor Units are used, and the lamp drivers are connected in parallel between the normal and standby units, the offline unit lamp driver modules shall maintain a positive health status unless a problem is detected. Any offline Vital Processor lamp driver module with a positive health status shall not generate lamp out errors.

I. Identification

1. Card files shall be supplied with printed labels that identify input and output ports on PCB by name assigned in the application firmware.

2. Ports shall be identified by PCB slot number and port number.

3. A method shall be used to mount a printed nametag on a front plate of each rack or cabinet as Authority approved.

J. Redundancy

1. The redundant Vital Processor pair failover shall be automatic from normal to standby to manual and from standby to normal.

2. The redundant Vital Processor pair shall function in warm standby configuration.

3. The failover from the normal Vital Processor Unit to the standby Vital Processor Unit shall cause minimal disruption to the data communication links.

PART 3 - EXECUTION

3.1 PRODUCTION

Not Used

3.2 INSTALLATION

A. Instrument racks shall be arranged and mounted in central instrument houses as indicated on Contract Drawings in accordance with Authority approved installation plans.

B. Cardfiles shall be mounted in standard 19-inch instrument racks. All wire connections to the cardfiles shall be via plug connected cables. Forced air ventilation shall not be used.

C. All cables or wiring leaving instrument racks shall be routed through rubber boots at the top of racks and be neatly routed and securely fastened with tie straps.

D. Mounting of cardfiles and associated equipment shall provide for easy access to all test points, indicators, and adjustments.

E. Normal and standby units, if not on same rack, shall be in the same row on adjacent racks.

F. Mounting of microprocessor equipment within an instrument house or room shall be restricted to an area between 1.5 feet and 5.5 feet above the finished floor.
3.3 TESTING

A. Factory Testing

1. VMIS shall undergo qualification testing in accordance with approved Qualification Test Procedure.

2. VMIS and all subsystems shall be tested in accordance with Authority approved Factory Test Procedure and as required with these Specifications.

3. Entire complement of instrument racks, or cabinets, for a given vital interlocking or interlocking zone shall be set up at the point of assembly, with all equipment installed. Racks or cabinets shall be interconnected with the same plug connector cables as will be shipped to the field, in accordance with Authority approved plans. Contractor shall simulate functions external to signal central instrument house or room, where required. All system functions shall be tested to determine that each function operates as required.

4. Contractor shall make adjustments and correct all defects as required to obtain proper operation.

5. VMIS shall be in compliance with and have means of accessibility to permit all testing as required by the current edition of “Rules and Regulations Governing Railroad Signal and Train Control Systems” as issued by Federal Railroad Administration. If the Contractor's system requires any external equipment to permit making such tests, such equipment shall be provided as part of the system.

6. All design changes required for proper operation shall be submitted for Authority approval.

B. Field Testing

1. VMIS and all subsystems shall be tested in accordance with these Specifications.

2. The latest type unit for testing vital microprocessor interlocking equipment, as recommended by manufacturer, shall be provided to assist diagnosing modules.

3. Contractor's tests of VMIS shall demonstrate that safety logic that is to be implemented by the VMIS is not masked or implemented by non-vital logic during testing. Contractor shall incorporate test functionality into the local control system that bypasses non-vital logic and introduces signal and switch requests directly into the application logic for the purpose of challenging locked routes during testing. Contractor shall demonstrate these requests are shown in the application logic via the laptop connection.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith will be considered incidental to the work specified under Section 16901 “Signal System Basic Technical Requirements.”

END OF SECTION 16959
PART 1 - GENERAL

1. DESCRIPTION

A. Work to be done under this Section consists of designing, providing and installing transformers.

1.2 REFERENCE STANDARDS

A. American Railway Engineering And Maintenance-of-Way Association (AREMA):

1. AREMA, Communications & Signal Manual, Part 14

1.3 SUBMITTALS

A. The Contractor shall submit for Authority approval, drawings, wiring diagrams and performance data for all transformers to be provided and installed under these Specifications.

B. The Contractor shall submit for Authority approval, calculated size of transformers required to feed loads created by equipment being provided and installed under this Contract. All transformers shall be rated to carry 125 percent of total load continuously.

C. The Contractor shall provide manuals describing operation and maintenance of each type of transformer.

D. The Contractor shall submit Test Procedures and Results in accordance with these Specifications.

1.4 QUALITY ASSURANCE

A. The Contractor shall inspect and test each transformer prior to shipment. Inspection shall conform to the Contractor's Factory Inspection and Testing Procedure as Authority approved.

B. Each transformer shall be inspected after it has been installed in the field. This inspection shall conform to the Contractor's Installation and Inspection Procedure as approved by the Authority. Installation shall not be considered complete until all installation defects have been corrected to the Authority's satisfaction.

C. Final operating tests to determine acceptability shall conform to the requirements of the Authority approved Field Test Procedure.

D. Transformers shall be in accordance with the AREMA Signal Manual, Part 14.2.10 for Single-Phase Transformers.

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIALS

A. Not Used

2.2 CONTRACTOR FURNISHED MATERIALS

A. Maintenance Materials:

1. Contractor shall furnish one transformer of each rating used in the system.

B. General

1. All transformers shall be air-cooled unless otherwise Authority approved.

2. Transformers shall be provided for signal power, isolation purposes, 100 Hz AC track circuits and general purpose transformers as required in these Specifications or Contract Drawings.

3. Track transformers shall be provided with sufficient primary and secondary voltage taps to adjust for varying feeder voltages between 100 and 125 volts.

4. Transformers shall not emit audible noise in excess of 75 dB, referenced to 0.0002 dynes/cm² at a distance of two feet at rated voltage and current.

5. Primary and secondary taps shall be brought to terminals mounted inside the transformer case. A connection for each secondary tap and at least two connections for the primary winding shall be brought out of the transformer to suitable terminals or bushings. All terminals shall be identified in an Authority approved manner.

6. Track feed transformers required for power frequency track circuits shall be equipped with terminal boards containing terminals for primary and secondary leads.

a. Secondary windings shall be arranged to provide for varying voltage in one-volt steps up to a maximum of 15 volts. Terminal boards shall comply with AREMA Signal Manual requirements.

b. Primary excitation shall be 120 VAC, 100 Hertz. All track feed transformers shall have a volt-ampere rating sufficient to handle the operating load. Track transformers shall not be susceptible to DC saturation by propulsion currents.

7. Transformers for signal power shall be single phase with 480 volt, 60/100 hertz, primary windings and 120 volt, 60/100 hertz, secondary windings. Transformer windings shall contain Class H insulation with four, 2-1/2 percent full capacity taps. Two taps shall be above the nominal voltage and two below nominal voltage. The transformer enclosures shall be of drip-proof construction and provided complete with provisions for wall mounting.
a. Each signal power transformer required for a central instrument house location shall be rated at a minimum of 15 kVA.

b. Each signal power transformer required for a wayside signal case shall be rated a minimum of 5 kVA.

2.3 DELIVERY, STORAGE AND HANDLING

A. Transformers shall be protected from damage throughout delivery, storage and handling.

PART 3 - EXECUTION

3.1 PRODUCTION

A. Not Used

3.2 INSTALLATION

A. Transformers shall be installed as shown on Authority approved installation drawings.

B. Mounting

1. Track transformers shall be rack mounted, except in junction boxes wherein they shall be mounted in accordance with Authority approved plans.

2. Signal power and general power transformers shall be wall mounted.

C. Isolation transformers may be wall mounted.

3.3 TESTING

A. The Contractor shall test each transformer with its associated system in accordance with these Specifications.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith will be considered incidental to the work specified under Section 16901 “Signal System Basic Technical Requirements.”

END OF SECTION 16963
PART 1 - GENERAL

1.1 DESCRIPTION

A. Work to be done under this Section consists of design, provision and installation of circuits, software, and hardware for an operating a computer-based Local Control system at each Central Instrument House (CIH) and Intermediate Instrument House (IIH).

B. Work shall include providing the design required to interface controls and indications with the Train Control Center (TCC). Contractor is responsible for a list of all controls and indications needed for complete operation of the interlocking plant from TCC. All track circuit indications shall be provided at the TCC. Contractor shall provide software and hardware for controls and indications data transfer between TCC and LCP as Authority approved.

1.2 SUBMITTALS

A. Contractor shall submit the product data including computer hardware and software specifications, wiring details, and plug connector details for Authority approval.

B. Contractor shall submit the screen design for Authority approval.

C. Each Design Review Package shall include the Local Control Screen Drawing.

D. Each Final Design Review Package shall include:
   1. A complete software functional description that includes operating instructions and graphical descriptions of all user inputs and local control indications.
   2. Screen display arrangement drawings showing mounting location of all signal equipment. Drawings shall include comparison of operating track direction to panel orientation.
   3. Assembly drawings with a keyed parts list showing ordering numbers for replacement parts for all equipment within the local control and indication panels to be provided under this Contract.

E. Contractor shall submit Test Procedures and Results in accordance with these Specifications.

1.3 QUALITY ASSURANCE

A. Each local control system component shall be new and free of defects.

B. All local control equipment shall be tested before shipping. Factory testing shall be conducted in accordance with the Contractor's Factory Test Procedure as Authority approved. Prior to shipment, a copy of the manufacturer's certification of factory tests performed shall be forwarded to the Authority.

C. All electrical components in these Specifications shall be rated to operate at power, voltage, current and temperature levels 20 percent above the level components shall be subject to in normal service unless otherwise specified.

D. Each local control system shall be inspected after it has been installed in the field. This inspection shall conform to the Contractor's Installation and Inspection Procedure as Authority approved. Installation shall not be considered complete until all installation defects have been corrected to the Authority's satisfaction.

E. The local control system shall be tested according to Authority approved test procedures.

1.4 DELIVERY, STORAGE AND HANDLING

Not Used

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIALS

Not Used

2.2 CONTRACTOR FURNISHED MATERIALS

A. Local Control Interface Panel. Above the desk in the operations section of each CIH and IIH, the Contractor shall provide a small panel equipped with a reset button, key switch override, audible alarm, and a data connection for a laptop computer
   1. Reset button reboots the LCC
   2. Data connection permits LCC operation with a lap top during an LCC failure

B. Display
   1. Local control panel display shall be LED based screen or other Authority approved solid-state screen. The screen shall be permanently mounted on the wall above the desk in the operations section of each CIH and IIH.
   2. Display shall be sized to comply with the requirements of Mil Standard 1472F.
3. Display Layout
   a. The top portion of the display shall include the track plan. Orientation of the plan shall be so that it is geographically correct, relative to the track and desk location in the CIH.
   b. The bottom portion of the display shall have text boxes to reflect user input and alarm status.

C. Computer: The local control computer (LCC) shall be an industrial grade computer that is rack-mounted in the CIH/IIH equipment section. The computer shall be rated to operate without functional degradation or failure as a result of shock, vibration, and environmental conditions.

1. Memory
   a. The LCC shall be provided with a minimum of 1 gigabyte of RAM and shall also satisfy the requirement that when the application and operating system are loaded and functioning at the peak performance level, 50% of system RAM shall be unallocated.
   b. The LCC shall be provided with a hard drive sized to store the complete and fully installed operating system including its utilities and its support software as well as the local control software. The hard drive shall also be sized such that a 75% spare hard drive capacity shall be available following 180 days of continuous operation.

2. Each LCC shall be provided with keyboard and mouse.

2.3 FUNCTIONAL REQUIREMENTS

A. The display shall provide user controls and indication interface as required to effectively and efficiently operate the interlocking using entrance/exit control.

B. The display shall be ergonomically designed and shall provide logical and unambiguous objects and methods that critically minimized the human man-machine interface interactions required to view indications and perform control functions.

C. Display Objects

1. The track display shall include the following objects;
   a. Interlocking Name (CIH)
   b. Track (CIH and IIH)
   c. Switches (CIH)
   d. Operating Mode (CIH)
   e. Signals (CIH)
   f. Traffic Indication (CIH and IIH)
   g. Track Circuits (CIH)
   h. Grade Crossing (CIH and IIH)
   i. Stations (CIH and IIH)

2. The supervisory portion of the screen shall include;
   a. Execute Button (CIH and IIH)
   b. Cancel Button (CIH and IIH)
   c. Alarm Acknowledge Button (CIH and IIH)
   d. User Input Text Box (CIH and IIH)
   e. Alarm Text Box (CIH and IIH)

D. Indications and Colors (CIH and IIH)

1. Display colors are intended to match those of the OCC display. The colors specified herein are subject to review and may be modified during the preliminary engineering phase. In the Signal System preliminary design review, the Contractor shall submit color scheme for Authority approval.

2. Background: Display background shall be black.

3. Track and Track Circuits
   a. Unoccupied track shall be indicated with a red line.
   b. White perpendicular lines shall indicate the track circuit boundaries. When an interlocking track has a route locked, the associated track display shall expand to approximately four times the normal width and be colored purple. When a track circuit becomes occupied, the track line corresponding to the occupied circuit shall expand in width to approximately four times that of the unoccupied track and shall be colored orange.
c. Track circuit names shall be indicated in white text. Where space permits, track circuit names should appear between the tracks in double-track areas. In interlockings, the names should appear outside of the tracks so that they do not interfere with the switch names.

d. For track circuits in the Cab Signal territory, current speed code shall be displayed next to the track name.

e. The display shall include all interlocking track circuits and all track circuits that are controlled by the CIH/IIH equipment. Where an intermediate house is located between the CIH and next adjacent CIH, a composite indication shall be provided that will indicate occupied if any of the track circuits controlled from the IIH are occupied.

4. Switches
   a. Track segments that correspond to the indicated switch position shall be solid line type. A section of track in the opposite position shall be a dashed line.
   
b. When a switch is requested, the section of track corresponding to the requested position shall become a solid flashing line while the switch is out-of-correspondence. When the switch indicates correspondence, the line in the requested position shall stop flashing and become solid and the opposite section of track shall become dashed.
   
c. When a switch is blocked, the switch shall be outlined by a blue box.

5. CIH / Operating Mode: The location of the CIH shall be indicated on the display by a solid white box. A single text character within the box shall indicate the operating mode, where “L” = Local; “A” = TWC/Auto; and “T” indicates TCC control.

6. Signals
   a. Signal symbols shall consist of a single solid circle with a line indicating the mast and base. The symbol is to be similar to that used on the mosaic panel.
   
b. The circular part of the signal shall be red for signals at STOP. The lines depicting mast and base shall be white.
   
c. When a signal is selected as an entrance, the circular portion of the signal symbol shall turn steady white. All possible exit signal symbols shall flash white. When the signal is cleared, it will turn solid green.
   
d. When a signal has been fleeted, a green box shall outline the signal symbol.
   
e. When a signal exit block has been selected, the signal symbol shall be shown in a solid blue box.
   
f. Signals in time locking shall be indicated by a flashing locking signal symbol.

7. Traffic Indication (CIH and IIH): Traffic shall indicate by arrows centered above areas where traffic locking is applied. A green arrow shall indicate the current unlocked traffic direction. When traffic is locked, the arrow shall be shown red.

8. Stations: Stations shall be indicated by an unfilled yellow box denoting the platform. Center platform stations will be shown with a single box between the tracks. Side platform stations shall be shown by boxes outside of the track. Station names shall be shown in white text inside the yellow box. Box shall be sized to allow two lines of legible text.

E. Controls
   a. Signal and Route Control (CIH):
      1) Prerequisites for route operation:
         a) User must be logged onto the system.
         b) Local control has been requested and surrendered by the control center, or the override key switch has been operated.
         c) There are no conflicting or opposing routes aligned and the desired traffic section is available.
         d) The exit is not blocked.
e) Switches in the route are not blocked out-of-position for the desired route.

2) Right-clicking the mouse button with the cursor over the desired entrance signal shall initiate a drop-down menu with the following commands:

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>N / X</td>
</tr>
<tr>
<td>Signal Cancel</td>
</tr>
<tr>
<td>Fleet</td>
</tr>
<tr>
<td>Fleet Cancel</td>
</tr>
<tr>
<td>Call On</td>
</tr>
<tr>
<td>Call On Cancel</td>
</tr>
<tr>
<td>Block</td>
</tr>
<tr>
<td>Block Cancel</td>
</tr>
</tbody>
</table>

3) Selection of “N / X” while the cursor is over a signal will designate that signal as an entrance, provided another entrance has not already been selected. With an entrance designated, selecting “N / X” with the cursor over a signal indicating that it is a valid exit will cause the exit to be selected. When an entrance/exit pair has been selected, the route shall be requested. The requested route will flash until the “Execute” button is clicked, at which time the route request will be implemented.

4) Selecting “Signal Cancel” with the cursor over a signal will cause the signal to be canceled if it is clear. Alternatively, the program shall allow multiple signals to be selected by left-clicking on the signal, and then right-clicking over a selected signal and selecting “Signal Cancel” and the “Execute” button.

5) To implement fleeting, the user shall be able to place the cursor over the desired signal, right-click, and select “Fleet” from the drop-down menu and clicking the “Execute” button. Fleeting shall be able to be canceled using the same procedure. Canceling fleeting shall not cancel a clear signal. Fleeting shall be requested or canceled for multiple signals by selecting signals using the left mouse button prior to using the drop-down menu command.

6) Call-on commands shall only be available for the following:

a) One signal at a time and only if the desired route has already been established (or if the track circuit is occupied), no conflicting or opposing routes, and for both the over-the-switch (O/S) and exit track circuits

b) To request a call-on, the user shall be able to place the cursor over the desired signal, right-click, and select “Call-on” from the drop-down menu and clicking the “Execute” button. The user shall be able to cancel call-on signals using the same procedure.

7) Signal Exit Blocks shall be requested and canceled in the same manner.

b. Switch Control.

1) Prerequisites for switch operation:

a) User must be logged onto the system.

b) Local control has been requested and surrendered by the control center, or the override key switch has been operated.

c) There are no conflicting or opposing routes aligned and the desired traffic section is available.

d) The switch is not in the desired position.

e) Switches in the route are not blocked.

f) Switch is not in a locked or occupied route.

2) Right-clicking the mouse button with the cursor over the desired switch shall initiate a drop-down menu with the following commands:

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set Normal</td>
</tr>
<tr>
<td>Set Reverse</td>
</tr>
<tr>
<td>Block</td>
</tr>
<tr>
<td>Block Cancel</td>
</tr>
</tbody>
</table>

3) The user shall be able to operate switches by placing the cursor over the switch, pressing the right mouse button, selecting the “Set Normal” or “Set Reverse” menu item and
clicking the “Execute” button. The user shall be able to select multiple switches using the left mouse button to make the same request for all selected switches.

4) Switch blocks shall be requested and canceled in the same manner.

c. Operating Mode Selection

1) Prerequisites for setting the operating mode:
   a) User must be logged onto the system.
   b) Communication link between TCC and the CIH is operating, or the Manual Override switch has been operated.

2) Right-clicking the mouse button with the cursor over the CIH symbol switch shall initiate a drop-down menu with the following commands:

3) “Set TCC” shall disable local and automatic control.

4) “Set Auto” shall only be available when in the Local mode and will surrender local control.

5) “Request Local” shall send local control request to the TCC unless the Override key switch is operated, in which case the selection will cause local control to be implemented.

F. Alarms (CIH and IIH)

a. Alarm conditions shall be displayed at the bottom of the screen. New alarms shall be colored red and blink until acknowledged. Each new alarm shall also cause an audible alarm until acknowledged. Alarms conditions shall include the following as applicable:

1) 60 Hz. Power Off
2) 100 Hz. Power Off
3) AC GROUND
4) DC GROUND
5) AC Blown Fuse
6) DC Blown Fuse
7) Data Transmission System Failure
8) Intrusion Alarm
9) Fire Alarm
10) Processor Alarm Non-Vital
11) Processor Alarm Vital
12) Battery Charger Failure

b. Alarms shall retained in the VMIS memory and be accessible from the LCP. The display shall include an alarm summary tab. Right-clicking the mouse button with the cursor over the alarm summary tab shall initiate a drop-down menu with the following commands:

<table>
<thead>
<tr>
<th>View</th>
<th>Acknowledge</th>
<th>Clear</th>
</tr>
</thead>
</table>

G. Terminal Operation

1. At temporary and permanent terminal stations, the local control software shall emulate the terminal panel as shown on the Contract Drawings. Terminal operations shall be on a separate screen from the local control. An on-screen button shall allow the user to switch between the two screens.

2. Terminal control inputs shall only be enabled when interlocking is in local control. When control is set to “Remote” or “Auto” terminal control shall be available at the TCC.

3. The Contractor shall provide three modes of operation for the terminal:

   a. Mode 1 will be set for the trains approaching terminal locations to diverge to the inbound track and depart from there on a straight route. A following train is held at the approach signal until the platform is clear.

   b. Mode 2 will be set for trains to alternate platforms. When both platforms available a train approaching terminal locations to diverge to the inbound track and depart from there on a straight route, next train will go straight and cross over upon departure.
c. Mode 3 will be set for the trains to approach terminal locations on a straight route and cross over upon departure. A following train is held at the approach signal until the platform is clear.

4. Contractor shall provide “Next Train” logic for input to the station sign system. The circuit will indicate from which platform the next train will depart based on first-in/first-out logic.

H. Interlocking Tests: The test functions shall be incorporated into the local control system. Control of test functions must bypass all non-vital local control logic and inject signal and switch request directly into vital logic to challenge the vital logic. The log-in function shall require a separate privilege level to use test functions.

I. Speed code downgrade: Speed code downgrade function shall be provided for each AF track circuit or cab loop. The log-in function shall require a separate privilege level to use Speed code downgrade control.

PART 3 - EXECUTION

3.1 PRODUCTION

Not Used

3.2 INSTALLATION

A. Local control and indication panels shall be located in the central instrument house.

B. Location of panel shall permit convenient use by an operator sitting in front of it.

C. Any damage caused during installation shall be repaired. Restored finish shall be equivalent to factory finish and performed in a manner satisfactory to the Authority.

3.3 TESTING

A. Local control system shall be tested in accordance with these Specifications.

B. Local control equipment tests shall consist of controlling wayside functions. All controls and indications on the respective panel shall be tested.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith will be considered incidental to the work specified under Section 16901 “Signal System Basic Technical Requirements.”
PART 1 - GENERAL

1.1 DESCRIPTION

A. Work to be done under this Section consists of designing, providing, and installing event recorders as described in these Specifications. Event recorders shall be installed at Automatic Highway Crossing Warning (AHCW) system cases and Central Instrument House (CIH) locations.

B. Where the VMIS has event recording capabilities that comply with the requirements herein, the VMIS may be used in lieu of a stand-alone event-recording device. Where event-recording tasks cause processing time to fall below specified limits, additional VMIS processors shall be provided as specified.

1.2 REFERENCED STANDARDS

Not Used

1.3 SUBMITTALS

A. The Contractor shall submit proposed event recorder product data for Authority approval.

B. The Contractor shall submit a detailed equipment layout and a bill of materials for a typical event recorder.

C. Each Final Design Package shall include details of the event recorder circuit design and connections.

D. The Contractor shall provide event recorder manuals that describe installation, operation and maintenance.

1.4 QUALITY ASSURANCE

A. Contractor shall factory test each event recorder with the Authority approved Factory Test Procedure.

B. Contractor shall inspect each event recorder in accordance with the Authority approved Installation and Inspection Procedure. Installation shall not be considered complete until all installation defects have been corrected to the Authority's satisfaction.

C. Event recorders shall be tested according to Authority approved test procedures.

1.5 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Event recorder components shall be protected from damage throughout delivery, storage and handling.

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIALS

Not Used

2.2 CONTRACTOR FURNISHED MATERIALS

A. Maintenance Materials: Two complete recorder units with all required components for installation.

B. Keys, Special Tools, and Test Equipment: Contractor shall provide 1 laptop computer for downloading the existing memory contents. The computers shall be provided with software, interface hardware, and cables for connection to the event recorder.

1. The computers shall be Pentium processor-based with hard disks of a size sufficient for operating system, application software and downloaded data from the full storage of at least 10 event recorders. The laptop computers shall be provided with Authority approved network cards.

2. Event recorders shall continue to store new events while downloading to the laptop computers.

3. Contractor shall either provide translation software or ensure that the data file format is such that the data may be printed directly from the laptop, or transferred to a database, or spreadsheet application.

C. Contractor shall provide microprocessor based event recorders containing non-volatile solid-state memory for data storage.

D. Event recorders shall be a multi-channel, multi-speed system containing self-test capability and battery backup.

E. Event recorder memory data storage shall function as a circular queue. When memory storage capacity is reached, the oldest event will be erased and replaced with the event containing the newer information.

F. Event recorders that monitor main lines without junctions shall have the capability of retaining all of the data for 340 train moves per day for 7 consecutive days before recycling. Each event will be date and time stamped.
G. Event recorders that monitor junctions shall have the capability of retaining all of the data for 480 train moves per day for 7 consecutive days before recycling. Each event will be date and time stamped.

H. The CIIH event recorder shall record the following information:
   1. Interlocking Track Circuits
   2. Approach Locking Track Circuits
   3. Signal Request
   4. Signal Clear
   5. Switch Request
   6. Switch Position
   7. Switch Locking
   8. Approach Locking
   9. Route Status
   10. Destination Code
   11. Route selection, Train to Wayside Communication (TWC) or Automatic
   12. Control, Train Control Center (TCC), Local Control Panel (LCP), or AUTO Mode.
   13. All Alarms
   14. Speed Command for each Occupied Track Circuit

I. Event recorders in Automatic Highway Crossing Warning cases shall record the following information:
   1. Approach Track Circuits
   2. Island Track Circuits
   3. XR Status
   4. Gate Down
   5. Gate Up
   6. Battery Voltage
   7. All Alarms

J. Contractor shall provide event recorders complete with an Ethernet interface for connectivity to the communications Ethernet switch to allow remote data retrieval via the CTS system.

K. Contractor shall provide to the Authority new and unused equipment and software required to program each event recorder’s data point mnemonics.

L. Event recorder shall be housed in a protected case.

M. Twisted pair inputs cables shall be provided.

N. The Contractor shall provide a barrier strip terminal block of adequate terminals and 10 percent spare terminals to interface with event recorder external circuits.

PART 3 - EXECUTION

3.1 PRODUCTION
Not Used

3.2 INSTALLATION
A. Contractor shall install event recorder in accordance with Authority approved installation drawings.

3.3 TESTING
A. Contractor shall test event recorders in accordance with Authority approved Installation and Inspection Procedures and these Specifications.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL
A. The Work specified in this section will not be measured separately for payment.

4.2 PAYMENT
A. All costs connected herewith will be considered incidental to the work specified under Section 16901 “Signal System Basic Technical Requirements.”

END OF SECTION 16972
SECTION 16976
GROUNDING OF EQUIPMENT - SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION
A. Work to be performed under this Section consists of designing, providing, and installing a grounding system for instrument houses, wayside signals, wayside cases, junction boxes, grade crossing gates and cantilevers, and other wayside equipment described in these Specifications or shown on Contract Drawings.

1.2 REFERENCED STANDARDS
A. ASTM International (Formerly American Society for Testing and Materials) (ASTM)
   1. ASTM B187/ B187M - Standard Specification for Copper, Buss Bar, Rod, and Shapes and General Purpose Rod, Bar and Shapes
B. American Railway Engineering And Maintenance-of-Way Association (AREMA)
   1. Communications and Signals Manual of Recommended Practice (C&S Manual)

1.3 SUBMITTALS
A. Contractor shall submit a grounding plan. The grounding plan shall be based on the enclosure layout and shall show:
   1. Ground rod placement
   2. Primary ground grid location
   3. Location of racks, trays, and other equipment connected to the grid and the path of all ground connectors that complete the plan.
B. Each Final Design Package shall include circuit and schematic drawings showing design and details for each type of grounding system and equipment. Drawings shall form part of an overall equipment layout submittal for instrument racks, entrance racks and cable trays as required by these Specifications.

1.4 QUALITY ASSURANCE
A. Grounding systems shall be inspected and any deficiencies noted shall be corrected in accordance with the Contractor’s Authority approved QC program. The inspection shall be conducted in conformance with requirements of an Authority approved Contractor Installation Inspection Procedure.
B. Grounding systems shall meet the requirements of the AREMA C&S Manual, Section 11, Parts 11.3.4, 11.3.5, 11.4.1, and 11.4.2.
C. Grounding systems shall be tested according to Authority approved test procedures.

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIALS
Not Used

2.2 CONTRACTOR FURNISHED MATERIALS
A. Ground rods shall be copper-clad steel, non-rusting type as manufactured by Copperweld Corporation, or Authority approved equal. Rods shall be at least 8 feet in length and at least 0.75 inch in diameter.
B. Ground rod connections shall be established by exothermic welds, cadweld types GR or GT, or Authority approved equal.
C. Internal ground wire, from equipment to ground buss, shall be insulated No. 6 AWG stranded copper wire. Insulated ground wire shall use colored green insulation.
D. A grounding buss of hard drawn pure copper having a minimum conductivity of 98 percent per ASTM B187 shall be provided in each instrument house and wayside instrument case. Minimum buss dimensions shall be 8 inches by 8 inches by 1/2 inch thick. A minimum of 12, 3/8 inch holes shall be drilled and tapped in the buss and twelve, 3/8 inch by 1/2 inch long hex head nickel plated bronze studs with 1 washer each shall be installed.
E. Grounding grid for instrument houses shall consist of ground rods and No. 4 AWG bare copper connecting cable. Instrument cases shall be grounded with a single No. 6 AWG connected to ground rod(s).

PART 3 - EXECUTION

3.1 INSTALLATION
A. General
   1. Ground connection to track rails or use of the neutral conductors of Public Power Utility or AC signal power supply system will not be permitted.
   2. Series grounding arrangements are not permitted.
   3. Ground rods shall not be visible above the finished grade and ground rods shall be installed near the finished grade surface in such a manner as to preclude the creation of a personnel trip hazard.
B. Instrument Houses

1. Each instrument house shall be grounded by means of a copper wire connection from the ground buss mounted on the wall of instrument house to driven ground rods around the foundation perimeter.

2. Ground wire connection shall be No. 6 AWG bare copper wire, which shall be buried at least 18 inches below the finished grade.

3. Resistance between earth ground and instrument house ground buss shall not exceed 5 ohms. Where a lower ground resistance is required for proper operation of the equipment, the Contractor shall provide conductors and ground rods to achieve the Authority approved design grounding parameters.

C. Wayside Equipment: All wayside equipment shall be grounded. Resistance between ground and the signal structure shall not exceed 5 ohms.

D. Junction Boxes, Wayside Cases

1. All junction boxes and wayside cases shall be grounded with a separate ground rod, exothermic weld and ground connection wire connected to 3/8 inch stud bolt provided with the box or case. Resistance to ground shall not exceed 5 ohms.

2. On aerial structures, ground connection shall be made from instrument case ground buss to ground grids installed beneath the structure. Contractor shall provide exothermic welded connection to either the ground conductor or to the handrail within 1 foot of the ground conductor connection to the handrail.

3. All ground rods shall have grounding wire attached to ground rod 4 inches above grade to facilitate maintenance inspection. Ground rod shall be driven in such a location that it does not create a tripping hazard.

4. When electrical resistance between equipment and earth is excessive, additional rods shall be installed until ground connection resistance meets the requirements of these Specifications.

E. Grounding of Inside Equipment

1. Entrance rack and instrument rack grounding shall be accomplished using a ground buss. All racks shall be electrically connected to ground buss by means of No. 6 AWG stranded wire. Means shall be provided to isolate each rack from ground for test purposes. Wire chases shall be isolated from racks and grounded separately.

2. All other individual apparatus not located on racks or herein specified to be grounded shall have individual insulated No. 6 AWG extra flexible ground connections to the ground buss. Connections shall be designed to be of the shortest possible distance.

3. Contractor shall provide any additional special grounding engineering, work, material, and labor required to meet these Specifications.

3.2 TESTING

A. Grounding systems testing shall be in accordance with these Specifications.

B. Should testing indicate that resistance between equipment and earth is excessive, an additional ground rod section shall be added. Additional rods shall be installed in multiple with the first rod until ground connection resistance meets requirements for ground tests. Contractor shall retest and verify proper results after ground rods are installed. Rods connected in multiple shall be spaced a minimum distance of 6 feet apart.

C. Ground Connection Resistance

1. All grounding connections shall be tested using the ratio ground resistance test method to determine that ground resistance is not greater than 5 ohms for CIH and other signal equipment. All ground connections shall be tested.

2. In the event that Authority approved Contractor ground resistance design and installation and testing results in greater than 5 ohms, the Contractor shall provide additional equipment or modifications to grounding to achieve the requirement.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith will be considered incidental to the work specified under Section 16901 “Signal System Basic Technical Requirements.”

END OF SECTION 16976
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section specifies the requirements for a comprehensive electromagnetic compatibility control (EMC) program that shall be provided in the Signal System design and installation.

B. Definitions – As used in this Section, the listed terms shall be defined as follows:

1. Electromagnetic Compatibility is the ability of equipment and systems to function as designed without degradation or malfunction in the intended operational electromagnetic environment without adversely affecting or being adversely affected by any other equipment or systems.

C. Electromagnetic Environment:

1. The known Authority Light Rail Transit System (LRT) electromagnetic environment includes: frequent close proximity to high voltage transmission lines; close proximity of diathermy equipments; close proximity to radio and television broadcast equipment. Within the LRT system, there will exist harmonics generated by the traction power AC/DC converter system, by the transit vehicle propulsion system, and by the communication system.

1.2 REFERENCE STANDARDS

A. Urban Mass Transit Administration (UMTA), now the FTA

B. Military Standards

C. International Electro technical Commission (IEC)

1. IEC 61000-4-1, Electromagnetic Compatibility Part 4: Testing and Measurement. Techniques; Section 1: Overview of immunity tests

D. Institute for Electrical and Electronic Engineers (IEEE)

1. IEEE Std 1100-1999, Recommended Practice for Powering and Grounding Electronic Equipment

E. American Railway Engineering And Maintenance-of-Way Association (AREMA)

1. AREMA - Communications & Signals, Part 11

1.3 SUBMITTALS

A. The Contractor shall submit the following for Authority approval:

1. The Electromagnetic Interference (EMI) Control Plan

2. The EMI Control Plan Report

3. Grounding Plan

4. Detailed EMC Maintenance Procedures

1.4 QUALITY ASSURANCE

A. The EMI Control Plan shall meet the requirements of all applicable standards.

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIAL

A. Not Used

2.2 CONTRACTOR FURNISHED MATERIAL

A. The EMI Control Plan shall include the following:

1. The Management Control Plan shall be implemented, enforced, and integrated as part of the overall design and development program. Define specific organizational responsibilities, lines of authority and control, and the implementation plan, including milestones to be used by the Contractor. Define responsibility for associate contractor equipments and subcontractor vendor items.

2. Identify Frequency Management methods for minimizing emission spectrum and receiver bandwidths, controlling oscillator frequencies,
pulse rise times, harmonics, sidebands, and duty cycles.

3. Identify the prediction or analysis techniques to be employed for determining the adequacy of specific aspects of the mechanical, electrical and electronic designs, including electromagnetic site surveys.

4. Employ the prediction or analysis techniques to identify equipment for which existing analyses and data document electromagnetic compatibility in identical or manifestly similar applications. Identify any potential problem areas and outline appropriate measures to be implemented to control EMI. When electromagnetic compatibility is to be certified based on similar applications, submit existing analyses and data.

B. The Contractor shall also consider mechanical design, materials, and construction methods that provide an inherent attenuation to electromagnetic emissions and susceptibilities without compromising other mechanical requirements of the individual equipment specifications. EMI Control Plan shall describe the material and construction used and the criteria for this selection, including:

1. Metals, castings, finishes, and hardware.

2. Fabrication considerations such as compartmenting, filter mounting, isolation, and type and attenuation characteristics of RF gaskets used on all internal and external matting surfaces.

3. Shielding and design practices to be employed for determining shielding effectiveness.

C. Wiring design shall describe the proposed electrical/electronic wiring designs to mitigate EMI. Include the practices to be used with regard to routing and isolation of wires and cables external to factory wired equipment and grouping of signal, logic and control and power cables. Describe installation criteria to be employed with regard to shielding and grounding of cable shields.

D. Electrical/Electronic circuit design shall describe the EMI suppression techniques which are to be applied to all parts and circuitry, whether capable of generating undesirable emanations or suspected of being susceptible to the coupling fields and voltage levels specified. Include the following:

1. Describe the proposed electrical/electronic wiring designs. Include the practices to be used with regard to routing and isolation of wires and cables external to factory wired equipment and grouping of signal, logic and control and power cables. Describe installation criteria to be employed with regard to shielding and grounding of cable shields.

2. Choice of component parts and circuitry, the criteria for use of standard parts and circuitry and bonding and grounding techniques.

3. Justification of selected filter characteristics, including type and attenuation, filter selection criteria and specific circuit applications.

4. Justification of selected filter characteristics, including type and attenuation, filter selection criteria and specific circuit applications.

5. Part location and separation based on orientation of electric and/or magnetic fields for reduction of emissions, susceptibility.

6. Location of critical circuits and decoupling techniques employed for each.

7. Shielding and isolation of critical circuits.

8. Failsafe criteria shall be used in filter design and parts selection for the Signal System.

E. The Contractor shall submit for Authority approval the Report, an analysis of the known electromagnetic environment developed under these Specifications, recommendations for frequency assignment plan, and receiver sensitivity plan. These analyses shall clearly demonstrate that the signal system will perform the intended functions without degradation.

F. Prior to equipment installation, the Contractor shall submit for Authority approval, a grounding plan detailing the installation parameters and criteria to be applied at each location to ensure the following:

1. Resistance from shields to ground is sufficiently low that expected shield effects are provided.

2. Conductive coupling is avoided.

3. Personnel and equipment are protected from hazardous voltages.

4. Other EMI control measures are not degraded.

G. Detailed EMC Maintenance Procedures shall be delivered to the Authority before the delivery of the last Operations and Maintenance Manual. The Contractor shall submit detailed maintenance procedures for all equipment, detailing actions and intervals, required to sustain signal to noise margins and overall EMC.

2.3 FUNCTIONAL REQUIREMENTS

A. Achievement of EMC shall be a joint endeavor of the Contractor, other contractors and site-specific electric utilities working with the Authority.

B. The Signal System Electromagnetic Compatibility Control Program is intended to ensure that equipment will operate in electromagnetic environments without
either causing or suffering harmful interference because of electromagnetic emission or response. The primary objective shall be to develop equipment and installation parameters that shall assure an electromagnetically compatible system. This objective shall be achieved through coordination of Signal System equipment selection and design, and installation design with the electromagnetic environment such as traction power supply, AC power distribution system, vehicle propulsion systems and nearby facilities and through the coordination of the equipment selection and design and installation design for all subsystems with each other.

C. The Contractor shall conduct such field surveys as required to determine the existing electromagnetic environment that may emanate from fixed facilities along the right-of-way that may interfere with the proper functioning of the Signal System equipments.

D. Approach to implementation of EMC shall include control of: conductivity coupled interference; interference coupled through common impedance; and interference coupled through radiated electric and magnetic fields.

E. The Contractor's equipment designs shall be immune to the residual alternating current present in the traction power system.

F. The Contractor's equipment designs shall be immune to the inductive and conductive emissions produced by the tractive effort control system.

G. The Contractor's equipment designs shall be immune to the inductive and conductive interference generated by the incoming power supply network.

H. The Contractor shall certify, through testing if necessary, the electromagnetic compatibility of equipment provided. Existing analyses and data, properly documented and verifiable for equipment and applications that are identical, may be used for this purpose.

I. The Contractor shall establish test requirements, test schedules and facilities; qualifications, both technical and managerial, of company personnel who will be specifically responsible to implement and control the overall EMI Control Program; and duties of any special review boards. The entire effort shall be integrated to assure continuity of effort and the progress of the efforts shall be subjected to continuous review in all the Contractor individual departments and at vendor facilities.

2.4 DELIVERY, STORAGE AND HANDLING
A. Not Used

PART 3 - EXECUTION

3.1 PRODUCTION
A. Not Used

3.2 INSTALLATION
A. In the selection, design, manufacture, and installation of all Signal System equipment, incorporate EMC concepts to minimize potential interference from within the Signal System and from nearby systems.

B. Consider the effect of signal equipment and other equipment sharing facilities.

C. Select train detection signal operating frequencies for overlay track circuits so as not to be affected by harmonics from rectification of traction power and controls of the vehicle propulsion subsystem.

D. Shield circuit wires and use twisted pairs in cables, as necessary, to minimize electrostatic and electromagnetic coupling.

E. Use cable sheath insulation and surge protection that shall withstand voltage transients and voltage spikes generated within the DC traction power system. Voltage variations include those lasting more than 500 microseconds, and voltage spikes include those lasting from 100 to 500 microseconds with amplitudes up to 2,700 volts. Select semiconductors to withstand maximum expected signal voltages without protection of surge suppressors. Assure that surge suppresser action starts above the maximum signal amplitudes but below the inherent breakdown voltages of semiconductors. Consider the effects of corona influence on voltage spikes, which will tend to limit the magnitude of large spikes, both positive and negative.

F. Consider the electromagnetic environment to which the Signal System will be exposed and incorporate techniques to minimize interference with system operation.

3.3 CABLE WIRING AND HARNESSING
A. Undesired proximity coupling among wires and cables interconnecting networks, chassis, and equipment racks is one of the principal causes of EMI. Group and separate wires and cables into similar classes by signal or power type and minimize EMI coupling between groups.

1. Use a wiring classification scheme to group wires and cables as follows:
   a. High-power AC and DC sources (50 volts and above).
   b. Low-power AC and DC sources (50 volts and below).
   c. Pulse and digital sources.
   d. Audio and sensor susceptible circuits.
   e. Video input and output circuits.
2. Power levels in adjacent wires within a common bundle or harness shall not exceed a 30 dB spread as a design goal.

3.4 SHIELDING

A. Shield signal cables and equipment enclosures against sources of electrostatic or electromagnetic interference considering the following items:

1. Make shields electrically continuous.
2. Use jumpers and electrical connector pins between connected sections to maintain uniform electrical continuity of the shield.
3. Clean surfaces to be connected to provide electrical homogeneity in the shield.
4. Use smallest possible openings in shields at connection points.
5. Use materials having high magnetic permeability, such as steel, for shielding low impedance or magnetic interference of low frequency.
6. Use materials having high conductivity such as copper and bronze for shielding high frequency interference.
7. Use metal conduits of high magnetic permeability in equipment rooms to enclose power wires that are a source of EMI to other equipment.
8. Use EMC gaskets made of conducting materials, such as copper or aluminum, where required, to seal removable panels, equipment drawers and doors. Compress all gaskets with sufficient pressure to assure an EMI seal at the point of maximum joint separation. The difference between maximum and minimum compressed heights of a gasket shall be sufficient to accommodate the joint unevenness of the mating surfaces.
9. Use metal barriers and compartments to separate equipment that generates EMI from other equipment.
10. Use metal screen covers over holes and openings in metal barriers and equipment enclosures, where required, to preserve shielding.
11. Minimize the number of joints, seams, inspection plates, adjustment holes, screened ventilation ports, gasket seals and openings.
12. Check equipment enclosures for EMI leaks through meters, switches, indicator lamps, fuse holders, handles and access doors.

3.5 GROUNDING AND BONDING

A. Grounding methods shall be designed to minimize the noise voltage generated by currents from two or more circuits flowing through a common ground impedance and to avoid creating ground loops that are susceptible to magnetic fields and differences in ground potential. Safety considerations also require the chassis or enclosure for electrical equipment be grounded to minimize passenger and Authority personnel shock hazards except in cases where a safety ground may be desirable at a point that would be unsuitable for a signal ground.

B. Design grounding equipment to accomplish the following:

1. Protect personnel and equipment from electrical hazards, including lightning, to the extent practicable.
2. Reduce potentials to grounding equipment neutrals.
3. Reduce or eliminate the effects of EMI and electrostatic interference arising within the Signal System.
4. Provide a single point grounding system for all equipment enclosures, cabinets, drawers, assemblies and chassis and cabinet subassemblies.
5. Isolate signal ground conductors from the equipment ground methods and from all enclosures, trays, conduits and structures.

C. The following guidelines shall be applied to grounding:

1. For all indoor and outdoor equipment requiring grounding, the grounding systems for enclosures, wireway, panels, switch boxes, pull boxes, conduits, terminal boxes, splice cases and similar enclosures to structures shall be designed to provide proper terminations for shielding and to avoid conducted coupling, low impedance ground loops and hazardous operation conditions.
2. All ground wires shall be sized in accordance with NEC requirements to provide an adequate conduction path for all possible fault and interference currents.
3. A single point ground wire shall not carry load currents.
4. Ground equipment racks and cabinets as required in these Specifications.
D. Design and implement bonding to accomplish the following:

1. Prevent static charge accumulation that could produce electromagnetic interference or constitute a personnel shock hazard.
2. Provide a homogeneous and stable ground plane.
   a. Provide a fault current return path.
   b. Prevent spurious development, rectification, and intermodulation of potentials between hardware elements.

E. Bonding shall be implemented through direct metal-to-metal contact. Continuous or multi-point bonding shall be preferred over single contact to reduce the concentration of high current densities at the point of contact.

F. Following guidelines shall be applied to bonding:

1. Clean all bare metal mating surfaces.
2. Where possible, weld all mating surfaces.
3. Where protective films are required, use film material with good conductivity, such as silver or gold plating.
4. Fastening methods shall exert sufficient pressure to hold the surfaces in contact, in the presence of deforming stresses, shock and vibrations associated with the equipment and its environment.
5. Paint shall not be used to establish electrical bonds.
6. Threads of screws or bolts shall not be used to establish bonds.
7. Ohmmeters shall not be used to evaluate RF bonds or RF gaskets.
8. Bonding of dissimilar metals shall be analyzed as to galvanic and electrolytic action.
9. Ground resistance shall be checked at the single point ground in each instrument housing and wayside device location to ensure that resistance to the single point ground does not exceed 0.5 ohm, and that resistance to ground is below 5 ohms.

3.6 TESTING

A. Perform tests, either separately or as part of other tests in accordance with these Specifications to ensure that EMI reduction techniques are effective on installed Signal System equipment.

B. Include the following items in these tests:

1. Susceptibility of equipment to electrical energy appearing on AC and DC power leads.
2. Susceptibility of equipment to spike interference on AC and DC power leads.
3. Susceptibility of equipment to intermodulation of unwanted and rejected signals at the input terminal.
4. Radiated magnetic field emissions from equipment, power cables and interconnecting wiring.
5. Radiated electric field emissions from equipment, power cables and interconnecting wiring.
6. Radiated susceptibility of equipment to short duration magnetic fields or spike interference on the input/output cabling.
7. Radiated susceptibility of equipment to magnetic fields and electric fields.
8. Grounding and Bonding:
   a. Personnel and system safety
   b. Floating grounds
   c. Ground loops
   d. Impedance coupling
   e. Resistance to the single point ground at each instrument housing and wayside device location.

C. When testing is required to document compliance with EMC criteria, submit EMC test plans for approval. Except where tests are to be performed in full accordance with published standards, include for each test, block diagrams depicting the test set-up, test instrumentation to be used, detailed procedures and method for recording data.

D. Submit test reports that are certified by a Licensed Texas Professional Engineer. The reports shall verify and document that EMC requirements have been incorporated into the Signal System design. Include the following items:

1. Test facility description, equipment grounding or bonding method, where required, to simulate actual equipment installation; physical layout and cabling of equipment under test; real or simulated dummy loads, and test instrumentation.
2. Modes of operation and operating frequency for each test, control settings on equipment tested, frequencies at which interference may
be expected and performance checks conducted.

3. Test procedure, including block diagrams depicting test setups, test instrumentation used, frequencies modulation characteristics of interfering signals, test data and test log summaries.

4. Discussion, in brief narrative form, of results and corrective actions initiated or proposed.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith will be considered incidental to the work specified under Section 16901 “Signal System Basic Technical Requirements.”

END OF SECTION 16978
PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section specifies the establishment and maintenance of Signal System Reliability and Maintainability (R&M) Program. The Signal System R&M Program shall be applied to obtain a valid assessment of the Mean Time Between Failure (MTBF) and Mean Time to Repair (MTTR) capabilities of all equipment furnished under this Contract.

1.2 REFERENCE STANDARDS

A. American Railway Engineering And Maintenance-of-Way Association (AREMA):

1. AREMA - Communications & Signals, Part 17.

B. Military Standards

1. MIL-HDBK-781 A - Reliability Testing For Engineering Development, Qualification, And Production

2. MIL-HDBK-338 Electronic Reliability Design Handbook. This handbook provides procuring activities and contractors with an understanding of the concepts, principles, and methodologies covering all aspects of electronic systems reliability engineering and cost analysis as they relate to the design, acquisition, and deployment of equipment or systems. Currently a two-volume set, it discusses the entire subject, heavily emphasizing the reasons for the reliability discipline. It includes general information, referenced documents, definitions, reliability theory, component reliability design considerations, application guidelines, specification control during acquisition, logistic support, failure reporting and analysis, reliability and maintainability theory, reliability specification allocation and prediction, reliability engineering design guidelines, reliability data collection and analysis, demonstration and growth, software reliability, systems reliability engineering, production and deployment reliability and maintainability (R&M), and R&M management considerations.

3. MIL-HDBK-H 108 Sampling Procedures and Tables for Life and Reliability Testing

4. MIL-STD-721C, Definition of Terms for reliability and Maintainability

1.3 DEFINITIONS

A. The following definitions apply specifically to terms used in this Section. Meanings of terms not defined herein are in accordance with the definitions in MIL-STD-721 and the latest edition of Quality Control and Reliability Handbook, H-108, as prepared by the Government Printing Office, Washington, D. C.

1. Mean Time Between Failure (MTBF): Average time that equipment will operate without a chargeable failure.

2. Mean Time to Repair (MTTR): Combined average time required to:
   a. Troubleshoot
   b. Repair equipment for operation after report of a failure.
   c. MTTR is measured from the time troubleshooting and repair work begins until restoration is completed.
   d. MTTR is a measure of maintainability of the design and equipment.
   e. Time required to locate and repair dependent (non-chargeable) failures shall be included in the total repair time.

1.4 SUBMITTALS

A. General

1. The Authority may accept, at its sole discretion, Contractor reliability data previously acquired from similar equipment and subsystems.

B. Reliability and Maintainability Program Plan

1. The Contractor shall submit for Authority approval a Reliability Program. The Program shall include:
   a. Key personnel in the Contractor's Reliability and Maintainability programs.
   b. Design, component selection details, and screening processes to be used to meet reliability requirements.
   c. Procedures, details, and formulas employed calculate MTBF and MTTR.
   d. Identification of sources proposed to be used for component reliability data.
   e. Proposed serialized type forms and reports, including preventive maintenance and discrepancy reports specifically for joint use by the Authority and the Contractor during field reliability assessment testing program.
   f. Plan and procedures for ensuring that subcontractors and suppliers comply with the R&M Program requirements.
g. Procedures to evaluate design changes for possible system reliability and maintainability impacts.

h. Provisions for providing calculated design reliabilities.

i. Plan and procedures for field reliability testing.

j. Plan and procedures for continual evaluation of field reliability testing results with accept-reject criteria.

k. Provisions for early fault detection and rapid fault isolation.

l. Provisions for providing a time log showing the actual factory time spent in repairing each piece of defective equipment removed during the course of the R&M Program.

m. Provisions for field repair time analysis.

n. Plan and procedures to track corrective measures and assess R&M impact of field equipment failures.

C. Predicted Reliability and Maintainability Reports

1. The Contractor shall initiate a study and submit to the Authority, a report documenting the Contractor’s predicted reliability for each subsystem. Where areas of common failure appear inherent in the design or equipment specified mode, an alternate design or equipment change shall be proposed for Authority approval.

2. Reports shall include complete methods and calculated R&M values. Actual performance data for a similar system for which reliability records have been maintained for a period of not less than five years, may be used to support or substantiate the submitted predicted R&M calculations.

3. Reports shall be updated and re-issued monthly and shall indicate by subsystem the estimated percent of design completion upon which reliability and maintainability predictions are based.

4. Reports shall include analysis of items for which prediction does not meet requirements or for which prediction has changed significantly from the last report. For items predicted not to meet requirements, proposed corrective action shall be described in the report.

5. During the design process, whenever the Contractor encounters reliability calculations in the design process that are below system design goals, an updated reliability report shall be created and forwarded to the Authority. If these reports indicate a marked decrease in predicted reliability, the Authority may require an alternate design or equipment change to increase calculated reliability to requirements specified in the Table of Reliability Goals.

1.5 QUALITY ASSURANCE

A. The reliability and maintainability assurance program shall meet the requirements of the AREMA Signal Manual, Part 17.4.1.

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIAL

A. Not Used

2.2 CONTRACTOR FURNISHED MATERIAL

A. Product of this Section consists of documents that establish and verify reliability goals have been met as specified.

2.3 DELIVERY, STORAGE AND HANDLING

A. Not Used

PART 3 - EXECUTION

3.1 PRODUCTION

A. The Contractor shall demonstrate system availability using engineering, analysis, and reliability tools and techniques, and report to the Authority that the Contractor’s design satisfies the specified system availability of not less than 99.5% for a 16-hour operating day under a seven day per week operation.

B. Assessment Program

1. Verification that equipment fulfills the reliability requirements described herein shall be accomplished via a reliability assessment program generally in accordance with MIL-HDBK-781 A.

2. Reliability values and requirements specified herein shall not be interpreted as a relaxation of signal control and interlocking system fail-safe design requirements.

3.2 INSTALLATION

A. Not Used

3.3 TESTING

A. Not Used
PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith will be considered incidental to the work specified under Section 16901 “Signal System Basic Technical Requirements.”

END OF SECTION 16995
PART 1 - GENERAL

1.1 DESCRIPTION

A. This section specifies providing and installing Operations and Maintenance Signs for the DART Light Rail Transit System (LRT).

B. Work shall consist of providing and installing Operations and Maintenance Signs including aluminum signs, traffic buttons, painted ties, sign posts, foundations, brackets and hardware; providing final camera-ready artwork for each sign; providing spares; providing all materials and labor required for complete sign and equipment installation in accordance with these specifications, the locations and details are shown in Table 1 below, and as shown on the Contract Drawings.

C. All Work must be coordinated and phased to avoid disruption to ongoing operations and construction.

1.2 REFERENCED STANDARDS

A. The following Codes, Regulations, Reference Standards and Specifications are used as references:

1. Codes and regulations of jurisdictional authorities.

B. All sign legends shall be computer generated and machine cut. Hand-rendered or hand-cut legends are not acceptable.

C. Sign colors, lettering, symbols and borders shall conform to the details shown in the Contract Drawings unless otherwise noted. All the above shall conform to TMUTCD, Standard Highway Sign Design for Texas and Standard Alphabets for Highway Signs and Pavement Markings.

1.3 SUBMITTALS

A. Submit the following for Authority approval and in accordance with these Specifications:

1. Contractor shall submit for Authority approval, manufacturer's technical data for sign materials and designs. Provide installation details and instructions for each type of sign and mounting required.

2. Contractor shall submit for approval:

a. Samples of the color and finish of aluminum materials and accessories required for the signs. The Authority's review of samples will be for color, texture, and materials only. Compliance with all other requirements is the exclusive responsibility of the Contractor. Furnish full-size samples of sign materials, when required by the Authority.

1) Office samples must be of sufficient size and quantity to clearly illustrate characteristics of the product. Include related parts and attachment devices and full range color, texture and pattern.

b. Shop Drawings: Submit shop drawings of all sign panels, components, parts and fittings. Provide installation procedures showing layout, jointing, complete anchoring and support systems for the various applications and mounting details for all signs. Drawings shall clearly show provisions or all performance functions described herein. Submit shop drawings for approval of details, sections, sign panels and signs at full size scale.

3. Final Design Review Packages shall include layout and installation drawings for wayside signs.

1.4 QUALITY ASSURANCE

A. Each sign shall be inspected prior to shipment. Inspection shall conform to the Suppliers inspection procedure.

B. AF track circuits shall meet the requirements of this contract and all applicable local, state and federal codes, reference standards, safety standards.

C. Each sign shall be inspected after it has been installed in the field. This inspection shall conform to the Contractor's Installation and Inspection Procedure as approved by the Authority. Installation shall not be considered complete until all installation defects have been corrected to the Authority's satisfaction.

1.5 QUALIFICATIONS

A. The sign manufacturer shall be an established firm, which is regularly engaged in the fabrication and installation of signs and approved by the Authority.
PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIAL

Not Used

2.2 CONTRACTOR FURNISHED MATERIAL

A. Maintenance Materials: Contractor shall provide 10 of each sign type used within the system, along with the corresponding mounting hardware.

B. Signs, Posts and Fasteners

1. All sign panels shall be made of aluminum, unless otherwise noted, and be manufactured or provided by the Contractor. All sign panels shall be manufactured by a sole source, and fabricated from material specified below under "Sign Panels".

2. Cut edges or drilled holes shall be deburred and smoothed.

3. Signposts and anchors must be square, 12 gauge galvanized steel Unistrut, or as approved by the Authority with 1/2-inch perforation on 1 inch centers. Signposts shall be 2 inches square. Anchor posts into the ground using a 2-piece breakaway anchor consisting of a 2-1/4 inches square, 3 feet long base, and 2-1/2 inches square, 1-1/2 feet long sleeve. Utilize connecting bolts, fittings and hardware as shown on Contract Drawings.

4. Concrete Grout shall be used for signpost anchor base installed in core-drilled concrete paving. Grout between anchor and concrete paving with concrete grout, fast setting, rapid strength gain 1000+ psi in 8 hours, and 5000+ psi in 24 hours. Grout shall be shrinkage compensating, contain no chloride, and comply with ASTM C1107 Types B and C. Use TXI Zip Crete as provided by Texas Industries (TXI) or approval equal.

5. Framing and Bracing shall use connecting bolts, fittings and hardware as shown on the Contract Drawings.

6. Sign Fastening shall use stainless steel hex-head lag bolts, washers, nuts, and clamps to attach signs to steel posts, braces, brackets, fences, guardrails and gates. Paint all exposed fastenings to match adjacent areas.

7. Special Fasteners shall be Hilti, Authority approved equal, anchor bolts and adhesives to secure signs or sign brackets to walls. Install as shown on the Contract Drawings and in these Specifications.

C. Sign Panels

1. All signs shall be solid one-piece panels.

2. Provide final camera-ready artwork for each sign.

3. Sign face shall not be permanently defaced by steam, acids, aromatics, scratching, inks or paints, and shall readily wipe clean with paint remover and solvents without affecting appearance or legibility of the sign finish or graphics.

4. Sign face shall retain legibility and finished appearance when sprayed with a 10 percent solution of nitric hydrochloric, or sulphuric acid for 30 minutes, or when scrubbed by a brush of medium hardness using common commercial cleaning compounds such as ammonia, detergents, laundry soaps, carbon tetrachloride, or petroleum base solvents.

5. Sign edges shall not be crazed or cracked and edge finish shall be smooth, clean, and neat.

6. Finished sign shall be absolutely flat.

7. All signs must have the holes drilled and sealed per type of installation as noted in the tables and Contract Drawings.

8. All signs shall have rounded corners with a 1-1/4-inch radius.

9. Reflectivity requirements: All sign copy and graphics shall be screen painted over 3M Scotchlite Reflective Sheeting Diamond Grade VIP (Visual Impact Performance) or Authority approved equal.

10. A protective covering shall be placed on and between signs to prevent damage during shipment. Damaged signs shall not be accepted.

11. Minimum standard sign panel thickness shall be 0.125 inches.

12. Sign face shall be warranted for a period of 10 years against chipping, delaminating and fading.

D. Table 1 provides a list and description of signs in this Contract. Each sign shall be fabricated according to the graphics and the specification sheets. Preliminary locations of Operations and Maintenance (O&M) mainline signs are indicated on the single line Contract Drawings.
PART 3 - EXECUTION

3.1 INSPECTION
A. Prior to procurement and shop drawing submittal, the Contractor shall examine the site locations and conditions under which signs are to be installed.
B. Prior to signage installation, the Contractor shall mark each sign location with a flag, paint mark, tape, or survey stick. The Authority's inspector shall approve each sign location prior to installation.
C. Contractor is responsible for location of underground utilities coordination Work.

3.2 ERECTION METHODS DETAILS
A. Install signs as shown in Authority approved Installation Contract Drawings. Installation types and methods include, but are not limited to the following:
   1. Unistrut post installations shall be in ballast, concrete, asphalt, pavers, or soil. Concrete is required when signs are located on pavements or other solid structures.
   2. When installing on painted ties, clean the tie surface before applying paint and apply 2 coats of paint on concrete ties and 4 coats of paint on wooden ties and apply glass beads per manufacturer's direction.
B. Post Erection: For each post, drive an anchor, then a sleeve into the ground with a pneumatic post driver. Install anchor and sleeve plumb. Drive directly into ballast rock, gravel, asphalt, dirt, or other material. On concrete paving, core drill a 3 to 4 inch diameter hole through the concrete, then drive an anchor and sleeve. Apply grout in between anchor sleeve and concrete, making grout flush with existing concrete. All anchors and sleeves shall be exposed from 1 to 2 inches above grade for bolt connections. Post should extend into anchor between 6 and 8 inches. Secure post with 90-degree bend stainless steel anchor bolt and the post must be plumb.
C. Dispose of surplus excavated material.
D. On bridges install posts in accordance with the Authority approved Contract Drawings.

3.3 INSTALLATION
A. Install sign units and components at the locations shown, securely mounted, in accordance with these Specifications.
B. Install signs level, plumb, and at the proper height. Coordinate with other contractors for installation of sign units to finished surface. Repair or replace damaged units as directed by the Authority.

3.4 TEMPORARY COVERS
A. Signs installed prior to their operational or testing function shall be covered to conceal the sign face from view.
B. Coverings shall be of a dark gray or black plastic heavy-duty material acceptable to the Authority, neatly affixed to sign face with matching or concealed fasteners. When coverings are removed, clean the signs and treat faces with antistatic solution.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL
A. The Work specified in this section will not be measured separately for payment.

4.2 PAYMENT
A. All costs connected herewith will be considered incidental to the work specified under Section 16901 “Signal System Basic Technical Requirements.”

# Sign OM-1, Permanent Speed Restriction

## Description

<table>
<thead>
<tr>
<th>Alphanumeric Colors:</th>
<th>BLACK</th>
</tr>
</thead>
<tbody>
<tr>
<td>Border Color:</td>
<td>BLACK</td>
</tr>
<tr>
<td>Background Color:</td>
<td>REFLECTIVE WHITE</td>
</tr>
<tr>
<td>Sign Shape:</td>
<td>SQUARE</td>
</tr>
<tr>
<td>Sign Size:</td>
<td>18 inches by 18 inches</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Alphanumeric:</th>
<th>Type: Series E *note</th>
</tr>
</thead>
<tbody>
<tr>
<td>Size:</td>
<td>8 inches *note</td>
</tr>
</tbody>
</table>

| Message Position:    | Centered top-to-bottom and left-to-right. |

| Border Width:        | ½ to ¾ inch, or equal but not to exceed stroke width of alphanumeric. |

| Border Placement:    | Set ½ inch from sign edge. |

(drawing not to scale)

## Indication: Reduce/Increase Speed to That Indicated on Sign

Numeral indicates maximum authorized speed.

## Remarks

### Purpose:

To provide operator the speed regulation in accordance with maximum authorized speed for particular segments of the system.

### Criteria:

<table>
<thead>
<tr>
<th>Sign Placement:</th>
<th>To be placed at full service braking distance when approaching lower speed restriction change points or at 3-car train distance in advance of higher speed restriction change points.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>In Cab Signal Territory, place a sign at block boundary where the maximum authorized speed code changes.</td>
</tr>
</tbody>
</table>

**Vertical:**

Should be within Train Operator’s normal field of view (9 feet from top of sign to top of rail), provided adequate clearance exists and line-of-sight is unobstructed.

**Horizontal:**

Signage posts should be placed at 9 feet from the track center, provided adequate clearance exists (including between LRT and Freight) and line-of-sight is unobstructed.

### Notes:

* Alphanumeric series and size based on two-digit speed restriction.

Signs should be installed adjacent to each track for normal and reverse running.
## Sign OM-2, DIVERGE SPEED

### DESCRIPTION

<table>
<thead>
<tr>
<th>Alphanumerics Color:</th>
<th>BLACK</th>
</tr>
</thead>
<tbody>
<tr>
<td>Border Color:</td>
<td>BLACK</td>
</tr>
<tr>
<td>Background Color:</td>
<td>REFLECTIVE WHITE</td>
</tr>
<tr>
<td>Sign Shape:</td>
<td>SQUARE</td>
</tr>
<tr>
<td>Sign Size:</td>
<td>18 inches by 18 inches</td>
</tr>
<tr>
<td>Alphanumerics:</td>
<td></td>
</tr>
<tr>
<td>Type:</td>
<td>Series E *note</td>
</tr>
<tr>
<td>Size:</td>
<td>6 inches *note</td>
</tr>
<tr>
<td>Message Position:</td>
<td>Centered top-to-bottom and left-to-right.</td>
</tr>
<tr>
<td>Border Width:</td>
<td>½ to ¾ inch, or equal but not to exceed stroke width of alphanumerics.</td>
</tr>
<tr>
<td>Border Placement:</td>
<td>Set ½ inch from sign edge.</td>
</tr>
</tbody>
</table>

(drawing not to scale)

### INDICATION: REDUCE SPEED TO THAT INDICATED ON SIGN FOR DIVERGING MOVE

Numeral indicates maximum authorized speed for diverging move through turnout.

### REMARKS

<table>
<thead>
<tr>
<th>Purpose:</th>
<th>To identify maximum authorized speed for diverging move through turnout.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Criteria:</td>
<td>Sign Placement: To be placed adjacent to home signal governing turnout.</td>
</tr>
<tr>
<td>Vertical:</td>
<td>Should be within Train Operator’s normal field of view (9 feet from top of sign to top of rail), provided adequate clearance exists and line-of-sight is unobstructed.</td>
</tr>
<tr>
<td>Horizontal:</td>
<td>Signage posts should be placed at 9 feet from the track center, provided adequate clearance exists (including between LRT and Freight) and line-of-sight is unobstructed.</td>
</tr>
<tr>
<td>Notes:</td>
<td>*Alphanumerics series and size based on 25 m.p.h. speed restriction for diverging movement. Signs should be installed adjacent to each track for normal and reverse running.</td>
</tr>
</tbody>
</table>
WAYSIDE SIGNS - SIGNAL SYSTEM

Sign OM-3, WHISTLE

DESCRIPTION

<table>
<thead>

</tr>
</tbody>
</table>

(Drawing not to scale)

INDICATION: SOUND WHISTLE PER RULES APPROACHING GRADE CROSSING OR DESIGNATED AREA.

REMARKS

Purpose: To identify point prior to grade crossings or other designated areas where train operator is to start sounding whistle.

Criteria: Sign Placement: To be placed at distance where train traveling at maximum allowable speed is ten seconds in approach to crossing or other designated area.

Vertical: Should be within Train Operator’s normal field of view (9 feet from top of sign to top of rail), provided adequate clearance exists and line-of-sight is unobstructed.

Horizontal: Signage posts should be placed at 9 feet from the track center, provided adequate clearance exists (including between LRT and Freight) and line-of-sight is unobstructed.

Notes: Signs should be installed adjacent to each track for normal running only.

</tbody>
</table>

**Indication:**
INDICATES END OF AUTOMATIC BLOCK SIGNALING TERRITORY.
Line-of-sight operations begin here.

## Remarks

**Purpose:**
To identify the end of automatic block signaling territory and the beginning of line-of-sight operations.

**Criteria:**
- **Sign Placement:** To be placed adjacent to first signal in signalized territory.
  - Vertical:
    - Should be within Train Operator's normal field of view (9 feet from top of sign to top of rail), provided adequate clearance exists and line-of-sight is unobstructed.
  - Horizontal:
    - Signage posts should be placed at 9 feet from track center, provided adequate clearance exists and line-of-sight is unobstructed.

**Notes:**
- *Series E may be used for “END” but not required.
Signs should be installed adjacent to each track for normal and reverse running.
### Sign OM-7, YARD LIMIT

</table>
## Sign OM-8, STOP

### DESCRIPTION

<table>
<thead>
<tr>
<th>Alphanumerics</th>
<th>REFLECTIVE WHITE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Colors:</td>
<td>REFLECTIVE WHITE</td>
</tr>
<tr>
<td>Border Color:</td>
<td>REFLECTIVE RED</td>
</tr>
<tr>
<td>Background Color:</td>
<td>OCTAGON</td>
</tr>
<tr>
<td>Sign Shape:</td>
<td>24 inches by 24 inches on horizontal and vertical axes for fixed signs. *note</td>
</tr>
<tr>
<td>Sign Size:</td>
<td>24 inches by 24 inches</td>
</tr>
</tbody>
</table>

Alphanumerics:
- **Type:** Series C **note
- **Size:** 8 inches
- **Message Position:** Centered top-to-bottom and left-to-right.
- **Border Width:** ½ to ¾ inch, or equal but not to exceed stroke width of alphanumerics.
- **Border Placement:** Set flush with sign edge.

(Drawing not to scale)

### INDICATION: STOP.

### REMARKS

**Purpose:** To indicate a full stop. Should proceed only as instructed by Operating Rulebook.

**Criteria:**

**Sign Placement:** To be placed on all bumping post and stub end tracks. Also may be used as a temporary sign in approach to construction, hazards, or other locations as noted in the plans.

**Vertical:** Should be within Train Operator’s normal field of view (9 feet from top of sign to top of rail), provided adequate clearance exists and line-of-sight is unobstructed.

**Horizontal:** Signage posts should be placed at 9 feet from the track center, provided adequate clearance exists (including between LRT and Freight) and line-of-sight is unobstructed.

**Notes:**

*Handheld signs (for use by maintenance crew in temporary situation) should be "18 inches by 18 inches", Series C, 6 inch; have a lightweight, tubular staff of minimum 9 inches made of a lightweight material. Use of handheld STOP Signs covered under flagging procedures in Operating Rulebook.*

**Specification as per TX MUTCD STOP sign MR1-1.**
## Sign OM-9, SAFETY STOP

### DESCRIPTION

- **Alphanumerics:** REFLECTIVE WHITE
- **Colors:** REFLECTIVE WHITE
- **Border Color:** REFLECTIVE RED
- **Background Color:** OCTAGON
- **Sign Shape:** OCTAGON
- **Sign Size:** 24 inches by 24 inches on horizontal and vertical axes for fixed signs. *note
- **Alphanumerics:**
  - **Type:** Series C *note
  - **Size:** 4 inches
- **Message Position:** Centered top-to-bottom and left-to-right.
- **Border Width:** ½ to ¾ inch, or equal but not to exceed stroke width of alphanumerics.
- **Border Placement:** Set flush with sign edge.

(Drawing not to scale)

### INDICATION: STOP. THEN PROCEED IF PERMISSIBLE AND REQUIRED.

### REMARKS

<table>

### Sign OM-11, AUXILIARY LIGHTS OFF

**DESCRIPTION**

- **Alphanumerics:**
  - **Colors:** BLACK
  - **Border Color:** BLACK
  - **Background Color:** REFLECTIVE WHITE
  - **Sign Shape:** SQUARE
  - **Sign Size:** 18 inches by 18 inches
- **Alphanumerics:**
  - **Type:** Series D
  - **Size:** 5 inches
  - **Message Position:** Centered top-to-bottom and left-to-right.
  - **Border Width:** ½ to ¾ inch, or equal but not to exceed stroke width of alphanumerics.
  - **Border Placement:** Set ½ inch from sign edge.

(Drawing not to scale)

**INDICATION:** TURN AUXILIARY LIGHTS OFF.

**REMARKS**

<table>
<thead>
<tr>
<th>Purpose:</th>
<th>To identify the point where auxiliary lights are to be off. Lights are to be off for CBD and Lancaster areas.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Criteria:</td>
<td>Sign Placement: To be placed at points entering areas where lights are to be off, such as CBD and Lancaster areas.</td>
</tr>
<tr>
<td></td>
<td>Vertical: Should be within Train Operator’s normal field of view (9 feet from top of sign to top of rail), provided adequate clearance exists and line-of-sight is unobstructed.</td>
</tr>
<tr>
<td></td>
<td>Horizontal: Signage posts should be placed at 9 feet from the track center, provided adequate clearance exists (including between LRT and Freight) and line-of-sight is unobstructed.</td>
</tr>
<tr>
<td>Notes:</td>
<td>*Alpha characters made need to be compressed 10 – 15%. Sign should be installed for normal running for each track.</td>
</tr>
<tr>
<td>Description:</td>
<td>Alphanumerics</td>
</tr>
<tr>
<td>--------------</td>
<td>---------------</td>
</tr>
<tr>
<td>Color:</td>
<td>BLACK</td>
</tr>
<tr>
<td>Border Color:</td>
<td>BLACK</td>
</tr>
<tr>
<td>Background Color:</td>
<td>REFLECTIVE ORANGE</td>
</tr>
<tr>
<td>Sign Shape:</td>
<td>SQUARE</td>
</tr>
<tr>
<td>Sign Size:</td>
<td>24 inches by 24 inches</td>
</tr>
<tr>
<td>Alphanumerics Type:</td>
<td>Series C *note</td>
</tr>
<tr>
<td>Size:</td>
<td>12 inches *note</td>
</tr>
<tr>
<td>Message Position:</td>
<td>Centered top-to-bottom and left-to-right.</td>
</tr>
<tr>
<td>Border Width:</td>
<td>½ to ¾ inch or equal but not to exceed stroke width of alphanumerics.</td>
</tr>
<tr>
<td>Border Placement:</td>
<td>Set ½ inch in from sign edge.</td>
</tr>
</tbody>
</table>

**INDICATION:** REDUCE SPEED FOR TEMPORARY SPEED RESTRICTION AS POSTED.
Numerical indicates maximum authorized track speed. Continue at restricted speed until indicated to resume normal track speed.

**REMARKS**

**Purpose:** To identify a temporary maximum allowable track speed due to scheduled maintenance activities and unusual or adverse operating conditions.

**Criteria:**

<table>
<thead>
<tr>
<th>Sign Placement:</th>
<th>To be placed at full service braking distance in approach to temporary speed restriction.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vertical:</td>
<td>Should be placed so that it can be easily staked (approx. 3 to 4 feet from top of rail.)</td>
</tr>
<tr>
<td>Horizontal:</td>
<td>Signage posts should be placed as determined by Operations Personnel in the field.</td>
</tr>
</tbody>
</table>

**Notes:** *Based on worst case of recommended m.p.h. signs for initial operations (40 m.p.h.) as illustrated above. Restricted format is a blank alphanumeric field and is to be used for restricted speeds of 20 m.p.h. or less. Sign is to be used in conjunction with the RESUME SPEED SIGN. Mounting will be temporary and capable of being staked.*
# Wayside Signs - Signal System

## Sign OM-13, Temporary Resume Speed

### Description

**Alphanumerics**
- **Colors:** REFLECTIVE WHITE
- **Border Color:** REFLECTIVE WHITE
- **Background Color:** REFLECTIVE GREEN
- **Sign Shape:** SQUARE
- **Sign Size:** 18 inches by 18 inches
- **Alphanumerics:**
  - **Type:** Series E
  - **Size:** 12 inches
- **Message Position:** Centered top-to-bottom and left-to-right.
- **Border Width:** ½ to ¾ inch, or equal but not to exceed stroke width of alphanumerics.
- **Border Placement:** Set flush with sign edge.

(Drawing not to scale)

**Indication:** Resume speed for normal authorized speed.

### Remarks

**Purpose:** To identify point at which the train can resume speed to normal maximum allowable speed for that line section.

**Criteria:**
- **Sign Placement:** To be placed at end of temporary speed restriction.
  - **Vertical:** Should be placed such that it can easily be staked (approx. 3 to 4 feet from top of rail.)
  - **Horizontal:** Signage posts should be placed at 9 feet from the track center, provided adequate clearance exists (including between LRT and Freight) and line-of-sight is unobstructed.

**Notes:** Sign is to be used in conjunction with TEMPORARY SPEED SIGN. Mounting will be temporary and capable of being staked.

</tbody>
</table>
### Sign OM-16, END BLOCK

#### DESCRIPTION

**Alphanumerics**
- **Colors:** BLACK
- **Border Color:** BLACK
- **Background Color:** REFLECTIVE YELLOW
- **Sign Shape:** TRIANGLE (inverted)
- **Sign Size:** 18 inches by 18 inches by 18 inches *note

**Alphanumerics:**
- **Type:** Series C
- **Size:** 6 inches **note
- **Message Position:** Centered top-to-bottom and left-to-right.
- **Border Width:** ½ to ¾ inch, or equal but not to exceed stroke width of alphanumerics.
- **Border Placement:** Set ½ inch from sign edge.

(Drawing not to scale)

#### INDICATION:
**END OF BLOCK INDICATOR TERRITORY.**
Line-of-sight territory begins here.

#### REMARKS

**Purpose:** To identify the end of block indicator territory.

**Criteria:**

**Sign Placement:** To be placed where block indicator territory ends and line-of-sight operation begins.

- **Vertical:** Should be within Train Operator's normal field of view (9 feet from top of sign to top of rail), provided adequate clearance exists and line-of-sight is unobstructed.

- **Horizontal:** Signage posts should be placed at 9 feet from the track center, provided adequate clearance exists (including between LRT and Freight) and line-of-sight is unobstructed.

**Notes:**
* Size may vary. Will be based on actual clearance available. Not to exceed signal head clearance envelope by more than 2 inches on either side.

** May need to compress alphanumerics width by 20%.

Sign is to be used in conjunction with START BLOCK SIGN and, when applicable, with INTERMEDIATE BLOCK SIGN.
### Sign OM-18, NO CLEARANCE

#### DESCRIPTION

<table>
<thead>
<tr>
<th>Alphanumeric</th>
<th>BLACK</th>
</tr>
</thead>
<tbody>
<tr>
<td>Border Color</td>
<td>BLACK</td>
</tr>
<tr>
<td>Background Color</td>
<td>REFLECTIVE YELLOW</td>
</tr>
<tr>
<td>Sign Shape</td>
<td>RECTANGLE *note</td>
</tr>
<tr>
<td>Sign Size</td>
<td>6 inches by 44 inches **note</td>
</tr>
</tbody>
</table>

Alphanumeric:
- **Type:** Series C
- **Size:** 3 inches
- **Message Position:** Centered top-to-bottom and left-to-right.
- **Border Width:** ½ to ¾ inch or equal but not to exceed stroke width of alphanumeric.
- **Border Placement:** Set ½ inch from sign edge.

(Drawing not to scale)

#### INDICATION:
AREA HAS NO SAFE REFUGE TO STAND OR WALK IN THE RIGHT-OF-WAY.

#### REMARKS

<table>
<thead>
<tr>
<th>Purpose:</th>
<th>To identify areas in the right-of-way where clearance is sufficiently reduced so as to cause hazard to patron or personnel.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Criteria:</td>
<td>Sign Placement: To be placed at site-specific locations where clearance is less than 8’ – 6” from center of track to a continuous structure on tangent track.</td>
</tr>
<tr>
<td></td>
<td>Vertical: Should be within personnel and patron normal field of view.</td>
</tr>
<tr>
<td></td>
<td>Horizontal: Signage should be placed as close to affected area as site allows.</td>
</tr>
<tr>
<td>Notes:</td>
<td>* Sign shape should be rectangular with long sides vertical.</td>
</tr>
<tr>
<td></td>
<td>** Based on Burlington Northern operational sign, with adjustment for adding ½ inch border and border offset. Could be used in conjunction with warning strips denoting extent of no clearance area.</td>
</tr>
</tbody>
</table>
## Sign OM-19, SECTION INSULATOR

<table>
<thead>
<tr>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Color: REFLECTORIZED BLUE</td>
</tr>
<tr>
<td>Size: 4 inches by 4 inches minimum *note</td>
</tr>
<tr>
<td>(6 inches by 6 inches preferred)</td>
</tr>
<tr>
<td>Type: 2-way reflectorized pavement marker</td>
</tr>
<tr>
<td>with one-color (blue housing) **note</td>
</tr>
</tbody>
</table>

(drawing not to scale)

### INDICATION: LOCATION OF SECTION INSULATOR.

### REMARKS

| Purpose: | To advise Train Operator that train will be entering an area where overhead power can be de-energized. |
| Criteria: | Sign Placement: Not a sign proper. Section Insulator indicated by reflectorized blue pavement marker affixed to tie at a minimum distance of one (1) car length. |
|          | Vertical: not applicable. |
|          | Horizontal: not applicable. |
| Notes:   | * There is no sign for section insulator indication. Section Insulator indicated by reflectorized blue pavement marker affixed to tie. |
|          | ** Pavement markers are as indicated above and as described in TX MUTCD Section 3A-3. |
## Sign OM-21, FOULING POINT MARKER

### DESCRIPTION

**Paint Color:** REFLECTIVE YELLOW  *note

USE AEXCEL – CHLORINATED RUBBER TRAFFIC PAINT OR EQUAL AND APPLY GLASS BEADS.

(Drawing not to scale)

### INDICATION:
INDICATES FOULING POINTS AT TURNOUTS IN LINE-OF-SIGHT OR YARD TERRITORY.

### REMARKS

<table>
<thead>
<tr>
<th>Purpose</th>
<th>To identify point at turnout to prevent fouling.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Criteria</th>
<th>Sign Placement:</th>
<th>Not a sign proper. Fouling point indicated by painted yellow tie. To be installed at locations noted in the tables.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Vertical:</td>
<td>not applicable.</td>
</tr>
<tr>
<td></td>
<td>Horizontal:</td>
<td>not applicable.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Notes:</th>
<th>* There is no sign for fouling point indication. Fouling point is to be indicated by painted yellow tie.</th>
</tr>
</thead>
</table>
### Sign OM-22, APPLY BRAKE FOR CROSSOVER

#### DESCRIPTION

<table>
<thead>
<tr>
<th>Description</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alphanumeric Colors</td>
<td>BLACK</td>
</tr>
<tr>
<td>Border Color</td>
<td>BLACK</td>
</tr>
<tr>
<td>Background Color</td>
<td>REFLECTIVE YELLOW</td>
</tr>
<tr>
<td>Sign Shape</td>
<td>DIAMOND</td>
</tr>
<tr>
<td>Sign Size</td>
<td>18 inch sides *note</td>
</tr>
<tr>
<td>Alphanumeric Type</td>
<td>Series D, E</td>
</tr>
<tr>
<td>Alphanumeric Size</td>
<td>6 inches</td>
</tr>
<tr>
<td>Message Position</td>
<td>Centered top-to-bottom and left-to-right</td>
</tr>
<tr>

<td>½ to ¾ inch, or equal but not to exceed stroke width of alphanumerics</td>
</tr>
<tr>
<td>Border Placement</td>
<td>Set ½ inch from sign edge</td>
</tr>
</tbody>
</table>

(Drawing not to scale)

#### INDICATION: APPLY BRAKES AT THIS POINT IF STOPPING AT NEXT CROSSOVER LOCATION.

#### REMARKS

**Purpose:**

To identify the point, under normal track conditions, where brakes should be applied to prepare for a stop at next crossover in unsignalized territory.

**Criteria:**

<table>
<thead>
<tr>
<th>Criteria</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sign Placement</td>
<td>To be placed at safe braking distance in approach to signal or fouling point of crossover. Used in line-of-sight territory.</td>
</tr>
<tr>
<td>Horizontal</td>
<td>Signage posts should be placed at 9 feet from the track center, provided adequate clearance exists (including between LRT and Freight) and line-of-sight is unobstructed.</td>
</tr>
<tr>
<td>Vertical</td>
<td>Should be within Train Operator’s normal field of view (9 feet from top of sign to top of rail), provided adequate clearance exists and line-of-sight is unobstructed.</td>
</tr>
</tbody>
</table>

**Notes:**

*Axes of diamond should be equal in length. Sides of sign should be equal length (18”). Line separating “A” and “B” should equal ½ the stroke width of alphanumerics, not to exceed ½ inch. Signs should be installed adjacent to each track for normal and reverse running.*
**WAYSIDE SIGNS - SIGNAL SYSTEM**

**Sign OM-23, BRAKE FOR STATION**

<table>

</tr>
<tr>
<td><strong>Border Width:</strong> ½ to ¾ inch or equal but not to exceed stroke width of alphanumerics.</td>
</tr>
<tr>
<td><strong>Border Placement:</strong> Set ½ inch from sign edge.</td>
</tr>
</tbody>
</table>

**INDICATION:** APPLY BRAKES AT THIS POINT FOR MANDATORY STOP AT NEXT STATION.

**REMARKS**

| Purpose: To identify the point, under normal track conditions, where brakes should be applied to prepare for a stop at a mandatory stop station. |
| Criteria: Sign Placement: To be placed at braking distance for a train at a braking rate of 2.75 mphps to stop at the mandatory stop station. |
| **Vertical:** Should be within Train Operator’s normal field of view (9 feet from top of sign to top of rail), provided adequate clearance exists and line-of-sight is unobstructed. |
| **Horizontal:** Signage posts should be placed at 9 feet from the track center, provided adequate clearance exists (including between LRT and Freight) and line-of-sight is unobstructed. |
| Notes: * Compress spacing on “BRAKE” by 20 to 25%. |
| Signs installed for normal direction track only. |
### Sign OM-24, END OF WIRE

**DESCRIPTION**

<table>
<thead>
<tr>
<th>Alphanumerics</th>
<th>BLACK</th>
</tr>
</thead>
<tbody>
<tr>
<td>Colors:</td>
<td>BLACK</td>
</tr>
<tr>
<td>Background Color:</td>
<td>REFLECTIVE YELLOW</td>

<td>Series C</td>
</tr>
<tr>
<td>Size:</td>
<td>5 inches</td>
</tr>
<tr>
<td>Message Position:</td>
<td>Centered top-to-bottom and left-to-right.</td>
</tr>
<tr>
<td>Border Width:</td>
<td>½ to ¾ inch, or equal but not to exceed stroke width of alphanumerics.</td>
</tr>
<tr>
<td>Border Placement:</td>
<td>Set ½ inch from sign edge.</td>
</tr>
</tbody>
</table>

(Drawing not to scale)

**INDICATION:** STOP, END OF CATENARY WIRE.

**REMARKS**

**Purpose:** To identify the point on tracks where catenary ends; or locations where the pantograph would come off the wire.

**Criteria:** Sign Placement: (A or B as applicable)

- A. To be placed in catenary structure one car length approaching end of wire condition.

- B. To be placed on a signpost or structure in advance of where the pantograph would lose contact with the catenary wire.

**Notes:** *Rectangle should have long sides horizontal and rounded corners.*
Sign OM-25, BERTHING MARKER

DESCRIPTION

Alphanumerics: REFLECTIVE WHITE
Colors:
Border Color: REFLECTIVE WHITE
Background Color: REFLECTIVE BLUE
Sign Shape: RECTANGLE *note
Sign Size: 8 inches by 12 inches
Alphanumerics:
  Type: Series D
  Size: 8 inches
Message Position: Centered top-to-bottom and left-to-right.
Border Width: ½ to ¾ inch or equal but not to exceed stroke width of alphanumerics.
Border Placement: Set flush with sign edge.

(Drawing not to scale)

INDICATION: STOPPING LOCATION FOR 1, 2 OR 3 VEHICLE CONSISTS.
Numeral indicates berthing position for 1, 2 or 3 vehicle consists.

REMARKS

Purpose: To identify areas in the right-of-way where train of designated consist is required to stop.

Criteria:

Sign Placement: To be affixed to ties by brackets. The locations of berthing markers for stations are noted in the tables.

Vertical: Signage is tilted so base of sign rests flush with tie. Top of signage to be tilted so aligned with top-of-rail but still providing clearance.

Horizontal: To be placed to the fullest extent of the tie.

Notes: * Rectangular to have long sides vertical.
## Sign OM-26, MILE POST MARKER

### DESCRIPTION

<table>
<thead>
<tr>
<th>Alphanumerics</th>
<th>REFLECTIVE WHITE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Colors:</td>
<td>REFLECTIVE WHITE</td>
</tr>
<tr>
<td>Background Color:</td>
<td>REFLECTIVE BLUE</td>
</tr>
<tr>
<td>Sign Shape:</td>
<td>RECTANGLE *note</td>
</tr>
<tr>
<td>Sign Size:</td>
<td>8 inches by 24 inches</td>

<tr>
<td>Alphanumerics:</td>
<td></td>
</tr>
<tr>
<td>Type:</td>
<td>Series D</td>
</tr>
<tr>
<td>Size:</td>
<td>2 inches to 2 ½ inches</td>
</tr>
<tr>
<td>Message Position:</td>
<td>Centered top-to-bottom and left-to-right.</td>
</tr>
<tr>
<td>Border Width:</td>
<td>½ to ¾ inch, or equal but not to exceed stroke width of alphanumerics.</td>
</tr>
<tr>
<td>Border Placement:</td>
<td>Set flush with sign edge.</td>
</tr>
</tbody>
</table>

### INDICATION:
Indicates mile location along right-of-way. Letters identify main trunk or branch line section. Numerals indicate tens, units, tenths and hundredths of miles.

### REMARKS

**Purpose:**
To identify mile location along right-of-way.

**Criteria:**

<table>
<thead>
<tr>
<th>Sign Placement:</th>
<th>To be affixed to signal masts, freestanding posts, and tunnel walls as required. To be placed every 0.1 miles in tunnels.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vertical:</td>
<td>Signage to be placed within maintainers' field of view (approx. 3 to 4 foot height from top-of-rail) except in tunnel areas.</td>
</tr>
<tr>
<td>Horizontal:</td>
<td>Signage on freestanding posts should be placed in-between tracks, except on bridges with center walkways, provided adequate clearance exists and line-of-sight is unobstructed.</td>
</tr>
</tbody>
</table>

**Notes:**
*Mile markers have five total spaces with top space identifying line section using Y = YARD, P = NC-1 & 2, T = TRUNK (OC-1 & 2/CBD), S = SOC-1 & 2, and W = WOC-1 & 2.; remaining spaces indicating tens of miles, unit miles; tenths of a mile; and hundredths of a mile; and whole miles separated from fractional miles section by a horizontal line equal to stroke width of the numerals. For whole miles under ten, the tens space will be blank.*
### Sign OM-27, SHOP TRACK NUMBER

#### DESCRIPTION

| Alphanumerics | REFLECTIVE WHITE |
| Border Color   | N/A               |
| Background Color| REFLECTIVE BLUE  |
| Sign Shape     | SQUARE            |

### INDICATION:
INDICATES CHAIN MARKER ALONG THE RIGHT-OF-WAY IN EACH DIRECTION.

### REMARKS

**Purpose:** To identify location of chain marker along right-of-way in each direction. The signs reflect the engineering stationing.

**Criteria:**

| Sign Placement: | To be affixed to catenary poles at stationings shown in the schedule (Placed approx. every 500 feet.) |
| Vertical: | Should be within Train Operator’s normal field of view (9 feet from top of sign to top of rail), provided adequate clearance exists between LRV and Freight and line-of-sight is unobstructed. |
| Horizontal: | Signage to be affixed to catenary poles as noted in the schedule. |

**Notes:** For each sign legend see the schedule.
## Sign OM-34, GATE IDENTIFICATION

### DESCRIPTION

<table>

</tr>
</tbody>
</table>

(Drawing not to scale)

### INDICATION: INDICATES GATE LOCATION ON LINE SECTIONS.

### REMARKS

<table>
<thead>
<tr>
<th>Purpose:</th>
<th>To identify gate location at the stations on each corridor.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Criteria:</td>
<td>Sign Placement: To be affixed to each gate approx. at stationing shown in schedule.</td>
</tr>
<tr>
<td></td>
<td>Vertical: Should be within personnel and patron normal field of view.</td>
</tr>
<tr>
<td></td>
<td>Horizontal: Signage to be affixed to the gates and centered from left to right.</td>
</tr>
</tbody>
</table>

| Notes: | *Rectangle to have long sides horizontal. |
|        | **Signs shall be mounted back-to-back to be visible from both sides of the gate. |
## Sign OM-35, TWC CALL

### DESCRIPTION

| Alphanumerics: | BLACK |
| Colors: | BLACK |
| Background Color: | REFLECTIVE WHITE |
| Sign Shape: | SQUARE |
| Sign Size: | 18 inches by 18 inches |
| Alphanumerics: | Series D *note, C, B |
| Type: | 2 inches |
| Size: | Centered top-to-bottom and left-to-right. |
| Message Position: | ½ to ¾ inch, or equal but not to exceed stroke width of alphanumerics. |
| Border Width: | Set ½ inch from sign edge. |

(Drawing not to scale)

**INDICATION:** INITIATE TWC CALL AT THIS POINT AT STATIONS THAT HAVE LONG PRE-EMPTIONS.

### REMARKS

**Purpose:** To identify location of TWC Call at this point.

**Criteria:**

| Sign Placement: | To be placed in advance of TWC Loop. |
| Vertical: | Should be within Train Operator’s normal field of view (9 feet from top of sign to top of rail), provided adequate clearance exists and line-of-sight is unobstructed. |
| Horizontal: | Signage posts should be placed at 9 feet from the track center, provided adequate clearance exists (including between LRT and Freight) and line-of-sight is unobstructed. |

**Notes:** *Compress spacing by 20 – 25% if necessary.*
## Sign OM-36, COAST

### DESCRIPTION

<table>

### Sign OM-39, END CAB SIGNAL BLOCK

#### DESCRIPTION

| Alphanumerics | BLACK |
| Colors:       | BLACK |
| Border Color: | REFLECTIVE WHITE |
| Background Color: | SQUARE |
| Sign Shape:   | 18 inches by 18 inches |
| Sign Size:    | Series D *note, C, B |
| Type:         | 3 inches |
| Size:         | Centered top-to-bottom and left-to-right. |
| Message Position: | ½ to ¾ inch, or equal but not to exceed stroke width of alphanumerics. |
| Border Width: | Set ½ inch from sign edge. |

(Drawing not to scale)

#### INDICATION:
ENTERING LINE-OF-SIGHT TERRITORY. OPERATE ACCORDING TO LINE-OF-SIGHT RULES OR CONTROLLER’S INSTRUCTIONS.

#### REMARKS

| Purpose: | To identify the point where cab signal operation end and line-of-sight operation begins. |
| Criteria: | Sign Placement: |
| Vertical: | To be placed at the exit boundary of the last track circuit in Cab Signal territory. |
| Should be within Train Operator’s normal field of view (9 feet from top of sign to top of rail), provided adequate clearance exists and line-of-sight is unobstructed. |
| Horizontal: | Signage posts should be placed at 9 feet from the track center, provided adequate clearance exists (including between LRT and Freight) and line-of-sight is unobstructed. |
| Notes: | *Compress spacing by 20 – 25% if necessary. |
| **Signs installed for normal and reverse direction track. |

(drawn not to scale)

**INDICATION: INTERLOCKING LIMIT – PROCEED ON PROPER INDICATION**

**REMARKS**

| Purpose: | To provide operator the designation of interlocking limit. |
| Criteria: | Sign Placement: To be placed approximately (but no greater than) 12 feet in approach to the insulated joints that define the interlocking limit. |
| Vertical: | Should be within Train Operator’s normal field of view (9 feet from top of sign to top of rail), provided adequate clearance exists and line-of-sight is unobstructed. |
| Horizontal: | Signage posts should be placed at 9 feet from the track center, provided adequate clearance exists (including between LRT and Freight) and line-of-sight is unobstructed. |

| Notes: | * Sign nomenclature shall include the direction and track corresponding to the location of the sign, in this example: "North-2" is North end of interlocking on track 2. Bottom line shall be abbreviated interlocking designation and entrance nomenclature. In this example: "MC-2S" is the 2S entrance to Malcolm Interlocking. |
| Signs should be installed adjacent to each track for normal and reverse running. |

END OF SECTION 16996
PART 1 - GENERAL

1.1 DESCRIPTION

A. Work to be done under this Section consists of providing and installing miscellaneous components and products as specified herein and as shown on Contract Drawings.

1.2 REFERENCE STANDARDS

A. American Railway Engineering And Maintenance-of-Way Association (AREMA):
   1. AREMA, Communications & Signals Manual, Part 1
   2. AREMA, Communications & Signals Manual, Part 2
   3. AREMA, Communications & Signals Manual, Part 14
   4. AREMA, Communications & Signals Manual, Part 15

B. Institute of Electrical and Electronics Engineers (IEEE):
   1. IEEE C37.14 - Standard For Low-Voltage DC Power Circuit Breakers Used In Enclosures

C. National Electrical Manufacturers Association (NEMA):
   1. NEMA 4 - NEMA Standards Publication 250-2003 Enclosures for Electrical Equipment (1000 Volts Maximum)
   2. NEMA 1 - NEMA Standards Publication 250-2003 Enclosures for Electrical Equipment (1000 Volts Maximum)

1.3 SUBMITTALS

A. Submittals shall be in accordance with the requirements of these Specifications.
   1. The Contractor shall submit performance data or a sample for each component or product type proposed as an "approved equal" to the Authority for approval. The Contractor shall obtain Authority's written approval to use equivalent component or product types.

1.4 QUALITY ASSURANCE

A. Miscellaneous components and products shall be inspected prior to shipment. Inspection shall conform to the manufacturers Inspection procedure.

B. Miscellaneous components and products shall meet the requirements of the AREMA Communications & Signal Manual.

C. Each miscellaneous component and product shall be inspected after it has been installed in the field. This inspection shall conform to the Contractor's Installation and Inspection Procedure as approved by the Authority. Installation shall not be considered complete until all installation defects have been corrected to the Authority's satisfaction.

D. Miscellaneous components and products shall be tested according to Authority approved test procedures.

PART 2 - PRODUCTS

2.1 AUTHORITY FURNISHED MATERIAL

A. Not Used

2.2 CONTRACTOR FURNISHED MATERIAL

A. All miscellaneous components and products used on this Contract shall be:
   1. New and free of manufacturing defects.
   2. Clearly and permanently labeled with value or type identification.
   3. All electrical component ratings shall be at least 20 percent greater than the maximum power, voltage, current, and temperature values that are expected for the components in service.

B. Printed Circuit Cards
   1. Printed circuit (PC) cards shall be of glass epoxy construction. Card material shall meet the requirements of NEMA Type FR-4. Cards shall have sufficient thickness to permit easy insertion and removal, and shall be physically keyed to protect against incorrect interchange. Circuits shall be formed by etching. Conductor material shall be copper and shall be protected from exposure to air by a conformal coating.
   2. PC cards containing components that may be damaged when a plug connector or plug-in unit is removed while equipment is energized shall be clearly marked or labeled with a warning label and the PC card shall contain a means to remove power from the cards.
   3. Components mounted on the PC card, weighing more than one-half ounce or with a displacement of more than one-half cubic inch, shall have a mechanical supporting attachment to the card that is separate from all electrical connections.
   4. Stacking or piggybacking of printed circuit card sections on printed circuit cards is not permitted.

C. Printed Circuit Card Connectors
1. Connectors shall have gold plating a minimum thickness of 0.000050 inch.

D. Circuit Breakers, Fuses and Fuse Clips

1. Fuses and circuit breakers shall be of suitable capacities to protect the wiring and the apparatus from the effects of short circuits or overloads. All circuit breakers and fuses shall be in accordance with these Specifications.

2. Circuit fuses shall be non-renewable and of fiber-case, time-lag, fusion type. Circuit breakers and fuses shall be correct size and rating for circuit current interruption and protect electrical equipment and circuits from short-term and long-term overloads.

3. In DC branch circuits, where fusing is impractical, a protective resistance unit shall be provided. All fuses shall be centrally located on power distribution panel and power racks.

4. Fuse clips shall be so constructed to retain their resilience under all installation and service conditions to assure a positive contact between clips and fuse.

E. Diodes

1. All diodes provided under this Contract shall carry a JEDEC number or be available from more than one manufacturer and be used within the published specifications for such number. All diodes shall be silicon type, unless otherwise Authority approved.

F. Resistors

1. All resistors, other than those required for electronic circuits, shall be in accordance with AREMA Communications & Signals Manual, Part 14.2.15.

G. Reactors

1. All reactors, other than those required for electronic circuits, shall be in accordance with AREMA Communications & Signals Manual, Part 14.2.20.

H. Capacitors

1. Capacitors, for electronic circuits, shall be in accordance with the applicable requirements of AREMA Communications & Signals Manual, Part 14.2.40.

I. Signal Terminal Blocks

1. Signal System terminal blocks shall be in accordance with the applicable requirements of AREMA Communications & Signals Manual, Part 14.1.5.

J. Signal Terminal Binding Posts

1. Signal System Terminal binding posts, other than those required for supervisory control circuits, shall be in accordance with AREMA Communications & Signals Manual, Part 14.1.10.

K. Terminal Post Insulators

1. All terminal posts, located on terminal boards in the wayside cases and wayside instrument houses used to terminate 50 Volts or greater, shall be provided with a protective insulator.

2. The type of insulator shall be individual for each terminal post and be fire-resistant.

L. Insulated Test Link

1. Insulated test links shall be in accordance with AREMA Communications & Signals Manual, Part 14.1.15.

M. Lightning Arrestors and Equalizers

1. Lightning arresters and equalizers shall be mounted on three-post porcelain or Authority approved type base in accordance with AREMA Communications & Signals Manual, Part 11.3.1.

N. Terminals for Wires and Cables

1. All solderless terminals shall be in accordance with AREMA Communications & Signals Manual, Part 14.1.1.

2. Terminals shall be of the solderless crimp-on type. Samples of all solderless terminals shall be submitted for Authority approval.

3. All stranded copper wire shall be fitted with an Authority approved terminal at all points where the wires are to be terminated on terminal binding posts.

4. Terminating means shall be of five types:
   a. A lug for terminating heavy wires or signal power wires;
   b. A solderless insulated terminal manufactured by AMP, Inc. under the trade name of "Ring Tongue Plasti-Bond", similar to Catalog Number 35628, or Authority approved equal, for terminating Numbers 16 and 14 AWG stranded wires;
   c. A solderless insulated terminal AMP Catalog Number 35627, or Authority approved equal, for terminating insulated Number 12-10 AWG wires;
d. A solderless insulated terminal AMP Catalog Number 324108 for terminating other stranded vital circuit insulated wires Number 20-16 AWG having a maximum diameter of 0.200 inches or Authority approved equal;
e. A solderless insulated terminal, AMP Catalog Number 320554, or Authority approved equal, for Number 8 studs and AMP Catalog Number 320571 or Authority approved equal, and be provided for one-quarter inch studs for nonvital circuit insulated stranded wires Numbers 16 to 22 AWG having a maximum diameter of 0.125 inches.

5. Where flag type terminals are required, they shall be AMP Catalog Number 322313, for terminating Number 16 AWG and 14 AWG stranded wires or Authority approved equal. Other pre-insulated terminals shall be as described in AMP Product Bulletin Number 109-1 or Authority approved equal.

6. Terminals shall be attached to the conductor ends in a manner that conductor flexibility shall not be impaired and terminal breakage probability will be reduced to a minimum.

7. Terminals shall be installed with a tool made and recommended by the Authority approved terminal manufacturer.

8. Tools shall be equipped with a ratchet device to insure proper terminal indentation and will not release until proper indentation is complete.

9. The Contractor shall provide to the Authority three terminal tools, which are new and unused.

O. Tagging for Cables, Wires, and Equipment

1. Except as otherwise specified in this Section, both ends of each cable, each cable wire and all single wires that terminate in all wayside enclosure and on equipment shall be permanently identified with a tag. Tags shall not obscure connecting links between terminal binding posts. Tags shall be installed so they may be read with a minimum of disturbance of tags and wiring. Each cable conductor shall be identified before applying tag.

2. Tags for wire, cable, transformers identification, resistors, reactors and other components shall meet the following requirements and be Authority approved:

   a. Sleeve Type Tags

   1) Tags for identification of all individual cable conductors and field-installed wires shall be sleeve type as manufactured by Raychem Corporation, Thermofit Marker System (TMS), W. H. Brady Co., Bradsleeve (XB-321,-322,-323), or Authority approved equal. Application of conductor nomenclature shall be in accordance with manufacturer's instructions and result in a permanently bonded and legible identification.

   2) Field change wiring tags for identification shall be wrap around and self-adhesive.

   b. Flat Plastic Tags

   1) Tags for identification of vital relay plug boards, individual transformers, resistors, reactors, terminals and other miscellaneous components shall be the flat plastic laminated type.

   2) Tags shall be 1.5 inches long by 0.75 inch wide with one, 0.3125 inch hole located in the center of the width. Distance from the edge of tag to the hole shall be approximately 0.28125 inch. Untreated tag shall be milk white "vinylite," or Authority approved equal.

   3) Identifying nomenclature space shall allow for three rows of lettering, and the tag material capable of receiving typed-on characters by conventional means. Lettering height shall be not less than 0.125 inch.

   4) After lettering, both face and tag backside shall be covered with a clear plastic "vinylite" coating or Authority approved equal. The coating shall be at least 0.01 inch thick.

   5) Nomenclature applied to tags on entrance racks and boards shall show terminal post identification on the top line. Functional nomenclature shall appear on the bottom line, or, if required, on the middle and bottom lines. Geometry coordinates, such as rack, row and post number, shall identify terminal posts.

   c. Flag Marker Tags for individual wire identification of shelf-mounted relays and wires and conductors in junction boxes shall be miniature locking type flag marker tags.

P. Pressure Sensitive Labels
1. Pressure-sensitive labels bearing the geometric coordinates shall identify the rows and columns on entrance racks.

2. Mark front of relay and rear of plug boards.

Q. Hardware

1. All mounting hardware exposed to the elements shall be hot-dip galvanized or other Authority approved material.
   
a. Galvanizing
      1) Hot dip galvanizing process shall be used. All parts shall be pickled so that scale and adhering impurities will be removed. The zinc coating shall be of commercially pure zinc, continuous, and thorough. It shall not scale or blister or be removable by handling or installation. Finished surface shall be free from fine line cracks, holes, or other indications of faulty galvanizing. It shall be smooth and free from adhering flux and other impurities. Edges and ends of parts shall be free from lumps and globules. Parts shall be coated with at least 2 ounces of zinc per square foot of galvanized surface, after all bending, cutting, drilling, and final fabrication.

b. Bolts in Cast Metal
   1) Any bolt installed in a cast metal assembly shall be coated with “Never-seize” prior to assembly.

R. Special Conduit

1. Flexible Conduit and Hose
   
a. Hose for TWC shall be Braided Cordura Rayon, vari-purpose hose, internal tube neoprene cover, or Authority approved equal. Hose shall be clamped at both ends with stainless steel clamps.

S. Stainless Steel Clamps

1. Hoses shall be clamped at each end using stainless steel clamps.

T. Cabinet Locks, LCP Locks, Padlocks and Keys

1. Cabinet locks, LCP locks, and keys shall be with key change in accordance with the Authority standard for signal equipment requiring cabinet locks and LCP locks. A minimum of 12 keys shall be included for cabinet and LCP locks and 150 keys for each type of signal and switch padlock. The Contractor shall obtain keying information from the Authority to ensure that keying is identical to keying used on the existing system.

2. Padlocks for signal apparatus requiring padlocks shall be as follows, or Authority approved equal:
   

d. Padlocks shall be provided and installed for all housings, doors and signal equipment covers. Switch padlocks shall be provided and installed for operations access side of electric locks, power and hand-throw levers of switch-and-lock movements, and manual control and panel operation.

e. All padlocks shall be stamped with the Authority logo and inscribed with the words "Property of Dallas Area Rapid Transit."

U. Sealing Compound

1. Sealing compound for use in sealing cable entrances shall be in accordance with AREMA Communications & Signal Manual, Part 15.2.15.

V. Paint and Finish

1. Signal equipment paint and painting procedures shall be provided and applied in accordance with AREMA Communications & Signal Manual, Part 2.4.30.

W. Cable Entrance Conduits

1. Cable entrance conduits for ground-mounted wayside signal cases shall be four inch galvanized steel, three feet six inches long, threaded on one end, reamed and chamfered and provided complete with one locknut and one
bushing for each conduit. One spare entrance conduit assembly shall be provided for each ground mounted wayside case.

2. Cable entrance pipes for ground-mount signal instrument houses shall be galvanized rigid steel (GRS) conduit running directly between the house and the nearest manhole or as approved by the Authority. Two spare conduits shall be provided and installed within each Signal Equipment Enclosures or Central Instrument House (CIH).

X. Rubber Mats
1. Rubber mats shall be provided for installation in the Signal Instrument House. Rubber mats shall meet the applicable sections of IEEE C-37-14 and NEMA-Standard 1CS-1970.

Y. Switch Circuit Controllers
1. Switch Circuit Controllers shall be GRS Model 7, US&S Co. Model U-5, Safetran Systems Corporation SSC-402, or Authority approved equal.
2. The Contractor shall submit switch circuit controller layout drawings for Authority approval. If a switch circuit controller layout comprises a portion of a larger layout that requires a drawing submittal, switch circuit controller layout submittal may be considered as a part of the total drawing submittal.
3. Switch circuit controller layouts shall be provided and installed complete with connecting rod, switch point lug, cable entrance, all bolts, nuts, washers, and fastenings.

Z. Lubrication
1. Switch tie plates lubrication for all switch-and-lock movement layouts shall be an Authority approved graphite lubricant, similar to Dixon’s Graphite “Railroad 60” or Authority approved equal.

AA. Train Stops
1. All train stops not made of cast aluminum shall be painted black.

BB. Environmental Protection
1. Protection for machined-finished surfaces, threaded rods and nuts and other parts that are susceptible to rusting shall be a corroding preventive compound, NO-OX-IDE Number 90918, or Authority approved equal. The product must have sufficient body to resist weather and rusting for at least six months.
2. Two gallons or equivalent weight shall be provided to the Authority as a deliverable.

CC. Trench Marker Tape
1. The Contractor shall provide and install trench marker tape for signal cable, bright yellow, six inches wide and continuously coded in black lettering with the following legend:

CAUTION CAUTION CAUTION BURIED SIGNAL CABLE

DD. Tamper-Proof Bolts
1. Equipment with covers that are not furnished with locks shall have at least one tamper-proof bolt per cover. The Contractor shall provide six tools for each type of bolt keying to the Authority as a deliverable. The Contractor shall provide tamper proof bolts compatible with those used on Authority’s existing system.

EE. Maintenance Materials:
1. Two rectifiers of each type and rating used in the system, including those normally considered an internal component of any given equipment.
2. Twenty fuses and 10 circuit breakers of each type and rating used in the system, including those normally considered an internal component of any given equipment.
3. Eight terminal strips of each type complete with hardware.
4. Thirty wire connectors of each type and size used in the system, including all multi-conductor connectors with hardware.
5. Two dozen of each type of hardware used, such as nuts, washers and screws.
6. One transformer of each rating used in the system.
7. Two of each type Printed Circuit (PC) card used in the signal equipment supplied under this Contract, but not mentioned elsewhere.
8. Three of each type of power supply, inverter, battery and battery charger supplied under this Contract.
9. Two of each type card extender for each type electronic equipment provided under this Contract.
10. One thousand feet of each type of wire and cable used.

PART 3 - EXECUTION

3.1 INSTALLATION

A. All material and apparatus specified shall be installed in accordance as described in these Specifications.
PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith will be considered incidental to the work specified under Section 16901 “Signal System Basic Technical Requirements.”

END OF SECTION 16997
SECTION 16998
TEST AND INSPECTION - SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

A. The Work to be done under this Section consists of tests and inspections that shall be performed to demonstrate that the systems, subsystems, assemblies, subassemblies and components provided under this Contract are in compliance with these Specifications.

B. Work shall include conductor disconnecting and reconnecting as required for testing.

C. Contractor shall perform all Work related to assisting Authority Corrosion Testing when the testing relates to Signal System components.

1.2 REFERENCED STANDARDS

A. American Railway Engineering And Maintenance-of Way Association (AREMA)

1. Communications and Signals Manual of Recommended Practice (C&S Manual)

B. National Institute of Standards and Technology (NIST)

1.3 SUBMITTALS

A. General Test Submittal Requirements

1. Contractor shall provide certified test results for all required tests. Contractor’s test program manager, the individual performing the test, and all witnesses shall sign all test results.

2. Test reports shall record each instrument’s calibration date and calibration expiration date. A certified metrology laboratory that maintains National Institute of Standards and Technology (NIST) traceability shall perform instrument calibration. Calibration shall be maintained as specified by each instrument’s manufacturer. Out-of-calibration instruments will be considered non-certified. Tests conducted with non-certified instruments will be summarily rejected.

3. Contractor’s engineer shall review all test reports prior to submittal to the Authority.

4. Any tests not described in these Specifications and required by the Contractor’s design to ensure safe operation or required reliability of the system shall be identified by the Contractor during the preliminary design review and included in the Test Program Plan.

B. Test Program Plan

1. Contractor shall submit for Authority approval, a Test Program Plan that includes:

a. A flow diagram indicating the logical sequence of tests, starting with Qualification Tests and ending with Integrated Testing.

b. A list of test procedures in test procedure number order and a brief test description.

c. A preliminary tests schedule that shows each test for each location with start and finish dates. The schedule portion of the Plan shall be a dynamic document that the Contractor updates monthly as the program progresses.

d. An organization chart and description of the Contractor’s in-house and field test organization.

e. Requirements and recommendations for witnessing by the Authority.

2. Qualification Test Procedures: Contractor shall submit for Authority approval, Qualification Test documentation. Documentation shall include either Qualification Test procedures or prior Qualification Test Results, as applicable.

3. Qualification Test Results: Contractor shall submit for Authority approval, completed Qualification Test Results for that equipment type.

4. Manufacturing Test Procedures: Contractor shall submit procedures for component Manufacturing Test as described in the Authority approved Test Program Plan.

5. Manufacturing Test Results: Contractor shall submit for Authority approval, completed component Manufacturing Test Results.

6. Factory Test Procedures: Contractor shall submit for Authority approval Factory Test Procedures for the sub-system or control point

7. Factory Test Results: Contractor shall submit for Authority approval, completed tested equipment Factory Test Results.

8. Installation Test Procedures: Contractor shall submit for Authority approval,
completed Installation Test procedures for the equipment type to be installed.

9. Installation Test Results: Contractor shall submit for Authority approval, completed Installation Test Results for the test.

10. Field Test Procedures: Contractor shall submit for Authority approval, Field Test Procedures for the system portion to be tested.

11. Field Test Results: Contractor shall submit for Authority approval, completed Field Test results for all tests at that location. Individual Field Test results shall not be submitted without prior Authority approval.

12. Integrated Test Procedures: Contractor shall submit Integrated Test Procedures for Authority approval.

13. Integrated Test Results: Contractor shall submit Integration Test results for Authority approval.

14. Final Test Certification: Prior to placing any Project section into service, the Contractor shall submit a letter signed by the contract's authorized representative wherein the Contractor shall certify that all section tests have been performed and all results and measurements are within Authority approved engineered values.

E. All Authority approved system and subsystem tests to demonstrate that installation meets these Specifications and design requirements shall be completed prior to any operational testing of systems or subsystems.

F. The Authority retains the right to witness all field tests. The Authority shall be notified in writing at least 48 hours prior to each field test. No part of the signal system shall be placed in service without the Authority being present and witnessing in-service tests.

G. Work shall include all tests required to ensure systems and subsystems proper and safe operation and to prove the total installation adequacy and acceptability. Tests to be performed shall cause each system and subsystem to be sequenced through its required operations, including imposition of simulated conditions to prove that installation complies with all specified fail-safe requirements.

H. In event of design errors or failure to meet these Specification requirements or any design or installation corrections, all tests or retests to prove compliance, and any required regression testing shall be included in the Work at no additional cost to the Authority.

I. Inspection and Tests shall meet the requirements of the AREMA C&S Manual.

PART 2 - PRODUCTS

2.1 AUTHORITY PROVIDED MATERIAL

Not Used

2.2 CONTRACTOR PROVIDED MATERIAL

A. Site Test Equipment and Materials

1. All test instruments and equipment required to conduct tests shall be available, ready-for-use not less than 1 week in advance of test date. Ready-for-use shall mean properly matched for test parameters, properly calibrated, sufficiently supplied with leads, probes, adapters, and stands, as required to conduct a particular test.

2. All temporary or interim test-related materials, special tools, connections, jumpers, shall be provided by the Contractor and available not less than 1 week in advance of test date.

B. Test Procedures: All test procedures shall be performed on standard forms that include, as a minimum, fields for the following:

1. Procedure Number and Revision

2. Test Location

3. Test Date
4. Test Objective

5. Test Prerequisites

6. Software Version(s)

7. Test equipment, manufacturer, model number, calibration and calibration expiration dates of each test equipment item that requires NIST traceability

8. Equipment or resources required from other sources outside of the Contractor's organization.

10. Personnel required to perform the test.

11. Test Set-up

12. Temporary connections or modification required to perform the test.

14. Anticipated results for each procedure step.

15. Pass/fail criteria for each procedure step.

16. Pass/Fail Notation and Remarks

17. Tester Signature

18. Signature of Tester certifying that all temporary connections or modifications have been restored.

19. Completion Date

20. Tester's Additional Comments

21. Witness printed and signature blocks with an appropriate block for the Authority, supplier, and Contractor.

22. Where required, attached Results Tables

C. Test Results

1. Submit test results for each test activity.

2. Original test results shall contain the original test forms filled out by the person(s) performing the tests, and original signatures.

3. Unless otherwise specified, submit within 7 days of test completion.

4. Blue ink shall be used to complete all test form entries.

5. Errors shall be crossed out with a single line and initialed by the person making the correction.

6. Test results shall include test procedure forms with all fields completed. Fields that are not applicable shall be marked Not Applicable or N/A.

7. Test results shall be submitted with a Test Summary Sheet that includes, as a minimum, the following:
   a. Test Number and Revision
   b. Interim test date if not completed
   c. Test Completion Date
   d. Narrative Summary of the Test Results
   e. Listing of any procedure failures, observations and procedure field modifications.
   f. Signature of the Contractor's Testing Manager
   g. Additional Comments

8. Unless otherwise approved by the Authority, tests in which one or more procedures have failed shall be repeated in their entirety.

D. Regression Testing: Contractor shall identify and be responsible for any regression testing required due to software changes after the test program has started.

E. Prior to commencement of regression testing, the Contractor shall submit a list of tests and/or procedures that require re-testing. Contractor shall also submit a revised test schedule for Authority approval.

PART 3 - EXECUTION

3.1 QUALIFICATION TESTS

A. Contractor shall perform Qualification Testing on all equipment to verify that the equipment complies with these Specifications, the specified design, and environmental requirements.

1. Qualification tests shall ensure that vital components function in a manner required for fail-safe operation. Testing shall include a full range of interface failures to the tested equipment.

2. Qualification tests shall ensure proper operation over the temperature, humidity, vibration and shock ranges expected for a rail application in the Dallas area.
B. Qualification tests may not be required for unmodified equipment that has a proven service record in a similar operating environment. In lieu of qualification testing, the Contractor shall submit documentation of prior qualification testing.

3.2 MANUFACTURING TESTS

A. Manufacturing tests shall be performed on each first article equipment type and subsequently at frequencies identified in the Authority approved Test Program Plan.

B. Manufacturing tests shall prove that the product is within acceptable physical and operating tolerances. Where practicable or industry practice, test results shall be affixed to the product.

C. Vital Relay Tests: Prior to factory test of a location, manufacturing tests shall be completed for all associated DC vital relays in accordance with AREMA C&S Manual Part 6.4.1 and manufacturer's recommendations. All associated AC vital relays shall be tested in accordance with AREMA C&S Manual Part 6.4.5 and manufacturer's recommendations.

3.3 FACTORY TESTS

A. Contractor shall provide written confirmation that all required systems, subsystems, assembly, and sub-assembly factory tests were successfully performed. These tests shall verify design, nameplate ratings, and compliant performance with these Specifications.

B. Instrument Houses and Wayside Cases: Each instrument house, wayside case or equipment enclosure shall be wired complete with all equipment installed at the point of assembly. A wiring verification and operational test shall be conducted in accordance with the Authority approved circuit plans. Functions external to the housing shall be simulated where required.

1. Energy distribution tests shall include the following:
   a. All fuses shall be removed and breakers opened.
   b. Verify each fuse and circuit breaker size with that on Authority approved circuit plans.
   c. All energy distribution shall be checked using resistance test instruments acceptable to the Authority to verify agreement with Authority approved plans.
   d. Verify wire gauge with that called for on Authority approved circuit drawings. All discrepancies in wire sizes shall be replaced with proper size wire.
   e. Each energy buss shall be electrically independent and tested against all other energy busses to ensure that no electrical short circuits exist.

2. Wiring verification test: All circuitry shall be checked for accuracy against Authority approved circuit drawings. Tests may be performed with energy on or off and shall verify the following:
   a. Point-to-Point Wiring
   b. During the wire verification test, a wire count on each terminal, relay contact, and junction point shall be performed to ensure that only the correct wire count cited on the Authority approved circuit plans is present at each terminal, relay contact, or junction point. Any discrepancies found shall be corrected.
   c. Verify tags and nomenclature.
   d. Verify that all components are as shown on Authority approved circuit drawings and located in proper positions.

3. Vital circuit tests shall be conducted with energy on during simulation testing.
   a. All vital circuits shall be tested to ensure the opening of each contact in a circuit cuts current to the controlled device.

4. Interlocking Tests, (Vital Processor): Contractor shall simulate all operating conditions to ensure each circuit function is in accordance with these Specifications. Functions tested shall include the following:
   a. Time Locking
   b. Route Locking
   c. Detector Locking
   d. Time Release Settings Verification
   e. Proper energy polarity that will interconnect with the existing and new circuitry outside the housing or case tested.

5. Adjustments and defect corrections in house wiring shall be installed as required to obtain proper operation.
6. All required design changes to obtain proper operation shall be submitted for Authority approval.

C. Instrument Racks

1. Instrument rack components and equipment for local control panel shall be wired with all equipment installed at the point of assembly. Racks shall be interconnected in accordance with Authority approved installation drawings. All system functions shall be simulated to determine that each function operates as required.

2. Adjustments and defect corrections in rack wiring shall be made as required to obtain proper operation.

3. All design changes required to obtain proper operation shall be documented and submitted for Authority approval.

3.4 INSTALLATION TESTS

A. Installation Tests shall prove that each equipment item is installed according to Authority approved installation drawings within acceptable physical tolerances.

B. Installation quality is subject to visual inspection.

C. Installation tests shall include inspection to ensure equipment is installed plumb and level where required, and that equipment is free of damage.

D. Inspections shall include reporting of scratches, dents, rust or poor paint quality. These tests shall be performed prior to any systems or subsystems Field Testing.

E. Prior to any Work that conceals an installation, the Authority shall witness the equipment Installation Test unless otherwise directed by the Authority.

3.5 FIELD TESTS

A. Field tests performed shall cause each installed system and subsystem to be sequenced through its required operations, including imposition of simulated conditions to demonstrate that installation complies with all specified fail-safe design requirements and operational functions.

B. Should an error be discovered during field testing due to field wiring and connections that do not agree with Authority approved circuit plans, the Contractor may correct such errors without prior Authority approval. Contractor shall not, however, make any changes which affect safety of operation on Authority approved circuit(s) as designed without prior and written Authority approval.

C. The Authority will make all final determinations as to whether only a part, or the whole test, shall be rerun when any field test results do not meet requirements specified for the test. Re-testing of tests shall be at no additional cost to the Authority.

D. Any changes made after completion of a test procedure shall require that the Contractor perform a retest and related regression testing in accordance with the applicable test procedure(s).

E. General Field Tests shall include the following:

1. Ground Verification test

2. Power racks - Energy Distribution System and Failure Alarm Checks

3. Breakdown test of all vital circuitry.

4. Nonvital circuitry wiring verification.

5. Line circuit verification between wayside instrument houses.

6. Vital Function Tests

7. Operating Tests

8. All applicable tests prescribed by AREMA C&S Manual Part 2.4.1.

F. Specific Field Tests shall include:

1. Energy Distribution

   a. Energy-Off Tests: With all power to wayside instrument house or case off, the following checks and tests shall be performed.

      1) All fuses shall be removed and breakers opened.

      2) Verify circuit breaker size compares to that on Authority approved circuit plans.

      3) All energy distribution shall be checked, using resistance test instrument acceptable to the Authority, to verify agreement with the Authority approved plans.

      4) Compare wire gauges with those on Authority approved circuit drawings. Discrepancies in wire sizes shall be replaced with the proper size.

      5) During energy distribution breakdown, a wire count on each junction shall be performed to ensure that only the correct wire count cited
on Authority approved circuit plans is present at each junction. Any discrepancies found shall be corrected and additional wires, if found, removed.

6) Tags shall be verified for proper nomenclature and terminal location.

7) Each energy buss shall be tested against all other energy busses to ensure that the busses are electrically independent and no crosses exist.

b. Energy-On Tests: Upon completion of energy-off tests, the following checks and tests shall be performed.

1) Insert fuses for power supply feeds and verify proper size according to Authority approved circuit drawings.

2) Turn on energy feeds and test operation of power transfer for proper operation.

3) Each AC voltage input shall be measured and recorded.

4) Each power supply or charger output voltage shall be measured and recorded.

5) Verify that designed voltage is present at all distribution points.

6) Check circuit power failure alarms and all other alarms that indicate to Train Control Center (TCC).

2. Circuit Continuity Tests: All Contractor installed wire and cable shall be tested to verify continuity of each conductor and that each conductor is connected to the proper terminal as shown on Authority approved drawings. Where parallel circuits exist, each parallel path shall be tested independently to verify path continuity.

3. Vital and Nonvital Circuit Breakdown: All circuits shall be checked for compliance with Authority approved circuit drawings. Tests may be performed with energy on or off and shall verify:

a. Point-to-point wiring.

b. A wire count of all field-installed wires shall be performed for each junction to ensure that only the correct wire count cited on Authority approved circuit plans is present. Any discrepancies found shall be corrected.

c. Verify tags and nomenclature.

d. Verify that all components are the same as on Authority approved circuit drawings and located in proper positions.

4. Breakdown of Control Circuits

a. All circuits shall be tested in their entirety for correct operation and response to each contact on each circuit element, such as relays and contactors. Where parallel paths exist, tests shall validate each path and circuits opened, when required, to ensure proper test.

b. Contractor shall simulate all operating conditions to verify that each energy circuit operates in accordance with these Specifications and Authority approved plans.

5. Line Circuits: The purpose of this test procedure shall be to verify the integrity of line circuits between wayside locations. All nomenclature shall be verified and line circuits tested for continuity.

6. Traffic Circuits. The purpose of this test procedure shall be to verify the integrity of traffic circuits between interlocking locations. These tests shall include:

a. Traffic direction shall be tested by first establishing each direction of traffic and then sequentially de-energized each individual track circuit from headblock to headblock and observing that traffic cannot be reversed.

b. Once traffic is established, an attempt shall be made to clear all possible conflicting routes and ascertaining that neither the conflicting route can be cleared nor can the established direction of traffic be affected.

c. Each block repeater relay shall be tested to determine that it follows all the proper track relays opened in wayside instrument housings.
d. With an established direction of traffic, the controlled signal governing entrance to that particular route shall be put to stop with the approach track circuit occupied. It shall not be possible to establish traffic in the opposite direction until a predetermined time has passed. This predetermined time shall be as indicated on Authority approved plans. It shall be ascertained that approach or time locking is effective for this test.

7. Interlocking Tests

a. A detailed test inventory and complete test procedures shall be submitted for Authority approval. These procedures shall be used to test safe and proper operation of interlockings. Test sequences shall be designed to demonstrate each function for correct performance in accordance with these Specifications and Authority approved plans. Furthermore, test sequences shall include simulated unusual conditions to determine that interlocking circuits will respond in a predictable, safe, and Specification compliant manner. When performing Switch Indication Locking, the signal should drop red with a route lined and when switch being tested is placed in hand operation.

b. Functions to be tested shall include:

1) Approach Locking
2) Time Locking
3) Route Locking
4) Verification of timing on time releases.
5) Detector locking
6) Signal operation in accordance with route and aspect charts.

c. Time tests shall be as follows:

1) Loss of Shunt
2) Approach and Time Locking
3) Flashing Rate Time

8. Route Security Locking: Each route shall be tested for route security. This test shall be performed by establishing the routes and falsely energized the route check relay for each opposing or conflicting signal while observing that the associated signals stay at STOP and the associated signal clearing relays remain de-energized.

9. Insulated Joint Tests

a. Each running rail insulated joint, gauge plate, switch rod, throw rod and circuit controller rod shall be tested by the ratio method using a track quality meter. The track quality meter shall be manufactured by Alstom Signaling (formerly General Railway Signal Company), or Authority approved equal. With a standard 1000 ohm resistor placed across the joint and with track circuit current supplied by the track quality meter, the ratio between the current flowing through the insulated joint and the current flowing through the standard resistor shall be determined by use of the track quality meter current probe. Utilizing this ratio, calculations shall be made by an Authority approved formula to determine the insulated joint resistance.

b. If the resistance is less than 5000 ohms, the insulated joint will be regarded as defective and the Contractor shall notify the Authority. Following the Trackwork Contractors repair or replacement of the joint, the Contractor shall re-test the joint at no additional cost to the Authority.

c. Contractor shall verify that power frequency track circuit polarity stagger is correct by applying a direct shunt diagonally across insulated joints, from the West rail of one circuit to the East rail of an adjacent circuit. Contractor shall verify that the Track circuits indicate occupied when the shunt is applied. (This test is not required for the one end of the pocket track where 2 transformer ends of adjacent track circuits have the same polarity.)

10. Power Tests. The following power tests shall be performed and recorded:

a. Main power feeder voltage shall be measured and recorded.

b. A check of all fuses shall be performed for capacity and type.

c. All power supplies, battery chargers, and batteries shall be checked for correct setting and quantities.
d. Buss-to-buss checks shall be made to determine that no shorts, crosses, or grounds exist.

11. AHCW Tests

a. General
   1) Standby battery power source shall be at fully charged.
   2) Verify function on all manual test switches, cutout pushbuttons and starting pushbuttons.
   3) Verify that the instrument case, flasher and gate equipment are properly installed, grounded, clean and lubricated.
   4) Wiring resistance between crossing gate mechanism and battery terminals shall not exceed 0.1 ohm.

b. Flashing light: Perform tests and inspection to verify that:
   1) Individual light units are arranged to shine in both directions along the highway, are mounted horizontally 2'-6" on center and the center of the lenses are not less than 8'-4" above the surface of the highway.
   2) Lamps flash alternately with a 50 percent duty cycle each and there are between 40 and 55 flashes per minute per lamp.
   3) Each lamp's voltage is set in accordance with manufacturer's specifications.
   4) Phantom indications have been eliminated.
   5) With flashers operating, each flasher is aligned to provide unobstructed view in accordance with AREMA requirements.
   6) The associated bells operate at the same time the flashing lights are enabled.

c. Crossing Gates: Perform tests and inspection to verify that:
   1) Each gate arm is equipped with a minimum of 3 red light units arranged to shine in both directions along the highway. Pedestrian gates shall be equipped with 1 red light.
   2) The gate when in the raised position, does not obstruct highway traffic and has sufficient clearance of overhead wires and structures.
   3) The gate start to down in not less than 3 or more than 5 seconds after the flashing light signals are activated.
   4) Gates reach the horizontal position in not less than 10 seconds or more than 15 seconds after initial motion begins.
   5) Maximum time to reach the horizontal position does not exceed 20 seconds from the time the flashing lights are first activated.
   6) Gates reach the vertical position in not less than 8 seconds or more than 12 seconds.
   7) The torque with the gate in the horizontal position is not less than 50 foot-pounds. The torque with the gate in vertical positions not less than 175 foot-pounds for arm lengths up to 25 feet and increasing linearly to 360 foot-pounds for 38-foot arms.
   8) There is no oil, grease or dirt on the armature or pole faces of the held-clear magnet.
   9) Circuit controller contacts are clean and properly adjusted.
   10) Gate do not droop more than 1 inch below horizontal when down, and gate and counterbalance do not strike any object during any portion of their travel or when in the vertical position.
11) Clutch slippage has been adjusted to manufacturer's specifications.

12) Flashing lights are activated at all times except when the gates are locked in the vertical position. Bell will sound when the lights begin flashing and continue to sound until the gate arm has descended to within 10 degrees of the horizontal position.

13) When the gate arm is physically prevented from moving while being raised or lowered or when in any fixed position, the gate operating mechanism will stop without damage to the mechanism or motor.

12. Overlay Track Circuit Tests
   a. Test overlay track circuit to ensure proper design, installation and adjustment.
   b. For each track circuit, perform tests to determine the effectiveness of the filtering. With the transmitter disabled, measure any harmonic noise or crosstalk interference at the receiver to verify compliance with maximum crosstalk level and EMI rejection requirements.
   c. After adjustment, test all track circuits as follows: With a 3 ohm per thousand feet simulated ballast leakage, the track circuit shall de-energize when shunted with a 0.02 ohm shunt 3 feet beyond the receiving end. Place the 0.02 ohm shunt 10 feet beyond the receiving end, the track circuit shall remain energized.
   d. All tests and normal operating parameters shall be recorded for each track circuit. These records shall be submitted for approval.

13. Electromagnetic Compatibility: Perform tests required to demonstrate compliance with electromagnetic compatibility criteria in accordance with Section 16878.

14. Magnetic Train Stop Operating Test
   a. When the electromagnetic is de-energized, verify that train stop subsystem causes the train to apply its service brakes in order to come to a complete stop after passing a stop signal in the direction of that signal.

1) Clear the signal controlling the train stop under test to an aspect less restricting than stop.

2) Move the train past signal under test until the train has completely cleared the track circuit in advance of such signal. Verify the train successfully completes its move without service brake application.

3) Run the train beyond the signal in reverse direction. Verify that the train successfully completes its move without service brakes application.

4) With the same signal at stop, run the train past the signal at stop. Verify that service brakes are applied after passing over the train stop.

b. Tests shall be required at all magnetic train stops in both directions on each track.

15. Switch Indication Locking Tests: This test shall be performed by establishing a route and placing the switch in hand operation mode while observing the associated signal drops to STOP (red) with the switch contacts in the open position.

16. Train-to-Wayside Communications (TWC)
   a. A test train shall be used to test all function at each TWC location.
   b. At the TWC loop under test activate a TWC function and verify that the proper TWC function relay is energized in the CIH or equipment case.

3.6 INTEGRATED TESTS

A. In accordance with these Specifications, the Contractor shall provide procedures, personnel, test equipment, and material to perform Integrated Testing.

B. Integrated Testing shall include:
   1. Safe Braking Tests
   2. Control Line and Line Circuit Verification Tests
TEST AND INSPECTION - SIGNAL SYSTEM

3. Signal Sighting Tests
4. Train Stop Verification Tests
5. Interlocking Operating Tests
6. Train-to-Wayside Communication Tests
7. Data Communications Tests
8. Automatic Crossing Warning System Tests
9. Other System Dynamic Tests, as required.

C. System Demonstration Testing

D. Contractor shall support the Authority’s System Integration testing.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. The Work specified in this section will not be measured separately for payment.

4.2 PAYMENT

A. All costs connected herewith will be considered incidental to the work specified under Section 16901 “Signal System Basic Technical Requirements.”

END OF SECTION 16998
